This article revealed the importance of methodological combinations for a better understanding of results and the mechanisms of changes in the evaluation of HIV-AIDS private sector activities. This HIV-AIDS monitoring and evaluation framework could help to homogeneously assess HIV-AIDS prevention, treatment and wellness activities currently being implemented by HIV-AIDS programmes within South Africa. In addition, the indicator matrix could help healthcare workers improve their HIV-AIDS monitoring and evaluation activities. The indicator matrix enables the detection of gaps in intervention levels in order to generate strategies that may enhance HIV- AIDS programmes in the future. The above proposed digitally automated conceptual framework provides a clear roadmap to HIV-AIDS programme planning; monitoring and evaluation. It delineates clear pathways to programme goals and objectives and defines relationships between programme inputs, processes, outputs and outcomes. It describes how programme factors interact with external and internal environmental factors. The dashboard and automation functionality allows real-time assessment of programme measures in a novel, innovative and user-friendly manner. Given that South Africa has a well-established multi sectoral response to HIV-AIDS with various public, private and NGO programmes dedicated to the on-going prevention, treatment and wellness of HIV-AIDS, there is a need to develop common tools which are imperative to HIV-AIDS operational research activities to streamline work activities and to attain the best results possible from HIV-AIDS programmes

A proposed framework such as this is not only relevant to the private HIV-AIDS sector, but can be adapted for use in other sectors to ensure a multi-sectoral response to the HIV-AIDS epidemic. The innovative computerised technique allows this conceptual framework ease of use and offers a competitive edge over its counterparts,

Logistic Management Analysis of Medical Equipment in Padang Port Health Office

Magdalena¹, Rizanda Machmud², Hardisman²

¹*Pursuing Masters Degree Program in Public Health Andalas University, Indonesia,*

²*Lecturer in Public Health Sciences in Faculty of Medicine in Andalas University, Indonesia*

ABSTRACT

The objective of this study is to know the process of storage, distribution, maintenance and control on logistic management of medical equipment at Padang Port Health Office. This research uses qualitative approach. The result of the study shows that the policy is guided by the Guidelines of Medical Device Management in Health Facilities in 2015 and regulations related to the management of state property but the existing policy has not been socialized to all health equipment managers and has not been downgraded in the form of technical guidelines or standard operating procedures. Human resources are less in terms of quality and quantity. The budgets are still lacking primarily. Infrastructure are still lacking mainly for the storage of medical equipment and warehouses. Implementation of storage, distribution, maintenance and control of health equipment logistic has not been implemented properly. The function test for 357 medical devices obtained 45 units (12,60%) of medical equipment can not be functioned, 3 units (0,84%) of health equipment can not be tested because there is no officer available and 21 units (5,88%) unknown health equipment.

Index Terms— *Analysis, Distribution, Logistic Management, Medical Equipment, Planning, Procurement, Storage.*

INTRODUCTION

World Health Organization (WHO) in 2015, states that more than 50% of health equipment in developing countries is not functioning or cannot be used optimally due to lack of maintenance efforts. WHO also estimates that 95% of medical equipment in developing countries is imported, most of which do not meet the needs of national health services and are not used effectively and efficiently ^{1,2,3}.

Padang Port Health Office (PHO) is one of 49 Port Health Office in Indonesia. Padang PHO has been awarded as the best manager of State Property in all of PHO in Indonesia in 2014 and implementing logistics management system especially health equipment in order to achieve excellent service. However in the subsequent execution of whether this system is retained to date in accordance with regulations relating to logistics management ⁴.

Based on preliminary survey results, there are still many health tools that are stacked in some storage

places, even some health equipment stored in the home office. Based on the review of documents from the State Property Report of Padang PHO in 2016 from 357 units of existing health equipment, 311 units (87.11%) of good health equipment, 5 units (1.40%) health equipment in damaged condition lightweight and 41 units (11,48%) health equipment in a state of severely damaged. The amount of equipment that is in a state of damage is closely related to the process of maintaining the tool.

In addition to the accumulation of goods, the problem found in the Padang Port Health Office is still there were health equipment that is not given the code number of goods. According to Decree of the Minister of Finance No. 29 / PMK.06 / 2010 of 2010 concerning the classification and verification of State Property, User of Goods / Proxy of Users of Goods must register and record State Property (BMN) into List User / List of User Power of Attorney according to and goods codification in order to realize the orderly administration and support the orderly management of State Property.

The results of the interviews that researchers conducted in the initial survey with the officer of BMN management on March 07, 2017 revealed that there are several items of medical equipment that has not been known to exist with the total initial value of IDR 4.791.477.250, - (four billion seven hundred ninety one million four hundred seventy seven thousand two hundred and fifty rupiah). The equipment is Blood Chemistry Analysis, Stethoscope, Defibrillator and Pacer Analyzer / tester, Pressure Transducer for NIBD and Filter Compressor. Besides, there is also a mutation of medical equipment without the knowledge of BMN managers.

Based on the above description, we need to conduct research on analysis of logistics management of health equipment at the Port Health Office of Padang.

METHOD

This type of research is qualitative research and data were analyzed with Miles and Huberman model through data reduction, Data Presentation and Verification. This study was conducted from January to December 2017 at Port Health Office of Padang.

Technique of taking informant in this research by purposive sampling that is sampling technique with certain consideration made by researcher based on characteristic or characteristic of population which have been known. Data collection in this research was conducted in several ways such as observation (observation), in-depth interview (Indepth Interview), and document review ⁵.

RESULTS

Policy

The policy for managing medical devices at Padang PHO is carried out based on the rules relating to the management of BMN such as the Regulation of the Minister of Finance of the Republic of Indonesia Number: 181 / PMK.06 / 2016 concerning Administration of State Property, Minister of Finance Decree Number 29 / PMK.06 / 2010 in 2010 concerning classification and codification of State property, Republic of Indonesia Minister of Finance Regulation No. 244 / PMK.06 / 2012 concerning Procedures for Implementation of BMN Supervision & Control, Minister of Home Affairs Regulation No. 17 of 2007 concerning Technical Guidelines for Regional Property Management and Tool

Management Guidelines Health at the Health Facility and the user guide for each tool. Besides that, the manager of medical devices who work in the work area does not get a decree from the Head of the Padang PHO and the task as manager of the medical device is not included in the job description in employee work goals of each management officer.

Resources

The results of the study found that personnel in the implementation of medical logistics management in the Padang PHO in terms of quantity were not enough. Padang PHO should have as many as 6 electromedical personnel while the Padang PHO has only one electromedical staff. Existing electromedical technicians have not been fully involved in the management of medical devices because they are deemed not to understand the equipment available in the PHO and the other reason is that there is no electromedical technical function in the PHO position map. In terms of quality it is still lacking because the officers have never received training or socialization about the management of medical devices in addition to multiple positions.

Tools

Padang PHO does not yet have facilities and infrastructure in accordance with the standards set by the Indonesian Minister of Health as outlined in the Guidelines for Standardization of Human Resources, Facilities and Infrastructure in the Port Health Office Number 1314 / MENKES / SK / IX / 2010 Year 2010. Cabinets and shelves storage is still not good at the main office or in several regional offices.

Storage

The storage process begins with the acceptance stage carried out by electromedical personnel, BMN users and managers. The acceptance process is carried out through three stages, namely physical examination, function test and tool testing. Then the recording of the tool is done with the Application for BMN and tool labeling. Then the tool is submitted to the head of the section (user) using the Handover Minutes. Tools received by the user are then stored or distributed to the work area office. Tool storage is carried out according to the function of the tool. Tools that function to diagnose diseases are stored in polyclinics or blood chemistry laboratories. Tools for vector control and sanitation are stored in

vector laboratories and sanitation and warehouses for equipment and pesticides. Small tools are placed on the floor and large tools are placed on shelves or on the floor. Similar items but various sizes are grouped together by sorting from the smallest to the largest size.

Distribution

The process of distributing of medical devices in Padang PHO is carried out according to BMN rules, namely Minister of Home Affairs Regulation No. 17/2007 concerning Technical Guidelines for Regional Property Management and Guidelines for Management of Medical Devices in Health Facilities. The activity begins with a request for medical devices to the head section, after being approved for a physical examination, a functional test and a tool test. Transportation facilities for shipping medical devices and drivers are available. The process of physical expenditure of goods, transportation processes and demolition processes is pursued as best as possible to avoid damage during the shipping process. Some things that are not yet in line are the Minutes of Examination of distributed Goods and reports on the realization of medical devices distributed to working area is not been found yet. This happens because technical instructions and standard operating procedures on how to distribute medical devices at PHO are not yet available. Besides, medical officers have never received training or socialization.

Maintenance

The process of maintaining medical devices in Padang PHO has not been carried out in accordance with the Guidelines for Management of Medical Devices in Health Facilities because preventive maintenance and inspection activities have not been carried out. Maintenance activities carried out in the form of corrective maintenance carried out by each section without involving electromedical personnel except for maintenance of ambulance cars. There is no record book of corrective actions including the length of time for repairs and no reports of maintenance, in addition to the number of uncalibrated ales.

Control

The process of controlling medical devices at the Class II Padang Health Office has not been fully in accordance with Minister of Home Affairs Regulation No. 17 of 2007 concerning Technical Guidelines for

Management of Regional Property. Control is carried out by the section head through bookkeeping / records checking.

DISCUSSION

Policy

According to the researchers' assumptions, seeing the many problems related to this policy indicate that health equipment management activities have not been a priority either by the Director General of Disease Prevention and Control of the Ministry of Health of the Republic of Indonesia the Padang Port Health Office. Whereas in carrying out medical device management activities at the Padang PHO, the first and fundamental step that must be carried out is to make the operational policies themselves from activities in real terms. This operational policy will move the organization to meet the management needs of medical devices in Padang PHO. Although nationally there are guidelines and regulations related to BMN as a reference, but in its implementation at the Padang PHO, technical guidelines and standard operating procedures need to be made in accordance with the characteristics of the Padang PHO so that implementation of standardized medical equipment management activities can be evaluated. Implementers of policies should be given a decree so that in carrying out their duties they have a legal basis for all actions that are used as legal aspects to determine or maintain something that is decided. It is recommended that the Head of the Padang PHO make a standard operating procedures for the management of medical devices so that the medical administrators in implementing management activities become more clear, systematic and standardized so that they can implement them appropriately.⁷

Resources

The quality of human resources involves two aspects as well, namely physical aspects, and non-physical aspects that involve the ability to work, think, and other skills. Therefore, efforts to improve the quality of human resources can also be directed to both aspects. To improve physical quality can be pursued through health and nutrition programs. Whereas to improve the quality or non-physical abilities, education and training efforts are the most needed.⁸

The implementation of logistic management of medical devices can run well should electromedical

personnel be added to 6 people in accordance with the Joint Regulation of the Minister of Health and Head of State Personnel Agency Number 46 of 2014 and Number 23 of 2014 concerning Implementation Guidelines for the Minister of Administrative Reform and Bureaucratic Reform of the Republic of Indonesia Number 28 of 2013 concerning the Functional Position of Electromedical Technical and Credit Numbers states that the number of electromedical personnel in the Class II Port Health Office environment is electromedical personnel of 6 people, consisting of; skilled 4 (four) people and experts 2 (two) people. In order for each work area to have one electromedical staff to manage medical devices that are available throughout the work area of the Padang PHO, the technical officers are more focused on working on their activities. Besides that, the electromedical personnel available are given roles according to their educational background. It is recommended that the Director General of Disease Prevention and Control as the main unit of the PHO add electromedical functional positions to the PHO position map.

Tools

Means are tools to facilitate and facilitate work. In the business world to achieve better results, besides human beings who are experts in their fields, materials / materials are needed as a means because material and means cannot be separated. Support for facilities such as workplaces, tools, transportation and funds is important for smooth work. The facilities used for logistics management of medical devices include cabinets, shelves and operational vehicles. Facilities that are available at this time should be maintained both in terms of quality and quantity because the facilities are very important to support the implementation of good health equipment management activities. It is expected that the Padang PHO can budget funds for the purchase of shelves or cabinets for the main office or regional office.⁹

Storage

Storage can be interpreted as an activity and business to carry out management, organization and arrangement of inventory items in the storage room. The process of storing medical devices in the Padang PHO is carried out based on BMN rules and Guidelines for the Management of Medical Devices in Health Facilities.¹⁰

DISTRIBUTION

The logistics distribution activity is basically

a continuation of the process of storing or storing logistics or empirically is one part of the logistics warehousing activity itself. It is better if the manager of the medical device makes a Minutes of Examination of the Distributed Goods and reports on the realization of medical devices that are distributed to working are. In addition, officers need to be given training or outreach on ways of distributing good medical devices..

Maintenance

Maintenance of health equipment is a series of preventive and corrective activities carried out to maintain quality medical equipment, safe and usable). It is better if the manager of the medical device keeps a schedule of preventive inspections and maintenance and records corrective actions including the length of time for repairs. Electromedical power is involved in the maintenance of medical devices. For this reason, all medical personnel management is given training in maintaining good medical devices.

Control

In the control process, the delivery of the minutes of the results of the inspection to the manager of medical devices is very important to do as feedback from control activities. The delivery of this minutes will be a correction for managers to improve the process of managing medical devices at the next Padang PHO. The results of this examination need to be submitted to the Head of Padang PHO to be a note for policy makers in determining the steps to improve the management of logistic equipment in Padang PHO.

It is hoped that these control activities will be carried out by all section heads to all work areas. The results of the examination are poured into the Minutes of Examination Results. The event news is sent to the manager of medical devices and sent to the Head of Padang PHO. Training and outreach should be given to implementers of logistical control equipment in Padang PHO.

CONCLUSION

The logistics management policy for medical devices at the Port Health Office in Padang is guided by regulations relating to the management of State Property and Guidelines for Health Equipment Management in Health Facilities of the Directorate General of Health Efforts of the Ministry of Health, but the policies have

not been disseminated to all medical administrators and have not been revealed in the form of Technical Guidelines and Standard Operating Procedures that are specific to Padang Port Health Office. Managing staff in logistics equipment management activities at the Padang Port Health Office in terms of quantity and quality are still lacking. Funds and facilities for logistics equipment management activities are still lacking. The implementation of logistics equipment management activities at the Padang Port Health Office has not been implemented properly so that not all available medical devices are available in ready-to-use conditions.

ABSTRACT

This study aims to analyze the effects of extract Andaliman Fruit / *Zanthoxylum Acanthopodium Dc* (EZA) to CAMP mRNA expression and bacterial load in Mice Balb-C before and after *Gardnerella vaginalis* infection. Experiment to Balb-c mice consists of three groups; Control groups, given EZA 5 days groups and EZA 7 days groups prior *Gardnerella vaginalis* inoculation. Bacterial number and colonies, mRNA CAMP expression, were examined 3 and 5 days after inoculation of *Gardnerella vaginalis*. Data showed that administration of EZA extract for 7 days before *Gardnerella vaginalis* inoculation had a significant effect both on the decrease in bacterial number and bacterial colonies as well as in enhancing CAMP mRNA expression. The five-day EZA extract reduced the number of bacteria and increased mRNA expression significantly but was less effective in reducing the number of bacterial colonies. Controls group that was not given anything had significant increases in bacterial numbers and colonies, and increased CAMP expression was higher compared to another group. Conclusion: this study found Extract of *Zanthoxylum acanthopodium DC* (EZA) indicated as a potential anti-bacterial and immunomodulator especially to *Gardnerella Vaginalis* infection.

Keywords: Andaliman Fruit, CAMP mRNA expression, *Gardnerella vaginalis*.

INTRODUCTION

Indonesia has many natural ingredients that are often used as herbal medicine for various types of diseases.^{1,2} Andaliman fruit or *Zanthoxylum acanthopodium Dc* is a species of the citrus family, Rutaceae that widely found in the area of North Sumatra, Indonesia which at the same time become the spice on food that is very liked by the community. This fruit is unique because its acidity is often used as an ingredient for traditional food made from raw fish.³

The family of Rutaceae family such as *Zanthoxylum armatum* has been extensively studied but the benefits of *Zanthoxylum acanthopodium Dc* still rarely studied. One of the benefits that have been studied is its ability to inhibit angiogenesis in breast cancer cells.⁴⁻⁹

One of the problems in Indonesia is bacterial vaginosis such as *Gardnerella vaginalis* (GV). This bacterium is very risky in pregnancy and can also cause inflammation of the pelvis. This bacterial can be replaced by vaginal lactobacillus and its characterized with low vaginal acidity.¹⁰⁻¹² Antibiotic treatments for this bacterial infection are not recommended because it is potential become a resistant or reoccurrence infection. It is suggested to try to find natural anti-microbial from plant or a non-pathogenic organism, recommended natural ingredients that affect bacteria while enhancing immune status.¹³

Natural ingredients that affect bacteria while enhancing immune status is supposed as good herbal medicine. Andaliman fruit has a flavonoid content that enables it to increase immune status as well as affect the

bacteria, but this is still an assumption that needs to be proven. One marker host defense to bacterial infection include *Gardnerella vaginalis* is cationic antimicrobial peptides (CAMPs).¹⁴

This study aims to analyze the effects of Andaliman Fruit extract *Zanthoxylum acanthopodium* Dc (Eza) to CAMP mRNA expression and bacterial load in Mice Balb-C before and after *Gardnerella vaginalis* infection.

MATERIALS AND METHOD

Andaliman Fruit Extraction.

The andaliman fresh fruit was obtained from an altitude of Lake Toba region, namely in the village Buttumalasang North Sumatra Indonesia. Andaliman fresh fruit as much as 2.5 kg dried in the hot sun and dry andaliman freezer into fruit (1.8 kg). The extraction was done in the laboratory of Research Institute for Medicinal and Aromatic Plants (Balitro) with the following steps: preparation of a test (extract) beginning of the drying process using the oven for five days to simplicia. Simplicia (1500 grams) smoothed using a grinder with the fineness of 3-4 mm into a coarse powder, then soaked in a steel boiler using solvent 96% ethanol as much as 7500 ml (concentration of 1: 5 liter).

Extraction technique maceration was mixer / stirring for 3 hours, left to soak for 24 hours and is filtered using a filter paper to separate the residue and filtrate. Results filtrate in-rotavator or evaporation to separate the solvent to obtain a thick extract Andaliman fruit (fruit preparations andaliman ethanol extract yield 7%).

Animal.

Mice (*Mus musculus*) strain Balb-c female adults age 8-12 weeks weighing 18-20gram used as a test dose of the experimental animals. Animals are given standard feed ad libitum and be treated according to conventional cages.

Protocol Intervention.

Animals *Balb-C* female, healthy, age 8-12 weeks, weighing 18-20 grams are from Bogor PT.INDOANILAB adapted for seven days in the laboratory animal faculty of medicine Hasanuddin University with standard cages and feeding according to the standard laboratory indefinitely. Animal weighing eight days and then divided into three cages at random (random) with mean

weight of not more than 20% of each group consisted of four tail as replication. K1: a control group (non Eza) CMC1% treatment by administering a dose of 0.1 ml / 10 grams of BB / as long as seven days by gavage, the 8th day of inoculation GV. K2: Eza group 5 days of treatment with 2% Eza administration dose of 0.1 ml / 10 g BW / day by gavage for five days, the 6th day of inoculation GV. K3: group Eza 7 days of treatment with 2% Eza administration dose of 0.1 ml / 10 g BW / day by gavage for seven days, the 8th day of inoculation GV.

GV Bacteria from the Laboratory of Microbiology UNHAS Makassar, a method of induction in mice that intravaginal inoculation concentration of 3×10^4 @ 10 μ l (Sirait et al.2017). Blood samples for the measurement of CAMP gene mRNA in mice each performed three times, namely: before treatment, after treatment and three days after inoculation GV. CAMP gene mRNA expression was identified using real-time PCR. Sampling vaginal secretions using a vaginal swab for bacterial load measurement is performed three times: before treatment, 24 hours after inoculation GV and GV 3 days after inoculation. The bacterial load is identified by microscopic examination per 10 fields of view and culture PCA colony counting.

Statistical analysis

Data were analyzed using paired t-test and considered as significant if probability value (p-value) <0.05. Data were presented as a mean and standard deviation.

RESULTS

The data showed that mice given Eza for 7 days before inoculation with GV showed a higher bacterial decline (-27.0) than others and this decrease was statistically significant (p<0.001). Results also showed that mice were given Eza for five days before GV inoculation also showed a significant decline (-26.8) post-inoculation GV but lower than that of 7 days (p<0.001). Control groups that were not given Eza did not experience a decrease in the number of bacteria instead had a significant increase (p=0.004) in the number of bacteria (+25.0) (Table 1).

TABLE 1: Effect Extract Zanthoxylum acanthopodium Dc (Eza) to the number of bacteria

Group	Total bacteria Mean±SD			P*
	day 1	day 3	Change	
Control	48.3 ±6.8	73.3±1.9	+25.0	0.004
EZa (5 days)	41.0±6.1	14.30 4.6	-26.8	<0.001
EZa (7 days)	34.5±5.2)	7.5±2.1	-27.0	<0.001

*Paired T-Test

+Increase

-Decreased

The data showed that after three days GV inoculation, mice were given EZa for seven days before injection with GV showed a higher number of bacterial colonies decline (-12.25) than others and this decrease was statistically significant (p<0.000). Results also showed that mice were given EZA for five days before GV inoculation did not show the number of bacterial colonies decline even increasing (+1.25) although not significant (p=0.312). Control groups that were not given EZa did not experience a decrease in the number of bacteria instead had a significant increase (p<0.001) in the number of bacteria (+54.75) (Table 2).

TABLE 2: Effect EZA to the number of bacterial colonies

Group	Total bacteria Mean±SD			P*
	day 1	day 3	Change	
Control	45.00 ±3.74	100.75 4.65	+54.75	<0.001
EZa (5 days)	22.50± 1.29	23.75(1.71)	+1.25	0,312
EZa (7 days)	18.50±1.91	6.25(2.22)	-12.25	<0.000

Paired T-Test

+Increase

-Decrease

The data showed that mice given EZa for seven days before inoculation with GV showed a significant increasing (p=0.016) of CAMP gene mRNA expression (+0.79). Results also showed that mice were given EZA for five days before GV inoculation showed a significant (P<0.001) increase of CAMP gene mRNA expression (+1.52) post-inoculation GV but lower than the control group increased. Control groups that were not given EZa showed a higher increasing in the number of CAMP gene mRNA expression (p<0.001) in the CAMP gene mRNA expression (+2.93) than that mice given EZa for seven days before inoculation with GV (Table 3).

TABLE 3: CAMP mRNA expression three days after inoculation GV

Group	CAMP gene mRNA Expression Mean±SD			P*
	day 1	day 3	Change	
Control	5.25 (0.14)	8.18 (0.09)	+2.93	<0.001
EZa (5 days)	5.10 (0.12)	6, 62 (0.14)	+1.52	<0.001
EZa (7 days)	5.06 (0.05)	5.86 (0.34)	+0.79	0,016

Paired T-Test

+Increase

-Decrease

DISCUSSION

Data showed that administration of EZa extract for seven days before GV inoculation had a significant effect both on the decrease in bacterial number and bacterial colonies as well as in enhancing CAMP mRNA expression. The five-day EZa extract reduced the number of bacteria and increased mRNA expression significantly but was less effective in reducing the number of bacterial colonies. Controls group that was not given anything had significant increases in bacterial numbers and colonies, and increased CAMP expression was higher compared to another group.

Extract of the *Zanthoxylum acanthopodium DC* (EZa) indicated to have potential as an anti-bacterial and immunomodulator especially to *Gardnerella vaginalis* infection. Some previous studies used in vitro and this study is relatively new because it uses invivo studies.

The content of the fruit of andaliman is quercetin and terpenoids; quercetin could induce CAMP, an Antimicrobial peptide (AMP) is very useful for bacterial elimination.^{3, 15, 16} Attention to AMP including CAMP began to increase along with increased bacterial resistance to antibiotics; it is also interesting because this AMP has a broadspectrum activity.¹⁷⁻¹⁹ EZa is potential as antimicrobial through its ability to induce CAMP. This assumption has been proven with a decreasing number of bacterial number and colonies due to EZa intervention.

CONCLUSION

Extract of the *Zanthoxylum acanthopodium DC* (EZa) indicated to have potential as an anti-bacterial and immunomodulator especially to *Gardnerella vaginalis* infection.

Effect of Bibliotherapy on Self-Concept in Children with Mental Retardation in SLB

Nursalam Nursalam¹, Kartika Harsaktiningtyas², Iqlima Dwi Kurnia³, Harif Fadhillah⁴, Ferry Efendi³

¹Professor, Faculty of Nursing, Universitas Airlangga, Surabaya, ²Nursing Student, Faculty of Nursing, Universitas Airlangga, Surabaya, ³Lecturer, Faculty of Nursing, Universitas Airlangga, Surabaya, ⁴Lecturer, Faculty of Nursing, Universitas Muhammadiyah Jakarta, Indonesian National Nurses Association

ABSTRACT

Introduction: Children with mental retardation are children with special needs with a level of intelligence > 70. The self-concept of a child with mental retardation is influenced by their pattern of care as well as their environment. Rejection by the environment and deviations in care adjustments can cause the child to be unwilling to communicate and interact, to form a bad perception of development and self-concept. Thus, the researchers were interested in studying the effect of bibliotherapy on the self-concept of children with mental retardation in SLB. The purpose of this study was to investigate whether bibliotherapy had any influence on self-concept.

Method: This study was a quasi-experimental research study which involved 42 respondents as its population. The population was made up of 24 students of SLB Sasanti Wiyata and 18 students of SLB AKW Kumara II Surabaya. The sample of this study was made up of 36 respondents according to the inclusion criteria, gathered using a purposive sampling technique. The independent variable was bibliotherapy. The dependent variable was self-concept. The instruments used were the Robson Self-Concept Questionnaires. The data analysis used a Manova test in SPSS with a significant value $\alpha < 0.05$.

Result: The results showed, in the treatment group via a Manova test, 0.005 for self-image, 0.033 for personal identity, 0.001 for self-esteem, 0.004 for self-ideal, 0.198 for role. With partial eta squared, the results indicated that bibliotherapy can affect self-esteem with a value of 0.302. The provision of bibliotherapy in this research was found to have a positive influence and improved self-concept in children with mental retardation in SLB.

Discussion: Bibliotherapy can improve self-concept in children mental retardation in SLB. With bibliotherapy, children will learn and also imagine according to circumstances and desires. Moreover, one of the session in bibliotherapy encourage the children express their feelings.

Keyword: *self-concept, bibliotherapy, mental retardation, children.*

INTRODUCTION

Children with intellectual disability or mental retardation are children with special needs due to their low intelligence. There are two causes of intellectual disability in children, which are clinical and biological reason^{1,2} The self-concept of mentally disabled children

is influenced by parenting and their environment. Children with an intellectual disability who go on to go to the same school as normal children will tend to get a low number of academic achievements, especially in relation to comprehending numbers, concepts, and language. This makes children with intellectual disability get more commonly rejected by their friends when socialising²⁻⁴.

Corresponding author:

Prof Nursalam

Faculty of Nursing, Universitas Airlangga, Indonesia

According to the data from the Ministry of Social Services of the Republic of Indonesia in 2011, the number of people with intellectual disability was

4,783,275. The Indonesian Ministry of Health's Data and Information Center in 2014 also published the number of children with mental retardation in Indonesia as having reached 6.6 million people, or three percent of Indonesians themselves⁵. In East Java, the prevalence of children with mental retardation is 125,190. Community Service Institution (*LPKM*) stated that the number of children with mental disabilities in Surabaya reached 10% and up to 20% in the lower grade of Schools for Exceptional Children (*Sekolah Luar Biasa/SLB*)². Intellectual disability or mental retardation in children below 18-year-olds in developed countries has increased by 3-4 new cases per 1,000 children over the last 20 years⁴.

There are three causes of intellectual disability in children; prenatal, perinatal and postnatal¹²⁰. The cognitive ability of children with mental retardation affects two areas of adaptive function, which are conceptual (language and memory competences) and social (intrapersonal communication competence and the ability to make friends)^{6,7}. Self-concept is developed from self-perception and positive experiences. Involving children in the various activities existing around them will help them to gain confidence and help them to improve their ability to interact with others^{8,9}.

The abilities possessed by children with intellectual disability causes them to tend not to have friends. Thus, they will have a low sense of self-concept. They will also find obstacles to their mentality in term of attention, emotion, and self-expression^{10,11}. As a result of the obstacles, children will find difficulty in the context of social relations, which is stressful^{12,13}. Individual psychological changes in the form of anxiety, depression and crying, as well as extending to changes in their eating habits, sleep, and daily activities¹⁴.

This study was conducted in order to improve the self-concept, self-identity, self-esteem, self-ideal and role of children with mental retardation. Self-concept can be seen in a child's behaviour in their visualisation of feeling optimistic and taking care of themselves. Self-identity can be seen in their ability to accept themselves and their behaviour, such as not isolating themselves and not avoiding others. Self-esteem can be seen in their confidence and their ability to respect others. Self-ideal is their ability to do the task well and to not to depend on others. The role is related to being able to express themselves and socialise with their peers^{15,16}.

MATERIALS AND METHOD

The design of this study was quasi-experimental with 42 respondents from 2 different SLB's for its population. The number of samples taken was 36. The samples were selected using the inclusion criteria. The samples of this study were children with mental retardation aged 8-15 years old. The technique used in the sampling process was purposive sampling¹⁷.

The questionnaire was used as the instrument of this study. The questionnaire was in the form of a list of questions related to the characteristics of the research subjects. The instrument used to scale independent and dependent variables was *Robson Self-Concepts Scale* questionnaire adopted from Humaira's study (2017)¹⁸. The questionnaire used was tested for its validity and reliability by the experts in accordance to the objective of this study. The item in that instrument was considered to be valid and relevant if $r \text{ count} > r \text{ table} = 0.3961$, with 25 respondents.

There were 30 questions used to describe self-esteem, role, identity, self-ideal, and self-image. The questionnaire consisted of 14 positive questions and 15 negative questions. There were 5 questions for self-image, 6 questions for identity, 6 questions for self-esteem, 7 questions for self-ideal, and 6 questions for role. Before they were asked to fill out the questionnaire, the respondents were asked to agree on the inform consent form. Privacy and confidentiality were maintained in this study. This study used the statistical test Manova with $\text{sig } \alpha \leq 0,05$ on SPSS version 21.

The data was collected between the control group and the experimental group, in which the researcher gave an intervention in the form of bibliotherapy for 30 minutes in accordance to the SOP used¹⁹. In this study, additional mentors were needed to help with the intervention in as many as 3 people. In the treatment group, there were 18 children divided into 2, placed in a different location. From the 9 children in each school, they were all divided into two groups. Thus, there were 4-5 children in each group. On the first day of the first week, a group introduction was conducted. On the second day, the children watched two videos entitled "Teruslah Maju Menggapai Mimpi" and "Tunjukkan Bahwa Kita Sama". On the third day, the activity conducted was colouring. The researchers implemented the characteristics stage here, where the children could express their emotions

safely through art^{10,20}.

On the fourth-day in-depth concept, the stage was conducted by doing a discussion with children with mental retardation regarding what they felt when watching the video and colouring. On the fifth day, all of the three activities (watching a video, colouring, and a discussion) were conducted to ascertain the influence of the therapy given to the children²¹. In the second week, the same therapy was given. In the control group, the

researchers did not provide any intervention besides the existing program from the school. After two weeks with 10 meeting-treatments, the post-test was held³.

RESULTS

According to the data from Table 1 regarding the respondents' characteristics, most of the respondents were 11-12 years old. There were 8 children aged 11-12 years old in the experimental group and there were 7 children within this age group in the control group.

Table 1 - Respondents' Characteristic Distribution

Respondents' Characteristics	Experimental Group		Control Group		Homo-geneity Test
	Total	Percentage	Total	Percentage	
Age:					p = 0.002
8-10 years old	4	22.23%	5	27.78%	
11-12 years old	8	44.44%	7	38.89%	
13-15 years old	6	33.33%	6	33.33%	
Total	18	100%	18	100%	
Gender:					p = 0.000
Male	11	61.11%	11	61.11%	
Female	7	38.89%	7	38.89%	
Total	18	100%	18	100%	
Father's Educational Background:					p = 0.000
Junior High School	5	27.78%	1	5.56%	
Senior High School	11	61.11%	11	61.11%	
College/ University	0	0%	3	16.67%	
No School	0	0%	1	5.56%	
Died	2	11.11%	2	11.11%	
Total	18	100%	18	100%	

A statistical test was conducted to show that the respondents' characteristics in this study were not homogenous. The data was considered homogeneous if the results of the statistical test showed $\alpha > 0.05$. The results of this study showed that the score for age was $p=0.002$, gender was $p= 0.000$, and father's educational background was $p=0.000$.

Table 2 - Mean and Standard Deviation of Bibliotherapy on Self-Concept

Variable	Experimental Group				Control Group				Sig.	Partial Eta Square
	Pre		Post		Pre		Post			
	Mean	SD	Mean	SD	Mean	SD	Mean	SD		
Self-Picture	9.17	1.200	10.17	1.681	8.56	1.542	8.61	1.501	0.005	0.208
Self-Identity	10.94	1.259	12.67	1.782	11.22	1.003	11.50	1.339	0.033	0.127
Self-Esteem	11.44	1.381	13.50	0.389	11.06	1.211	11.389	0.389	0.001	0.302
Self-ideal	14.00	0.970	16.11	0.412	14.67	14.14	14.333	0.412	0.004	0.127
Role	12.06	1.434	12.44	0.534	12.44	1.947	12.389	0.534	0.006	0.203

The statistical test in this study showed the mean and standard deviation. The results were analysed by the Manova test to ascertain the significant influence of bibliotherapy on the self-concept of children with mental retardation. The significant value of each variable was self-picture $p=0.005$, self-identity $p=0.033$, self-esteem $p=0.001$, self-ideal $p=0.004$ and role $p=0.006$. The results showed that bibliotherapy significantly influenced self-concept ($p=0.302$; $\alpha > 0.05$).

DISCUSSION

This study showed a significant improvement in the children's self-esteem. The result of the multivariate test proved that p -value < 0.05 . Thus, the significance level of self-esteem could be seen from the 95% level of confidence. Self-esteem improvement was also proven by partial eta square in the Manova test with a result of 0.302. The results of the observation also showed the significant improvement in their self-esteem. This improvement was visualised by the ability of the children with mental retardation to complete the task, to be confident, to answer the questions, and to state or mention their dreams. In short, bibliotherapy influenced the self-esteem of children with mental retardation²². It increased their confidence, which made them believe that they had the same abilities as other children.

Age was a factor which influenced how long they had undergone self-concept education, especially from their family and the school. This is in accordance with a study conducted by Alesi Rappo², in which age was able to change the children's self-esteem and behaviour. From the results of the observation conducted by the researchers during bibliotherapy for 10 days, the children's understanding was a bit difficult. Thus, each facilitator had to accompany them in order to facilitate their imagination. Moreover, by accompanying the children, the children's understanding and concentration, as well as their trust in the facilitators, increased.

The respondents' parents' level of education was mostly high school and junior high school graduates. There were also some parents who had no educational background. The parents' level of education was a factor which led to a low self-concept in their children. The researchers argued that the family environment, in this case, the parents, influenced the children in their self-concept development. During the child's development, their environment could determine the child's understanding level. The parents' background influenced not only the child's self-concept, but also their behaviour. The higher parents' level of education means that a better quality of parenting was given to

their child, especially in relation to guiding their children in understanding self-concept, for children with mental retardation.

There were more parents of children with mental retardation who were private employees/entrepreneurs compared to parents who were jobless. This condition forced the parents to rarely take care of their children because they needed to meet the economic needs of the family. The busier the parents, the less often the parents provided a good example of behaviour and monitored their child's development. From the obtained data, there were children with mental retardation who had no parents. This caused the children to be insecure because they felt that they were unlucky and isolated themselves.

There was a significant improvement in the self-esteem observed in this study. This is in accordance with the study conducted by Zipora Shechtman²³, which stated that bibliotherapy could increase self-esteem. Another study showed that bibliotherapy is useful for children in identifying and exploring their emotions in order to control their child's reactions in difficult situations²². Bibliotherapy was found to be effective when used to improve the children's enthusiasm and motivation. Through bibliotherapy, children can learn and imagine as they wish. In bibliotherapy, there is the discussion method in which the children can express their feelings.

CONCLUSION

This study found that bibliotherapy was able to improve the self-picture, self-identity, self-esteem, self-ideal, and self-role of children with mental retardation. The results of the partial eta squared via the Manova test showed that self-esteem was the most influencing variable in bibliotherapy.

Gender Differences in Relationship between Commuting and Health Outcomes in Jakarta Metropolitan Area, Indonesia

Milla Herdayati¹, Tris Eryando¹

¹Department Population and Biostatistics, Faculty of Public Health, Universitas Indonesia (FPH-UI)

ABSTRACT

Jakarta is the center of business and economy in Indonesia causing commuting workers to Jakarta every day become a common phenomenon. They pack Jakarta for working in the morning and return to their residence in the afternoon. This study aims to analyze the link between commuting and health and whether these relationships differ by gender. The study used a cross-sectional design of 4,533 commuters using the mode of transportation except walking/cycling. The findings of this study show that commuting has a physical impact only on male commuters, whereas the psychic influenced women and men, but has no impact on social outcomes. Public transportation has a lower health risk than cars and motorcycles, especially where the duration journey above 60 minutes. The findings of this study contribute to the academic field in urban development studies, including public transportation system, to minimize the impact of commuting for public health. The transition from private to public transportation should be encouraged to increase the benefits for the health of the commuter community.

Keywords: *commuting, health outcomes, gender*

INTRODUCTION

Jakarta is a megapolitan city and one of the largest cities in Southeast Asia and becomes the centre of economic growth in Indonesia and accounts for 80% of Indonesia's GDP¹. This position has resulted in high mobility of people every day from sub-urban around to Jakarta. This kind of people group are known as commuters. The commuter movement from and to Jakarta becomes a common phenomenon every day. Generally they head to Jakarta for work purpose but reside in a sub-urban area known as Bodetabek area (Bogor, Depok, Tangerang, and Bekasi). This is due to the high price/rent of house and living cost in Jakarta. In 2014 from 28 million people aged five years and over in Jabodetabek areas, as many as 3.6 million (13%) were commuters and the majority of them were for work purpose (82%)².

Jakarta is known as one of the most jammed cities in the world. This condition has influenced the duration of commuting. In Indonesia 2011-2014, some commuters spent more than 60 minutes (25%) in a single trip³. Some studies show that commuting gave impact on physical health, mental, social, and even commuter's quality of life. These impact on health are explained in three ways. First, commuting is associated with a variety of physiological responses, such as increased blood pressure and musculoskeletal disorders⁴, increased risk of myocardial infarction and increased urine catecholamine⁵. Longer commuting time reduce physical activity, which positively associated with the hypertension, waist circumference and Body Mass Index (BMI)⁶. Physical activity is a risk factor for type 2 diabetes, cardiovascular, osteoporosis, and risk of metabolic syndrome⁷. Other studies have also reported that commuters have sleeping disorders and high fatigue^{4,8,9}. Second, the commuters experience stress exposure, therefore increasing negative mood causing anxiety, low tolerance, frustration^{8,10,11} and unhappiness^{12,13}. Third, long commuting also gave impact on the social aspect. Commuting has limited individual's leisure time for recreational and social activities¹⁴.

Corresponding author:

Milla Herdayati

FPH-UI, A Building, 2nd Floor, Depok-Indonesia.

E-mail: millaherdayati@gmail.com

The commuting effect correlates with commuting time and mode of transport¹⁴. Car users have lower health and satisfaction and higher BMIs than those who use public transport. However, the use of public transport for more than 30 minutes actually decreases the level of life satisfaction, happiness and raises the level of anxiety¹⁵. Commuting travel patterns differ by gender^{16,17}. Women, although they have a shorter trip distance than men, but they tend to use public transport, and have multi-purpose/destination trips such as working, shopping¹⁸. In addition, safety and security trip are important issues affecting women greatly, including become victims of sexual abuse^{1,18}.

This study aims to analyze the relationship between commuting both duration and mode of transport with health and whether the relationship differs by gender.

MATERIALS AND METHOD

This study analyzes secondary data of the Jabodetabek Commuter Survey in 2014 from CBS Indonesia. The area coverage survey consisted of 13 regions in Jakarta, Bogor, Depok, Tangerang and Bekasi (Jabodetabek). The sample of this study is the commuter who commute for work with exclusion criteria: commuter by walking/cycling. Final sample were 4533 persons.

Outcome variable is health outcomes include physical, mental/psychological and social aspects. These aspects are represented by the variables such as; physical; psychological/mental (feel stress, have had bad experiences such as accidents and sexual harassment); and social (involvement in community activities and refreshing). Alternative answers to these questions consist of two categories (yes and no).

Exposure variable consists of commuting time and mode of transportation. Commuting time is derived from the “long trip from house to place of activity (single journey)”. The transportation mode is taken from the question of “the main mode of transportation commonly used”. For analysis purpose, time and commuting modes are combined into one exposure variable, and classified into: 1) motorcycle > 60 min as *reference*; 2) motorcycle ≤ 60 min; 3) car ≤ 60 min; 4) car > 60 min; 5) public ≤ 60 min; and 6) public > 60 min. The covariates consist of socio-demography, family situation, and commuting patterns. Statistical analysis used binary logistic regression and Odds Ratio (OR) with 95% confidence intervals (CI) were estimated from the models.

FINDINGS

This study has shown if male commuters were older than female, married person were more, and only one-third were highly educated, while half of female were highly educated. All commuters work in the formal sector with the same average income between men and women. The majority of male commuters are the primary wage earner, and live with children (<13 years old) more in number compared to female commuters.

Commuting patterns have shown a difference between women and men. Women commuters have a shorter distance, commute less than five days a week, the numbers of modes of transportation were more than one type, and the transportation costs spent greater than that of men. Women commuters chose public transport and motorcycle for duration less than 60 minutes, while motorcycle becomes the main choice for men.

Low physical health is felt by men and women with a prevalence of 22-37%. Physical complaints are the majority perceived by motorcycle users. Commuting is associated with low physical health for men only. Car's users have lower physical health risks compared to motorcycle users with <60 minutes, where public transport users have the same risks as motorcycle's users.

Psychological problems in commuting were higher than physical problems. The condition is felt both in men and women. For female commuters, low psychological risk is felt by users of public transport and motorcycle with duration less than 60 minutes compared

to motorcycle's users with duration of more than 60 minutes, while other mode users are not significant. For male, the psychological impact correlated with commuting except on the car users with duration of more than 60 minutes. Similar to female, low risk men also appeared for public transport users, car users and motorcycle users with duration of less than 60 minutes compared to motorcycle users with duration of more than 60 minutes.

The study show that commuting is related to health outcomes and differs by gender. Physical effects felt by men, while the psychological impact felt both by men and women. The impact of commuting correlated with the mode and duration of commuting. The public transport users have a health risk lower than car and motorcycle users. The study findings support the previous studies that public transport is positively correlated with health^{12,15,16,19}. Switching commuters from private cars to public transport can provide health benefits as well as active commuting (walking/cycling). This situation becomes a potential factor for increasing energy expenditure and reducing body fat because the public transport user performs physical activity in the form of walking towards public transit^{20,21}. In addition, public transport users have lower stress levels than car users¹¹ and they have time to relax such as reading, listening to music, and socializing²². In this study, quite a lot of commuters choose a motorcycle as a mode of commute, whereas a high risk compared to other modes especially if the duration of commuting more than 60 min. Motorcycle has a high risk of accidents because it depends on distance, speed, and frequency of uses²³.

The analysis of this study has considered some confounder variables, but other variables that substantially act as confounder are not available such as commuter compensation (job satisfaction/housing quality), gender roles in households, and contextual variables (traffic jam level/public transportation system). The study also used a cross-sectional design, so the researcher cannot conclude that commuting has a causal effect on health, there may be other causes of health problems and daily life of commuters that affect commuting.

Although this study has its limitations, this study has an important contribution to understanding the complex relationship between commuting and health by gender. Future studies are expected to use longitudinal study and consider other covariates thus strengthen the results of this study.

CONCLUSION

This study concludes that there is a commuting relationship with commuter health, and the relation is different according to gender. The impact is greater on car and motorcycle users especially on long durations than public transport users. These findings may become the basis of consideration for the government in urban development to minimize the impact of commuting. The biggest challenge is to encourage commuters to switch to public transport, which has benefits for public health. This effort is certainly accompanied by improvements of the quality of public transport from aspects of affordability, convenience, and security especially for women.

Ventilation with Risk Quotient (RQ) Benzene Non-Carcinogen in the Shoes *Home Industry* of Romokalisari, Surabaya

Ratna Ayu Harsetianingrum¹, Abdul Rohim Tualeka²

¹Department of Occupational Health and Safety, ²Public Health Faculty, Airlangga University, Surabaya

ABSTRACT

The objectives of this study were to identify the presence of ventilation, Risk Quotient (RQ) of benzene non-carcinogen and the relationship between them in the shoes home industry of Romokalisari, Surabaya. Type of study was observational, cross sectional analytics with 10 workers as total population.

Data analysis was using cross tabulation to know the frequency of ventilation and Risk Quotient (RQ), that obtained from the value of Intake benzene non karsinogen (Ink), benzene concentration in work environment (C), inhalation rate (R), length of work/day (tE), working frequency/year (fE), duration of work (Dt), worker's weight (Wb) and average time period (t_{avg}). Analysis relationship between ventilation with Risk Quotient (RQ) of benzene non carcinogen was using Chi-Square Test and Prevalence Risk (PR).

The results obtained most of the workplace were not ventilated (9 places (90%)). Concentrations of benzene in the environment 0.04 mg/m³-2.91 mg/m³. Inhalation rate (R) 0.5 m³/hr-0.7 m³/hr. Length of work per day (tE) 8 hours/day-15 hours/day. Frequency of work per year (fE) 312 days/year-365 days/year. Duration of work (Dt) 14 years-43 years. Weight of worker (Wb) in 8 people (80%) ≤70 Kg. RfC benzene 0.03 mg/m³. Risk Quotient (RQ) > 1, indicating that there was a possibility of non-carcinogenic health risks. P-value was 0.035, meaning there was relationship between the existence of ventilation with the Risk Quotient (RQ) benzene non-carcinogen in workers. Prevalence Risk (PR) was 9.000, meaning that the absence of ventilation has a risk 9 times greater for the risk of non-carcinogen health effects. Recommendations were by making good ventilation in the workplace and consuming CYP2E1 enzyme contained in cow liver and salmon to lower benzene levels in the body.¹³

Keywords : Benzene, Ventilation, Risk Quotient, Workers, Shoes Home Industry

INTRODUCTION

Benzene is widely used as a good organic solvent for various industrial processes such as rubber industry, shoes, paint solvents, components in motor fuel, components in detergents, pesticides and pharmaceutical manufacturing.³ The US-EPA has classified benzene

as a carcinogenic substance against humans (GrupA), so now the use of benzene as a solvent is increasingly constrained.²⁰

In general, people can smell benzene from concentrations of 60 ppm to 100 ppm and to feel benzene in water at concentrations of 0.5 to 4.5 ppm.⁷ Based on Permenakertrans Nomor Per.13/MEN/X/2011 about Threshold Limit of Physical Factor and Chemical Factors at Work, maksimum benzene exposure is 1.59 mg/m³,¹² American Conference of Governmental Industrial Hygienists (ACGIH) states the limit of benzene exposure is 0.5 ppm with maximum exposure for 8 hours of work,¹ while the American Petroleum Institute (API) states that the absolute limit of safe exposure to benzene is zero.^{14,16}

Continuous exposure to benzene and exceeding predetermined threshold values can cause adverse health effects, especially exposure through inhalation. The impacts that can arise from acute exposure to benzene can cause disruption of the nervous system, lack of oxygen supply to the brain, dizziness, rapid heartbeat, headache, tremors, confusion and fainting.^{18,19} Benzene toxicity to the central nervous system arises after exposure to benzene through inhalation/respiration with high concentrations (3,000 ppm for 5 minutes) or 30 to 60 minutes via digestion.³

Based on the study previously about benzene and affect to the body have not been conducted study about effect ventilation to the risk quotient yet. As non formal Industry, shoes industry should to know effect ventilation to RQ worker for preventing disease by benzene.

The shoes home industry of Romokalisari, Surabaya is a small shoes manufacturing sector in Surabaya. In the production process in the shoes home industry of Romokalisari, Surabaya there is the process of gluing shoes with the use of glue materials in which there is a chemical content of benzene. In addition, the presence of ventilation in the shoes home industry of Romokalisari, Surabaya allegedly can affect the level of exposure of benzene in the workplace. Therefore, the study aims to determine the existence of ventilation, Risk Quotient (RQ) of benzene non-carcinogen and the relationship between the existence of ventilation with Risk Quotient (RQ) benzene non-carcinogen in home industry shoes Romokalisari, Surabaya.

MATERIALS AND METHOD

This study was an observational study with cross sectional analytical design in home industry of shoes Romokalisari Surabaya with total population counted 10 workers. This study was conducted at home industry of shoes Romokalisari, Surabaya in October 2017.

Variables in this study were the presence of ventilation and Risk Quotient (RQ) of benzene non-carcinogen. Determination of Risk Quotient (RQ) of benzene non-carcinogen was calculated from Intake benzene non-carcinogen (I_{nk})/RfC. The value of Intake benzene non-carcinogenic was the result of calculation that was directly proportional to the value of benzene concentration in the working environment (C), inhalation rate of worker (R), length of work/day (tE), working frequency per year (fE), duration of work (Dt) and was

inversely proportional to the worker’s characteristic value (consisting of worker’s weight (Wb) and average time period (t_{avg})).

Primary data collection included the presence of ventilation data and worker characteristics (worker’s weight (Wb), length of work / day (tE), working frequency every year (fE), duration of work (Dt)). Secondary data collection included benzene concentration value data in work environment (C), worker inhalation rate (R) and average time period (t_{avg}) used for non-carcinogen intake benzene (I_{nk}) and RfC value used to calculate Risk Quotient (RQ).

Data analysis was using cross tabulation to know the frequency of the presence of ventilation and frequency of value to determine Risk Quotient (RQ) of benzene non-carcinogen that is result of calculation from Intake benzene non-carcinogen (I_{nk})/RfC. To determine the value of non-carcinogen intake benzene (I_{nk}), it was necessary to know the frequency of benzene concentration values in the work environment (C), inhalation rate of worker (R), length of work/day (tE), frequency of work each year (fE), working duration (Dt), worker’s characteristic value (consisting of worker’s weight (Wb) and average time period (t_{avg})). The relationship analysis of the presence of ventilation with Risk Quotient (RQ) of benzene non-carcinogen was using Chi-Square Test and to know the amount of risk was using Prevalence Risk (PR).

FINDINGS

The Presence of Ventilation

Based on Table. 1 below, it could be seen that most of the place workers to work in the shoes home industry of Romokalisari, Surabaya had no ventilation that was counted 9 places (90%).

Tabel 1. Distribution of The Presence of Ventilation at Worker’s Place in The Shoes Home Industry of Romokalisari, Surabaya

The Presence of Ventilation	N	%
Yes	1	10,0
No	9	90,0
Total	10	100,0

Based on Peraturan Menteri Kesehatan Republik Indonesia No. 48 in 2016 about Occupational Safety

and Health Standards in Office, it said that one of the requirements of building safety and security was the availability of ventilation for circulation and air exchange needs, especially when there were equipment that used solvent such as benzene. In addition, based on Keputusan Menteri Kesehatan Republik Indonesia Nomor 1405/MENKES/SK/XII/2002 in 2002 about the Health Working Environment Requirements in the Office and Industry, it said that every office space and industry had to had air/ventilation holes. Standard air exchange was 0.283 m³/min/person with ventilation rate of 0.15 to 0.25 m/s. For non-cooling working rooms should had a ventilation hole at least 15% of the floor area by applying a cross ventilation system.¹¹

LEED¹⁰, ASHRAE², and ICC⁹, suggested that additional ventilation at the end of construction would

reduced VOC concentrations (including benzene) to acceptable levels. In indoor environmental studies, BRE reported that seasonal variation in indoor air concentrations was due to higher concentrations of exterior air infiltrated to buildings, and a greater effect of indoor sources during the winter than in the summer months. This was because the available ventilation at a low/bad level.⁴ VOC concentrations including benzene are reduced when the level of ventilation and material emission standards were met.⁸

Risk Quotient (RQ) of Benzene Non-Carcinogen

The following on the below were data of benzene concentration, inhalation rate, worker characteristics, non-carcinogenic benzene intake and Risk Quotient (RQ) in the shoes home industry of Romokalisari, Surabaya.

Average								0.0933	10.9823

In Table. 2 above, the value of Intake benzene non-carcinogenic (I_{nk}) can be calculated using the following formula:

$$\text{Intake Benzene Non - Carcinogen} = \frac{C \times R \times tE \times fE \times Dt}{Wb \times Tavg}$$

Based on the calculation of Intake benzene non-carcinogen (I_{nk}) value above, it was known that the maximum intake value received by workers in the shoes

home industry Romokalisari Surabaya was 0.2285 mg/Kg/day).

$$\text{Risk Quotient (RQ)} = \frac{\text{Intake}}{RfC}$$

Risk Quotient (RQ) of benzene non-carcinogen determines benzene exposure having non-carcinogenic risks in the worker's body or not. The value of Risk Quotient (RQ) is calculated using the following formula:

It was known that the non-carcinogenic benzene RfC values established by US-EPA²¹ are 0.03 mg/m³ or 0.0085 mg/Kg/day. Based on the calculation table above, the average value of Risk Quotient (RQ) on workers in the shoes home industry of Romokalisari, Surabaya was 10.9823 mg/Kg/day and the highest RQ was 26.8785 mg/Kg/day. This showed that RQ>1, meaning that there was a possible indication of the risk of non-carcinogenic health effect and the need for control measures.¹⁵

This was in accordance with the results of study that conducted by Edokpolo, Yu and Conneli⁵ on the Health Risk Assessment for Exposure to Benzene in Petroleum Refinery Environments, found that RQ>1 for scenarios 2A and 3A indicating possible health risks for groups exposed to benzene. A study conducted by Fahrudi⁶ on the Risks of Cancer and Non-Cancer at Benzene

Exposure Workers in Home Industry Shoe Kelurahan Oso Wilangun Surabaya, found that benzene levels measured in the workplace air ranged from 0.04 mg/m³ to 7.44 mg/m³, RQ≤1 was counted 8 people (40%), RQ>1 was counted 13 people (60%) and ECR calculation got all workers with ECR value>10⁻⁵ was counted 20 people (100%).

The Presence of Ventilation with Risk Quotient (RQ) of Benzene Non-Karsinogen

In the bivariate analysis of the relationship between the presence of ventilation with Risk Quotient (RQ) of benzene non-carcinogen, the Risk Quotient (RQ) variable was made in 2 values, that were RQ≤1 and RQ> 1 in the Prevalence Risk (PR) calculation. The following below was relationship between the presence of ventilation with Risk Quotient (RQ) of Benzene Non-Carcinogen.

Tabel. 3 Relationship between The Presence of Ventilation with Risk Quotient (RQ) of Benzene Non-Carcinogen The Shoes Home Industry of Romokalisari, Surabaya

The Presence of Ventilation	Risk Quotient (RQ)				Total		p-value	Prevalence Risk (95%CI)
	RQ≤1		RQ>1					
	N	%	N	%	N	%		
Yes	1	10.0	0	0.0	1	10.0	0.035	9.000 (1.418-57.1117)
No	1	10.0	8	80.0	9	90.0		
Total	2	20.0	8	80.0	10	100.0		

Based on the results in Table. 3 above, it was found that the p-value of the relationship between the presence of ventilation with Risk Quotient (RQ) of benzene non-carcinogen was 0.035 and when compared with α that was 0.005 then p-value 0.035 was smaller than α so it could be seen that there was a relationship between the presence of ventilation with Risk Quotient (RQ) of benzene non-carcinogen in the shoes home industry of Romokalisari, Surabaya.

Prevalence Risk (PR) showed 9.000, meaning that the absence of ventilation was 9 times greater risk for non-carcinogen health effects (RQ>1) to workers in the shoes home industry of Romokalisari, Surabaya and there was a significant relationship between the presence of ventilation and the value Risk Quotient (RQ) to worker in the shoes home industry of Romokalisari, Surabaya which could be seen from PR value does not pass 1 (1,418-57,1117).

These results were consistent with the theory expressed by LEED¹⁰, ASHRAE², and ICC⁹, suggesting

that additional ventilation at the end of construction would reduce VOC concentrations (including benzene) to acceptable levels. VOC concentrations including benzene were reduced when ventilation levels and material emission standards were met.⁸ According to the Tokyo National Institute of Technology and Evaluation, indoor benzene concentrations were usually higher than in the open air which could be caused by the entry and accumulation of benzene from external sources and the presence of dominant benzene sources indoors.¹⁷

CONCLUSION

The result of study found out that most of places (90.0%) for workers to work did not had ventilation. The most of worker in the shoe home industry of Romokalisari, Surabaya had Risk Quotient (80.0%) more than 1. There was a significant relationship between the presence of ventilation with Risk Quotient (RQ) of benzene non-carcinogen in the shoes home industry of Romokalisari, Surabaya (p-value = 0.035, Prevalence Risk = 9.000). Recommendation were by making

ventilation in a good workplace and by consuming CYP2E1 enzyme contained in beef liver and salmon that serves to lower benzene levels in the body.¹³

Conflict of Interest: All authors have no conflicts of interest to declare.

Source of Funding: This is an article “Ventilation with Risk Quotient (RQ) Benzene Non-Carcinogen in The Shoes Home Industry of Romokalisari, Surabaya” of Occupational Health and Safety Department that was supported by Activity Budget Plans 2018, Faculty of Public Health, Airlangga University.

Ethical Clearance: The study was approved by the institutional Ethical Board of the Public Health, Airlangga University.

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **editor.ijphrd@gmail.com**

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic - ISSN:** 0976-5506, **Frequency:** Monthly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal. The frequency is **Monthly**. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialities concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and south east Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.

Application of Different Controllers and their Evaluation for Super Heater Temperature Control in Thermal Power Plant

A. Yasmine Begum¹, M. Balaji², G V Marutheeswar³

¹Associate Professor, Department of Electronics and Instrumentation Engineering, ²Assistant Professor, Dept. of ECE, ³Professor, Dept. of Electrical Engineering, Sree Vidyanikethan Engineering College, Tirupati, India

ABSTRACT

Superheaters are heat exchangers that transfer energy from flue gas to superheated steam. Controlling of steam temperature at the superheater outlet is a very difficult task in thermal power plant. A superheater model and an appropriate optimal control strategy are the essential tools for improving the accuracy of this control system. Superheater is simulated as a unit of a control loop that generates steam of desired state values. To simulate the steam superheater on the computer, the heat exchanger assembly is described by sets of non-linear partial differential equations (PDE). The equations are then solved by modified finite difference method. A linearized model of the superheater is identified using system identification tool box in order to design optimal control strategies for Superheated Steam (SHS) temperature system. Then to tune Proportional Integral Derivative (PID) controller parameters optimally, different tuning schemes were applied to superheated steam temperature system. However, due to new challenges in keeping up with rapid changes in load demand and the transients, performance of the PID controller is far from being optimal. Hence a Model Predictive Controller (MPC) is designed for the superheated steam temperature regulation in a supercritical coal-fired power plant. Compared with the performance of the plant using a conventional PID controller, the steam temperature controlled by the MPC is found to be more optimal which leads to more efficient plant operation and energy saving.

Keywords: Superheater; Temperature Control; PID Tuning; MPC.

INTRODUCTION

One of the most challenging control loops is steam temperature control loop in a power plant boiler. The reason behind it is, highly non-linear and it has quite a long dead-time and time lag. Another challenge is that the steam temperature is affected by the boiler load, air flow rate, the amount of soot produced in the boiler tube and the combustion of burners in service. The thermal efficiency of the boiler-turbine unit is improved when the steam from the boiler drum is superheated. The steam temperature above 538 °c if left for even a shorter period brings damage by shortening the usable life of the boiler and the turbine. Therefore, the steam temperature has to be maintained constant to minimize the thermal stress on boiler-turbine unit.

LITERATURE SURVEY

Design of controller for a boiler-turbine unit has gained more popularity in the past years. Advanced

control strategies like Fuzzy control, Predictive control, LQG/LTR and H_∞ control are applied to improve the performance of a thermal power plant and the simulation studies shown by modern control techniques are encouraging compared with the PID controller ^[1]. PID controller can be implemented easily and quickly for any process in the industry.

To design a controller for a single variable stable system a FOPDT model is mostly preferred. The underlying theme is that a simple model is sufficient to study the essential dynamics of the system. Maffezzoni et al., 1997 proposed a simple model to tune controller for a boiler-turbine unit. Wen Tan et al., 2004 proposed a simple two-by-two model for a boiler-turbine unit and it captured the essential dynamics of the unit. In this model a PID control structure is derived and a tuning methodology for a simple two-by-two model of a boiler-turbine unit is proposed ^[2]. Tan et al., 1999 proposed a reduction procedure for a PID controller for a

centralized controller. He compared the performance of the final PI controller with the original loop-shaping H_∞ controller for a boiler-turbine unit and he showed that the performance of final PI controller did not degrade much with the original loop-shaping H_∞ controller^[3].

The Model Predictive Heuristic Control (MPHC) algorithm is first developed by Richalet et al., 1978^[4], which is followed later by a number of other such algorithms, including Dynamic Matrix Control (DMC), Quadratic Dynamic Matrix Control (QDMC)^[5], Generalized Predictive Control (GPC)^[6], and Shell Multivariable Optimizing Controller (SMOC)^[7]. All these algorithms make use of linear process models to predict the future moves of the control variables. It has been demonstrated that the predictions made via the linear model are effective in calculating the next values for the control variables. Fu et al., 2013^[8] proposed a DMC controller for steam temperature control and the proposed controller is tested in a power plant simulator and in a field operating coal-fired power plant having a drum boiler. Simulation tests showed that the DMC control strategy outperformed the PID controllers.

Sanchez et al., 2004^[9] developed a DMC and a Fuzzy controller to regulate the steam temperature in a 300 MW power plant. The controller performance is compared to an existing PID, and the test results showed tighter temperature control when advanced control strategies were used. Clarke et al., 1988^[10] developed MPC using GPC algorithm, which became popular both in academic studies and in industry applications.

Advantage of this algorithm is that it can be used with unstable and non-minimum phase plants. Here the GPC controller showed good performance against the existing PID controller for regulating the superheated steam temperature in a coal-fired thermal power plant. Lemos et al., 2010 developed a novel predictive controller called MUSMAR to a superheater which consist of single attemperator and two heat exchangers and he showed that performance of MUSMAR is better than the conventional controller^[11].

Hlava et al., 2011 designed a predictive control strategy for a complex superheater which consist of several superheaters, reheaters and several spray

type attemperators. The predictive controller strategy is based on switched linear models of a complex superheater. Simulation results proved that significant performance improvement is achieved using MPC when compared with the traditional controller. It is easy to implement a PID controller but the benefit of advanced control strategy is improvement in its performance. There is always a trade-off between ease to use and tune and cost to implement^[12].

MATHEMATICAL MODEL OF SUPERHEATER

For flue gas, the Reduced energy equation is expressed as

$$\frac{C_p \rho_2 F_2}{\alpha_{s2} O_2} \left[u_2 \frac{\partial T_2}{\partial x} + \frac{\partial T_2}{\partial t} \right] + (T_2 - T_s) = 0$$

From burned gases to steam via the wall, the Heat transfer equation is expressed as

$$\frac{\partial T_s}{\partial T} - \frac{T_1 - T_s}{C_s G} - \frac{T_2 - T_s}{\alpha_{s1} O_1} - \frac{T_2 - T_s}{\alpha_{s2} O_2} = 0$$

The continuity equation for steam is expressed as

$$\frac{1}{F_s} \left\{ F u_1 \left(\frac{\partial \rho_1}{\partial p_1} \frac{\partial p_1}{\partial x} + \frac{\partial \rho_1}{\partial T_1} \frac{\partial T_1}{\partial x} \right) + u_1 \rho_1 \left(\frac{\partial F}{\partial p_1} \frac{\partial p_1}{\partial x} + \frac{\partial F}{\partial T_1} \frac{\partial T_1}{\partial x} \right) + \rho_1 \left(\frac{\partial F}{\partial p_1} \frac{\partial p_1}{\partial t} + \frac{\partial F}{\partial T_1} \frac{\partial T_1}{\partial t} \right) \right\} + \frac{\partial u_1}{\partial x} = 0$$

Newton's equation for steam is expressed as [13]

$$\frac{\partial p_1}{\partial x} + \rho_1 u_1 \frac{\partial u_1}{\partial x} + \rho_1 \frac{\partial u_1}{\partial t} + \rho_1 g \sin(\theta) + \frac{\rho_1 \lambda_1 u_1 |u_1|}{2d_n} = 0$$

The Energy equation for steam is expressed as

$$\frac{\partial}{\partial t} \left\{ \rho_1 \left(C_1 T_1 + \frac{u_1^2}{2} \right) \right\} + \frac{\partial}{\partial x} \left\{ \rho_1 u_1 \left(C_1 T_1 + \frac{u_1^2}{2} \right) \right\} + \frac{\partial}{\partial x} \{ C_1 U_1 \} + \frac{\partial}{\partial x} \{ \rho_1 u_1 g z \} - \alpha_{1s} O_1 (T_s - T_1) \frac{1}{F} = 0$$

Table I: Relevant parameters for the superheater dynamic model

Parameters	Description
$T_1(x, t)$	Steam temperature, °c
$T_2(x, t)$	Flue gas temperature, °c
$T_s(x, t)$	Temperature of the wall of the heat exchanging surface of the superheater, °c
$P_1(x, t)$	Pressure of steam, Pa
$u_1(x, t)$	Velocity of steam, m/s

Conted...

$P_2(0,t)=P_2(x,t)$ $= P_2(L,t)$	Pressure of flue gas, Pa
$u_2(0,t)=u_2(x,t)$ $= u_2(L,t)$	Velocity of flue gas, m/s
X	the state variable along the active length of the wall of the heat exchanging surface of the superheater
T	time, sec
$c_1 = c_1(P,T)$	heat capacity of steam at constant pressure, J/kg/K
$c_2 = c_2(P,T)$	heat capacity of flue gas at constant pressure, J/kg/K
c_s	heat capacity of superheater's wall material, J/kg/K
d_n	diameter of pipeline, m
$F_1 = F_1(x)$	steam pass cross section, m ²
$F_2 = F_2(x)$	flue gas channel cross section, m ²
G	acceleration of gravity, m/s ²
$G = G(x)$	weight of wall per unit of length in x direction, kg/m
L	active length of the wall, m
$O_1 = O_1(x)$	surface of wall per unit of length in x direction for steam, m
$O_2 = O_2(x)$	surface of wall per unit of length in x direction for flue gas, m
$z = z(x)$	ground elevation of the superheater, m
αS_1	heat transfer coefficient between wall and steam, J/m ² /s/K
αS_2	heat transfer coefficient between the wall and flue gas, J/m ² /s/K
$\lambda_1(x)$	steam friction coefficient, l
θ	superheaters constructional gradient, l
$\rho_1 = \rho_1(P,T)$	density of steam, kg/m ³
$\rho_2 = \rho_2(P,T)$	density of flue gas, kg/m ³

Figure 9: Simulated outlet temperatures at the open loop control system

Figure 10: Comparison of measured and simulated outlet temperatures at the open loop control system

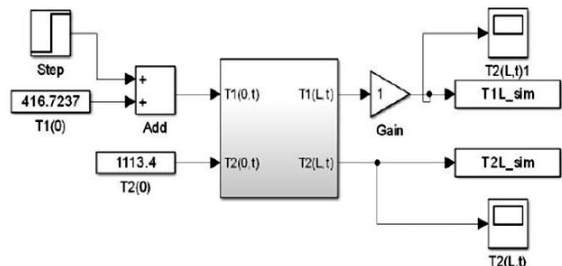

Figure 11: System identification using MATLAB and simulink scheme

The identified transfer function using system identification toolbox in MATLAB is given as

$$G_p(s) = \frac{0.8247}{54000s^3 + 4297s^2 + 113.7s + 1}$$

The identified FOPDT model using transfer function approach is given by

$$G_p(s) = \frac{0.8247}{65.7709s + 1} e^{-47.8911s}$$

Frequency Response based System Identification Algorithm

The First Order plus Dead-Time model for a given plant is represented by

$$G_p(s) = \frac{K}{Ts + 1} e^{-Ls}$$

Where, K is the process gain, T is the time constant and L is the dead-time.

The frequency response of a First Order Plus Dead-Time model is given by

$$G(j\omega) = \frac{K}{Tj\omega + 1} e^{-j\omega L}$$

The ultimate gain K_c is obtained at the crossover frequency ω_c . ω_c is determined from the first intersection of a Nyquist plot with the negative part of the real axis. The resulting equations are

$$\begin{cases} \frac{K(\cos \omega_c L - \omega_c T \sin \omega_c L)}{1 + \omega_c^2 T^2} = -\frac{1}{K_c} \\ \sin \omega_c L + \omega_c T \cos \omega_c L = 0 \end{cases}$$

where k is the gain of the system and it is calculated directly from the given transfer function. The two variables $x_1 = L$ and $x_2 = T$ is defined as [14]

$$\begin{cases} f_1(x_1, x_2) = kK_c(\cos \omega_c x_1 - \omega_c x_2 \sin \omega_c x_1) + 1 + \omega_c^2 x_2^2 = 0 \\ f_2(x_1, x_2) = \sin \omega_c x_1 + \omega_c x_2 \cos \omega_c x_1 = 0 \end{cases}$$

The Jacobian matrix J is denoted as

$$J = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} \end{bmatrix}$$

The Jacobian matrix is calculated as

$$J = \begin{bmatrix} -kK_c \omega_c \sin \omega_c x_1 - 2\omega_c^2 x_2 - kK_c \omega_c & kK_c \omega_c^2 x_2 \cos \omega_c x_1 & \sin \omega_c x_1 \\ \omega_c \sin \omega_c x_1 - \omega_c \cos \omega_c x_1 & \omega_c^2 x_2 \sin \omega_c x_1 & \end{bmatrix}$$

The First Order plus Dead-Time model thus identified using the frequency response method is given by

$$G_p(s) = \frac{0.8247}{174s + 1} e^{-37s}$$

Figure 12: Closed loop step responses

The simulation results are shown in Fig.12. From the responses it is seen that although the PID controller designed with the transfer function identification algorithm looks better, but it does not exhibit overshoot characteristics of Ziegler-Nichols’ tuning method, mostly due to the inaccurately identified parameters of a First Order Plus Dead-Time model. Hence, FOPDT parameters identified by the frequency response based approach are used for tuning of controllers for superheater steam temperature system.

PID control schemes are widely used to satisfy the steam temperature control quality requirements in a thermal power plant. Controller plays a major role to achieve the desired response of the process. In order to reduce thermal stress on the boiler it is important to keep the steam temperature constant at the output of the superheater. Tuning is a process of adjusting controller gains to attain satisfactory control for the superheated steam temperature system. The PID controller is tuned using distinct tuning methods and thus, optimal controller parameters are identified based on the least value of the Integral Time weighted Absolute Error, as it amplifies the effect of even small errors in integral value.

TABLE II: Settings of PID controller tuning for SHS system using various tuning methods

Zeigler Nichol’s step Response method	$K_p = 1.2/L,$ $T_i = 2L,$ $T_d = L/2$

MODEL PREDICTIVE CONTROLLER

MPC is an optimization-based control methodology which utilizes a dynamic mathematical model for the calculation of control signal by minimizing a cost function.

The aim of this research work is to replace the PID cascade control loop, which controls the steam temperature at the outlet of the final superheater with a Model Predictive Controller. The block diagram of the MPC based steam temperature control is illustrated in Fig. 15 where T_{set} is the set point temperature and T_{out} is the temperature at the final superheater outlet [15].

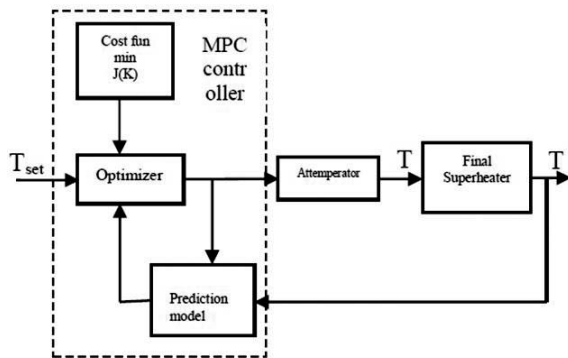

Figure 15: Superheater steam temperature control using MPC

Prediction of State and Output Variables: The sampling instant is taken as k_i , where $k_i > 0$. The state variable vector $x(k_i)$ gives the current plant information. The future control trajectory is given as

$$\Delta u(k_i), \Delta u(k_i + 1), \dots, \Delta u(k_i + N_c - 1)$$

Where N_c is referred as control horizon.

Keeping $x(k_i)$, the future state variables are estimated for N_p number of samples, where N_p is called prediction horizon. The optimization window length is defined as N_p . The future state variables are expressed by

$$x(k_i + 1|k_i), x(k_i + 2|k_i), \dots, x(k_i + m|k_i), \dots, x(k_i + N_p|k_i)$$

Where $x(k_i + m|k_i)$ the predicted state variable at with given current plant information. N_c should be chosen in such a way that it should be lesser than or equal to the prediction horizon.)

The FOPDT model is converted to state space model. Based on the state variables A, B, C, D the future state variables are estimated sequentially using the set of future control parameters.

$$\begin{aligned} x(k_i + 1|k_i) &= Ax(k_i) + B\Delta u(k_i) \\ x(k_i + 2|k_i) &= Ax(k_i + 1|k_i) + B\Delta u(k_i + 1) \\ &= A^2x(k_i) + AB\Delta u(k_i) + B\Delta u(k_i + 1) \\ x(k_i + N_p|k_i) &= A^{N_p}x(k_i) + A^{N_p-1}B\Delta u(k_i) + A^{N_p-2}B\Delta u(k_i + 1) \\ &\quad + \dots + A^{N_p-N_c}B\Delta u(k_i + N_c - 1) \end{aligned}$$

The predicted output variables based on predicted state variables is given as

$$\begin{aligned} y(k_i + 1|k_i) &= CAx(k_i) + CB\Delta u(k_i) \\ y(k_i + 2|k_i) &= CA^2x(k_i) + CAB\Delta u(k_i) + CB\Delta u(k_i + 1) \\ y(k_i + 3|k_i) &= CA^3x(k_i) + CA^2B\Delta u(k_i) + CAB\Delta u(k_i + 1) \\ &\quad + CB\Delta u(k_i + 2) \\ y(k_i + N_p|k_i) &= CA^{N_p}x(k_i) + CA^{N_p-1}B\Delta u(k_i) + CA^{N_p-2}B\Delta u(k_i + 1) \\ &\quad + \dots + CA^{N_p-N_c}B\Delta u(k_i + N_c - 1) \end{aligned}$$

All predicted variables are formulated in terms of current state variable information and the future control movement and where

$$\begin{aligned} y &= [y(k_i + 1|k_i) y(k_i + 2|k_i) y(k_i + 3|k_i) \dots y(k_i + N_p|k_i)]^T \\ \Delta u &= [\Delta u(k_i) \Delta u(k_i + 1) \Delta u(k_i + 2) \dots \Delta u(k_i + N_c - 1)]^T \\ Y &= Fx(k_i) + \Phi \Delta U \end{aligned}$$

Where

$$F = \begin{bmatrix} CA \\ CA^2 \\ CA^3 \\ \dots \\ CA^{N_p} \end{bmatrix}; \quad \Phi = \begin{bmatrix} CB & 0 & 0 & \Lambda & 0 \\ CAB & CB & 0 & \Lambda & 0 \\ CA^2B & CAB & CB & \Lambda & 0 \\ \dots & \dots & \dots & \dots & \dots \\ CA^{N_p-1}B & CA^{N_p-2}B & CA^{N_p-3}B & \Lambda & CA^{N_p-N_c}B \end{bmatrix}$$

Optimization of MPC: For the unit step signal $r(k_i)$ at sampling time k_i , within a prediction horizon the aim of the predictive control system is to bring the predicted output as close to the set point signal. The set point signal remains constant in the optimization window. Then to determine the ‘best’ control parameter vector ΔU in such a way that error between the set point and predicted output is minimized.

The vector that contains information about set point information is assumed as

$$R_s^T = [1 \ 1 \ \Lambda \ 1]^T r(k_i)$$

The cost function J which is the reflection of the control objective is expressed as

$$J = (R_s - Y)^T (R_s - Y) + \Delta U^T \bar{R} \Delta U$$

The first term in the cost function expression is linked to the objective of minimizing the errors between the predicted output and the set point signal. The second term in the cost function expression is linked to the size of ΔU . The objective function J i.e error is to be made as small as possible. The optimal ΔU which minimize J is given as

$$J = (R_s - Fx(k_i))^T (R_s - Fx(k_i)) - 2\Delta U^T \Phi^T (R_s - Fx(k_i) + \Delta U^T (\Phi^T \Phi + \bar{R})) \Delta U$$

The first derivative of the cost function J is denoted as

$$\frac{\partial J}{\partial \Delta U} = -2\Phi^T (R_s - Fx(k_i)) + 2(\Phi^T \Phi + \bar{R}) \Delta U$$

$$j = 0, 1, \dots, N_c - 1$$

The necessary condition of the minimum J is obtained as

$$\frac{\partial J}{\partial \Delta U} = 0$$

The optimal solution for the control signal is given as

$$\Delta U = (\Phi^T \Phi + \bar{R})^{-1} \Phi^T (R_s - Fx(k_i))$$

The matrix $(\Phi^T \Phi + \bar{R})^{-1}$ is called the Hessian matrix. R_s is expressed as

$$R_s = [1 \ 1 \ \Lambda \ 1]^T r(k_i) = \bar{R}_s r(k_i)$$

Where

$$\bar{R}_s = [1 \ 1 \ \Lambda \ 1]^T$$

The optimal solution of the control signal is linked to the set point signal $r(k_i)$ and the state variable $x(k_i)$ through the following equation

$$\Delta U = (\Phi^T \Phi + \bar{R})^{-1} \Phi^T (\bar{R}_s r(k_i) - Fx(k_i))$$

The following parameters of the MPC for the superheater steam temperature system were found to give the optimal performance

Prediction horizon NP = 20

Control horizon NC = 4

RESULTS AND DISCUSSION

From the extensive simulation studies on the SHS system, we infer the following PID controller tuned using Zeigler-Nichols' step response method has 38.8536% overshoot, oscillations and ITAE is 4063. The SHS system took about 310.3671 seconds to reach the steady state. PID controller tuned using Zeigler-Nichols' frequency response method has oscillations, 44.0963% overshoot and ITAE is 6334. The SHS system took about 353.4316 seconds to reach the steady state. PID controller tuned using Chein- Hrones- Reswick settings for set point regulation with 0% overshoot has 3.6049% overshoot and ITAE is 7531. The SHS system took about 445.6775 seconds to reach the steady state. PID controller tuned using Chein-a Hrones- Reswick setting for set point regulation with 20% overshoot has 14.8077% overshoot and ITAE is 10370. The SHS system took about 522.2486 seconds to reach the steady state. PID controller tuned using Chein- Hrones-Reswick settings for disturbance rejection with 0% overshoot has 34.3818 % overshoot and ITAE is 5132. The SHS system took about 353.5899 seconds to reach the steady state. PID controller tuned using Chein-Hrones-Reswick settings for disturbance rejection with 20% overshoot has 45.0507% overshoot and ITAE is 6760. The SHS system took about 398.9422 seconds to reach the steady state. PID controller tuned using Gain Phase assignment algorithm has ITAE 6378 and it has 16.4095% overshoot. The SHS system took about 382.1922 seconds to reach the steady state.

The PID controller tuned using Chein-Hrones-Reswick settings for set point regulation with 0% overshoot has less overshoot when compared with other tuning methods. The design, development and implementation aspect of MPC for SHS system is discussed and its performance is studied through simulation. It was found out that MPC has achieved good set point tracking without overshoot, better dynamic response and the least value of ITAE and a good speed of response compared to the other control methods. It would be more appropriate to use this control method in boilers to control the superheater steam temperature with good precision at the optimum value and thereby increases the efficiency of the boiler and turbine.

ABSTRACT

Power dissipation is an important consideration in the design of CMOS VLSI circuits. In the case of battery-powered application, high power consumption leads to reduction in the battery life and affects reliability, packaging and cooling costs. With technology processes advancing towards deep submicron and nano regimes, the scaling down of the threshold voltage levels in turn causes an exponential increase in sub threshold leakage currents leading to increase in leakage power. With the advance of each generation of the fabrication process a five-fold increase in leakage power dissipation is present. Leakage currents flow when the circuit is idle and so power is wasted. Efficient leakage power reduction techniques have become critical for the deep submicron and nanometre circuits. In this paper, a 4-bit Johnson counter is designed using LECTOR technique and is analyzed with different types of sleep techniques. We have used digital schematic editor (DSCH) for designing; simulation and layout generation is done using Micro wind Layout Editor.

Keywords: CMOS, Scaling, Leakage power, D flip-flop, Johnson Counter, Dual sleep, Dual stack, Stacked sleep, LECTOR

INTRODUCTION

Power consumption is one of the top issues of VLSI circuit design, for which CMOS is the primary technology. The power consumption of CMOS consists of dynamic and static components. During the switching of transistor, dynamic power is consumed and regardless of transistor switching static power is consumed. Previously, the dynamic power consumption was (at 0.18 μ technology and above) the single largest concern for low-power chip designers since it accounted for 90% or more of the total chip power. However, as the feature size shrinks, e.g., to 90nm and below, static power has become a great challenge for current and future technologies.^[11,12]

The scaling to nanometer regime has resulted in a rapid increase in leakage power dissipation. Hence, there is a great need to reduce static power dissipation during periods of inactivity. The power reduction has to be achieved without trading-off performance which makes it harder to reduce leakage during normal operation. There are several VLSI techniques to reduce leakage power. Scaling improves transistor density and functionality on a chip. Scaling will increase speed and frequency of operation and hence higher performance. As voltages scale downward with the geometries, threshold voltages should also decrease to gain the performance advantages of the new technology but leakage current increases exponentially. Power gating is one such well known technique where a sleep transistor is placed between actual ground rail and circuit ground (called virtual ground). This device is turned-off in the sleep mode to cut-off the leakage path. In this paper, we describe a new leakage power reduction technique called LECTOR (Leakage Control transistor) for designing 4-bit Johnson counter using CMOS technology. Previous techniques are summarized and compared with our new approach presented in this paper.^[13]

SLEEP TECHNIQUES

A. Dual Sleep Transistor Approach: Different types of methods are developed for leakage power reduction. One of such methods is dual sleep transistor approach (Fig.1). It uses two extra pull-up and two extra pull-down transistors in sleep mode either in OFF state or in ON state. The dual sleep portion can be made common to all logic circuitry.^[4]

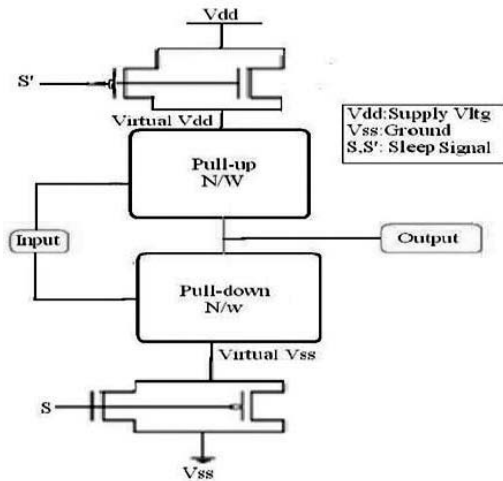

Fig. 1: Dual Sleep Transistor Approach

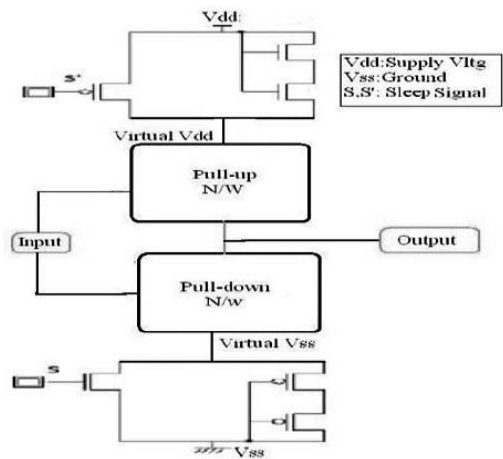

Fig. 2: Dual Stack Approach

B. Dual Stack Approach: In dual stack approach (Fig.2), 2 PMOS and 2 NMOS in the pull down network and pull-up network are used respectively in addition to the sleep transistors. The advantage is that NMOS degrades the high logic level, PMOS will degrade the low logic level.

C. Stacked Sleep Transistor Approach: In this technique, sleep transistor was getting stacked, which reduces the leakage current to great extent. This technique uses two stacked sleep transistors

in power supply rails and two stacked sleep transistor in ground. Thus leakage reduction takes place in two steps. Firstly, due to stack effect of sleep transistor and secondly due to sleep transistor itself. It is well known fact that NMOS are not efficient in passing the power supply. But in this technique, stacked sleep transistor will use PMOS in the power supply and NMOS in the ground for maintaining exact logic state of the circuit.^[1,2]

Fig. 3: Stacked Sleep Transistor Approach

PROPOSED TECHNIQUE

The proposed technique for leakage reduction in CMOS circuits is called LECTOR. It provides two Leakage Control Transistors (LCTs), a p-type and a n-type within the logic gate and the source terminal of each LCT controls the gate terminal of the other. LECTOR is effective in both idle and active states of the circuit results in better leakage reduction. Either one of the two LCTs is always “near its cut-off voltage” for any input vector combination, thus increasing the stacking effect without any additional control signals.

Fig. 4: Lector technique

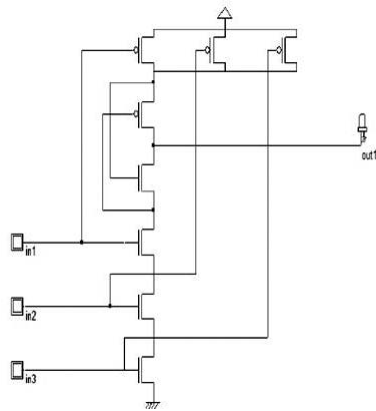

Fig. 5: 3-input NAND gate using Lector

It works based on the fact that a state with more than one transistor off in a path from supply voltage to ground is far less leaky than a state where only one transistor is off in any supply to ground path. The LCTs are self-controlled and do not require any control logic unlike in the popularly used sleep transistor method.[12]

PROPOSED TECHNIQUE

A. D flip-flop circuit: The D flip-flop with set/reset, shown in the figure is implemented using Digital schematic software (dsch2) for logic verification. It is then implemented using conventional CMOS technology, dual sleep approach, dual stack approach, stacked sleep approach and finally using LECTOR technique.

Fig. 6: D flip-flop

B. Johnson counter: Counter is a device that stores the number of times a particular event or process occurs often in relation to a clock signal. Counters are used in almost all the digital circuits for counting operations. Johnson counter also called as twisted ring counter is the modified form of a ring counter. It is implemented using storage

elements like D flip-flops. In Johnson counter output of the last stage is complemented and connected to the input of the first stage. A new schema symbol is made for the D flip-flop circuits and is used in the implementation of Johnson counter in dsch2 software.[17]

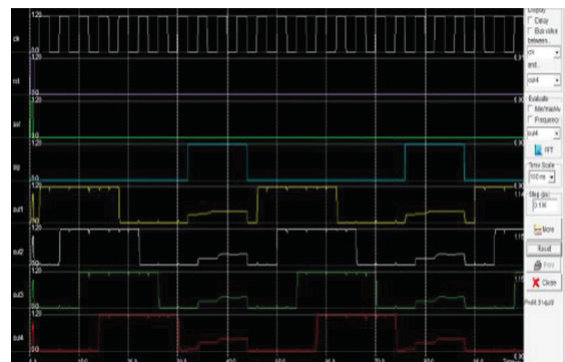

Fig. 18: Johnson counter using dual stack

Fig. 19: Johnson counter using stacked sleep

Fig. 20: Johnson counter using lector

We compare the LECTOR technique with different sleep techniques in terms of power consumption and the results are tabulated.

Table 1: Comparison of Lector technique with different sleep techniques in terms of power consumption for D-FlipFlop

	D Flip-Flop (μw)		
	120nm	90nm	70nm
Conventional CMOS	25.206	22.509	9.122
Dual Sleep	22.806	20.865	7.991
Dual Stack	22.609	21.053	8.357
Lector	9.609	6.982	3.640

Table 1: Comparison of Lector technique with different sleep techniques in terms of power consumption for Johnson Counter

Approach	Johnson Counter (μw)		
	120nm	90nm	70nm
Conventional CMOS	51.836	40.409	16.244
Dual Sleep	44.771	35.333	16.171
Dual Stack	44.514	35.146	16.273
Lector	25.111	19.237	10.540

CONCLUSION

Sub threshold leakage power consumption in nanoscale technology is great challenge to VLSI designers. Although there are several techniques to reduce leakage power, based upon the technology and design criteria the designer can choose the techniques. In this paper, Power consumption of 4-bit Johnson counter is reduced using different sleep methods and LECTOR technique. Unlike other leakage control techniques, LECTOR does not need any additional control circuitry to monitor the states of the circuit. Also the power consumption is greatly reduced using LECTOR technique with minimum possible area and this method can be used in several integrated circuits for power efficiency.

Parallel Hardware Architecture for Implementation of High Speed MAC

M Govinda Raju¹, Roopa J¹, Amit M Ugargol¹

¹Dept. of Electronics and Communication R V College of Engineering Bangalore, India

ABSTRACT

Multiply and accumulation (MAC) is basic function in most of the signal processing applications like video, image processing, pattern recognition. Multipliers corresponding to the MAC unit are designed using combinational logic circuits. Modern computers consist of dedicated MAC unit and multiplication is usually performed using serial hardware which is referred as a unit cell. This MAC unit cell as supported in many architectures fail to meet the real time response for high rate data applications. The rationale of this paper is to propose parallel architecture for multiply and accumulate operation with high throughput rate. The proposed architecture performs the multiplication of operands involved in the MAC unit parallelly and accumulates the result. The architecture also enables reusing of hardware for higher order taps based on the reusability factor. The functional units of the proposed architecture are developed at module level using RTL and behavior is simulated in Xilinx ISE 14.1 and synthesized on Virtex 7 family of FPGA. The obtained throughput for 128 taps is 16 MACs per cycle with reusability equal to 1 at clock frequency of 8.33 MHz for precision fixed to 8 bits.

Keywords: MAC, Real timer response, PHA, Throughput rate, Verilog HDL, Xilinx ISE 14.1, Vertex7 FPGA, Space and Time Complexity.

INTRODUCTION

Major operation in most of the Digital VLSI circuit is computation. To perform computation, arithmetic circuits consisting of multipliers and adders are used. The amount of power consumption and operating speed of these digital circuits is mainly decided by complexity of the multipliers. Multiply and accumulate operation is most common step used in digital signal processing application like image processing, pattern recognition, Fast Fourier Transform (FFT), Discrete Fourier Transform (DFT), convolution etc. It computes product of two numbers and adds that product to an accumulator. The unit that performs this operation is known as Multiplier – Accumulator (MAC) unit. The operation corresponding to this unit is known as MAC operation.

Consider basic MAC operation:

$$y = \sum_{k=1}^K A_k \cdot x_k \quad \dots(1)$$

Where $A_k := 1, 2, 3, \dots, K$ & $X_k : k = 1, 2, 3, \dots, K$ & are the input samples / operands involved in MAC operation, y is the output result. Where K is the length or number of coefficients corresponding to MAC operation.

MAC unit mainly consist of two major blocks namely multiplier and accumulator as shown in figure 1. The figure shows that, the output of the register is fed back as one of the input to adder, so that output of the multiplier corresponding to each clock cycle will be added with previously accumulated value. Multipliers corresponding to the MAC unit designed using combinational logic. Modern computers consist of dedicated MAC unit to perform this operation. Based on application speed requirement, different multipliers are used. For low speed application serial multipliers are preferred, whereas for high speed application parallel multipliers are preferred. Several attempts have been done by many researchers in designing the architecture to perform MAC operation, such that it gives high computational performance.

Fig. 1: Regular MAC architecture [2]

The implementation of MAC operation using serial hardware as supported in many architectures fail to support high sampling rate to achieve high data rate. However, parallel hardware could be designed to perform the MAC operation at considerable higher rate. In this work, the Parallel Hardware Architecture is proposed for implementation of MAC operation. It uses the partial product generator blocks in parallel to perform the MAC operation. The blocks of the proposed architecture are designed using the Verilog HDL at module level and behavior is simulated in Xilinx ISE 14.1. The space and time complexity of the proposed architecture is done by simulating the design on vertex7 FPGA board

DISTRIBUTED ARITHMETIC

Distributed arithmetic is one technique used for faster implementation of MAC for fixed coefficients. It makes use of LUTs extensively to reduce multiplication operation. Distributed arithmetic is based on distribution of arithmetic operations involved in MAC across its architecture. It consists of look up tables (LUTs), adders & shifters.

A. Formulation of Distributed Arithmetic:

Distributed arithmetic is multiplication-less technique. It involves pre computation of all possible inner products and their storage in look up table (LUT). The individual bits of the different input samples used as pointer for these memory locations. Based on the different inputs bits combination, value has been read and same will be accumulated. The process will be continued till all the bits of input sample covers/ processed. When sign bit of all the input samples arrive the corresponding value is read from the LUT must be subtracted from the accumulator value. The final result will represent MAC operation corresponding to the applied inputs.

Considering coefficient vector as A and input sample as x each of length K. Where these input samples are expressed using N-bit two's compliment binary representation.

For kth sample,

$$|x_k| < 1$$

$$x_k: \{b_{k0}, b_{k1}, b_{k2}, \dots, \dots, b_{k(N-1)}\}$$

Where b_{k0} the sign bit, b_{k(N-1)} is the least significant bit. It can be expressed as

$$x_k = -b_{k0} + \sum_{n=1}^{N-1} b_{kn} \cdot 2^{-n} \quad \dots(2)$$

Substituting equation (2) in (1)

$$y = \sum_{k=1}^K A_k \left[-b_{k0} + \sum_{n=1}^{N-1} b_{kn} \cdot 2^{-n} \right] \quad \dots(3)$$

Equation (3) can be rewritten as,

$$y = - \sum_{k=1}^K (b_{k0} \cdot A_k) + \sum_{k=1}^K \left[\sum_{n=1}^{N-1} (b_{kn} \cdot A_k) 2^{-n} \right] \quad \dots(4)$$

On expanding the magnitude part of equation (4) and after combining the terms corresponding to the same magnitude position, the new expression can be rewritten as,

$$y = - \sum_{k=1}^K A_k \cdot (b_{k0}) + \sum_{n=1}^{N-1} \left[\sum_{k=1}^K A_k \cdot b_{kn} \right] 2^{-n} \quad \dots(5)$$

The equation (5) has following terms:

$$\sum_{k=1}^K A_k \cdot b_{kn} \quad \text{has } 2^K \text{ possible values} \quad \dots(6)$$

$$\sum_{k=1}^K A_k \cdot (-b_{k0}) \quad \text{has } 2^K \text{ possible values} \quad \dots(7)$$

For fixed coefficients A, memory size required for implementation of LUT to realize the possible multiplication is 2 * 2^K words. The size of memory required to store inner product terms is dependent on length of coefficient vector (A_K). Distributed arithmetic completely eliminates use of multipliers to achieve product operation. The multiplication of MAC is converted into memory accessing operation to read LUT.

Fig. 2: Block diagram of 4-tap DA with 32-word LUT [4]

B. Memory Reduction: From the equation (6), it can be shown that for large values of K the memory size grows too large to be practical. However, the memory requirements can be reduced by a factor of 2 with a slight modification to the adder in figure. 2. If the adder is changed to an adder/

subtractor, the lower half of the memory table can be removed. The memory size will be 2^K . Further, additional reduction in memory requirements can be achieved through the use of offset binary coding (OBC) to achieve memory size to 2^{K-1} .

Drawbacks of the distributed arithmetic:

- Size of the memory required to store pre-computed terms grows exponentially with length (K).
- For larger value of length (K) memory reduction techniques failed to control increase in memory size.

PARALLEL HARDWARE ARCHITECTURE

Parallel hardware architecture replaces LUT by partial product generator and summation block. This architecture exhibits linear dependency of memory on taps. Parallel hardware architecture uses partial product generator blocks in parallel to perform the MAC operation. Parallel architecture processes entire input sample represented using B-bits at once, when clock cycle occurs. This architecture also offers the flexibility to reuse the computational blocks during MAC operation.

Reusability factor (R) corresponding to parallel hardware architecture predicts number of times the operational blocks are used during processing of single output sample. To perform the MAC operation of K coefficients, it consumes amount of product generator blocks. In which, each input blocks and corresponding coefficient registers are associated with R number of inputs. Each coefficient register stores coefficients in an interleaved fashion.

As initial step in parallel hardware architecture, both input samples and coefficients are expressed in 2's complement binary representation using B-bits. Based on the LSB bit of the coefficient registers, partial products are generated and further these products are added using summation block, result are accumulated.

A. Functional Units of Parallel Hardware Architecture: Parallel Hardware Arithmetic architecture consists of three blocks to perform the sum of product operation for given coefficients:

- Partial product generator block
- Summation block
- Accumulation block

B. Partial Product Generator Block: The figure 3 shows the partial product generator. The input samples will drive the product generator block. The coefficients which drive the distributed arithmetic system and the MUX are multiplexed together to utilize the reuse of components. The individual bits of the coefficients are either stored in interleaved or multiplexed way in a single register. The input samples are moved further one sample at a time when all the bits of the coefficient registers are filled.

Each bit of the coefficient register is coupled with corresponding input samples. Based on the select line input to the switching network, it routes the proper input sample to the multiplexer. At an instance only one bit of the coefficient register is shifted right. Depending on the Least Significant Bit (LSB) position value, MUX sets output to corresponding input sample X_k when LSB is '1' or output to '0' when the LSB is 0. The contents of the registers (coefficient register) reach the same initial state once all bits are covered. Since LSB is connected to the Most Significant Bit (MSB) the bits will shift back to their original positions

Fig. 3: Partial Product Generator [4]

C. Summation Block: The registered adders are arranged as tree formation in the summation block. The diagram of the summation block is shown in figure.4. For every clock cycle the partial products move further to next level in the tree, this aids in the easy implementation of the summation block using adders.

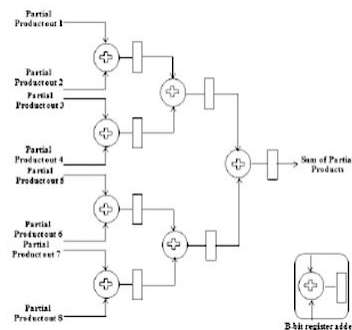

Fig. 4: Summation Block [4]

D. Accumulation Block: The figure 5 shows the shifted output from the summation block and the accumulation block output. From the figure it is clear that the output result is ready after $R * B$ clock cycles. The result from the summation block is stored for cycles and further shifted right each bit at a time and further added to the next result of summation block. Till $R * B$ bits are processed, the cycle is repeated. The Parallel Hardware Architecture based accumulator block has one accumulator for each reuse and multiple such accumulators. The output is obtained after summing all the values in accumulator after partial products are generated for all R . Small area and lower latency are the main advantages of the multiplexed feedback accumulator over the other approaches. The multiplexed feedback accumulator require only single accumulator compared to that of accumulators and no additional adders are required to calculate the output. The sign control (T_s) is initialized to zero and it is made as one once the Most Significant Bit (MSB) occurs.

Fig. 5: Accumulation Block [4]

The interconnection of functional units of parallel hardware architecture for four taps is shown in figure 6 the architecture uses a number of partial product generator blocks connected in parallel. The blocks execute concurrently to generate many partial products in a single clock cycle. Then, the partial products are added using adder stages to get the final sum. The accumulator value is added to the sum to get the final sum. The number of partial product blocks is dependence on the reusability factor. The switching network blocks use a common select line. The multiplier blocks are controlled by different select lines or coefficient registers. On each select line input, the entire sample is passed on to the output.

DESIGN AND IMPLEMENTATION OF PARALLEL HARDWARE ARCHITECTURE

The functional units of the proposed architecture are developed using H/W RTL code in Verilog at module level. Each module is characterized by module name, input and output ports, event or clock base control. the data flows from the top most switching module to bottom accumulator module through intermediate modules such as partial product generator and summation block.

Once the modules are developed individually, their behavior is simulated in Xilinx ISE 14.1. In the simulation process, the module is synthesized on Virtex 7 family of FPGA and its logic functionality is verified. Further, these modules are cascaded to build the complete architecture. All the modules are controlled by a common clock.

Fig. 6: Parallel Hardware Architecture [4]

RESULTS AND DISCUSSIONS

The proposed architecture is developed using hardware RTL code, Verilog for four, eight and sixteen taps. The complexity is analyzed by varying different parameters of the design. The throughput in terms MACs per cycle is found for different number of taps, number of bits and reusability factor. The space complexity is found in terms number of LUTs and slice registers by varying number of filter taps and number of bits.

Throughput of the proposed architecture in terms of MACs per cycle is given as:

$$\text{Throughput} = \frac{K}{B.R} \text{ MACs/Cycle}$$

A. Throughput Vs Reusability with Precision

Fixed To 8 Bits: The figure 8 shows MACs per cycle with reusability, with precision fixed to 8 bits for various taps (K). For higher tap values, the throughput is exponentially decreasing with

respect to reusability. When reusability is equal to unity, K product generators will work in parallel to perform the MAC operation. Whereas, for higher values of R, the number of product generators required will be less. It reuses the existing hardware to perform the MAC operation. The reusing of hardware to perform the MAC will lead to efficient utilization of resources, but at the cost of decreased throughput rate. These parameters are to be traded off for better performance.

Fig. 8 : Variation of MACs per cycle with respect to reusability, with precision fixed to 8-bits

B. Throughput Vs. Length with Reusability Fixed To 2:

The figure 9 shows MACs per cycle with respect to taps for different bit precisions with reusability fixed to 2. It indicates that, the throughput rate remains constant irrespective of length of taps. The throughput corresponding to 8-bit precision has a higher value compared to 64-bit precision. For varying length of taps MACs per cycle remain constant. It is independent on the variation of and has inverse relation with bit precision $\left[\frac{1}{B} \right]$. Throughput decreases with increase in number of bit precision

Fig. 9 : Variation of MAC per cycle with respect to Length of taps, with Reusability fixed to 2 by varying precision

C. Throughput Vs Bit Precision with Reusability Fixed To 2:

The figure 10 shows throughput with respect to precision in bits, with reusability fixed to 2. The figure 10 shows the variation of throughput for different taps. It indicates that, the MACs per cycle decreases with increase in bit precision, for various tap lengths. The throughput corresponding to the higher order taps at low bit precision is high. Throughput has inverse relation with both number of bits and reusability.

Fig. 10: Variation of MAC per cycle with respect to Number of bits, with Reusability fixed to 2

In proposed parallel hardware, the reusability is decides the throughput rate. At R=1, the maximum throughput rate is attained at the cost of hardware complexity. These two factors must be traded off depending upon the application. However, the parallel hardware MAC has constant relation with filter length at desirable Whereas, the throughput decreases with higher bit precision.

D. Number of Slice LUTs Vs Length with Varying Bit Precision:

The figure 12 shows variation of number of slice LUTs with respect to Length of taps, with changing Bit precision. The number of slice LUTs required to implement the design increases with increase in the number of taps. In addition, the number of slice LUTs required also increase with increase bits precision at desired tap value. However, slice LUTs shows inverse relation with reusability.

Fig. 12: Variation of Number of LUTs with respect to Length, for different Number of bits

E. Number of Slice Register Vs Length with Varying Bit Precision: The number of slice registers required to synthesize hardware is also obtained from the synthesis listing summary report. The figure 13 shows number of slice registers with respect to variation in Length, with varying Bit precision.

Fig. 13: Variation of Number of Slice Register with respect to Length, for different Number of Bits

The figure shows that, the number of slice registers required to implement the design increases with increase in the number of taps. In addition, the number of slice register required also increase with increase bits precision at desired tap value. However, slice register shows inverse relation with reusability.

CONCLUSION

The functional units of the proposed architecture are developed at module level using Verilog HDL and behavior is simulated in Xilinx ISE 14.1 and synthesized on Virtex 7 family of FPGA. The throughput in terms of MACs per Cycle of the designed module is gauged with respect to different parameters by developing test benches. The hardware complexity in terms of number of slice LUTs and slice registers is empirically presented.

The obtained throughput for 128 taps is 16 MACs per cycle with reusability equal to 1 at clock frequency of 8.33 MHz for precision fixed to 8 bits as opposed to 1 MAC per cycle seen in serial MAC found in different architecture. With increase in reusability, the throughput is observed to be decreasing. The throughput is shown to be dependent on bit precision and reusability. Whereas, in serial MAC throughput varies with number of taps.

The space complexity for 16 taps is found to be 1078 number of slice LUTs with reusability equal to 2 for bit precision fixed to 32 bits. With increase in number of

taps and bit precision, the required number of slice LUTs increases. The disadvantage of this method is increased hardware complexity as opposed to serial MAC. Hence, the throughput and hardware complexity must be traded off. The parallel architecture exhibits constant throughput irrespective of coefficient length for fixed bit precision and reusability factor. The architecture even offers the flexibility to reuse computational blocks while performing MAC operation.

ABSTRACT

Key to most parts of medication from primarily care to specific medications, drugs prescribed by physician have turned into a noteworthy segment of healthcare frameworks overall. Inferable from their psychoactive impacts, these medications are frequently taken in ways not expected by the specialist or by somebody other than the individual for whom it was recommended. Patients frequently neglect to take their medication prescribed by the specialist or take it out of the plan suggested by the specialist. There are additionally examples of young people taking medications, for example, sedatives, stimulants and depressants. Thus, the major problem is that after the issuing of medicine prescribed by the specialist, its utilization can't be monitored. This paper provides insights on how to construct a framework around physician endorsed drugs which is helpful in validating the usage of medication on the basis of identity of the patient and the scheduled prescribed to that patient. It also helps in facilitating the doctor or pharmacist to monitor the utilization of medication through an app which will be used by the pharmacist register the patient with the complete personal information and the prescribed medication.

Keywords: *IoT healthcare network, IoT Architecture, Visions of IoT*

INTRODUCTION

Key to most parts of medication from primarily care to specific medications, drugs prescribed by physician have turned into a noteworthy segment of healthcare frameworks overall. Inferable from their psychoactive impacts, these medications are frequently taken in ways not expected by the specialist or by somebody other than the individual for whom it was recommended. Patients frequently neglect to take their medication prescribed by the specialist or take it out of the plan suggested by the specialist. There are additionally examples of young people taking medications, for example, sedatives, stimulants and depressants. Thus, the major problem is that after the issuing of medicine prescribed by the specialist, its utilization can't be monitored. IoT based healthcare devices have helped the patients to take their medication at the prescribed time.

1.1. IoT Healthcare Network: The IoT healthcare system or the IoT network system for healthcare (called as IoThNet) is one of the indispensable components of the IoT in healthcare. It acts as a supporting system which provides encourages the transmission and acceptance of patient's medical information, and empowers the utilization of healthcare services custom fitted communications.

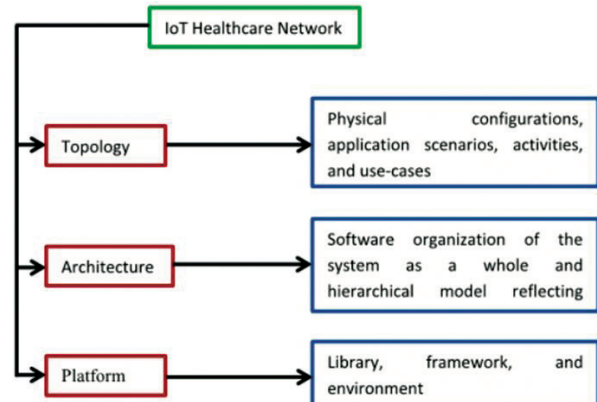

Fig. 1: IoT Healthcare Network

1.2. IoT Healthcare Architecture: The IoThNet architecture refers to a diagram for the specification of the IoThNet's physical components, their practical association, and its working standards and strategies. Many investigations have verified that the IPv6-based 6LoWPAN is the base of the IoThNet. As indicated by the idea of IoThNet, wearables and sensors utilize IPv6 and 6LoWPAN frameworks for the transfer of information using the protocol-802.15.4. Information is then reverting back through sensor nodes using UDP (User Datagram Protocol).

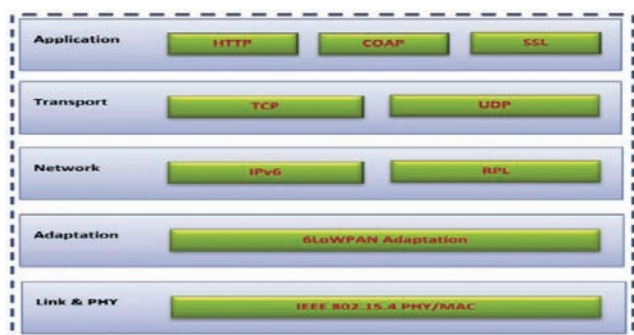

Fig. 2: IoT protocol stack of 6LoWPAN

1.3. Vision of IoT in Healthcare

1.3.1. Challenges of today's

Healthcare: Despite the facts that, the world's interest for medicinal services have increased, regardless we live in the traditional model of hospital-centric care, in which residents visit specialists.

Some of the challenges and barriers faced by these hospital-centric cares are:

- **Rising medical cost:** One of the biggest factors in the health care today is the increasing cost for the healthcare.
- **Urbanization:** It was predicted by World Health Organization that 70 percent of world's population lives in urban cities which implies that urban cities require more healthcare services.
- **Adherence monitoring:** The absences of adherence results in increasing risks of hospitalization and thus, raise the burden to the patients.

1.3.2. IoT-driven medicinal services: Progressing from hospital-centric to patient-centric:

An IoT technology plays an important role in many different areas of medical field:

- **Hospitals:** Hospitals are getting more noticeable to treat, operate, admit or monitor expanding number of patients. Keeping in mind the end goal to run their operations easily, they always depend on advanced advances. For instance, "Smart Ambulances" can do early diagnosis as a result of which the staff could make the required arrangements before the patient arrives. Such situation could be imagined with the reconciliation of IoT technology. Smart ambulances will be requiring an arrangement of medicinal sensors which are reliable for performing diagnosis, a protected interface for communicating with the hospital, and other preparations like an

operating room. Surgeries may turn out to be more relevant and productive with IoT. Thus, one can imagine the part of IoT in different divisions of the hospitals, for example, Intensive Care Unit (ICU), essential care unit, and specific units.

- **Clinics:** Primarily, patients visit their family doctors who could exploit IoT in a wide range of ways. For instance, the specialists are able to get the lab reports of their patients virtually before their visit. IoT has the potential to give a protected twoway interaction amongst patients and clinic receptions to arrange appointments without making long telephone calls. IoT gives solutions which are cost friendly for clinical facilities in order to create an associated screening for their patients so the doctor could invest greater quality time with their patients.
- **Anywhere (Non-clinical Settings):** There are some other areas also where the IoT is providing tremendous benefits to the patient:
 - **Mobile clinics:** There is an expanding enthusiasm for portable health clinics. IoT has the potential to have a major effect in improving the infrastructure of the mobile clinics that could collaborate with the the hospitals to interact virtually for diagnosis.
 - **Telemedicine:** IoT has a great deal to offer in this field because of the fact that a huge segment of total population of the world possesses cell phones and smartphones, which are not just specialized gadgets for communication, but rather likewise utilized for interfacing with various different sensors. On account of medicinal care, smartphones are assumed to have a fundamental part by allowing patients to test their own health themselves. Thus, the hospitals can still work well by expanding the virtual care services.
 - **Smart Homes:** While the telemedicine services could decrease the number of sittings to hospitals and clinics, the need for setting up a technical IoT infrastructure in patient's home is becoming important and thus, establishing smart homes provides supportive network to allow citizens to experience quality of life.
 - **Smart cities and connected communities:** The quick relocation of huge population towards urban areas has increased the

demands and difficulties in many urban communities.

Consequently, rising efforts have been made for building smart cities by incorporating different infrastructure to enhance bearable-ness, supportability, affordability and proficiency. The healthcare system is a fundamental piece of smart cities and urban conditions. For instance, urban areas have been incorporated with environment sensors which are helpful in streaming the sensor information to a brought together area like the cloud servers that can be accessed by the healthcare department. This could help in making citizens mindful of various

conditions, for example, poisons and pollutants, dust, temperature and humidity conditions, etc. IoT helps in conveying this data continuously to prevent medical problems in advance.

1.4. Existing devices and apps available: According to a survey, it was found that only 47 percent of the patients take their medication on time. The solution to this problem led to the development of an IoT based device which is now popularly known as smart pill containers or smart pill bottles. These devices are able to generate and transmit signals when the bottle is opened. This helps as a reminder for the patients to take their medication at the prescribed time.

Some of the IoT based smart devices are described here with their functionalities:

Table 1: Smart Pill containers and their functions [2]

S. No.	Product	Limitations	Comparison with Smart Med Minder
1.	CerePak -It is a MeadWestVaco product that records when pills are removed. The information is sent using RFID to the reader attached to a computer. This blister pack can hold upto 32 pills.	It can only hold 32 pills. No locking function on the device which can result in drug overdose.	There is no specific number of pills that can be stored in the device. The device exhibits a strong locking phenomenon for the prevention of drug overdose.
2.	eCAP -It is a cap produced by Information Mediary Corporation (IMC) that can be fitted on pill bottles. It is provided with a beep alert and flash to remind the patient to take his medicine. The cap also records the openings of the bottle and transmits the data using RFID to the reader which is attached to a computer.	There is no locking mechanism on the device	The device exhibits a strong locking phenomenon for the prevention of drug overdose.
3.	Glow Cap -Glow Cap is a product of Vitality that can be fitted on pill bottles. It is provided with a beep alert and flash to remind the patient to take his medicine.	The device only beeps alert through LED. There is no functionality of transferring the opening and closing alert to the patient through the app.	The device facilitates alert for opening and closing of the bottle to the patient through the app.
4.	MedSignals -It is a pillbox comprising of 4 slots. It is provided with a beep alert to remind the patient to take his medication on time. The correct slot can be identified with the flashing light.	No locking mechanism on the device. Transfer of information takes place over a phone line.	The device exhibits a strong locking phenomenon for the prevention of drug overdose. The device facilitates alert for opening and closing of the bottle to the patient through the app.
5.	MEMS 6 Track Cap - It is an AARDEX Group product that is useful in recording pill bottle openings and closings. It is provided with an LCD display which shows the frequency of openings and the time since the bottle was last opened.	No locking mechanism on the device.	The device exhibits a strong locking phenomenon for the prevention of drug overdose.

Conted...

6.	Rex – It is a product of Mediocre Technologies. It provides verbal instructions when a patient presses the button. The instructions could be text-to-speech generated by computer or in the form of human voice using microphone.	The device doesn't transfer the data of how many pills taken or the consumption record of the medicines.	The device doesn't transfer the data of how many pills taken or the consumption record of the medicines.
7.	SIMpill - It can be attached to the sides of the pill bottle and it the openings of the bottle and sends a message to a computer. If the bottle is not opened on time then, the computer transmits a reminder message to the patient's phone which can be in the form of a text-message, voice or email.	The device sends the reminder message for taking the medication on time through text message or email. There is no locking mechanism on the device for the prevention of drug overdose.	The device uses the latest smart application for transferring the data and signals. The device exhibits a strong locking phenomenon for the prevention of drug overdose.

PROPOSED SMART MED-MINDER BLOCK

2.1. Description:

Pharmacist's App: This app will be helpful in creating a patient's profile and register the prescribed medication to the patient. It will be associated with bottle ids, scheduled time and prescriptions of each patient. This app will also provide the pharmacist privilege to connect to a bottle id of any patient at any time. The unlock notification of the bottle as well as the requirement of refill of medicines can be seen by the pharmacist through the bottle id of any patient stored in this app.

Patient's Phone App: The major purpose of this app is to unlock the pill bottle to take the medicine through finger scan, retina scan, voice recognition or Bluetooth authentication. The push notification of this unlocking event would be sent to pharmacist's app as well as to patient's loved ones. This app also enables the patient to view his prescription schedule and also set an alarm at the scheduled time.

Pill Bottle: The 'smart bottle' will consist of two components. The electrical component consists of the circuitry for power, Bluetooth connectivity and microcontroller unit. The mechanical unit exposes the functionality for the locking mechanism of the bottle.

A. Battery: A lithium battery is used to provide voltage for the Bluetooth chip and the microcontroller.

B. Voltage Regulator: To encourage the distinctive voltage inputs required by the finger scanner, Bluetooth chip and the microcontroller, we will utilize a controller to level move the input DC as required by each of them.

C. Bluetooth Chip: A Bluetooth Low Energy chip (Bluetooth Smart or Version 4.0+) will be utilized to associate with the pharmacist and patient's app to the pill bottle.

D. Microcontroller: The MCU will keep up the clock, make and send logs to Bluetooth, receive verification from the other modules and communicate the lock/unlock signal.

E. Lock Driver: As the lock engine will take more power than can be provided by the output pins of the microcontroller hence, the output from the microcontroller would drive a gate controlling flow of power to the lock.

F. Position Sensor: It will identify if and when pill bottle has been opened as a component of the control loop. The output of the position sensor will be encouraged as input to the microcontroller unit to tell if locking/unlocking event was fruitful or not. We will utilize a hall effect sensor to detect the change in magnetic field because of the lock.

G. Lock: Locking instrument will be a linear solenoid on the top of the cap that embeds a locking pin into a space on the pill bottle, guaranteeing that the cap can't turn until the

point that is controlled and pin is lifted. Pin shall be having a little magnet to work with the hall effect sensor. [1]

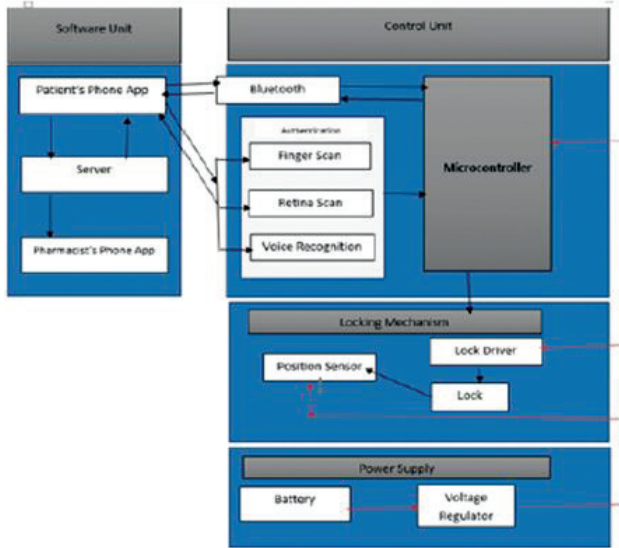

Fig. 3: Proposed framework for Smart Med-Minder

*RED LINES depicts power supply.

The cap of the smart pill box is connected with the patient’s phone app as well as the pharmacist’s app. The pharmacist maintains the complete database of the patient which includes patient’s full name, address, contact number and prescribed medicine schedule of each patient. Each patient is given a patient id and bottle id associated with the bottle given to the patient by the doctor on treatment. The pharmacist is provided with privilege to connect to any bottle id of any patient at any time. The unlock notification of the bottle as well as the requirement of refill of medicines can be seen by the pharmacist through the bottle id of any patient stored in this app.

The patient can unlock the bottle using various mechanism present in the patient’s app. These mechanisms include Fingerprint scanner, Retina scanner, Bluetooth authentication, Voice Recognition system or by using manual lock present on the cap of the bottle. If the patient unlocks the bottle on the prescribed time, a signal is sent to the patient’s app as well as the database that the medicine has been taken at that particular time. The pharmacist can check any patient’s medication history from the database.

If the patient forgets to take the medicine on the prescribed time then, the smart pill bottle beeps

an alarm and flashes an LED light to remind the patient to take the medication on time. It also sends a notification to the patient’s phone app to take the prescribed medicine.

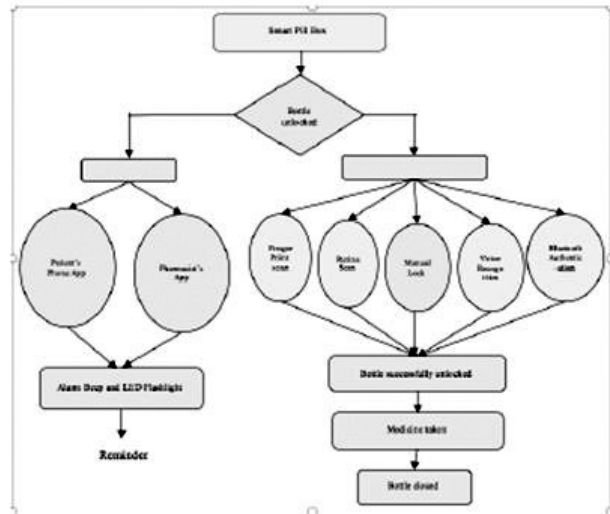

Fig. 4: Flowchart of Smart Med-Minder

2.2. Features of Smart Med-Minder

- a. Portable:** The device is small in size and easy to carry anywhere.
- b. Daily reminder:** The device facilitates daily alarm as per the scheduled time of the prescription. It also flashes the LED light present on the bottle.
- c. Notifications:** The device provides push notification to the patient as well as the pharmacist. This app also enables the loved one’s of the patient to get notifications whether he took the medicine or not.
- d. Tracking of dosage:** It’s a big deal when people don’t take their medicine on time. This app enables the patient to keep a track of their dosage history.
- e. LED flash light:** An LED flash light is provided on the pill bottle that flashes in case of overdose warning, daily alarm and low battery indicator.
- f. Double dose tracking:** The device sends a notification to the app as well as flashes the LED light if the bottle is unlocked before the scheduled prescription time. This helps in reducing overdose of medicines.
- g. Safety lock:** The device facilitates a high safety mechanism so as to keep it away from children or other people. The safety module offers five choices to the patient for unlocking the device depending upon the patient’s comfort:

- Fingerprint scanner
- Retina scanner
- Voice recognition system
- Bluetooth authentication
- Manual lock on cap

h. Tamper-proof: The device is tampered proof.

Limitations of the Proposed Model: The device is designed to provide various services to the patients such as locking mechanisms to prevent drug overdose, daily LED flashlight to remind patients to take medication and much more. Yet, the device has some limitations which need to be overcome.

The device exhibits several safety lock mechanisms such as Bluetooth authentication, Fingerprint scanner, Retina scan, Voice recognition system and as well as a manual lock on the cap. The locking mechanisms provided help in preventing drug overdose. But, the Smartphone through which bottle is opened should support the finger scan, retina scan, Bluetooth, voice recognition functionalities. Moreover, various safety phenomenon used increases the cost of the device at the initial state. In the scenarios where the smart phone of the patient gets discharged, the bottle will get opened only through the manual lock provided on the cap of the bottle.

CONCLUSIONS AND FUTURE SCOPE

There exist many scenarios where young people taking medications, for example, sedatives, stimulants and depressants more than what they are prescribed by their doctor. Drug over dosage is becoming a major problem in today's youth. A solution to this problem could be monitoring of the medication after issuing it from the doctor. The smart pill box solves the problem to much extent. It also helps in facilitating the pharmacist as well as the patient's loved ones to keep a check on the utilization of medication through an android application. It sends reminder and push notifications to the patient's phone to take the prescribed medicine on time. It also enables to keep a track of overdose of medicine by the pharmacist. One major drawback of the smart pill bottle

is the cost factor. The bottle facilitates many unlocking mechanism such as fingerprint scanner, retina scanner, Bluetooth authentication, voice recognition system and as well as manual lock on the cap. The inclusions of these mechanisms in the android application results in the rise of the cost of the pill bottle. Thus, the device needs to be cost-efficient so that it is in reach and available to every individual.

Providing Cyber Security using Machine Learning for Social Networks

Sheba Pari N.¹, Majjaru Chandrababu¹, Senthil Kumar K.²

¹Research Scholar, ²Associate Professor, SITE VIT University, Vellore, India

ABSTRACT

Social networks are the most common type of interaction between people these days. Attacks on these networks are currently at an all time high which can be by corrupting the data, introducing malicious data, getting access to confidential data or intrusion on the network. The main requirement is providing security to such networks. As and when security is being provided to these networks, attacks are also evolving. Cyber attacks are becoming complex which means that sometimes the threat for which the solution needs to be found is unknown. Threats are becoming automated, which means threats are AI induced. If threats are AI induced, using less efficient algorithms for cyber security is not the optimal solution. Hence Machine learning algorithms are used in conjunction to provide cyber security for social networks.

Keywords: attacks; cyber security; intrusion; machine learning; social networks;

INTRODUCTION

Social networks are the most common type of interaction between people these days, where communication is done by means of data contents such as text, images, videos and so on. A network built of people with similar ideas or views. Sharing of data, which includes personal information, is very common on social networks. In this age of social networking, keeping this information private and secure is the foremost challenge. This paper talks about providing cyber security to social networks. When computer systems or networks are protected from any sort of harm such as cyber attacks it is defined as Cyber Security. This harm caused can be, by corrupting the data, introducing malicious data, getting access to confidential data or intrusion on the network. Cyber Security is practices which are used to protect the network of systems from cyber attacks^[1]. Protecting the systems can either be physical protection or cyber security. A fraction of cyber security is information security to maintain the integrity, authenticity and confidentiality of the data. Threats (Cyber Attacks) being injected in the network can take many forms which the cyber security tries to resolve. But past few years the complexity of cyber attacks has significantly increased and is still increasing^[2]. These threats are hard to detect and resolve. These threats may not just be about information theft but can lead to worse

situations such as chronic loss to an entire industry. Since the threats are evolving drastically, the old school way of treating the threats won't do any good to the system and may not also be practical to implement. It has been predicted that in the coming years the major cyber attack could involve artificial intelligence systems. Attackers have started automating the threats wherein the threats have successfully entered the network without being detected by same cyber security methods used till now.

The test is to find threat which you have no idea about. When we take an analogy of this, this is the same situation which happens in our human body. Our DNA is being attacked by a huge number of unknown viruses on a day to day basis. But our immune system distinguishes between what belongs to our body and what doesn't belong. It adapts to threats which mutate as well. Motivated by this ability of the human immune system, Artificial intelligence technology against cyber attacks which are complex has enabled a sophisticated way for industries to protect themselves. The worst social media cyber attacks are^[3]

A. Phishing messages: Phishing is an effort by the attackers to obtain sensitive/personal details of the user. Custom phishing messages are sent via social media and when the user accesses the message, the attacker gets access to the user's device and in turn all confidential details.

B. Impersonation: In this type of attack fake accounts are created by the attackers on social media and are connected with genuine users. The attacker spreads a Trojan through these social media accounts to get access to the user’s device.

C. Account Takeover: When there is vulnerability in 3rd party applications, the attackers can gain access to accounts and the accounts of legitimate users are compromised.

D. Botnets: When malware are introduced into the networks without the users knowing about it is called at Botnets.

All these attacks are majorly interested in gaining access to sensitive information. This can be prevented by the users with social media accounts by

- Not trusting communications with users who is not known.
- Not opening any links or attachments received to the user account.
- Not posting anything and everything from the internet onto the user account.
- Not posting Confidential/sensitive information about self.

MACHINE LEARNING AND CYBER SECURITY

Artificial Intelligence is making our machines intelligent comparable to an individual’s intelligence. Artificial Intelligence is a broader concept whereas Machine learning is a part of Artificial intelligence which is more concerned about machines learning by themselves [4]. Social networks are continually under attack. Using AI features, attacks have been able to spread from system to system without supervision faster. Attackers are using machine learning to increase the impact of their attack. When the impact of attacks are progressing at a rapid rate, using old school cyber security techniques will not be able to protect our systems from cyber attacks. In addition to that complexity of the attack has made detecting more difficult. Hence cyber security needs to be provided using machine learning [5].

When huge volumes of information are involved such as the data in social networks, machine learning and cyber security are best suited for processing. The

main advantages of using machine learning techniques over existing techniques of cyber security are

- More powerful and more efficient.
- More faster in detecting
- Cyber security using machine learning does not require previous understanding of an attack to understand whether it is harmful or not.
- It even works against attacks which wouldn’t have been detected by earlier methods. Machine learning is broadly classified into 3 types, supervised learning, unsupervised learning and Reinforcement learning [6]. In supervised learning, the training data is analysed first, results of which are used for future analyses of different data. In this, for every data instance there is an input and a corresponding output which is labelled data. The Unsupervised learning deduces the function from non-categorized data. In this we have only input data and no labelled data. Based on the data it may be clustered, summarized are some patterns may be found. When supervised and unsupervised learning are combined it is called as semi-supervised learning. This is when there are some labelled data and majority of unlabelled data. In Reinforcement learning, there is an agent who is acting in an environment and what actions the agent takes at every stage is what is decided. This action can either be penalties or rewards based on the result.

METHODOLOGY

To provide cyber security attacks for social networks using machine language a number of algorithms have been proposed earlier. A few algorithms that can be used for providing cyber security are Fully connected Feed-forward Deep Neural Networks (FNN), Convolutional Feed-forward Deep Neural Networks (CNN) and Recurrent Deep Neural Networks (RNN)[6]. All of the above algorithms are based on neural networks. A Neural Network (NN) usually consists of elements of huge numbers that are interconnected called neurons, working in harmony to solve definite problems. There are 3 groups of neurons, first called as Input neurons which sense the environment through sensors and the next set of neurons, the hidden neurons which are activated through weighted connections between the input and hidden units [7]. The third group is the output neurons which are activated through the weighted connections between the hidden unit and the output units.

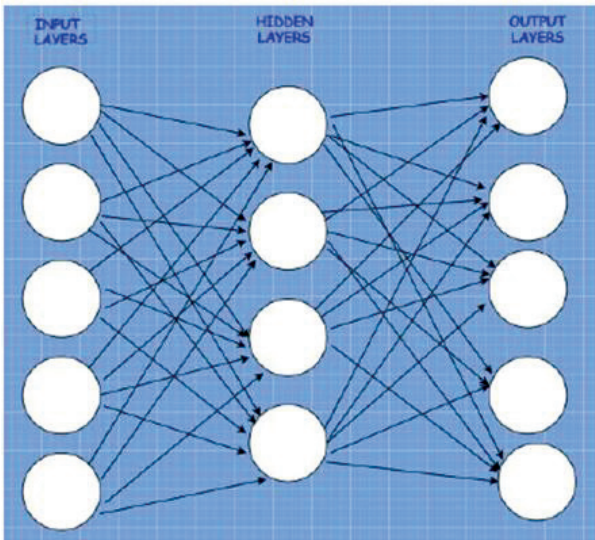

Figure 1: Neural network with one hidden layer

- A. FNN:** This algorithm is a type of Deep Neural Networks (DNN) where every neuron is connected to all the neurons in the previous layer. FNN provides an optimal solution for classification where input data is not assumed. The drawback is that the cost of computation is really high.
- B. CNN:** This algorithm is a type of Deep Neural Networks (DNN) where input data is not taken from all neurons but only a set of neurons of the previous layer. This technique has lesser cost of computation. This is usually preferred for spatial data but not for non-spatial data.
- C. RNN:** This algorithm is a type of Deep Neural Networks (DNN) where data is sent from neurons also to previous layers. This technique is hard to implement. Their performance when measured is the highest when compared to other algorithms.

While providing cyber security to social networks, there are volumes of data that need to be analyzed^[8]. When huge, dissimilar volumes of data are involved, NN and DNN seem more powerful and detect threats better than other techniques. Especially when complex abstract layers are involved these techniques seem to have an upper hand in solving problems. The reasons these techniques are used are due to the ability to find a solution accurately for unknown functions. There are many challenges when using NN and DNN for providing cyber security to social networks^[9]. A large part of this data's parameters should be labeled which is a practical concern. Various problems that may be encountered should be expected. To anticipate this for voluminous amount of data is complex and time

consuming. Best probable solution should be attempted to solve non convex data model problems. The entire problem is subdivided into sub problems and each are solved individually. So which means a neuron's network function constitutes other functions which in turn can be a composition of other functions^[10]. Each function is the nonlinear weighted sum. Finally these individual solutions are assembled to solve non convex problems. This method improves performance and is faster. Often finding the optimal solution is not a feasible option so other methods must be used in conjunction. Supplying the models with in appropriate or insufficient data can cause certain problems so a proper understanding of the problem, its complexity and covering all available data is a must^[9]. The different steps involved in implementation are^[10]

Figure 2: Steps in Implementation

- **Understanding the problem:** Analyzing of the various threats to Social networks. Threats which can be already known or still evolving. Highlighting potential serious issues.
- **Analyze Data and Data Dependencies:** This is the key step wherein the data, the data flow and the resultants to be got are analyzed.
- **Classification of threats:** In this step the rate of occurrence and the total number of threats are reviewed. The composition of functions and sub-

functions are validated. The common threats are listed and analyzed. Classification is done using DNN.

- **Prepare Dataset:** Majority of the implementation time is usually involved in preparation of data. The data used must be assessed, validated and also might be transformed to produce optimal results.
- **Developing the model:** In this step the model NN or DNN is developed.
- **Evaluate Model:** In this step validation is done to check if the data was classified correctly from the available data sets. Also evaluation of the labeled data is done.

CONCLUSION

Social networks consist of huge amount of data where data confidentiality must be met. When data is spoken about, making sure data is secure is a primary concern. Data must be protected from various cyber attacks such as Phishing messages, Impersonation, account takeover, and botnets. There are various methods in which cyber security can be provided to these attacks. Threats are evolving hence the methods used to provide security also needs to be advanced. Machine learning is used to support cyber security to social networks. Most of the machine learning models is based on supervised learning, unsupervised learning or reinforcement learning. All the models are based on neural networks and in turn deep neural networks. DNN models can be Fully connected Feed-forward Deep Neural Networks (FNN), Convolutional Feed-forward Deep Neural Networks (CNN) or Recurrent Deep Neural Networks (RNN). All are based on the basic neural networks. To implement the above models for providing cyber security for social networks using machine learning there are a number of steps such as Understanding the problem, Analyze Data and Data Dependencies, Classification of threats, Prepare Dataset, developing the model and finally evaluate model.

ABSTRACT

Nano science and nanotechnology are the examination and uses of little things. Nanomaterials can be utilized crosswise over in every one of the fields of science, for example, science, science, physical science, materials science, and designing. Researchers and designers are finding a different approaches to tailor wanted materials at the nanoscale. With the goal that their properties, for example, higher quality, lighter weight, expanded control of light range and synthetic reactivity can be utilized. The expansive scope of business items incorporate stain-safe and sans wrinkle material and makeup are accessible today. In the present article a wide vision – another measurements in time of science on nano materials is focussed.

Keywords: optical filters, Nanoscale, quantum effects, bioelectronic devices, nanocoatings.

INTRODUCTION

Nanoscale materials are characterized as an arrangement of substances where no less than one measurement is not as much as roughly 100 nanometers. A nanometer is one millionth of a millimeter. Which is around 100,000 times littler than the breadth of a human hair. nano materials are of intrigue (fig.1) in light of the fact that these have one of a kind optical, attractive, electrical and different properties at the nanoscale. These properties have the potential effect in hardware, pharmaceutical, and different fields.

Fig. 1: Nanomaterials

Fig. 2: Nono as new era of science and technology

nano materials hold potential to make supercomputers. These are sufficiently little to be conveyed in a shirt take. Machines can be built that can repair harmed tissues when gone through the human body. Nanostructured materials are utilized as a part of sensors, optical filters, low-edge laser, controlled medication conveyance and organic location.

Nano pharmaceutical is a generally new territory of biotechnology. The potential outcomes for new treatments and medical procedures to regard sicknesses and infections, for example, disease, appear to be interminable. The idea of nano robots and cell repair machines is additionally suitable. Diverse kinds of nanoparticles are being contemplated for applications in nano medication. They can be carbon-based skeletal-type structures, for example, the fullerenes, or micelle-like, lipid-based liposomes. They have various applications in medicate conveyance and the corrective business. At the nano scale these materials can have distinctive properties in light of the fact that their relative surface region to volume proportion is increased. Another motivation to have such properties is new quantum effects. These properties are not found in their mass part. Nano materials have a substantially more prominent surface region to volume proportion than their regular forms. It can prompt more prominent substance reactivity and influence their quality. Quantum effects can turn out to be more critical in deciding properties and qualities of materials at the nanoscale. They prompt novel optical, electrical and attractive practices.

Occurrence: Some nano materials happen normally. The nano materials are built and intended for a specific item and right now being utilized as a part of numerous business items and procedures. They can be found as sunscreens, beauty care products, donning merchandise, recolor safe apparel, tires, gadgets, and additionally numerous other regular things, and are utilized as a part of pharmaceutical for reasons for finding, imaging and medication conveyance.

History of nano materials: Individuals were going over different nanosized objects and the related nanolevel procedures, and utilizing them practically speaking some time before the beginning of nanoera. Instinctive nanotechnology ancient pieces grew immediately, truth be told, they were not understanding the idea of these items and procedures. Around then little particles of different substances had properties diverse to those of similar substances with bigger molecule estimate was known, They were not knowing the purpose behind that.

In this way, individuals were occupied with nanotechnology subliminally. They couldn't figure that they were managing the nanoworld wonders. In numerous cases insider facts of old nanoproduction essentially go from age to age, Individuals knew and utilized characteristic textures: flax, cotton, fleece, silk. They could develop them and process into items. They didn't know what makes these textures exceptional? Infact , they have a created system of pores with the extent of 1-20 nanometers. They didn't know that these are average nanoporous materials. Characteristic textures possess absorption properties due to their nanoporous structure. Textures assimilate sweat well, rapidly swell and dry. Individuals aced the methods for getting ready bread, wine, brew, cheddar and different foodstuffs since antiquated circumstances. They didn't realize that the aging procedures at nanolevel. In Ancient Egypt it was somewhat normal to color hair dark. For quite a while it was trusted that the Egyptians utilized mostly regular vegetative colors like henna and dark hair color. As of late, Ph.Walter led inquire about on hair tests from old Egyptian entombment locales, It demonstrated that hair was colored in dark with glue from lime, lead oxide and little measure of water. Over the span of the coloring procedure nanoparticles of galenite (lead sulfide) were shaped. Normal dark hair shading is furnished with a color melanin. It is spread in hair keratin. The Egyptians could influence the coloring to glue respond with sulfur, which is a piece of keratin. They got galenite particles of couple of nanometers. That gave even and consistent coloring.

The British historical center flaunts Licurg's bowl as a major aspect of its legacy. This outstanding bowl is made by glass producers of Ancient Rome. This bowl has surprising optical properties. It changes shading with change of area (inside or outside) of the light source. In regular light the bowl is green, if lit up from inside, it turns red. The investigation of sections of the bowl, completed in the research facilities of General Electric in 1959 out of the blue. They demonstrated that the bowl comprises of common pop lime-quartz glass and has around 1% of gold and silver, and likewise 0,5 % of manganese as segments. The analysts at that point accepted, that the unordinary shade of glass is given by colloidal gold. Afterward, researchers found particles of gold and silver from 50 to 100 nanometers in estimate utilizing an electronic magnifying instrument.

Regular natural nano materials:Biological frameworks include characteristic, utilitarian nano materials. The structure of chalk and viruse, the wax precious stones covering a lotus leaf, arachnid and insect parasite silk^[2], the blue tone of tarantulas,butterfly wing scales, normal colloids like drain and horny material. Indeed, even our own bone frameworks are for the most part characteristic natural nano materials.

APPLICATIONS

Nano materials are as of now in business utilize, Very expansive scope of business items is accessible today. Stain-safe and without wrinkle materials, beautifying agents, electronic supplies, paints and varnishes are accessible in showcase. Nanocoatings and nanocomposites are discovering utilizes as a part of various shopper items, for example, windows, sports gear, bikes and vehicles. There are novel UV-blocking coatings on glass bottles.

These shield refreshments from harm by daylight, Nano-dirt composites. Nanoscale titanium dioxide, for example, is discovering applications in makeup, sun-square creams and self-cleaning windows. Nanoscale silica is being utilized as filler. It incorporates beautifiers and dental fillings. Nanoscale added substances to or surface medicines of textures. These can give light weight ballistic vitality diversion in individual body protective layer. It can assist them with resisting wrinkling, recoloring, and bacterial development.

Eyeglasses, PC and camera presentations, windows, and different surfaces are covered with clear nanoscale films. The film statement can influence them to water and deposit repellent, antireflective, self-cleaning, impervious to bright or infrared light, antifog, antimicrobial, scratch-safe or electrically conductive.

Nanoscale materials empower us launderable and strong brilliant textures. Nano types of gear with

adaptable nanoscale sensors^[3] have capacities to monitor wellbeing^[4]

Lightweighing of autos, trucks, planes, water crafts, and space specialty could prompt critical fuel reserve funds. Nanoscale added substances in polymer composite materials are being utilized as a part of polished ash, tennis rackets, bikes, bike protective caps, vehicle parts, gear, and power instrument lodgings, These materials make them lightweight, firm, solid, and strong. Carbon nanotube sheets are presently being delivered for use in cutting edge air vehicles. For instance, the blend of light weight and conductivity makes them perfect for applications, for example, electromagnetic protecting and warm administration.

CONCLUSION

Nanoparticles have potential applications in various fields. Custom-made nano-particles are particularly composed and framed with modified physical properties keeping in mind the end goal to satisfy the necessities of particular applications. They can fill in as the final result, similar to sensor for uncommon purposes, pharmaceutical medications and quantum spots. They can fill in as parts in finished results, as on account of carbon dark in elastic items. The physical properties of the nano materials assume a key part in their execution. The novel physical and concoction properties of nano materials furnish interface electronic flag transduction with DNA acknowledgment occasions. These materials are utilized to configuration progressed bio-electronic devices with inventive capacities. There is as of now minimal accessible data on the blast and inflammable danger of these materials.

S R Engineering College, Warangal, India

ABSTRACT

Lately, end users have turned out to be more worried about the human experience and the individual comfort of the individual is ending up more vital in the plan of the constructed condition. Computational Fluid Dynamics (CFD) is a device that licenses appraisal of individual comfort. CFD is a flood of fluid mechanics that uses numerical methods to break down and take care of problems including fluid flows. The crucial reason for these problems are the Navier-Stokes conditions. While research applications of CFD are creating, as it the utilization of CFD in the aeronautic trade, the utilization of CFD in Civil Engineering applications is as of now at the bleeding edge. Arup have as of late built up a group to chip away at such projects and a portion of these will be displayed in this paper. The paper will talk about the research question of each task, the methodology received in building up the models, the aftereffects of the reproductions and a few exercises picked up going ahead. In view of the projects done to date, it can be presumed that CFD has been appeared to be an intense instrument that adds important data to fluid flow problems.

Keywords: Navier-Stokes, Computational Fluid Dynamics (CFD), pedestrian comfort, thermal comfort.

INTRODUCTION

Computational Fluid Dynamics (CFD) is the utilization of PCs and numerical methods to take care of problems in fluid flow. It is a strategy for understanding incomplete differential conditions in continuum mechanics utilizing numerical techniques. It includes separating the issue into a discrete number of volumes that can be examined all the more effortlessly^[1]. Consolidating the arrangements from these little volumes allows the age of the total arrangement. The conditions overseeing fluid movement depend on the crucial physical standards of the preservation of mass, force and vitality. CFD has been effectively connected in numerous regions of fluid mechanics, including, warmth and mass exchange^[2], synthetic response and ignition^[3], aerodynamics of autos and air ships, and pumps and turbines. The utilization of CFD in structural building applications, albeit later, is at present at the forefront because of the direct viable applications. Applications of CFD to structural designing incorporate breeze displaying and the dynamic reaction of structures^[4], ventilation^[5], fire, smoke flow and visibility^[3], scattering of poisons and profluent^[6], and warm move in buildings^[7]. Customarily, the collaboration of these wonders has been completed tentatively, utilizing scaled

models and short estimations. Be that as it may, it is once in a while conceivable to precisely catch all marvels ensuring repeatability. In the approach of enhancing computational power, and the improvement of numerical techniques, for example, Finite Element Analysis, CFD offers a chance to show numerous varieties of a similar issue at full scale, all the more effectively, in a virtual domain.

Similarly as with any PC reenactment, the nature of the outcomes is dependent on the nature of the data sources, the presumptions, demonstrating attributes utilized and the conditions used to speak to the wonders. There will definitely be approximations, and a hearty model approval process is fundamental. An abnormal state understanding of the displaying procedure and of the marvels being demonstrated is essential for the yield to be of any down to earth utilize.

With a specific end goal to catch the wonders in adequate detail, substantial limited volume models are essential requiring huge preparing power. These extensive models create an awesome measure of information, which thusly should be put away and broke down. The upsides of CFD be that as it may, far out-measure the drawbacks. It is a non-meddling, virtual displaying technique with

intense representation abilities. Results can be caught over the whole area. There are likewise critical cost and time reserve funds with CFD as there is chance to survey correlations between elective frameworks rapidly and effectively, without the disturbance of rolling out physical improvements on location.

This paper will talk about a few projects as of late attempted by the new CFD group at Arup, in particular, a Dublin Docklands tall building wind contemplate, a Hospital thermal comfort ponder, and a Dundrum Ventilation Shaft fire consider. The research question of each undertaking will be talked about, the methodology received in building up the models exhibited, and at long last the outcomes showed.

CFD MODELLING METHODOLOGY

Displaying in CFD contains three principle stages: pre-preparing, reproduction and post-handling. Pre-handling right off the bat includes the development of the geometric model for the flow space of intrigue, and the resulting division of this area into little control volumes (cells), a procedure frequently called ‘fitting’. The flow field and the conditions of movement are discretized, and the subsequent arrangement of logarithmic conditions is explained to give esteems at every hub. Once the model and the work have been made, suitable introductory conditions and limit conditions are then connected.

The Navier-Stokes conditions, the representing conditions for the conduct of fluid particles, are understood iteratively in each control volume inside the computational space until the point that the arrangement unites. The field arrangements of weight, speed, air temperature and different properties can be ascertained for each control volume at cell focuses and interjected to external indicates all together render the flow field.

Post-preparing includes diagramming the outcomes and survey the anticipated flow field in the CFD display at chosen areas, surfaces, or planes of intrigue. The Navier-Stokes conditions, utilized inside the CFD examination, apply a numerical portrayal to rough the laws of material science to create to a great degree precise outcomes, giving that the situation displayed is illustrative of the real world. In every one of the accompanying illustrations, Fire Dynamic Simulator Version 5.5.3 was utilized.

DUBLINDOCKL AND STALL BUILDING WIND STUDY

Computational Wind Engineering (CWE) is a branch of CFD worried about conduct of wind. Like breeze burrow tests, it can be utilized to understand the breeze flow through a urban domain and the impact of a proposed advancement on the neighborhood wind microclimate. Not at all like limit layer wind burrow tests, a virtual geographical model can be developed at full scale and hence, maintains a strategic distance from any closeness problems (i.e. Reynolds number infringement). What’s more, the breeze speed profile, which is reliable with the real world, can be determined straightforwardly in CWE as opposed to created misleadingly in a breeze burrow utilizing extra unpleasants components.

The proposed advancement at the Dublin Docklands comprises of the development of a place of business going in range from 8 to 17 stories, known as the Dublin Docklands tall building. The development of new buildings and the modification of the current landscape may adjust the flow of the breeze in the encompassing territory [8]. The proposed improvement can create a breeze domain at ground level that is discomforting or even perhaps hazardous to pedestrians. The appraisal of discomfort and pain of pedestrians was done as per the Lawson Comfort Criteria

(Table 1). The fundamental wellspring of pedestrian discomfort identifies with the power of the breeze felt on their body and their apparel, as extra exertion is required to arrange the breeze. Despite the fact that the power following up on a man is identified with the breeze speed, the level of pedestrian discomfort depends on recurrence of event and the movement being attempted and additionally the breeze speed.

Table 1: Lawson Comfort Criteria.

Wind effect	Threshold	Stationary	Strolling	Transit
Calm				
Felt on face				
Leaves move	4.0m/s			
Dust raised	6.0m/s			
Felt on body	8.0m/s			
Hard to walk	10m/s			
Trees moving				
Storm	15m/s			
Dangerous	20m/s			

A limit layer wind burrow investigation of the proposed advancement at the Dublin Docklands was beforehand directed by BMT Fluids to survey the effect of the proposed advancement on the breeze microclimate. Arup were charged to direct a further breeze appraisal to analyze the areas recognized as causing pedestrian discomfort or trouble and to assess the viability of the proposed relief measures.

The nearby breeze atmosphere was resolved from authentic meteorological information recorded at Dublin Airport. Two diverse datasets were investigated, to be specific; the information related with the greatest every day wind speeds recorded over a multi year time span somewhere in the range of 1985 and 2015, and the mean hourly breeze speeds recorded over a multi year duration somewhere in the range of 2005 and 2015. The breeze speeds in the region of the improvement will contrast from the breeze recorded in Dublin Airport. It is important to change the breeze rates to assess neighborhood conditions^[10]. From this, a solitary breeze speed profile was resolved for every bearing for both comfort and pain criteria, as outlined in Figures 1 and 2.

Figure 1: Comfort criteria

Figure 2: Distress criteria

The geometry for the CFD show was produced in ‘Sketchup’ drawing bundle utilizing illustrations got from the Client and Google Earth pictures of the encompassing zone. The geometry was transported in into ‘Flame Dynamics Simulator’ (FDS) programming

[11-12], utilized as a part of the CFD displaying. A view from the East of the Dublin Docklands tall building is delineated in Figures 3 and 4. The Dublin Docklands tall building was taken at the focal point of the computational space which extended 550m in the North-South bearing and 410 m in the East-West course. The space was demonstrated as 102.4 m in height.

Figure 3: Sketchup Geometry

Figure 4: CFDmodel

As a major aspect of the computational procedure, the area was isolated into a sum of 16million cells. The cells go in estimate from 0.4 m at the Dublin Docklands tall working to 3.2 m at the external area. Shut limit conditions were connected on the base face of the area, and open limit conditions were demonstrated somewhere else. Information inspecting areas were been as conceivable to the correct sensor areas utilized as a part of the breeze burrow tests.

For the motivations behind approval of the CFD demonstrating process, the conditions in the breeze burrow were displayed utilizing CFD and examinations were drawn. The consequences of this approval indicated great consistency with the first breeze burrow test comes about.

The evaluation of the pedestrian comfort and misery in the pedestrian avenue between the 3Arena and the Dublin Docklands tall building shows that the fundamental territories of concern are at the southern end. The comparable breeze speeds from the point of view of comfort and pain are 12m/s and 24 m/s separately

(Figure 5). These breezes emerge when high westerly breezes are coordinated to ground level by the building façade. These high breezes cause discomfort and misery between the 3Arena and the Dublin Docklands tall building (Figure 6). Halfway along the building, the identical hourly normal whirlwind from a comfort point of view is 8.3 m/s. At the northern end, the investigation uncovers that the breeze speeds are deficient to cause either discomfort or trouble.

Figure 5: Distress Criteria, Wind from the West, Minimum values in blue (0m/s), Maximum values in red (20m/s)

Moreover, it is conceivable that the breezes from the south and north will make trouble the overall population. The identical hourly normal blast speed is evaluated at 15.4m/s and 16.3m/s from the North and Southwest, separately. These breeze speeds surpass the trouble limit for the overall population of 15m/s.

The appraisal of the pedestrian comfort and misery in the ways between the Dublin Docklands tall building uncovers that the breeze conditions may be discomforting and troubling to pedestrian. Be that as it may, the level of discomfort and trouble is identified with the breeze bearing. For example, while westerly breezes with a yearly return period may deliver conditions unsatisfactory for undertaking any action inside the undercroft, a slight move in heading toward the south outcomes in a satisfactory domain. No doubt a significant part of the pedestrian discomfort and trouble is because of westerly breezes. From the viewpoint of comfort, the equal hourly normal blast speed in the undercroft ways runs between 10 m/s and 13.9 m/s for westerly breezes, which is viewed as uncomfortable independent of the action being attempted. The fundamental wellspring of pain is because of westerly breezes which go between 15m/s and 30m/s along the length of the building. These high breeze speeds close ground level are because of the building channeling abnormal state twists descending.

The breeze speeds are additionally expanded through the undercroft ways as the breeze is constrained through smaller openings underneath the building. In spite of the fact that it may be normal that easterly breezes may cause comparable pedestrian discomfort and trouble inside the building undercroft, it is clear from this isn't the situation. The divider on the western limit of Dublin Port acts to aggravate the breeze. The feign idea of the divider makes the flow discrete and the arrangement of extensive vortex between the divider and the Dublin Docklands tall building. The vortex demonstrations to push a significant part of the breeze over the Dublin Docklands tall building. As a result there is less flow going under the Dublin Docklands tall building.

The appraisal of the Dublin Docklands tall building demonstrated that the southern degree of the pedestrian lane between the 3Arena and the Dublin Docklands tall building is inclined to pedestrian discomfort and misery. Pedestrian discomfort and trouble is likewise anticipated in the undercroft of the Dublin Docklands tall building. The investigation uncovers that rapid breezes at ground level in charge of conceivable pedestrian discomfort were to a great extent because of westerly breezes, where the building demonstrations to coordinate abnormal state twist towards the ground. The arrangement of a 2.5 m wide shelter with a 0.45 m upstand for the full width of the western side of the building is proposed as a moderation measure.

HOSPITAL THERMAL COMFORT STUDY

Arup was appointed to lead a thermal comfort investigation of a proposed new Hospital. An underlying examination of authentic climate information was done to recognize thermal conditions. Computational Fluid Dynamics (CFD) displaying was used so as to understand the inside flow field in the rooms and to recognize zones of patient discomfort.

Thermal comfort is a subjective assessment by people of their fulfillment with the thermal condition. Keeping up a standard of thermal comfort for inhabitants of walled in areas is an imperative objective of HVAC frameworks [13-14]. Inferable from the worldwide activity to enhance carbon impressions, many building proprietors are picking normally ventilated frameworks. A coveted inward temperature of 22°C for persistent comfort has been indicated by the Design Team. The

goal of this examination is to assess whether an interior temperature of 22°C can be kept up:

- During winter conditions, with a surrounding outside temperature of - 4.5°C With the louvers in the vacant position
- Assuming the warming arrangement of brilliant boards recommended by the Design Team is completely operational
- Assuming the geometry and format of the rooms as got from the Design Team.

The temperature atmosphere in the region of the new healing facility was assessed from just about 20 long stretches of memorable temperature information (December 1996 until December 2015) recorded at a neighborhood air terminal. Investigation of the information uncovered that the most continuous least temperatures were between 4-8°C, anyway is was normal to have temperatures as low as - 4°C. On seven events in 20 years, the temperature fell underneath - 8°C, and the base temperature recorded over the investigation time frame was - 10°C which happened twice (Figure 6)

Figure 6: Frequency of Minimum Temperature Data EN1991-1-5 provides information on ambient temperature for thermal modelling

The characteristic outside temperature might be resolved from Figure NA.1, Table 5.1 and Table 5.2. Considering the climate maps given by the Eurocode, winter conditions, a light hued façade surface, and a North-East confronting introduction, a base air temperature of - 9°C was resolved.

The geometry for the CFD show was made utilizing the Revit demonstrate beforehand created for the venture. An aggregate of three best floor rooms were displayed, each with a story territory of 23 m2. The section-to-piece height was taken as 4.0 m and a false roof was incorporated at a height of 3.0 m above

floor level. Brilliant boards were displayed as surface mounted on the false roof, as showed in the arrangement perspective of the model. Every room has three 3.0 m x 0.6 m boards, one 1.2 m x 0.6 m board and one 1.8 m x 0.6 m boards giving an aggregate territory of brilliant boards per room of 7.2 m2. Coating units 2.5 m x 1.95 m and aluminum spandrel boards 2.5 m x 1.0 m and 2.5 m x 0.75 m were displayed, which can all be found in the height perspective of the model.

Extractor units with a breadth of 0.15 m were displayed in the region of the shower in the ensuite of each room. An exchange filler of territory 0.6 m x 0.6 m with half free zone was demonstrated in the lower part of the ensuite entryways. A louver of 2.5 m wide and 0.3 m high was displayed in each room. The free zone of these louvers was taken as 2.5 m x 0.2 m.

As determined by the Design Team, the warmth transition of every 3 m x 0.6 m board was taken as 1 kW/m2. The warmth transition of the littler boards were figured around region. The extractor flow rate, likewise determined by the Design Team, was taken as 0.065 m3/s.

The limits to the model at the floor, the roof, the back (along the inner passage) and the sides (interior allotments with neighboring rooms) were demonstrated as shut limits. The inside introductory temperature was taken as 22°C. The front of the model (the side containing the windows) was demonstrated as an open limit, with a connected outside encompassing temperature of - 4.5°C. This is spoken to by the blue segment.

The results from the CFD modelling at a height of 0.5m above the floor are illustrated below. Figure 7 presents the internal and external temperatures when the louver is in the open position and the external temperature is set at -4.5°C. Results indicated that the internal temperature at a height of m above the floor reaches 17.2°C when the external temperature is 0°C and 18.4°C when the external temperature is +5°C.

The results from the CFD modelling at a height of 1.5 m above the floor were also captured when the louver is in the open position and the external temperature is set at -4.5°C, 0°C and +5.0°C respectively. Results indicated that the internal temperature at a height of 0.5 m above the floor reaches 17.8°C when the external temperature is 0°C and 19.0°C when the external temperature is +5°C.

Figure 7: External Temperature -4.5°C

From the investigation of temperature information did for the neighborhood, temperatures of +5.0°C happen around 5% of the time, normal temperatures of +5.0°C happen roughly 16% of the time and least temperatures of +5.0°C happen around 34% of the time. A temperature of +5.0°C happens in the most continuous band. Given this, and the aftereffects of the CFD reenactments – the proposed design of brilliant boards and louvers won't convey a surrounding temperature of 22°C and will bring about a thermally uncomfortable condition. Results from this work brought about an amended thought of the proposed ventilation framework for the healing facility.

DUNDRUM VENTILATION SHAFT FIRE STUDY

Smoke Management System Limited dispatched Arup to deliver a CFD displaying examination for the mechanical differential weight shaft proposed for the Dundrum Apartment square, Dublin. The building is a current 3 story high private advancement with a storm cellar auto stop. The height of the most astounding floor is 8.575 m over the ground.

The proposed system (Figure 8) involves a mechanical concentrate system of 2 m³/s, which is connected to the entryway region with a vent arranged at abnormal state near the roof, and a normally ventilated gulf shaft, which associates with the anteroom territory through a vent that is situated at low level (i.e. with a delta guide close toward the floor).

The system for the anteroom territory is made out of two concentrate fans (one in activity and one on

standby) that are measured with a specific end goal to not surpass a differential weight of - 50 Pa inside the hall region. This is keeping in mind the end goal to stay away from spillage of smoke into the staircase zone while allowing the opening of the entryways as the system keeps on removing air smoke. The two concentrate fans are situated on the rooftop. The fans are associated with each entryway through a pole, which has an estimated zone of 0.5 m², with a damper arranged near the roof in each anteroom.

The substitution air provided into the hall is given through a little delta shaft. This pole, which provided the make-up air, is associated with each entryway however a low level louver or exchange grille. The motivation behind the arrangement of make-up air is to keep the weight differential of - 50 Pa being surpassed.

Figure 8: Proposed depressurisation system

1. The weight is kept up by the lopsidedness between the extraction rate and the gulf rate of airflow. Endless supply of flame in any of the halls, the extraction fans come into task. The smoke shaft damper opens on the level where the fire is distinguished, while the dampers on alternate levels stay shut. Air from the make-up shaft will be drawn into the suitable hall zone naturally by the extraction system. The system will separate consistently and it will be estimated keeping in mind the end goal to not surpass the - 50 Pa with the staircase entryway shut.
2. Through a CFD investigation, the ability of the de-pressurization mechanical smoke system to accomplish the accompanying viability criteria [15] for the entryway zone is inspected:
3. **Visibility:** least 10m to light-reflecting signage (e.g. divider);

4. **Temperature:** greatest 60°C at 1.8 m (head height) and underneath for inhabitants;
5. **Speed:** speed 5 m/s at all areas on the departure course, with the exception of at the bay/separate vents. A speed of 10 m/s is worthy in closeness to the bay and concentrate vents;
6. **Pressure:** a weight contrast of < 50 Pa ought to guarantee that the entryway opening power does not surpass 100 N at the handle of an ordinary (0.8 m x 2.0 m) single leaf entryway. The weight contrast over the stair entryway (and ways to condos other than that of flame starting point) will be constrained with the end goal that the power required to open the door(s) does not surpass 100 N.

Two models were created with the end goal of this investigation:

1. **Fire Model:** this situation plans to exhibit that the proposed depressurization system is fit for averting smoke entering the departure staircase in case of a fire in one of the condos.
2. **Weight appraisal display:** the point of this situation is to show that the proposed depressurization system is equipped for keeping up an adequate weight differential (i.e. <50 Pa) inside the entryway with the goal that entryways can be opened and shut when the smoke separate system is working.

The CFD comes about for the fire situation have demonstrated that smoke does not spread to the escape staircase. Reasonable conditions for visibility (in excess of 10 m) and temperature (under 60°C) are kept up consistently inside the escape staircase. In this manner, this shows the proposed depressurization system is equipped for averting smoke entering the staircase. What's more, smoke spreading inside the entryway is cleared at 210 s which compares to under 120 s after the flat entryway is shut. The time taken to clear the smoke inside the passage is under 2 minutes, which is regarded a satisfactory execution of the smoke control system. Also, the speed levels are kept underneath 10 m/s with the exception of on the region of the bay flame broil which is viewed as worthy.

The CFD comes about for the weight appraisal display have demonstrated that the weight levels are kept up between - 12.5 and 7.5 Pa when the proposed

depressurization system is enacted and achieved unflinching state conditions. These weight levels are inside the scope of - 50 and 50 Pa which relates to the acknowledgment criteria with the goal that tenants can open or close entryways in the hall. Along these lines this shows the proposed depressurization system is equipped for keeping up a adequate weight differential inside the hall so entryways can be opened and shut when the smoke separate system is working.

CONCLUSION

This paper displayed three projects as of late finished by the Arup Ireland CFD group. These three illustrations serve to feature the wide expansiveness of applications conceivable with CFD demonstrating, giving a profundity of understanding and knowledge. On account of the Dublin Docklands wind think about, CFD had a part to play in educating plan such to relieve unsavory breeze conditions. Authorization was allowed by the arranging expert putting CFD examination as equal to wind burrow testing. For the Hospital thermal comfort think about, CFD displaying demonstrated that the underlying outline would bring about uncomfortable conditions in the rooms, where they would be sufficiently warm however without inflow of natural air, or excessively cool yet with inflow of outside air. The result of the CFD think about was to change the outline. For the smoke shaft in Dundrum, CFD displaying could demonstrate that the changed smoke shaft had the ability to perform sufficiently and fulfill viability criteria. In rundown, CFD can possibly enhance nature of configuration, is of prompt reasonable utilize and has a critical part to play in counseling building later on.

A Study on Pattern Matching Intrusion Detection System for Providing Network Security to Improve the Overall Performance of Security System

Goje Roopa¹, M. Sampath Reddy²

¹Assistant Professor, Department of CSE, ²Associate Professor, Department of Electronics & Communication Engineering, S R Engineering College, Warangal, India

ABSTRACT

The security of computer networks assumes a vital part in modern computer systems. Keeping in mind the end goal to uphold high protection levels against malicious attack, various software tools have been at present created. Intrusion Detection System has as of late turned into a warmed research theme because of its capacity of detecting and preventing the attacks from malicious network clients. A pattern matching IDS for network security has been proposed in this paper. Many network security applications depend on pattern matching to extricate the risk from network activity. The expansion in network speed and movement may influence existing calculations to end up a performance to bottleneck. Thusly it is extremely important to grow speedier and more proficient pattern matching calculation with a specific end goal to defeat the troubles on performance.

Keywords: Pattern Matching, Intrusion detection, Network Security

INTRODUCTION

The Internet and in addition nearby networks is expanding at a gigantic speed. This one path enhances the quality and convenience of the human life yet on the other hand gives a stage to network culprits and programmers. The quantity of intrusions into computer systems is developing and raising concerns about computer security. So computer networks are typically ensured against intrusions by the methods for get to restriction strategies. Regardless of the exertion gave to deliberately outlining a framework to ensure such attacks, network security is extremely hard to ensure, since attacks misuse obscure shortcomings or bugs, which are generally contained in framework and application software (McHugh et al, 200; Proctor, 2001). Intrusion detection which alludes to a specific class of framework attack detection issues is a generally new research territory in computer and information security [7]. When all is said in done IDS can be ordered into abuse and anomaly detection approaches. Abuse detection framework can dependably recognize intrusion attacks in relation to the known patterns of found vulnerabilities. Be that as it may, emanant intervention of security specialists is required to characterize precise standards or patterns, which confine

the applications of abuse detection systems, recognize deviations from typical network practices and caution for potential concealed attacks [2]. It can recognize novel attacks without from the earlier learning about them if the classification display has the generalization ability to separate intrusion pattern and information amid preparing. Tragically, anomaly detection approach experiences high false positive rate on ordering ordinary network activity. Along these lines, machine learning procedures have been utilized to catch the typical usable patterns and characterize the conduct as either ordinary or anomalous [26]. While the pattern matching algorithms are connected to network security, the speed of pattern matching normally turns into a bottleneck.

This paper proposes a pattern matching calculation which beats the inadequacies of traditional algorithms. The paper is sorted out as takes after: section-II related work, section-III Pattern Recognition Methods, section-IV Pattern Recognition System, section-V conclusion.

RELATED WORKS

Pattern Recognition is one of the most essential territories which have been considered in computer

science. In a standard formulation of the issue, we are given a pattern and an information and it is required to discover all events of the pattern in the information [3]. Since the publication of the Bayer-Moore and Knuth-Morris-Pratt calculation, a few many papers have been distributed managing pattern recognition.

As observed from the writing study conveyed over, the analysts worldwide have been working in different Intrusion Detection procedures by and large and Pattern Matching methods specifically. The above diagram of related works shows that pattern matching procedures are reasonable to give a solution to some open issues in IDS improvement. The different algorithms are accessible for Pattern Matching procedure with changing level of exactness. It ought to be expressed that, for the sending of IDSs utilizing pattern matching system in operational environments, one of the fundamental challenges is the high production of false alarms. There is a need of a calculation which gives low false alarm rate.

THE PATTERN RECOGNITION METHODS

Pattern recognition experiences an imperative producing for a long time. Pattern recognition incorporates a great deal of strategies which are inducing the advancement of various applications in various field.

1. Statistical Pattern Recognition: The Statistical strategies have been commonly utilized for pattern recognition. Measurable approaches have various focal points. It can give accurate notification of malicious exercises that regularly happen over expanded time frames and are great markers of looming foreswearing of-benefit attacks [23]. Be that as it may, it likewise has disadvantages. It can be hard to decide edges that adjust the probability of false positive alarms with the probability of false negative alarms. In addition, this strategy require accurate measurable distributions, be that as it may, not all practices can be demonstrated utilizing simply factual strategies. The measurable pattern recognition manages includes only without consider the relations between highlights.

2. Data Clustering: Data clustering is a strategy for discovering patterns in unlabeled data with numerous dimensions. It is an unsupervised technique. The principle preferred standpoint of

data clustering is the capacity to gain from and identify intrusions in the review data, while not requiring the express descriptions of different attack classes. The technique for data clustering can be partitioned into two classes, one is progressive clustering and the other is partition clustering.

3. Fuzzy Set: As the quantitative highlights in the intrusion data are partitioned into the interim with fresh limit, there might exists a sharp limit issue for pattern classification. The fuzzy rationale gives the halfway participation in set theory to integrate with the association manages and visit scenes which tackled the above issue. Fuzzy manage based systems enlivened by the fuzzy set theory have been effectively connected to unravel numerous complex and non-direct issues. The application of fuzzy sets in pattern recognition began in 1966, where two essential operations—abstraction and generalization. Pattern Recognition system in light of fuzzy sets theory can mirror considering process individual generally and profoundly.

4. Artificial Neural Networks: The Artificial Neural Network strategy empowers us to plan helpful nonlinear systems tolerating substantial quantities of contributions, with the outline construct exclusively in light of cases of information yield relationship. The principal Artificial Neural Network demonstrate was proposed in 1943. Today it is growing quick. Essentially it is a data clustering technique in light of separation estimation. This approach applies natural concepts to machines to perceive patterns. Pattern Recognition utilizing Artificial Neural Network is an extremely appealing since it requires least convent learning, and with enough layers and neurons, an Artificial Neural Network can make any mind boggling decision region.

5. Structural Pattern Recognition: Structural Pattern Recognition accentuations on the description of the structure, specifically clarify how some straightforward sub-patterns form one pattern. The sentence structure investigation and structure matching are the two principle strategies in structural pattern recognition. The premise of punctuation examination is the theory of formal dialect, the premise of structure matching is some of unique method of arithmetic in view of

sub-patterns. The structural pattern recognition handles with image information. This technique can be utilized as a part of applications with larger amount, for example, picture interpretation. Pattern Recognition of multidimensional items should be possible by structural pattern recognition with static classification or artificial neural networks.

6. Support Vector Machine (SVM): Support Vector Machine in view of the factual theory and strategy for SVM is a successful device that can take care of the issues of Pattern Recognition.

7. Approximate reasoning approach to Pattern Recognition: This technique utilized two concepts-one is fuzzy applications and the other is compositional control of induction can adapt to the issue for manage based pattern recognition^[31].

8. A logical combinatorial approach to Pattern Recognition: This approach can apply for both regulated pattern recognition and unsupervised pattern recognition.

PATTERN RECOGNITION SYSTEM

The anomaly intrusion detection system experiences high false alarm rates while the abuse intrusion detection system needs generalization capacities and can't identify new attack writes. Pattern Recognition strategies have been found to strike a fine adjust in this exchange off. The utilization of pattern recognition and classification has developed in the previous couple of years. The unpredictability of the classification systems and their expanded accessibility has made them more available. They can channel commotion and concentrate highlights from movement to encourage classification. Pattern classification is a progression of steps, beginning with the information, moving to segmentation, data extraction and translation and at last classification. After the classification, cost components can be added to build the intensity of the decision to act. All together for pattern recognition to be valuable in network security, two huge issues must be tended to; Data extraction and classification. Information from a solitary bundle is lacking for include extraction

Ordering various bundles may give a premise to depicting highlights yet what number of parcels are sufficient and how would we orchestrate the data from numerous parcels to make it helpful for data extraction.

The point of pattern classification is to use the information gained from pattern investigation to train the computer keeping in mind the end goal to achieve the classification. The progression of classification is the piece of the pattern recognition system.

The subsequent stage following Data extraction is classification. It is the way toward utilizing the data set to order the activity as ordinary or ill-conceived movement. The classifications can be isolated into three classifications: typical, Denial of Service and Scan. Numerical qualities were doled out the three classifications in view of their likelihood. Four sorts of classifiers are utilized: Bayesian, Feed Forward with Back propagation, ART2 and Kohonen neural networks.

CONCLUSION

Over the most recent twenty years, Intrusion Detection Systems have gradually developed from have and working system particular application to distributed systems that include a wide exhibit of working system. The difficulties that lie ahead for the up and coming generation of Intrusion Detection Systems are many. Traditional Intrusion Systems have not adjusted sufficiently to new networking ideal models like remote and portable networks. Components like noise in the review data, constantly changing activity profiles and the substantial measure of network movement make it hard to manufacture an ordinary movement profile of a network for the reason intrusion detection.

A perpetual issue that avoids far reaching arrangement of IDS is their powerlessness to stifle false alarms. Therefore, the essential and likely the most critical test that should be met is the improvement of viable strategies to diminish the high rate of false alarms.

Pattern Recognition is the core of all logical request, including understanding ourselves and this present reality around us and the creating of Pattern Recognition is expanding quick, the related fields and the applications of pattern recognition wound up more extensive and more extensive. IDS in view of pattern recognition have the fortes, for example, self versatility, low consume, resiliences and self learning and so on. So it can entirely enhance the all performance of security system. Obviously, the working of the patterns is the precondition.

A Study on the Aspect of Nanomaterials towards Sustainable Energy

P. Venkata Ramana Rao¹, K. Srishailam², K. Devender², L. Radha Krishna³

¹Assoc. Professor, ²Asst. Professor, Department of Physics, ³Faculty, S R Engineering College, Warangal, India

ABSTRACT

The utilization of nanotechnology to build up a suite of sustainable energy production plans is a standout amongst the most vital logical difficulties of the 21st century. The test is to configuration, to incorporate, and to describe new utilitarian nanomaterials with controllable sizes, shapes, and/or structures. Nanotechnology is producing a ton of consideration nowadays and in this manner building awesome desires in the scholastic network as well as among financial specialists, the legislatures, and industry. This paper, investigates a portion of the conceivable executions of nanotechnology for as good as ever strategies for energy conversion, viewing a requirement for this as managed without trading off our condition. Its one of a kind ability to manufacture new structures at nuclear scale has just created novel materials and gadgets with incredible potential applications in a wide number of fields. Center is given to essential part of nanomaterials, arrangement and portrayal some of nanomaterials imperative for sustainable energy, dye sensitized solar cells and hydrogen production technology.

Keywords: energy conversion, solar energy, hydrogen, dye sensitized solar cells.

INTRODUCTION

Nanotechnology has assumed a critical part in the outline, amalgamation, and portrayal of different new and novel energy materials and impetuses for processing powers from non-renewable energy source assets, for example, coal, oil, and flammable gas. Today, petroleum derivatives still record for 90% of the world's energy utilization, and their utilization is relied upon to crest around the year 2050. The far reaching utilization of petroleum derivatives is tormented with issues, for example, the age of increasingly genuine natural issues, the related atmosphere transforms we are witnessing, and the way that the long haul accessibility of unrefined petroleum is constrained. Therefore, it is important to build up a suite of sustainable energy sources and energy-storage materials [1].

The utilization of petroleum derivative based advances is most likely one of the main sources of the continuous increase in the contamination and in the convergence of ozone depleting substances. Sustainable sources must have higher commitment on the lively lattice in providing more energy accessible for the humankind in a short period, having low ecological effect.

The interest on the conversion of environmen-count neighborly energy sources prompted the improvement

of a few gadgets that took the benefit of the continuous advancement on a few fields of research, which can bring about new materials for effectively created gadgets. For instance, the performance of direct methanol power modules, an outstanding technology was enhanced because of the improvement of nanomaterials particularly intended for the ener-gy conversion process and their advancement enables the utilization of light to help the procedure through a synergic course of action [2]. The combination and chara-cterization of new and novel useful nano-materials with wellcontrolled sizes, shapes, poro-sities, crystalline stages, and structures are absolutely critical for leaps forward in a few sustainable energy advances.

This article gives a diagram of how nanoscience and nanotechnology may add to the advancement of more productive and sustainable energy frameworks. Nanotechnology is an expansive term regularly used to portray materials and wonders at nanoscale, i.e., on the size of 1 billionth to a few many billionths of a meter (Fig.1). Be that as it may, it specifically infers the miniaturization as well as the exact control of particles and atoms to plan and control the properties of thenanomaterials/nanosystems. Nanomaterials show distinct size-subordinate properties in the 1-100 nm run where quantum wonders are involved. This is one of the major reasons why nanotechnology has a significant

affect on energy conversion and storage. These properties are totally not quite the same as those controlled by bulk materials, producing uniquely designed gadgets with capacities not found in bulk materials or in nature [3].

Figure 1: Length scale and some related example.^[4]

Nanoscience and nanotechnology (N&N), and their merger with surface science (SS), may add to the improvement of a more effective and sustainable energy framework. Like any science or technology field, SS has developed along a period pivot that could be imagined as a S-bend (Fig. 2). In the beginning periods, inquire about exercises were dominated by improvement of a “tool compartment” for test readiness and portrayal (e.g. single precious stones) and in addition theoretical models and calculation schemes^[5].

Figure 2: The historical improvement of surface science has taken after a S-shaped curve, which has filled in as a reason for the development of an extensive assortment of different fields (not the minimum Nanoscience and Nanotechnology), every one of them following its own particular S-curve.

Today, Nanoscience and Nanotechnology influence for all intents and purposes any field of science and technology, as outlined by the crossing points^[5]

SIZE MATTERS ON THENANOSCALE

It is notable that the properties of issue change essentially when the size changes from the macroscale to the microscale and from the microscale to the nanoscale.

Nanotechnology is frequently defined as the science and engineering occurring at measurements of 100 nm and underneath. Nanomaterials show distinct size-subordinate properties in the 1-100nm territory where quantum marvels are involved. This is one of the major reasons why nanotechnology significantly affects energy conversion and storage.

Important to recall is that the impacts of morphology, structure, and creation of nano-materials are similarly important. It is likewise important to think about the collaboration of size, morphology, structure, and organization for the plan and controlled readiness of nano or nanostructured materials. The composite materials demonstrate a proficient energy move in the form of intense pho-ton motion from the metal nanoparticles to neighboring semiconductor particles. Contrasted with unadulterated semi-conductor frameworks, the enhanced energy exchange prompts a higher grouping of electron/opening sets on the semiconductor surface with upgraded photocatalytic rates. Optical properties of the metallic nanoparticles could be tuned based on their size, shape, and creation. This implies a controllable interaction happens between the metal and semiconductor materials. The sound control of the photoactivity of the composite materials ends up conceivable in the obvious and UV district of the solar range^[1,6].

Another case of a size impact is the nickel impetus utilized for hydrogen or syngas production by means of reforming or fractional oxidation of methane. Synergist hydrogen production is an important procedure for both petroleum product conversion and for biomass use. On the off chance that modest hydrogen could be effortlessly delivered, numerous issues in energy production and nature could be illuminated. Nickel-based impetuses have been widely utilized and investigated due to the high action, minimal effort, and copious accessibility of nickel. In any case, nickel-based impetuses experience the ill effects of a fast deactivation by coke formation and/or molecule accumulation at high temperatures. A high steam/carbon proportion has been connected for the industrial production of hydrogen or syngas over Ni-based impetuses, in order to inhibit coke formation and sustain the reactant forms. This isn't energy proficient in light of the fact that a gigantic measure of energy is squandered to produce steam. To make and enhance nanocatalysts, new and novel impetus readiness strategies are important. For instance, a Rh_Ni@CeO2 impetus arranged by means of an infection layout for the oxidative steam reforming of ethanol^[7]. This novel impetus readiness technique can likewise be utilized to increase the energy or limit of a Li-particle battery.

NANOTECHNOLOGY FOR SOLAR CELLS AND SOLARFUELS

In the near future nanotechnology may add to proficient and minimal effort frameworks for quality rating, storing, and transporting energy. Materials and structures that are planned and fabricated at the nanoscale level and thin movies can offer the potential to create new devices and procedures that may enhance efficiencies and lessen costs in many areas, as solar photovoltaic frameworks, hydrogen production, power modules, solar thermal frameworks and energy saving advances as low e-coatings and electrochromic devices for smart windows. Usually ignored that the portion of commitment of renewable energy sources to the total energy spending will originate from all conceivable forms of applications and sources and to be powerful it must be combined with energy saving technological breakthroughs^[8]. This energy source can be utilized as a part of various ways: photovoltaic (PV) technology – which specifically changes over light into electrical current, solar– thermal frameworks – utilized as a part of solar collectors, artificial photosynthesis – which creates either carbohydrates or hydrogen via water splitting, the alleged ‘passive solar’ advancements, where building configuration maximizes solar lighting and heating, and even biomass technology – where plants utilize the solar radiation to drive chemical transformations and create complex carbohydrates, which are utilized to deliver power, steam or biofuels. All these energy-related procedures and their applications are encased in the purported solar economy^[3,4].

PV solar cells enable production of power by the means of photoelectric impact. Currently, PV market is based on silicon wafer-based solar cells (thick cells of around 150– 300 nm made of crystalline silicon). This technology, classified as the first-generation of photovoltaic cells, accounts for more than 86% of the global solar cell market. The second-age of photovoltaic materials depends on the presentation of thin film layers (1– 2 nm) of semiconductor materials.

The use of nanocrystal quantum spots^[9], which are nanoparticles normally made of direct bandgap semiconductors, prompts thin film sun based cells in light of a silicon or conductive straightforward oxide (CTO), like indium-tin-oxide (ITO), substrate with a covering of nanocrystals. Photocatalyzed rot of toxins at different titania surfaces is of incredible intrigue. Electron exchange responses are at the base of these photoinduced shapes and were likewise the subject of

one of the hypothetical duties. The average arrangement of photocatalysis includes gathering of light photons in a semiconductor (most generally TiO₂), and coming about transformation of these photons to electronic excitations, which by then initiate the desired synthetic response on the semiconductor surface^[10].

Color sharpened sun oriented cells (DSCs) developed by Michael Grätzel turned into a particularly prominent other option to silicon based sunlight based cells as a result of their awesome potential to change over sun powered vitality into electric vitality effortlessly. This cell can be produced using shabby materials, for instance, inorganic and natural colors which don't ought to be exceedingly unadulterated as is required for silicon wafer.

The color sharpened (Gratzel) sun powered cell (Fig. 3) is maybe the most punctual sun based cell direct using nanoscale portions for its execution^[11]. Here, light ingestion happens prevalently in color particles tied down to the surface of nanoparticles of a wide bandgap semiconductor, typically TiO₂.

The streamlining of the color/TiO₂ layer is vigorously subject to nanoscale creation and portrayal; the TiO₂-layer must have an extensive surface zone to adequately fuse color, anyway a structure that is thin and adequately open to take into consideration profitable accuse transport of least hardships. Without thinking about light dissipating impacts, the ideal film engineering under these conditions is column like, with as much surface region as possible (thin columns) in parallel with the essential of profitable (low opposition) stream of charge. Accomplishing complex and pre-made, and reasonable, nanostructures on substantial scale surfaces is a test.

Figure 3: Schematic of a color sharpened sunlight based cell, the execution of which fundamentally depends upon nanoscale parts. Light ingestion occurs in a color, which is tied down to a nanoporous semiconductor layer^[5]

Power devices (FC) are electrochemical devices that change over a fuel, for example, hydrogen or methanol specifically to power through an electro-catalytic process rather than by ignition, in this manner potentially yielding significantly higher energy conversion efficiencies than in conventional burning engines. With hydrogen as a fuel, the FC is an amazingly clean energy converter (however recollect that an overall cleanness, based on life cycle analysis (LCA), relies upon how hydrogen is created). At the heart of a FC are the cathodes, on which the actual electro-catalytic conversions happen.

Metal hydrides have for quite a while been in center as one of several alternatives to store hydrogen in a hydrogenbased economy. Two different alternatives are high-weight gas containers and fluid hydrogen. In metal hydrides one uses the way that hydrogen take-up in specific metals is exothermic, and besides permits immersion takes-up that are close, or may even outperform, that of liquid hydrogen. The esteem one needs to pay for this stockpiling approach is:

- the heat generated during uptake is usually lost energy and should be re-provided for later release of hydrogen,
- the cost of the storage material,
- the extra weight and volume of the storage material (especially troublesome in versatile applications),
- the added technological intricacy of regulating valves and weight meters and so forth (in comparison with e.g. normal gasoline as a fuel),
- the safety precautions.

We won't harp on all these issues here, yet take note of that there is a reestablished interest in hydrogen storage materials, both conventional metal hydrides and new materials, for example, carbon nano-structures and novel compounds^[5].

CHARACTERIZATION OF ENERGY - RELATED NANO OR NANOSTRUCTURED MATERIALS

To configuration, to blend, and to apply nano-materials, we have to understand the reaction mechanisms and procedures occurring on the surface of nano or nanostructured materials, under ultrahigh vacuum (UHV) conditions as well as under real conditions. Fortunately, advance in vacuum technology and surface-

science strategies has prompted significant advance in our ability to characterize nanomaterials and especially surface procedures. A suite of surface-touchy systems, for example, AES, particle scattering spectroscopy (ISS), UV and X-ray photoemission spectroscopy (UPS and XPS), high-resolution electron energy loss spectroscopy (HREELS), low energy electron diffraction (LEED), and scanning test microscopies (e.g., scanning tunneling microscopy, STM, and atomic force microscopy, AFM)^[1].

Model systems consisting of either flat, single-crystal surfaces or welldefined nanoclusters on surfaces are examined under clean and wellcontrolled, frequently UHV, conditions. With this approach, a great amount of detailed insight into fundamental procedures on surfaces has been obtained.

CONCLUSION

Sustainable energy production, transformation and utilize are especially expected to maintain the readily and cheap access to energy to the growing and increasingly demanding world population while minimizing the impact on the earth. The novel multifunctional materials created from the broad and multidisciplinary field that is nowadays called nanotechnology are critical to conquer a portion of the technological limitations of the various alternatives to the non-renewable energies. Novel multifunctional materials delivered through utilization of nanotechnology offer great upgrades in all domains of total energy framework, for example, transportation and storage of energy. To anticipate where and how nanotechnology will have the largest impact is unrealistic. On the short term basis it will probably have more visible influence on existing energy framework through introduction of better and more energy productive materials, on fuel conversion schemes and so forth.. In farther future nanotechnology will doubtlessly play a major part in the improvement of genuinely sustainable arrangements like advanced PV systems. For sustainable energy production nanotechnology is one of the fastest growing research fields today.

Nanomaterials fill in as energy carriers, absorbents, media for energy transfer, catalysts, converters, and energy pools or vessels for reactions. In all of these applications, the core technology to be produced is the preparation of novel nanomaterials with controllable sizes, shapes, and/or structures. Conventional techniques, for example, doping, impregnation, and particle exchange, will

continue to be utilized, yet there is great opportunity to learn from and attempt to impersonate the nanomaterials and nanomachinery in nature. Many properties of living systems could potentially be harnessed, and techniques based on nonequilibrium characteristics will have interesting applications later on.

The examples above illustrate how N&N may influence and penetrate into various subsystems of the total energy framework, for example, primary supply of energy (solar light harvesting, and so forth.), storage (hydrides, and so forth.), conversion and utilization of energy (power devices, industrial catalysis, and so on.), and abatement of environmental impacts (emission and water cleaning).

This evolutionary character and the long time scales call for caution in promising excessively too early – otherwise N&N risks facing a genuine backlash when (as well) high expectations and too far reaching promises are not satisfied.

A Study on the Comparison of Various Retrieval Methods based on the Measured Accuracy

M. Ayyavaraiah¹, Bondu Venkateswarlu²

¹Research Scholar, Dayananda Sagar University, ¹Assistant Professor, Malla Reddy College of Engineering, Secunderabad; ²Associate Professor, Dayananda Sagar University

ABSTRACT

In this day and age, innovation is improving step by step, the most upgraded research zone in computerized image preparing is image retrieval system. The procedures utilized for recovering image based on content, the substance as content, sketch, shading and shape that can be depict the image. Here we introduce different image retrieval strategies which is utilized as sketch content. So the system is alluded to as Sketch Based Image Retrieval System (SBIR). In this current paper, we actualize EHD, Integrated EHD & HOD and HOG algorithms and provide the examination of 3 algorithms based on their measured accuracy. SBIR is invaluable than absolutely message base image search. The retrieval system utilizing sketches can be basic and powerful in our every day life, for example, Medical finding, computerized library, search engines, wrongdoing aversion, geographical information, photograph sharing locales and remote sensing systems.

Keywords: EHD, Database, HOG, Sketch, Image.

INTRODUCTION

With the advancement of the innovation and accessibility of the image catching gadgets, for example, scanners, computerized cameras, the measure of the computerized image accumulation increments quickly. It is imperative to effectively store and recover images for various applications, for this reason many image retrieval system have been produced. Query By Image Retrieval (QBIR) is otherwise called content based image retrieval. In the advanced image preparing, content based image retrieval is most mainstream and rising research zone. The information removed from the content of query is utilized for the content based image retrieval information systems. In these systems the watchwords are clarified with images and after that utilizing content based search technique recover images. To extricate the visual content of an image like surface, shading, shape or sketch is the objective of CBIR. This paper presents utilizing sketch as a content, so the system progresses toward becoming Sketch Based Image Retrieval System (SBIR).

This paper is exhibited the issues and difficulties that identified with actualizing a CBIR system utilizing free hand sketches. The most critical errand is to conquer any hindrance amongst picture and sketch. In sketch based image retrieval system client gave an illustration

surface, where the client can draw a sketch as info. The element vector of info sketch contrasts and highlight vector of database images and recover the coordinated image from the database and show on screen as yield of the system. This system recovers the image superior to the past utilized systems.

Section 2 gives the writing review, which gives the information about beforehand utilized systems for image retrieval. Utilizing HOG descriptor and integrated EHD are clarified in section 3. Section 4 demonstrates the system result. At long last section 5 gives the conclusion of the system.

RELATED WORK

A. Retrieval using Cross Media Relevance Models:

For ordering libraries have normally utilized manual image explanation and after that later their image accumulations are recovered. Be that as it may, manual image explanation methodology is a costly and work serious and consequently there has been incredible enthusiasm for thinking of recovering images based on content in a programmed way. Here, to explaining and recovering images based on a preparation set of images, we propose a programmed approach [1].

He accept that a little vocabulary of blobs can be depicted as locales in an image . Utilizing bunching from image highlights blobs are produced. Given a preparation set of images with explanations, we demonstrate that to foresee the likelihood of producing a word given the blobs in an image probabilistic models is utilized. This might be utilized to consequently clarify and recover images given a word as a query. Here demonstrates that importance models enable us to determine these probabilities normally. Creator says his approach demonstrates the convenience of utilizing formal information retrieval models for the errand of image explanation and retrieval.

B. Content Based Image Retrieval: It is a programmed procedure based on client contribution to search pertinent images. The info could be sketches, illustration images or parameters. An ordinary CBIR process first the image highlights extricates and proficiently store them. At that point it contrasts and the database images and returns the outcomes^[2].

Highlight extraction and likeness measure are exceptionally subject to the utilized highlights. There would be in excess of one portrayal in each component,. Among these portrayals, to depict highlights histogram is the most regularly utilized procedure.

PROPOSED SYSTEM DESIGN

In the proposed system for enhancing the productivity of an image retrieval system, we incorporate the EHD and HOG descriptor. There is endeavoring to beat the disadvantage of individual EHD and HOG descriptor algorithm.

A. System Architecture: In the system architecture a productive sketch based image retrieval system is proposed.

Fig. 1 demonstrates the fundamental system engineering. It includes squares like Display subsystem, Feature vector age, Feature extraction, Retrieval subsystem and Database administration subsystem.

In this, the Histogram of Oriented Gradients (HOG) and Edge Histogram Descriptor (EHD) highlight vector integrated together. From this element vector locate the comparative image.

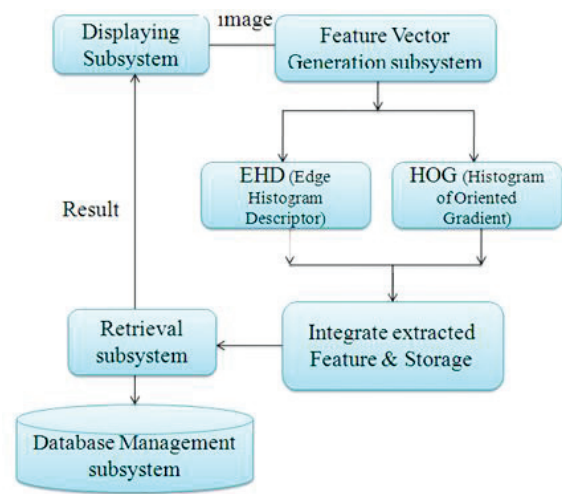

Fig. 1: System Architecture

The showing subsystem gave the attracting surface to client to draw the sketches. And furthermore give the screen to retrieval of coordinated images ^[3]. The Display subsystem that is actualized UI can be found in Fig. 2 and our program has been composed in Java.

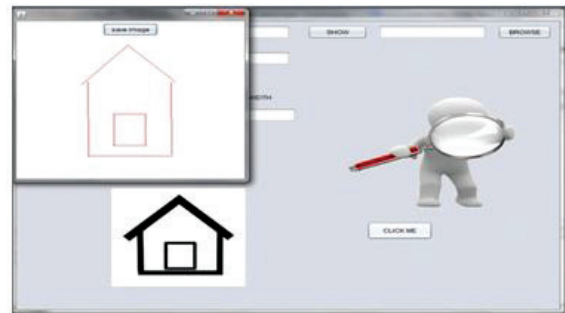

Fig. 2: Implemented User Interface

B. Proposed Algorithms

1. Edge Histogram Descriptor (EHD)

Histogram: The histogram is the most generally utilized designs. To connote any comprehensive component creation of an image. Histogram is helpful for ordering and recovering image.

Edge: Edge in images constitute an essential element to speak to their content. One method for speaking to a critical edge highlight is to utilize a histogram in the image space speaks to the recurrence and directionality of brilliance changes in the image subsequently it is called as Edge Histogram.

The EHD speaks to the spatial dispersion of edges in an image. The extraction procedure of the EHD comprises of the accompanying stages ^[4].

1. The image exhibit is partitioned into 4x4 sub images.

2. Each sub image is additionally parceled into non-covering square image obstructs whose size relies upon the determination of the information image.
3. The edges in each image-square is sorted into one of the accompanying
4. Six composes vertical, even, 45 corner to corner, non-directional edge , 135 slanting and no-edge.
5. Each canister esteem is standardized by the aggregate number of image-hinders in the sub image.
6. The standardized receptacle esteems are nonlinearly quantized.

There are five kinds of edge Histogram

At the point when the client select EHD algorithm, SBIR system finds the edges of the image. Fig. 3 demonstrates the edges of the image utilizing EHD algorithm.

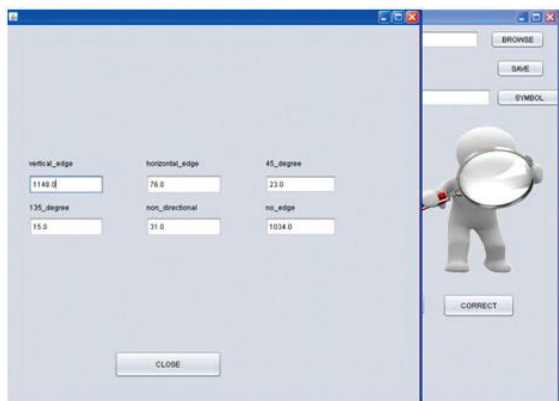

Fig. 3. Edges of Image Using EHD Algorithm

These edges as an element vector of image and this element vector contrast and the database images include vector, when coordinates the component vector comparative image is show on the showing subsystem as a yield image.

Fig. 4 shows the Sketch based image retrieval by using EHD algorithm.

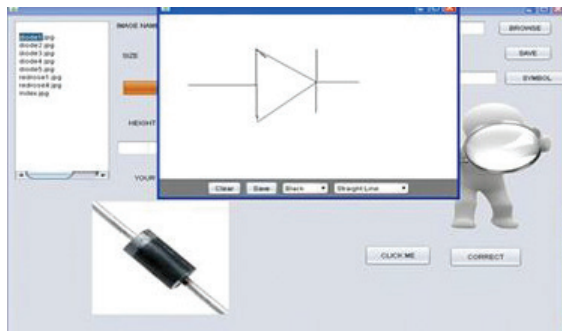

Fig. 4: Image Retrieval By Using EHD

2. Histogram of Oriented Gradients Descriptor (HOG):

Histogram of Oriented Gradients (HOG) are highlight descriptors utilized for the capacity of protest recognition in image preparing and PC vision. The procedure figures measure of gradient orientation in limited areas of an image. The Histogram of Oriented Gradient descriptors is that the neighborhood question appearance and shape inside an image can be portrayed by the dissemination of edge directions or power gradients^[5].

The utilization of descriptors can be accomplished by partitioning the image into cells. The cell is little coupled areas, and for each cell collect ling a histogram of gradient directions or edge orientations inside the cell for the pixels. The course of action of these histograms, at that point speaks to the descriptor. For improved accuracy, the neighborhood histograms can be differentiate standardized by computing a measure of the force over a bigger area of the image, entitled as block, and after that with this incentive inside the block to standardize all cells.

Histogram of Oriented Gradients (HOG) by

1. Gradient Computation
2. Orientation Binning
3. Descriptor Blocks
4. Block Normalization
5. SVM Classifier

For executing the HOG calculation, first prepare the image and after that the test image. HOG calculation finds the gradients of the image as a component vector. Fig. 5 demonstrates the gradients of the image.

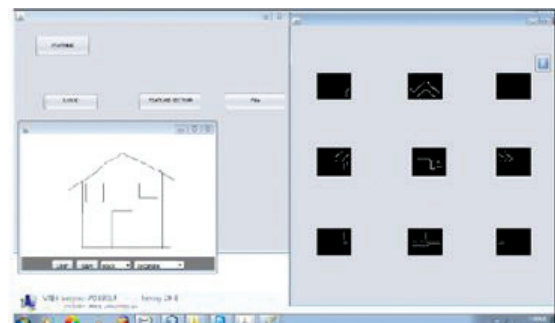

Fig. 5: Image Gradients Using HOG

3. Integrated EHD & HOG: While preparing the image, first discover the power gradients of the image utilizing HOG descriptor and then discover the edges of the image utilizing EHD descriptor. In database client which image he will prepare so he can characterize class and put the element vector in related class.

In testing client draw sketch on surface zone, first discover the gradients and edges of the image as a component vector, subsequent to finding the element vector utilizing SVM demonstrate classifier discover the element vector has a place with which class. When class is discover it contrast the element vector and highlight vector of chose class images and then demonstrates all images according to closeness coordinate with edge set by the client and recover comparative images. This system recovers images superior to the individual EHD and HOG descriptors.

Register an integrated EHD and HOG by

1. Compute gradient of image utilizing watchful.
2. Find gradient at specific edges or edge (even, vertical, 45-degree and so on).
3. Save block to database.
4. Utilize SVM demonstrate for grouping.

Fig. 6 displays the retrieval of image by using integrated EHD & HOG.

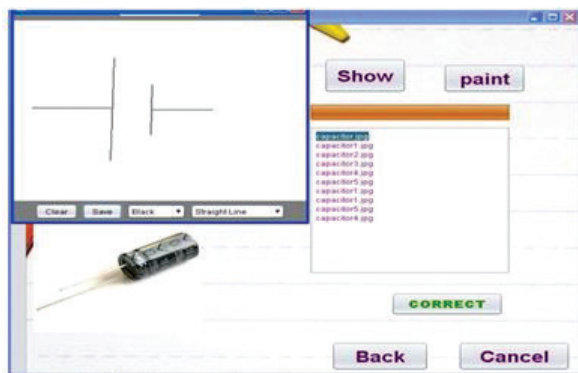

Fig. 6: Using Integrated EHD & HOG for Image Retrieval

RESULT AND DISSCUSION

While testing the Sketch Based Image Retrieval System, compute the Precision and Recall to assess the viability and accuracy of the system.

Where the Precision gives information identified with viability of the system.

Precision=Q/P.....

Q = No. of images displayed with similar shape. P = No. of images displayed.

Where the Recall provides the information regarding exact accuracy of the system.

Recall=Q/Z

Q = No. of images displayed with similar shape.

Z = No. of images with similar shape in whole database .

Fig. 7 shows Precision & Recall graph of integrated System.

Fig. 7: Precision & Recall Graph of Integrated System

Fig. 8 shows the accuracy of EHD, HOG & Integrated EHD & HOG.

Fig. 8: Accuracy of the System

Think about the integrated system, based on standard precision esteem, system recovers preferred image over the individual EHD and HOG system (appeared in Table D). So the integrated system is more powerful than other system.

Table I : Sketch Based System effectiveness

Method	EHD	HOG	Integrated EHD & HOG
Average Precision	80%	84%	90%

A. Integrated System Advantages

1. It is look at for substantial database.
2. Integrated EHD and HOG is more superior to the individual descriptor.
3. The edge Histogram descriptor not predominantly search better for information poor sketch, while other case demonstrate better outcome can be accomplish for more point by point this issue can be overwhelmed by the HOG strategy.
4. Capture edge or gradient structure that is exceptionally normal for neighborhood shape.

B. Integrated System Disadvantages

1. Time required to recover image is more contrasted with individual EHD and HOG.
2. In this system muddled images can not draw.

CONCLUSION

In this system depict the individual sketch technique and endeavor to incorporate this strategy for diminishing the individual strategies downside. In this system to actualize the new searching strategy and enhancing the nature of searching image, in this procedure EHD and HOG technique work parallel and standardized outcome is shown. This system recovers the image superior to the individual EHD and HOG. Integrated system gives the better accuracy.

In future work to make board which can draw confounded images i.e give device, takes a shot at shading spaces. Additionally can make more classes in Integrated system to characterize the images.

A Study on the Significant Difference between the Students of General Category and Reserved Category in their Achievement in English

C. Goverdhan¹, D. Santhosh¹, Katyayani Sangam², S. Shailaja³, D. Mahesh⁴

¹Asst. Professor, Department of English, S R Engineering College, Warangal, India; ²University of Hafar Al Batin, Kingdom of Saudi Arabia; ³Asst. Professor, Department of English, ⁴Faculty, S R Engineering College, Warangal, India

ABSTRACT

The present investigation was directed to discover the present situation of achievement in English subject based on locality, gender, income and caste. The specialist embraced the overview strategy to discover the previously mentioned issue. 70 students of ninth grade were chosen by utilizing stratified random examining process as the example of the study. Data was gathered by taking an independent achievement test and the gathered information was broke down by the utilizing SPSS software. The finding of the examination uncovered that there is no huge distinction between the scores of Achievement test in English among the girls and boys and additionally uncovered that there is critical of family income's influence among the gatherings on the achievement of English.

Keywords: English, Achievement, Secondary Level Students, Sub-urban, Rural Learners, Family Income.

INTRODUCTION

Step by step English language turns out to be more well known language among the Indians. English language is presently a global language and additionally an interdisciplinary language. Language is implied by which youngsters think about the past, get a handle on the present and approach what's to come. With no uncertainty language assumes a critical part in the intellectual, mental, enthusiastic and social improvement of a man. So English has involved a one of a kind position in our nation, however after the freedom its place in the educational modules is changed. English language is spreading significantly in the present time too. So everybody hurries to get his kid conceded in the school to learn English where English is unmistakably instructed.

The essential capacity each young fellow is relied upon to have the capacity to express him obviously and adequately and the absence of it hampers his advance in scholarly subjects. For a scholastic achievement of students there are numerous variables that influence the achievement. The present examination was directed in the retrogressive zone of Bankura region to know the status of achievement of English.

OBJECTIVES OF THE STUDY

The examination was led to satisfy the accompanying goals:

- To see if kid and young lady students vary essentially in their achievement in English.
- To discover influence of family income for the achievement of English.
- To explore whether the students of general and saved caste vary fundamentally in their achievement.
- To discover the distinction of sub-urban and rustic students in the event that they have in their achievement in English.

HYPOTHESES OF THE STUDY

In the present study null hypothesis were confined. They are as per the following:

- Ho1) There is no huge distinction amongst kid and young lady students in their achievement in English.

- Ho2) There is no huge distinction of connection between the students with respect to their locality of home in the achievement in English.
- Ho3) There is no critical connection of family income's influence on the achievement in English.
- Ho4) There is no critical distinction between the students of general and saved caste in their achievement in English.

DELIMITATION

The present study was delimited in the following aspects:

Sample area: The study was confined to the students of 9th grade from Nanda Pallimangal High School (H.S) and Hirbandh High School (H.S) in the Block of Hirbandh, Bankura district in West Bengal. So it is impossible to apply the generalization of the present study to all the students West Bengal.

Sample size: The present study contained the small size of sample which was 70 students. So only the sample of 70 students that can "t be applied the generalization to all the 9th grade students.

Time: To do the present research work, the duration of time is vital. But here the time is limited. So the outcomes and results of the study might affect the validity and reliability of the research. To get fruitful result, the longitudinal research is very essential for this study.

Content area: Content area for the study was limited that is only 2 units of the English subject were chosen by the researcher for taking achievement test.

Curriculum: For this study the researcher followed only the curriculum prescribed by the West Bengal Board of Secondary Education.

VARIABLES

Dependent Variables: Students' achievement

Independent Variables: Gender, Family income, geographical area and Caste

Intervening Variables: Intelligence, Motivation, time spent in study at home

Research Design: The investigator selected Descriptive research design. Under this design, more specific design that is **Survey study** was conducted to give detailed description of existing phenomena with the using of collected data.

Sample: To consider the whole masses isn't possible to the specialist. With the objective that the examiner depended upon the sample. To assemble data from the masses i.e. ninth Grade students, the analyst picked the sample measure i.e. 70 students of ninth grade in Bengali medium schools i.e. Nanda Pallimangal High School (H.S) and Hirbandh High School (H.S). To pick sample, the specialist used stratified random examining process. Through this technique the picking sample is 40 young woman students and 30 kid students. For ANOVA testing the sample gauge was 51 from the total sample that is 70 was picked by the operator. To test criticalness association differentiate between the students of sub-urban and commonplace, the master picked the sample gauge was 26 from certified sample by the method of randomization.

RESEARCH TOOLS

- One poll for achievement test made by the specialist where add up to questions are 30 with 1 imprints and these inquiries are numerous decision based alternatives.
- Another poll made by the scientist for meeting of the students to get some prominent data.

STATISTICAL TECHNIQUES

In the present examination, a few measurable methods^[1] were utilized by the agent for breaking down the quantitative information as per the idea of factors included and goals of the investigation. A concise portrayal of the spellbinding and inferential measurable methods utilized as a part of the investigation of information is given beneath:

1. Mean(M)
2. Standard Deviation(SD)
3. t-test
4. Correlation(Pearson)
5. ANOVA

All these statistics were calculated by using SPSS software.

MAJOR FINDINGS OF THE STUDY

Real discoveries of the present investigation have been originated from the examination and understanding. This investigation was centered around achievement of English at ninth grade students based on gender, income of the family, territory and class.

1. There is no noteworthy distinction between the scores of achievement test in English^[2] among the understudy gatherings (girls and boys). Along these lines, it is inferred that both the gatherings were equivalent with respect to their achievement in English.
2. There is a huge connection of contrast between the gatherings (rural and provincial students) in their achievement in English. In this manner it is reasoned that both the gatherings were same and the locality of the students did not have any connection to their achievement.
3. There is no critical influence^[4] of family income among the gatherings on the achievement in English. Hence it is inferred that the three gatherings based on family income were not equivalent in their achievement in English. It implies that the family income had influenced on their achievement.

There is a noteworthy contrast between the students of general classification and held classification in their achievement in English. Hence it is incorporated that the classifications of students had no huge influence on their achievement in English.

CONCLUSION

The purpose of the present study was to find out the students' achievement on the basis of gender, area, income of the family and category of the 9th students. The result of the study has been discussed under the following-

Gender: The outcome in light of the examination of the present investigation uncovered that the two gatherings (girls and boys) were discovered equivalent in regard of mean scores yielded by them on Learning Outcomes (Achievement of English). This prompted the acknowledgment of the null speculation $H_0:1$ expressing that students who are boys and girls have no noteworthy distinction for their achievement in English.

Area: The result based on the analysis of the present study revealed that the two groups (suburban and rural students) were found equal so the null hypothesis was accepted.

Family income: The outcome in light of the investigation of the present examination uncovered that the three gatherings (high, medium and low income) were not discovered equivalent. It implies that the income of the family has huge influence on the achievement of the students. This prompted the dismissal of the null speculation.

Caste: The outcome in light of the investigation of the present examination uncovered that the two gatherings (general and held caste) were discovered unequal in regard of mean scores yielded by them on Learning Outcomes (Achievement in English). This prompted the dismissal of the null speculation. It is expressing that the mean score of general caste students is very more noteworthy than the mean score of held caste students for the achievement of English.

SUGGESTION FOR FURTHER STUDIES

The examiner is very mindful of the constraints under which display look into was directed and in this way acknowledges no broad speculations could be made. These discoveries^[6] are just demonstrative of patterns. The present examination recognized a few different ways of conceivable investigation and number of critical discoveries has been accounted for in the present investigation. For additionally think about, the agent is recommending a few zones-

Population: For the present examination the examiner picked the ninth grade students as population of the investigation. The examination can be directed based on other level of students like lower essential, upper essential, higher auxiliary and so forth as population of the investigation.

Sample size: The present investigation was delimited to 70 students of ninth grade. It can be planned and recreated on more extensive sample.

Sample: Sample of the present investigation was bound to the students of ninth grade of govt. helped schools. Be that as it may, for better legitimacy of the investigation it can be directed on expansive sample and sample can be taken from both govt. and tuition based schools.

Geographical area: The examination was kept in the area of Hirband square of Bankura locale, W.B. So for additionally consider the replication of this exploration should be possible in different states, different areas of W.B and so on. And it is likewise relevant to the urban area.

Variable: The present examination depended on the variables like achievement, gender, income of the family. Comparative examinations might be directed by including more variables like intrigue and mentality and so on.

Content: The investigation was delaminated to two units of English subject of class 9. It can be led by taking more units of the said subject.

Subject: The present investigation was kept to one subject that is English as it were. Comparable research endeavors can be placed in on different subjects likewise e.g. Material science, Chemistry, Mathematics, Social Sciences Hindi and so on.

Curriculum: The present examination was directed to assess the achievement of the students by taking the recommended curriculum of WBBSE. Comparative investigation can be led by taking the curriculum of CBSE or ICSE.

A Study on the Synthesis of Polypyrrole Nanocomposites for their Morphological Studies

E. Purushotham¹, K. Devender¹, P. Venkata Ramana Rao², S. Satyavani³

¹Asst. Professor, ²Assoc. Professor, Department of Physics, ³Faculty, Department of EEE, S R Engineering College, Warangal, India

ABSTRACT

This study examines the data about the synthesis of polypyrrole/Cr₂O₃ doped nanocomposites (NCs) as a protecting color in organic coatings. Polypyrrole/Cr₂O₃ doped NCs were set up by in situ chemical oxidative polymerization of pyrrole monomer. Here dopant Cr₂O₃ nanoparticles (NPs) were orchestrated by arrangement ignition technique utilizing Aloe-vera gel as fuel with ammonium per sulfate (APS) as oxidant. Diverse convergences of Cr₂O₃ (10-50 wt %) NPs were fused into the polypyrrole. The combined nanocomposites were described by methods for powder X-ray diffraction (PXRD) and Scanning electron microscopy (SEM). The measure of the NPs were computed by Scherer strategy, and observed to associate with 20 nm. TEM results are in predictable with the XRD results. The morphology of the got composites demonstrates the permeable and agglomerated particles which are because of vast measure of gas advancement amid NPs synthesis by arrangement burning strategy and electrical properties were considered.

Keywords: SEM, Cr₂O₃, Polypyrrole (PPy), Nanocomposites, XRD.

INTRODUCTION

Directing electroactive polymers (CEP) still remain a subject of extraordinary examination of many research bunches around the world. Amid the previous decade, there have been numerous reports concerning productive examinations. Conductive polymers, for example, Polypyrrole (PPY), polypyrrole (PPy), and their composites are broadly utilizes as sensors [2], vitality stockpiling materials, because of the effortless synthesis and flexibility in preparing [3]. Leading polymers including polypyrrole (PPy), Polypyrrole (PPY), polyethylene di-oxythiophene (PEDOT), and polythiophene (PT) have both electrochemical twofold layer capacitance and pseudo-capacitance emerging from the quick and reversible oxidation and decrease forms identified with their p-conjugated polymer chains [1-3]. Among these directing polymers, PPy is outstanding as a promising cathode material for supercapacitors, in light of the fact that it has different huge favorable circumstances, for example, high particular capacitance, great conductivity, bio-compatibility and outstanding mechanical properties [4]. However, like other electronically directing polymers, PPy experiences volumetric shrinkage amid release process which can prompt

diminishing in cyclic strength [6-9]. Nanocomposites are a class of composites in which the strengthening stage measurements are in the request of nanometers [4]. Due to their nanometer measure qualities nanocomposites have unrivaled properties than the ordinary, miniaturized scale composites due to maximize the interfacial grip. Such enhanced properties can be achieved in nanocomposites in which the building squares are scattered in a polymer matrix. Of directing polymers, polypyrrole (PPy) is for the most part perceived to be one of promising leading polymers for business application because of its high electrical conductivity, great ecological steadiness and simplicity of synthesis [4]. To enhance the cyclic strength of the directing polymer, scientists have as of late combined different PPy-based composites with various leveled organized materials to ruin the volume change of the leading polymer amid the charge– release forms [10-12]. As is known to all, progress metal oxides have been greatly detailed as anode materials for pseudo-capacitors as a result of their vast capacitance and quick redox kinetics [3]. In this paper we report the synthesis of Cr₂O₃ nanoparticles utilizing Aloe-vera gel, synthesis of polypyrrole/Cr₂O₃ nanocomposites and their structural, morphological and electrical studies in detail.

MATERIALS AND METHOD

Experimental

Synthesis of Polymer: The synthesis Polypyrrole (PPY) depended on mixing fluid arrangement of aniline hydrochloride and ammonium persulphate at room temperature, trailed by the detachment of PPY hydrochloride accelerate by filtration and drying. An equi-molar volume of aniline and hydrochloride corrosive was disintegrated in refined water in a volumetric carafe to get 100 ml of arrangement. Thus, ammoniumpersulphate (0.6M) was disintegrated in 100 ml water. The two arrangements were kept for 1 hour at room temperature and then mixed in a measuring glass, blended with a mechanical stirrer and permitted to polymerizing. Following multi day, the PPY encourage was gathered on a channel, washed with 0.3 M HCL and $\text{CH}_3)_2\text{CO}$ over and again. The Polypyrrole hydrochloride powder was then dried in air in vacuum at 60°C for 24 hour.

Bio-Mediated Synthesis of Cr_2O_3 Nanoparticles: The chromiumoxide nanoparticles were orchestrated without anyone else 'proliferating low temperature burning strategy', utilizing chromium nitrate ($\text{Cr}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$) as forerunner and Aloe-Vera gel as a fuel. Truth be told 2.14 g of chromiumnitrate was taken in 300 ml petri-dish and 10 ml of Aloe-Vera gel was added to the petri-dish and kept on an attractive stirrer for ~ 10 min. The uniform mixture of both oxidizer and additionally the fuel was then brought into the pre-warmed suppress heater kept at 450°C . The mixture overflows with foam yielding at last a dark powder of NiO nanoparticles.

The normal molecule size of the NiO was computed by Debye-Scherrer and it was observed to be ~ 15 nm^[12-16].

Fig. 1: Flow Chart for Preparation of Cr_2O_3 NPs

Synthesis of Polypyrrole/ Cr_2O_3 nanocomposites:

Synthesis of Polypyrrole: Copper oxide composites were completed by in-situ polymerization strategy. Aniline (0.3 M) was mixed in 0.3 M HCl and mixed for 15 min to frame aniline hydrochloride. Copper oxide powder were included the mass part to the above arrangement with energetic mixing to keep the copper oxide homogeneously suspended in the arrangement. To this arrangement, 0.6 M of ammonium for every sulfate, which goes about as an oxidizer was gradually included drop-wise with nonstop blending at ice temperature for 4 hours to totally polymerize. The accelerate was separated, washed with deionized water and $\text{CH}_3)_2\text{CO}$, and at long last dried in a stove for 24 h to accomplish a steady mass. The Polypyrrole - copper oxide composites were along these lines got containing different weight level of chromium oxide (i.e.10, 20, 30, 40, and half)

RESULTS AND DISCUSSIONS

XRD Analysis

Fig. 2: XRD Pattern of (a) PPy (b)PPy/ Cr_2O_3 , (50 wt %).

X-Ray Diffraction studies were performed utilizing Shimadzu-7000 diffractometer with Cu as the objective (1.54 Å) and chromium as the channel. Fig.2 demonstrates X-ray diffraction example of Polypyrrole. An expansive pinnacle focused at $2\theta = 25.530$ might be allocated to the dispersing from the Pyrrole chains at interplanar dividing which plainly infers the shapeless idea of Polypyrrole and it compares to diffraction planes (200) of unadulterated Polypyrrole and PPY/Cr₂O₃ nanocomposites. It was plainly seen from the PXRD diagram that unadulterated PPY was in undefined nature and as the Cr₂O₃ fixation increments from 30wt % the shapeless nature mostly vanish and crystallinity in the NCs were watched. It was apparent that the Cr₂O₃ nanoparticles were totally interlocked between the polypyrrole chains. There were no extra polluting influence crests were seen in XRD range. The normal crystallite size (D) was planned by utilizing Scherrer's formula^[5],

$$D = \frac{0.89\lambda}{\beta \cos\theta} \quad \dots(1)$$

Where D, the average crystallite size, λ ; the wavelength of the X-rays (0.15405 nm). The deliberate average crystalline size (D) of PPY/Cr₂O₃ 30 wt % NCs were establish to be 28-36 nm.

Morphology studies

Fig. 3: SEM Images Of a) Cr₂O₃ b)Ppy c) & d) 10wt% &50wt% of Ppy/Cr₂O₃ NCs

The Fig.3 demonstrates surface morphology of the composites were considered by methods for SEM and the results indicated agglomeration of particles. From micrographs of TEM, particles size was around 25nm. Since it is exposed that the nanocomposite is accompanied by much micrometric and nanometric irregularity^[12-14].

Fig. 4: TEM Images of Polypyrrole/Cr₂O₃ 50wt% NCs

Fig (a) and (b) Shows TEM picture of Polypyrrole/Cr₂O₃ 50wt% NCs (50 wt %) nanocomposites. TEM picture with interplanar separating d esteem equivalent to 0.28 nm. These results are in predictable with the PXRD.

DC Conductivity Studies: The dc conductivity of the nano-composites were considered by utilizing Keithley 6514 electrometer. The plot of surface dc conductivity of PPY and its composites with temperature are appeared in Fig. The conductivity is found to increment with increment in temperature. This expansion in conductivity with temperature is the normal for “warm enacted conduct”. The expansion in conductivity could be because of increment of effectiveness of charge exchange between the polymer chains and the dopant with upgrade in temperature. The warm restoring influences of the arrangement of polymer chain, which prompts the expansion of conjugation length perhaps at the same time achieves increment in the conductivity of the composites.

Fig. 5: DC Conductivity Study of Ppy/Cr₂O₃ NC

Ethical Clearance: Not required

Source of Funding: Self

Conflict of Interest: Nano Materials

CONCLUSIONS

Pure and PPy/Cr₂O₃ NCs were effectively arranged by in-situ polymerization technique. The nanocomposites demonstrated high crystalline nature with no contamination tops. The surface morphology of the composites were examined by methods for SEM and the results indicated agglomeration of particles. From micrographs of TEM, particles size was around 25 nm which was in great concurrence with that of the molecule size figured from Scherer condition. The expansion in conductivity could be because of increment of productivity of charge exchange between the polymer chains and the dopant with improvement in temperature. Every one of these results together uncover that the synthesized composites can be utilized as a part of the field of optical applications.

ABSTRACT

Ideal from the eighteenth century huge measure of research is going in the field of fluid flow and its application to regular problems. From the invention of the computer and development in the field of fluid mechanics, its governing equations and approach of numerical techniques, CFD has begun and has advanced to a great degree. The plan and the development procedure of any item finished the years has turned out to be moderately more simple and less tedious to the customary strategies, so here the fundamental intention of this paper is to give a history, have the significance and feasibility study of computational Fluid Dynamics (CFD) as a computational apparatus for different analysis of engineering related application based problems. It manages the present situation, generally extent of CFD, its pertinence for engineering problems, test for its validation of the obtained results and its focal points over the test strategies.

CFD as an instrument can be connected for problems identified with turbo-machinery, building performance for various weather conditions, storm analysis, warm exchangers, completely created turbulent flow in pipes, analysis of fluid flow and airfoil of an airplane, cooling of electronic chips in the processor using constrained convection and so on.

Keywords: simulation, CFD, analysis, turbulence models, validation.

INTRODUCTION

Presently a days noteworthy consideration is given on improving the effectiveness and minimizing the fuel utilization of engines because of the worldwide exertion of reducing Carbon-dioxide discharges. Coming to Refrigeration frameworks it is COP (Coefficient of Performance) that issues the most, significant endeavors have been made by researchers all through the world in making these frameworks more solid, more eco-accommodating, optimizing to get most elevated yield for a given input. Coming to analysis of fluid flow through pipes, it is the decrease in the inlet pumping vitality that is most essential for such frameworks to work effectively.

In 17-eighteenth century researchers all through depended mainly on exploratory validation of a theory rather than simply the mathematics. With the appearance of computers, educated information about fields in which research occurred and with development of the mathematics for the theory, another field which was the unification of mathematical models and computers to obtain answers for a certain sort of an issue. This

field has developed hugely since then. A great deal of innovation in fields identified with this occurred in the nineteenth century, which offered ascend to assortment of subjects, various application fields and parcel of ways to approach a given issue. With the revelation of fluid mechanics governing flow equations, numerical methods to unravel differential equations in mathematics, this field took off. There are diverse apparatuses to examine distinctive sort of problems, starting with Finite Element Method (FEM) for auxiliary based problems, Finite Volume Method (FVM) for fluid mechanics, thermal, heat transfer problems.^[12]

Despite the fact that, these computational methods (simulation) are destructive in the industry for configuration reason, research and development (R and D), their validation may at present be under inquiry. Importance of results rely on the field of use analyzing its qualities, confinements and trying to improve the blunders in development of the model under study.

This paper investigates different angles to be thought about: the field of use, the plan, RandD study, particular parameters of interest in the work under

study. It additionally investigates the feasibility of use of CFD principles (methods) to the given research issue, its significance, its results and their validation with the customary or neo-conventional methods of obtaining the consequences of the study. The extent of use of CFD is humongous, ideal from fluid flow to bio-mechanics using the relative principles, anyway this paper depends on an audit and dialog of mainly the use of CFD principles to center mechanical engineering problems.^[12]

APPLICATIONS OF CFD

Since the appearance of computational fields and capacity of solving differential equations numerically, the fields in which CFD is connected has increased. This paper mainly takes a gander at applications from more extensive domains like car, aviation segments with fixation in IC Engines, Turbochargers, Heat transfer problems , air foils and couple of utilizations in non-customary fields.

CASE STUDIES

1. An-Shik Yang et.al.^[1] employed CFD as a tool in Urban and community planning to simulate, obtain flow parameters and characteristics around different buildings to obtain ventilation. Simulation domain (3kmx2kmx0.6km) was taken. A standard k- ε two equation turbulence model was used.
2. D.Bhandari et.al.^[2] carried out work in analyzing fluids(air and water) passing through a closed pipe (internal flow) using CFD software. The results obtained were for fully developed turbulent flow. GAMBIT was used for geometry modeling, Fluent for simulation. The pipe was made of steel for simulation with (length x diameter)of 8m x 0.2m. Inlet velocities of (water, air) are 0.05,1 m/s. A standard k- ε model was used.
3. S.Kandwal et.al.^[3] carried out research work for NACA 4412 airfoil, compared simulation results with work conducted by Abbott et.al. GAMBIT and Fluent was used for geometry modeling and simulation. Unstructured mesh was used. Inlet temperature and mach number of 288.17K and 0.15.
4. Rajesh Bisane et.al.^[4] carried simulation work for 4- stroke C.I Engine and analyzed the exhaust gas system. Diameter of diffuser inlet and engine outlet=0.0254m, 0.15m. A standard k- ε model was implemented, with GAMBIT for geometry creation. Inlet mass flow for conventional, turbocharged, supercharged was 0.00749,0.0115,0.014 kg/s at 562K,686K,637K respectively. Outlet opening pressure= 1.325,2.89,2.94 bar at 353K,669K,573K respectively.
5. Rajesh Khatri et.al.^[5] conducted work on analysis of laminar flow over a flat plate. A flat plate 400mm long was maintained at a constant temperature of 333K. The fluid was passed over the plate at a velocity of 2m/s at 300K.
6. Pulkit Agarwal et.al.^[6] carried out work for heat Transfer from Fins of an air cooled motorcycle engine under varying climates. Fluent was used for simulation. Speed range was 40-72 kmph. The engine was modelled as aluminium cylinder with fins on outer surface and a stroke volume of 150 to 187 cm³ . Model creation was done using GAMBIT. A fine mesh was created near the fins. A face mesh was done by quad element. The volume was meshed by hex element. A fixed pressure of 101.325kPa was set as BC. Top and bottom surfaces were specified as adiabatic walls and the flow was kept from left to right. Temperature was specified at the inner surface. Metallic fin was meshed and specified as solid region.
7. Mukesh Didwania et.al.^[7] carried out work on analysis of heat transfer through two different shaped fins. Air was facilitated by the blower at a certain suitable velocity based on Reynolds number. SOLID WORKS was used to create the geometry model. It had three parts Solid Base, Solid Fin Surface and rectangular duct. All were created independently and assembled. Mesh was generated by ANSYS and it included Tetrahedral, Wedges, Pyramids, Hexahedral and Polyhedral mesh. The bottom wall was kept at a constant temperature of 430 K. No slip condition was applied leading to a zero velocity. The side walls were adiabatic. The inlet air temperature was 280 K. Simulation was done with FLUENT. A standard k- ε model was employed.
8. Arularasan R et.al.^[8] conducted work on analysis of a heat sink for cooling of electronic devices to select an optimal heat sink design, studies on

the fluid flow and heat transfer characteristics of a parallel plate heat sink was done. Fluent was used for simulation. Parameters involved were fin height, fin thickness, base height and fin pitch which ranged from 16-48mm, 0.8-1.6mm, 4-12mm, 1.5-4mm respectively. A condition of heat input at 100W was assumed at the heat sink base.

9. Vinod M. Angadi et.al.^[9] conducted work on analysis of heat transfer enhancement of car radiator using nano- fluid as a coolant. The analysis was done using STAR CCM+. Aluminium oxide was used as an additive. Flow rate changed from 2-6 litre/ min . Nano particle volumetric concentration varied from 1% to 6% of base fluid. Fin geometry was modelled on STAR CCM+ with Tube length, space between tubes, thickness, length as 31,1.5,0.3,2 cm. Number of fins used=34.

Fin material used : aluminium. Temperature was taken in the range of 1000K-5000K. A 313K was the static temperature taken as initial conditions. Inlet temperature=50 degrees , convective heat transfer coefficient=50 W/m²K.

10. Ravi shankar P R et.al.^[10] did take a shot at supercritical aerofoil at various approach with a basic aerofoil. NACA SC(02) 0714 and NACA 4412 aerofoil profiles were utilized for flow analysis. GAMBIT for geometry creation and FLUENT for simulation. The analysis was done at a Mach number of 0.6. A standard k-ε demonstrate was utilized. Limit conditions were defined with properties of fluid being thickness, consistency, thermal conductivity and particular heat of air as 1.185 kg/m³ , 0.0000183 kg/ms , 0.0261 W/mK ,1.004 kJ/kgK individually. Weight of 101325 Pa and a speed of 250 m/s was set.

RESULTS, DISCUSSION AND REMARKS

1. **An-Shik Yanget.al.results were:** Its howed that due to presence of two high rise building and a low height building in between, the wind velocity was at 1m/s. A better ventilation at 1.5-2m/s was obtained eliminating a high rise building.

Remarks: Can be implemented with k-ω or SST models to obtain further accuracy and perform a comparative study.

2. **D.Bhandari et.al.results:**

Table 1: Result

Result	Simulation	Experimental	% error w.r.t exp.
Centerline Velocity (Air, Water)	1.19,0.061(m/s)	1.22,0.0612 2 (m/s)	2.45 %; 0.359 %
Skin friction coefficient (air, water)	0.01, 0.009	0.00795,0.01	-25.4% ; 10%

Remarks: A k-ω model is better for fully developed turbulent, it can implemented to obtain more fine results. CFX is less time consuming and utilize less space for same meshing. Type of meshing is not specified, that will decide what package to be used for better results and convergence.

3. **S. Kandwal et.al.results:**

Table 2: Result

Result	Simulation	Experimental	% error w.r.t exp.
Coefficient of lift and drag	0.654, 0.001	0.649, 0.007	-0.77% ; 85.1%

Remarks: SST model works better for airfoils. Also research could be conducted by simulating using CFX package for unstructured mesh type as it works better.

4. **Rajesh Khatri et.al. results:**

Table 3: Result

Result	Analytical	Simulation	% error w.r.t exp.
Heat transfer coefficient (W/m ² K)	8.77	9.28	5.49 %
Heat Flux (W/m ²)	115.76	121.81	4.96 %

It was watched that limit layer thickness was greatest for Reynolds number 10,000 and minimum for Reynolds number 50,000 It was watched that the variety of nusselt number was linear till the Reynolds number increased to 5876. The CFD comes about demonstrated a 5.5% blunder with the scientific arrangements, indicating dependability of the CFD code.

Remarks: The type of turbulence model used is not defined. SST model works good for such problems.

5. PulkitAgarwalet.al.results: It was watched that with increase in temperature on the fin surface , increasing air temperature which occurred in view of lessening in heat transfer due to less temperature slant. It was in like manner saw that the heat lost at same vehicle speed increased with diminish in natural temperature. With enduring temperature, heat transfer increased with speed.

Remarks: Type of turbulence exhibit isn't clearly defined. A standard k-ε turbulence show is used for building simulation, yet its seen that k-ε SST show makes better results.

6. Mukesh Didwania et.al.results:

Table 4:L Result

Result	Rectangular fin	Circular fin
Heat transfer rate (W)	-406.93	-397.85
Pressure loss (Pa)	0.091872931	0.091870584
Increase in temperature (K)	10.1492	10.15789

It was concluded that Circular fin was optimum fin for maximum heat transfer.

7. Arularasan R et.al.results: By keeping a minimum measure of fins, a greatest conceivable fin pitch could be maintained with the goal that the weight drop would be minimum and wind current would be most extreme. In view of the manufacturability and flow speed or flow sidestep constrains, diminish in fin thickness was not practical. It was discovered that for a low thermal obstruction and low weight drop in the chose heat sink demonstrate, the geometric parameters like the fin tallness, fin thickness, base stature and fin

pitch were observed to be ideal at 48 mm, 1.6 mm, 8 mm and 4mm separately.

Remarks: Type of turbulence demonstrate isn't obviously defined. A standard k-ε turbulence show is utilized for building simulation, however its seen that k-ε SST demonstrate creates better outcomes. Additionally an all the more fine work must be utilized for precise outcomes.

8. Vinod M. Angadi et.al.results: It was watched that with increase in the fluid flow rate and by keeping the base fluid steady without adding any nano-particles, the heat transfer coefficient esteems continued increasing. Additionally when nano fluids in certain portions were added to the base fluid and the flow rates were kept steady , heat transfer coefficient increased. With increase in the estimation of temperature the heat transfer coefficient esteem increased. It was proposed to keep a higher extent of fluid flow rate clubbed with a higher volumetric level of nano-particles added substances, which would guarantee an improved heat transfer.

9. RavishankarPRet.al.results: Results in the middle of approach from 0-15 degrees the drag weight for supercritical aerofoil was less contrasted with straightforward aerofoil , at 15 degrees drag weight for supercritical aerofoil was slightest and at 30 degrees the drag weight for supercritical aerofoil was more than the basic aerofoil. The speed diminish in the flow field in supercritical aerofoil was less when contrasted with basic aerofoil.

Remarks: k-ε SST display creates better results. As it deals with free stream and close divider conditions.

From the contextual investigations and writing overview, it was watched that Computational Fluid Dynamics gives the comfort of being ready to turn off , turn on particular terms of governing equations, direct the analysis for various conditions, obtain results, begin a similar study, propose the best method feasible and so forth. This allows the testing of theoretical models, suggesting new ways for theoretical investigations, likewise gives a stage to test theories which would never potentially have been practical through experimentation. Along these lines, CFD gives a couple of significant favorable circumstances when contrasted and test fluid dynamics:

Lead time in plan and development is diminished fundamentally alongside a noteworthy savings in allotment of supplies for experimentation. It can mimic flow conditions which are un-paralleled, not reproducible in trial demonstrate test. It can recondition the parameters and get distinctive yields and approve. CFD gives all the more closer, definite and complete information which can suit part of parameters and make it as near genuine circumstance as would be prudent. The most prominent component of it is its savvy include contrasted with trial fluid dynamics or wind burrow testing and in a way specifically addresses worldwide vitality utilization by consuming less power and being profoundly proficient.

CONCLUSION

The whole paper displayed Computational Fluid Dynamics as an apparatus for various research cases and constant problem solving. The scope of problems experienced or handled is from wind stream simulation around buildings for planning urban areas to engine related or heat transfer problems. In the wake of studying the cases and reviewing writing, appropriate remarks were made. As it is observed, it can be presumed that the wide assortment of use of CFD is admirable, the on-going and already done research compliment each other through validation and from the contextual investigations it is seen that validation is attractive and is in close concurrence with the exploratory results. Consequently CFD as an instrument for simulation can be viewed as dependable for research works, or specific problem solving.

An Enhanced Study on the Challenges Encountered in Mathematical Modelling

Anusha¹, C. Balarama Krishna¹, G. Ravi Kiran¹, P. Ramchander Rao²

¹Asst. Professor, Department of Mathematics, ²Faculty, S R Engineering College, Warangal, India

ABSTRACT

This paper compactly shows challenges encountered when demonstrating systems mathematically. Mathematical displaying altogether involves math symbols, numbers and relations shaping an utilitarian condition. These mathematical equations can speak to any arrangement of interests, additionally gives ease PC reenactments. Mathematical models are widely used in various fields i.e. engineering, by scientists, and analysts to give an unmistakable understanding of the issue. Demonstrating contributed a considerable measure since reversal of the idea. Straightforward and complex structures raised because of demonstrating. In that sense displaying is a vital piece of engineering. It can be alluded to as the essential building square of each framework. An intricate model anyway isn't a perfect arrangement. Engineers must be mindful not to dispose of all data as this may render the planned model pointless – as nitty gritty in this paper the model ought to be straightforward with all fundamental and important information. Fundamentally the motivation behind this paper is to demonstrate the significance and obviously clarify in detail challenges encountered when displaying

Keywords: Replica, Modelling, Algorithm, Taxonomy, Challenges and Uncertainty

INTRODUCTION

Throughout the years Mathematical models were utilized and still in ongoing history have gotten a huge conceptualisation in engineering. Mathematical models can be characterized as – just communicating a true framework as far as math symbols, numbers and relations shaping a useful mathematical condition. The equations speaking to a framework come in various structures – arithmetical, partial quadratics and straight or non-direct systems depending much on the wonders being displayed. Certifiable framework includes extraordinary, disconnected wonders subsequently various portrayal or plan of every marvel. Fundamentally the inferred condition for a specific marvel holds less however significant data and framework flow should have been recognized hereafter managed. In engineering, straightforwardness, succinctness and understanding are critical developments for each undertaking in engineering. Engineers pride themselves on these points of reference. An excessive amount of definite data on a model forces troubles when creating algorithms and may from this time forward bring challenges amid framework recreation: where reproduction is the specialty of imitating a true procedure.

MODELLING

Mathematical displaying in basically terms can be depicted as the building square of science, computing, examining and engineering. In control engineering, modelling:”mathematical portrayal of a physical wonder, framework or gadget, mathematical models takes numerous structures, for example, dynamic framework models, factual models, diversion models, differential equation...etc.”simulation:”a PC program, or bundle, that endeavors to reenact or mimic a conceptual model of a specific framework or gadget.” These two fundamental ideas are correlative segments – exist together. Simulation frames a necessary with theoretical mathematical models. The sole reason for simulation is to set up some benchmarking, new experiences to an issue, foresee conduct for systems. The fundamental measure is to build up a model, compose algorithm and at long last mimic the theoretical model for advance understanding. Simulation of the model has an additional preferred standpoint since this method can be executed the same number of times until a successful and adequate model is attained^[1-3]. In control engineering simulations are executed utilizing projects,

for example, MATLAB, SCILAB, C, C++, Linux and so forth. These projects have their own benefits of understanding and performance^[4-6]. The basic/simple of displaying are essential in this way challenges should be routed to enhance demonstrate adequacy and approval on simulations. Simulations console nature of a model subsequently validation. Quality of attainability in science, computing and engineering is accordingly of demonstrating. Take for example, building bridges to high rises and autos to PCs, demonstrating must be done to assess and understand the characteristics that may affect the framework introduction. Models are utilized as learning progressions, modest to outline and execute than genuine partners and safeguard replicas or models (fakers). Consequently, models and their one of a kind usage are articulations of entomb – subjective understandings^[7].

Importance’s of Mathematical Modeling:

1. Can speak to the performance of a framework or process (framework usefulness)
2. Useful computerized information or pictures can be made from mathematical models
3. Can speak to genuine marvels involving one of a kind practices:
 - a. Physical framework e.g. engines
 - b. Financial framework
 - c. Social framework and so on.
4. Predicting likelihood of results (i.e. future expectations) – since foreseeing likelihood of results of a genuine framework is monotonous and appropriate unrealistic which has prompted the utilization of models. Models have a stipend of adaptability and simulations are completed as regularly as an architect needs.
5. Economically demonstrating is savvy as opposed to genuine experimentation and displaying goes for delivering a satisfactorily precise model at insignificant cost with some adaptability.
6. Modelling in Engineering empowers the assessment of expected change.
7. Models are basic for choice investigation and basic leadership.

ALGORITHM

Fundamentally algorithm implies uncertain strides to taking care of a specific issue, given as set of directions

or mathematical formulae’s. Albeit, every issue can be exceptional, algorithm does not mean an unequivocal response to the issue but rather a rule prompting an answer. As a noteworthy truth, algorithms are inalienable in engineering and computing helping in neutralizing distinctive marvel i.e. framework contact, info and yield voltages, monetary adjust, interests and so on. In this way, Algorithmic subject is one of the developing zones in science, computing and engineering. As in this way, it has prompted an assortment of reading material and articles being distributed on the topic, covering easy to convoluted points – thing arranging, seeking to framework demonstrating.

Mathematical Modeling incorporates meticulous assignments however set down directions are non-existent. Take for example fine art or critical thinking – as people with various information base and unparalleled traps sacked some place, can concoct heap approaches for a similar situation leaving a greater space for thinking and contentions about which arrangement is ideal. An indistinguishable applies to engineers from each may have an approach to settle the wonder. In any case, there are three exchange offs that a designer must be acquainted with from the beginning of demonstrating and hardening with one of these perspectives bargains alternate: this viewpoints hold inside properties including mix of measures of good-of-fit in every mode, subsidizing and show level of opportunity. These three perspectives refute the way that any model outlined is perfect^[8]. These exchange off perspectives are:

1. Accuracy
2. Cost
3. Flexibility

Why Algorithms in Engineering: Everything considered, PC application would not typically exist like they are today or be conceivable without ALGORITHMS. In spite of the fact that PCs are intended to help—the work they do is past mind boggling utilizing algorithms. Basically algorithms give the focal part in computing, information examination, and demonstrating thusly key in relatively every part of our being—professional and personal. As we confront distinctive difficulties in our day-to-day life, businesses, industrial facilities, engineering and in banks (accounts) algorithms are planned intuitively and deliberately to help alleviate the problems—Problem Solving Techniques. Algorithms essentially contribute close to 99.9% in displaying giving concise understanding.

Mathematical Modelling and Algorithm Flow Diagram *Conted...*

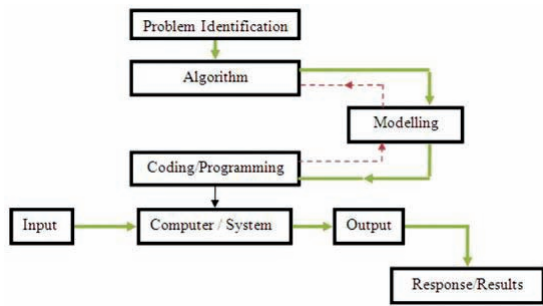

Fig. 1: Modelling and Algorithm Flow Diagram

Understanding a problem from the beginning is an exceptionally vital perspective an information examiner, PC pro and a specialist can accomplish, fizzling which the objective tried or wanted won't be met since the essentials are misjudged and confused. As a preventative measure, it is standard to get the problem appropriate from a hypothetical and pragmatic point of view before planning algorithms. One needs to settle on factors like computational means, diagnostic techniques and so on with everything taken into account making an entire and extensive algorithm. Displaying at that point comes as a subsidiary from the algorithm. At exactly that point in the wake of outlining a powerful model, a program can be composed, fixed and kept running on framework sustaining proper contributions to assess and investigate the sources of info connection to the yield reaction. However, the above stream diagram in Figure 1 may demonstrate a straightforward method of mathematical displaying and algorithm, don't be tricked to the reality – as displaying and algorithm can at present face challenges examined in segment 4 of this paper. The accompanying subsection defines all phrasings utilized when demonstrating. Table 1 gives an itemized taxonomy.

Modelling and Algorithm Taxonomy

Table 1: Taxonomy

Term	Description
Algorithm	
Ambiquity	Multi-interpretations, multi-outcomes and inexactness of a system.
Uncertainty	A certain min – max boundary a system is required to operate at or system inherent deficiencies, thus, of knowledge incompleteness.

Unknowns	Not known—the dissimilarity between developing/becoming and present knowledge.
Unknowable	Unattainable knowledge. Knowledge that is no way near humans due evolutionary progressions, limitations and or can be 'attained by quantum leaps by humans ^[7]
Modelling	
Approximation	This modelling aspect emphasis relevance by approximating reasoning hence dealing with formulae complication and complexity
Simplification	Tractability needed on problems and solutions—promotes absolute comprehensiveness
Fallacy	The misfortune of being oblivious fallible or erroneous belief on the methodology due to unfounded and wrongful misleading notations.

MATHEMATICAL MODELING CHALLENGES

Perusing this, you may end up making an inquiry like, “why demonstrate?” rather than applying subjective judgements and instinct to decide. There is nothing incorrectly in contemplating except for one should remember that human comprehensions might be imperfect. Wrong judgements are (i.e. characteristic to people) made and when executed there can prompt wrecking catastrophes^[9, 10]. Uncertainty is in the human instinct in this manner inescapable. In this way, demonstrating is basic in each choice problem. Displaying has been the stay for analysts, scientists and engineers, reforming ventures, lives the world over – settling on it the apparatus of decision for all orders. In any case, demonstrating master experiences various challenges on their particular fields^[7].

Demonstrating on the counterbalance can be seen as a problem, in this manner requiring a gathering of talented specialists (i.e. analysts, scientists, engineers and so forth) to cure the circumstance. The undertakings can be shared by in excess of one cognizant gifted personality shaping the shared view and empowering smooth innovativeness and developments among a group of specialists. Demonstrating verifiably gives

valuable grounds and additionally unambiguous entomb subjective understanding – nonetheless, displaying can yield begging to be proven wrong understandings and challenges^[7].

Sensibly, systems are special and have bunch qualities, traits, and capacities as hence these properties make overpowering, hard to tackle problems which then again makes demonstrating an impressive assignment. Take for example, a mechanical transport line framework i.e. metal transportation belt in mining industry, on its full and ordinary activity it experiences afflictions, for example, rain, dust, exceptionally hot climate, contact, belt extend, belt tear, voltage floods, control cuts, engine drive warming up and backfire. These can be a repulsive assignment for engineers in the matter of how to display this framework to cure all the nonlinear inconsistencies previously mentioned. From this time forward, the former parts cover the most widely recognized challenges in detail.

Knowledge and Skills in Modeling: The essential prerequisite before displaying is gathering data for specific process we mean to research. The information acquired will thusly be useful for facilitate investigation and translation. These optional advances prevalently manage the result of the procedure. On the off chance that the information, examinations systems are imperfect, the ultimate result will be defective rendering the model defective and unusable. Social affair, examining and deciphering information require expertise and experience. The vast majority do not have these characteristics, constraining their demonstrating capacities. Multifaceted nature lessening, information testing, supposition (i.e. accept nonlinear procedure to be direct) are confinement in displaying. To be out of line to the procedure presumptions are joined into the technique to decrease multifaceted nature and over investigation of data^[11]. It is constantly best not over break down process, as this could mean just pertinent data is consolidated to the model. Over dissecting of the procedure characteristics, capacities prompts advancement of complex models. Consequently, as the model consolidates numerous characteristics, it wind up close incomprehensible if certainly feasible for the model to be comprehended. Along these lines, individuals achieve a halt when it comes to credits to center or incorporate into the model. Disposing of a few information thought to be unessential can have mishaps conceivably pulverizing outcomes. The inquiry is how you decide pertinent and throwing out insignificant information from a group? This remaining

parts an implausible factor. Specialists swing to center around the choice problem rather the entire procedure by overlooking different variables. It has been by and by for an a long time, it is working yet is it best? The inquiry stays to be replied.

Whom to involve in the Modeling process: Countless or enterprises without the expected aptitudes to take care of the choice problem, outsource their choice problem – a typical standard. This can be an overwhelming errand for the accompanying reasons; the measure of assets used to distinguish stern and qualified specialists – if not known to them. Typically organizations that are compelling and productive are less accessible, along these lines, delays are inescapable; Outsourcing ventures is expensive thusly, budgetary limitations are a gigantic impediment to any extend movement. As subsequently, organizations with stringent spending reserves depend on less expensive help; the fundamental angle is NO one is a specialist in all orders – who are the correct individuals to evoke the errand to achieve a shared objective?

Uncertainty in Models: Demonstrating is intended to decrease the consequences of vulnerabilities yet because of advanced advances and or high framework many-sided quality has demonstrated fairly hard to stay aware of vulnerabilities. Systems are required to execute basic choices with potential antagonistic outcomes. It is anyway basic for specialists i.e. scientists, analysts, engineers to be learned, gifted and ready to apply their instinctive reasoning to settle on imaginative and viable choices. Instinctive here infers to choices that are sensible, expository, conceivable, and practical and prove – based. As a part of this instinct, an expert(s) ought to be straightforward on the choice and know the thinking behind each every critical choice as this guide in enduring vulnerabilities with profundity understanding. In science and engineering, vulnerabilities are caught as far as lower and upper limits. This demonstrates a huge low and high limit which a framework is to work inside those limits. These limits are resilience edge to anomalies on the framework. A resilience edge innately gives a framework typical and solid task with no consequences acquired. Having resilience edge is the best strategy to rehearse than confinement. Specialists are still tested tremendously when managing uncertainty. There are difficult to distinguish and almost difficult to quantify thus impediments are set. Sound deceitful however it turned out to be working for quite a long time. Another factor is that of desires. Engineers and society desires

are at verge point (vast and overpowering). For each framework composed performance of high class bore is normal thus putting weight on displaying and planning specialists. This anyway decreases the resilience of errors^[10].

Prosperity/Plentiful of Information: Knowledge is the capacity to make basic, systematic choices in light of the assets at ones transfer and do vital activities to supplement choices made. Essentially every living creature ready to execute and get by in this cruel tyrannical callous earth it's assumed clever. Wealth of information can be seen as part of Decision Making (DM). Having a lot of information advances the nature of reasonability and DM. DM can be ascribed into three perspectives. Right off the bat, information and data handling – breaking down, testing and assessment of the information. Also, learning creation/development – following the examined information a database can be made for additionally utilize. Thirdly, evaluation of the related vulnerabilities and dangers – this angle must be carefully surveyed for the advancement of the framework in task. This guideline has an additional favorable position on vigor and it includes progressively the adaptability of the framework and last however slightest it improves the capacity of suitable basic leadership. However, as a specialist it should come regular that having plenitude of information does not mean moment assurance. There might be a few irregularities that may prompt errors in DM yielding undesired results. Examining and investigating information to screen out the errors or irregularities is tedious and require aptitude which a great many people don't have.

CONCLUSION

The paper has been composed, all displaying and algorithm challenges delineated. Displaying is an unmistakable idea everything being equal, analysts and engineering processes. It enables the specialists to be immensely imaginative and innovative. It is anyway urgent and standard to shoulder at the top of the priority list that challenges are inescapable in any genuine problem as it is for demonstrating. Tending to any demonstrating problem without earlier legitimate skills and knowledge can be an impediment to a useful arrangement. The intelligent paper has represented in detail the capability of these problems on the adequacy of demonstrating. The paper spread out and clearly teaches learners over each platform.

ABSTRACT

Heterocyclic chemistry offers a case for the absence of distinct demarcations; truth be told, it overruns the majority of the other chemical disciplines. Heterocyclic are inseparably woven into the existence forms. The fundamental enthusiasm of the agrochemical enterprises in heterocyclic is frequently associated with their regular event. Synthetic chemistry gives cornucopia of heterocyclic systems. Heterocyclic compounds assume a similar major part in harvest and creature treatment as they do in medication. We will consider here just the utilization of synthetic compounds on crops in the field; numerous specialists have been created that capacity as insecticides, fungicides, herbicides, and plant growth regulators (PGRs), and these operators are by and large called pesticides. Principle point of this paper is to display the information in regards to the heterocyclic compounds that constitute the biggest family or organic compounds. These are critical with wide exhibit of synthetic, agricultural and industrial applications.

Keywords: heterocyclic substances, Synthesized compounds, agricultural.

INTRODUCTION

This will endeavor to draw out a portion of the features of heterocyclic compounds especially of pesticidal importance in the zone of organic chemistry. This surveys the history, importance and grouping of pesticides and examines quickly about their monetary importance in the cultivating sector. The yield insurance chemicals broadly utilized as a part of horticulture to control different irritations are named insecticides, fungicides, rodenticides, herbicides and fumigants relying on their method of movement. Among pesticides, insecticides are broadly utilized chemicals to control different maladies caused by various creepy crawlies.

Nitrogen, oxygen and sulfur containing heterocyclic compounds are key building squares used to create compounds of natural or therapeutic enthusiasm to scientific experts. Countless containing heterocyclic building squares have applications in pharmaceuticals and agrochemical research and medication revelation. Heterocyclic compounds likewise have a down to earth use as segments in colors, cell reinforcements, copolymers, bases, and ligands.

As in pharmaceutical research, the industry combines a huge number of compounds for testing in the already specified regions; many are found to have some level of movement, however frequently not with enough to legitimize business advancement. The cost of creation likewise may keep the acquaintance of new operators with the market, as will mammalian lethality contemplations. By the by, the field is substantial and of incredible importance in the immense zone of horticulture. The genuine estimation of synthetic agrochemicals just ended up obvious by the disclosure in the 1940s of the great insecticides Dichlorodiphenyltrichloroethane [DDT; more legitimately 1,1-bis(p-chloro-phenyl)-2,2,2-trichloroethane], and esters of organophosphorus acids, for example, parathion ((EtO)₂P(S)OC₆H₄NO₂-p), among different compounds. Research on pesticides and PGRs turned into a major action of numerous industrial firms, and an incredible assortment of structures were found to have business esteem, heterocycles being noticeable among them. This will condense a portion of the heterocyclic compounds that were marketed amid the early long periods of pesticide and PGR inquire about. Survey these compounds gives a great prologue to the extensive variety of heterocyclic ring systems found in the more dynamic specialists.

The present work clarifies amalgamation of thiadiazole, isoxazole, benzimidazole, dihydropyrimidinones, and benzodiazepine subordinates, and their organic importance, for example, insecticidal and fungicidal properties.

MATERIAL AND METHOD

Synthesis of new thiadiazolyl derivatives containing imida- zolidin taxophore akin to imidacloprid

This arrangements with the combination of 1,2,3-thiadiazolyl imidazole subordinates as neo nicotinoid insecticides. This investigation relates fundamentally to N-(4-aryl-5-1,2,3-thiadiazolylmethyl)-2-nitroiminoimidazoline subordinates. Retro synthetic examination of target particles requires fittingly substituted propio and valerophenones as beginning materials for 1,2,3-thiadiazole subordinates and 2-nitroimino imidazole as a moderate. The semicabzones of propio and valero-phenone (2a-k) are cyclised with thionyl chloride to get 5-alkyl-4-aryl-1,2,3-thiadiazole (3a-k), which is additionally transformed into 1-oxo-2-1-[1-(4-aryl-1,2,3-thiadiazol-5-yl)methyl/propyl]-tetrahydro-1H-2-imidazolyliden-1-hydraziniumolate (6a-p). The succession of synthetic strategy is delineated.

The formation and portrayal of bizarre compound (6 l-p) acquired in the buildup of 4-aryl-5-(1-bromopropyl)-1,2,3-thiadiazole with 2-nitroimine imidazole is depicted.

Synthesis of isoxazolyltriazole derivatives as fungicides: With a view to getting naturally dynamic isoxazole subordinates containing triazole moiety, combination of a progression of compounds have been considered and the synthetic system is portrayed. The triazole moiety has been observed to be an important taxophore to show fungitoxic properties hindering the phone divider combination and otherwise called C-14 demethylation inhibitor (to go about as fungicide). The vast majority of the misused azole fungicides contain a fragrant ring framework, and to the best of the author's information no compound with isoxazole heterocyclic moiety has so far been synthesized and contemplated for their fungitoxic properties.

The objective particle 5-aryl-3-(4H-1,2,4-triazol-4-yl methyl) isoxazole (13a-k) is set up by N-alkylation of 1H-1,2,4-triazole (12) with 5-aryl-3-chloromethyl-

isoxazole under mellow essential conditions utilizing diverse bases in polar dissolvable. The yields got are in the scope of 80-90 %. The likelihood of formation of C-4 alkylated item is discounted in view of the unequivocal portrayal of the item utilizing ghastly information.

Synthesis of Picloram: Picloram is a herbicide that specifically slaughters broadleaf weeds. Its union is appeared in plot 5. Picloram has auxin-like (growth-advancing) properties; it acts by expanding plant growth so quickly as to go through the normal supplements and slaughter the plant.

Applications of Heterocyclic Compounds in Agricultural

Triazine Derivatives: Different 1,3,5-triazines have to a great degree significant properties as herbicides. It was expressed in 19841a that they constitute the most important class of heterocyclic compounds in all of agrochemistry. The most unmistakable is atrazine, which at high focus is an aggregate herbicide, yet at bring down fixations is helpful for preemergence control of weeds. Numerous triazines have been examined, and a few have showed up available. A portion of these are appeared in Figure 1. All depend on the consecutive uprooting of .chlorine from cyanuric chloride (2,4,6-trichloro-1,3,5-triazine,) with nucleophiles.

Figure 1

Pyridine Derivatives: Some valuable pyridine subsidiaries are appeared in Figure 2. It will be demonstrated that these subsidiaries display an assortment of kinds of biochemical action. Paraquat and diquat are both quaternary salts in view of bipyridyls. Pyridine is the beginning material for the two compounds. They are non-particular, quick activity herbicides that follow up on every green plant through

impedance with the photosynthetic electron-transport framework. Fluridone is a herbicide that is a gamma-pyridone subordinate. It is a carotenoid inhibitor; this is an outstanding kind of movement that meddles with the photosynthesis procedure so as to prompt creation of the plant-deadly singlet oxygen.

Figure 2: Some pyridine agrochemicals

Pyrimidine Derivatives: Some prominent pyrimidine-based agrochemicals are shown.

The combination of these compounds utilizes the customary cyclization techniques for pyrimidine chemistry. For instance, dimethirimol is set up by response of the n-butyl subordinate of ethyl acetoacetate with N, N-dimethylguanidine. This operator and ethirimol are fungicides, which appear to act through impedance with the digestion of adenine in the plant. Bromacil and lenacil are analogs of uracil and are produced using cyclizations around urea; both are utilized as aggregate herbicides. Diazinon, pirimiphos, and pirimicarb are insecticides that respond with the catalyst cholinesterase that is engaged with the sensory system. Their prompt precursors are 4-carbonyl subsidiaries of the pyrimidines, which are predominant forms in keto-enol tautomerism; the acyl bunches are included by assault oxygen of the enolic form. Fenarimol is set up by buildup of dichlorobenzophenone and 5-lithiopyrimidine. It is a valuable fungicide that demonstrates to square ergosterol biosynthesis in the organisms. A few heterocyclic compounds are powerful blockers of sterol biosynthesis. Plant - growth controlling force is found in ancymidol, which acts by restraining gibberellin biosynthesis. Gibberellins are cyclic diterpenes of 19-20

carbons that are growth-advancing operators in plants; their hindrance impedes the growth of plants without executing the plant. A simple of the normally happening purine subsidiary zeatin (which controls cell division) has an incentive in enhancing the storage of plants.

Triazolopyrimidines: Flumetsulam was the first of another family of herbicides containing the triazolo[5,1-a]pyrimidine ring system². Important in this compound likewise was the nearness of a sulfonamido gathering. Here, the ring framework has [1,5-c] combination and the switched structure of the sulfonamide gathering. It is dynamic against grass and broadleaf weeds. Triazolopyrimidines show their herbicidal movement by restraining the compound acetolactate synthase³.

Pinoxaden: This herbicide is dynamic against grass weed species in the developing of grain oat crops, particularly rice. It is an inhibitor of acetylcoenzyme A carboxylase. Its structure developed from contemplations of the pyrazolidine-3,5-diones (and their enol subsidiaries), huge numbers of which have important herbicidal activity⁴.

Alkyne-Containing Heterocycles: Numerous heterocycles with alkyne bunches have powerful pesticidal action and constitute another wide family accepting consideration. As herbicides, they fill in as inhibitors of the protein protoporphyrinogen-IX oxidase, which catalyzes the last advance in the biosynthesis of chlorophyll. An ordinary herbicidal heterocycle a work in progress is pyraclonil, which is appeared alongside a few other valuable alkynyl-heterocycles⁵.

Thiamethoxam: This new bug spray is classed as an individual from the important neonicotinoid family, which go about as agonists of the nicotinic acetylcholine receptor. Thiamethoxam has foundational action, implying that a level of it or dynamic metabolic products⁶ is kept up in the plant and ingested by the assaulting creepy crawlies. It is particularly utilized as a part of the security of tomato crops.

Chlorantraniliprole: Diamide insecticides are another class of as of late presented edit insurance operators, which carry on as activators of ryanodine receptors in the creepy crawlies. This prompts uncontrolled calcium discharge in muscles. Chlorantraniliprole is an individual from this family and is in business use for security from different pests⁷.

Triketones with Heterocyclic Substituents:

Triketones speak to a very much considered, yet at the same time growing, family of herbicides. Some with pyridyl substituents are among the most dynamic. The triketones are inhibitors of the plant protein 4-hydroxyphenylpyruvate dioxygenase (HPPD), which assumes a key part in the biosynthesis of plastoquinone and tocopherol⁸. Nicotinoyl syncarpic corrosive is appeared as an ordinary structure of this compose. Its intense herbicidal movement prompted synthetic work that has yielded many related structures in an effort to enhance selectivity in the herbicidal activity.

Examples of the Results from More Recent Research Only a few illustrative structures will be shown here, defining some trends in research of the 2000s.

Applications of Heterocyclic Compounds in Commercial Fields:

Heterocyclic compounds are of awesome importance in a wide range of fields of business. They speak to specific, all around created regions of innovation. A critical utilization of heterocyclic compounds is in the field of colors and shades. Broadened conjugation is an important element for a compound to be colored, and heterocyclic systems, typically multicyclic, in awesome numbers have been built around this principle⁹. Industrial organic chemistry can follow its beginnings back to the (coincidental) disclosure of mauveine in 1856 by W. H. Perkin; it was the principal organic compound to be arranged synthetically at the industrial scale. Another heterocyclic compound, indigo was gotten from regular sources and was utilized for hundreds of years before it was synthesized in 1883 and later made financially. These two early compounds show the expanded conjugation so important in the improvement of new color and shade chemicals^{1b}. Innovation in the region of photography is very created, making utilization of heterocyclic compounds in different courses in the few stages of the process^{1c,d}.

Heterocyclic compounds can take an interest in polymer innovation in a few different ways. They can be pendants on a polymer chain, as may be formed from the polymerization of vinyl monomers with heterocyclic substituents. There are forms where the polymer is formed by shutting heterocyclic rings. At last, heterocyclic gatherings can be added to beforehand formed polymers^{1e}. Ruined heterocyclic amines are utilized as light stabilizers in plastic and covering

formulations, ensuring against debasement by bright radiation. These specialists are known as blocked amine light stabilizers (HALSs) and are normally subsidiaries of 2,2,6,6-tetramethylpiperidine¹⁰. A case of a HALS operator is Tinuvin 770 (BASF), which is a diester of sebacic corrosive and 4-hydroxy-2,2,6,6-tetramethylpiperidine. It is thought to act through the formation of a piperidinoxyl radical¹¹.

A flourishing and exceedingly important field is the development of coordination edifices from metallic species and heterocycles. These com-plexes can be valuable as response impetuses and have different uses too. To delineate the impetus region (which is extensive), the zirconium complex formed from the anion of indenylindoyl anion and $ZrCl_4$ is offered for instance. The complex has the formula Zr_2Cl_2 and is an amazing impetus for the polymerization of olefins.

Another significant property is the particular official of certain metallic species¹³. A case of this kind of ligand is the 1,10-phenanthroline subordinate (PDALC), which specifically ties to bigger metallic cations, for example, Ca^{++} and Pb^{++} . The solidified coordination complex formed from calcium perchlorate has the formula $[Ca(PDALC)_2](ClO_4)_2 \cdot H_2O$. Certain heterocyclic ligands have unique incentive in particular complexation since, as on account of PDALC, the spine containing the ligating nitrogen iotas can be unbending and offer a cavity of settled geometry to get the metal.

A generally new and as yet creating field is the utilization of hetero-cyclic compounds in electro-optical applications, which incorporates light-producing diodes (LEDs), thin-film transistors, and photovoltaic cells. One kind of helpful structure has a few heterocyclic rings, for example, pyrrole or thiophene participated in a straight mold. The phosphole ring framework is another member in this sort of cluster. This is delineated by compound in which two thiophene rings are appended to a focal phosphole ring (as the sulfide). This compound has LED properties; when stored as a thin film between a bilayer cathode and anode, yellow light was produced by use of a low voltage¹⁴. Other related structures are being analyzed for comparable electro-optical action.

Another new utilization of heterocyclic compounds is in the field of ionic fluids. These compounds for the most part are quaternary salts of certain heterocyclic bases, and they are discovering use as high-bubbling

polar solvents for extractions or as response media¹⁵. Normal, among the ionic fluids known so far are salts of imidazole, which are appeared as takes after.

CONCLUSION

The Review depicted in this, exhibits the amalgamation of new chemical substances embracing different methodologies and the compounds are screened for pesticidal movement in order to discover a lead particle for a predefined organic action and clarifies blend of thiadiazole, isoxazole, picloram, and benzodiazepine subordinates, and their natural importance, for example, insecticidal and fungicidal properties.

An Overview of the Factors Affecting Handovers and Effective Highlights of Handover Techniques for Next Generation Wireless Networks

Pramod Kumar P¹, CH Sandeep², Naresh Kumar S³

¹Research Scholar, Osmania University, Senior Assistant Professor, ²Research Scholar, SR University, Associate Professor, ³Assistant Professor, Department of CSE, S R Engineering College, Warangal, India

ABSTRACT

Mobility is the need of the hour computing and communication devices of today are ubiquitous and work in heterogeneous environment. Wordings, for example, Always Best Connected, Seamless Mobility are considered as key highlights of Next Generation Wireless Networks (NGWN). The test for Next Generation Wireless devices is guaranteeing end-to-end availability via consistently relocating between Heterogeneous wireless technologies (viz. Wireless LAN, WiMax, Cellular, UMTS, and LTE and so forth.) This procedure of handover between various wireless technologies alluded to as Vertical Handovers/Handoffs has critical significance among industry and the scholarly world scientists. The prime target of this paper is to give a one-stop literature store on nuts and bolts of Handovers, Classifications, Algorithms, Factors impacting Handovers and alluring highlights of Handover mechanisms for NGWN.

Keywords: Multi Attribute Decision Making (MADM), Soft Handoff, Hard Handoff, Next Generation Wireless Networks, VHD algorithms.

INTRODUCTION

The 4G Revolution has started with a considerable lot of the points of interest in wireless technology. Wireless technologies, for example, LTE, WLAN, WiMAX, and so on were produced with various standards and these technologies offer assortment of administrations, distinctive information rates and differing territory of scope. One of the approaching test in organize administration is to set up association between end to end heterogeneous wireless technologies. To give such end-to-end association between heterogeneous networks we have to perform Handover. On the off chance that the serving and target base station amid Handover are of various wireless technologies then such a Handover is called as Vertical Handover/Handoffs. The term interworking is utilized to express collaborations between heterogeneous networks with the point of giving a conclusion to-end communication^[1]. A Handover decision is a huge issue, in Next Generation Wireless Networks (4G). Handoff between two base stations (BSs) of a similar system is called Horizontal handoff. Flat handoff includes a terminal gadget to change cells inside a similar kind of system (e.g., inside a CDMA arrange) to keep up benefit progression. It

can be additionally arranged into Link-layer handoff and Intra-system handoff. Even handoff between two BS, under same Foreign Agent (FA) is known as Link-layer handoff. In Intra-system handoff, the flat handoff happens between two BSs that have a place with two unique FAs and the two FAs has a place with a similar system and consequently to same Gateway Foreign Agent. Vertical handoff alludes to a system hub changing the kind of availability it uses to get to a supporting framework, more often than not to help hub mobility. Vertical handovers allude to the programmed fall over starting with one technology then onto the next so as to keep up communication^[2].

Fig. 1: Basic Structure

The vertical handoff system enables a terminal gadget to change networks between various kinds of networks (e.g., somewhere in the range of 3G and 4G networks) in a way that is totally straightforward to end client applications.

RELATED WORK

The prerequisite for handoff component can be classified in to dynamic and non-dynamic necessities. The dynamic prerequisites incorporate RSS, speed, throughput, client inclinations, handover idleness, network stack adjusting as parameters and non-dynamic necessities incorporate network cost, control utilization, network security and bandwidth as parameters.

Fig. 2: Architecture

We have to discover approaches to enhance vitality proficiency in wireless networks. Power is expended amid versatile exchanging or handoffs. Amid handoff, visit interface initiation can cause impressive battery seepage. The issue of intensity sparing additionally emerges in network disclosure in light of the fact that superfluous interface initiation can increase control utilization. It is additionally vital to consolidate control utilization factor amid handoff decision. Secure handoff has turned into a vital factor in wireless networks. The network security comprises of the arrangements and strategies embraced by the network to forestall and screen unapproved get to, abuse, alteration, and network-available assets. The security highlights, for example, most elevated amounts of respectability, validation, and secrecy, network security ought to be inserted in the handoff arrangements. NGWN comprises of heterogeneous network overseen by various administrators like 2G, 3G portable communication systems, WLAN, IEEE 802.16e (WiMax), satellite. Issues in 4G network can be mobility, when portable client changes starting with one network then onto the next network or from one Base Station (BS) to another the component utilized is —Handover. So in heterogeneous network vertical handoff decision (VHD) is mostly utilized for persistent administration. A handoff conspire is required to save availability as devices move about, and in the meantime reduce unsettling influence to on-going exchanges. Accordingly, handoffs must display low idleness, support negligible measures of information misfortune, as well as scale to extensive networks.

PROPOSED SYSTEM

In the event that a misfortune occasion happened in wireless environment the congestion window size will be dropped. This is one of the real issues of TCP and SCTP. At the point when bundles are lost because of mobility or most exceedingly awful radio channel conditions, the transmission rate lessening causes a critical throughput decrease. With a specific end goal to conquer this issue, and recognize misfortunes because of congestion, 3SE appraisals the correct bandwidth capacity ahead of time. In the event that the switch under evaluations the bandwidth capacity, it will under use the connection and waste the important bandwidth asset, and if the switch overestimates the capacity, it will give inappropriate criticism to senders to increase their congestion windows and may cause line development and much support flood. It is exceptionally hard to choose a legitimate estimation of bandwidth capacity ahead of time for a wireless connection. This is on the grounds that a wireless channel is shared by contending neighbor hubs and the quantity of hubs sharing this channel may change constantly. And another reason is that the wireless connection bandwidth is influenced by many changing physical conditions, for example, flag quality, proliferation separation and transmitter control. those evaluated on the auxiliary way. On the off chance that the bandwidth on the optional way is bigger than the bandwidth on the way where the time out happened then the way definition are swapped. The optional way turns into the new essential way and the other way around. The point of this change is to transmit new packets on the way that is by all accounts in better conditions, increasing the likelihood of a fruitful communication. With a specific end goal to stay away from visit way swaps, a period hysteresis of 60s is presented. wireless bit is a 802.11b WLAN. Connections have diverse limits, except if generally indicated, the one-way spread postponement is set to 40ms on the settled part and is unimportant on the wireless channel. The 3SE incorporates execution of Dynamic Address Reconfiguration and Integration with the MIH system. The reenactment comes about assessing the vehicle of MIH messages by means of 3SE and the effect of handover signaling delays.

ANALYSIS

Framework introduce 3SE and its capacities in particular multihoming, multistreaming, address

reconfiguration and can recognize among misfortunes because of congestion and radio channel disappointments. Among the fundamental curiosities introduced by 3SE, there are the expanded bandwidth estimation and the productive utilization of multihoming by the redefinition of essential and optional way. What's more, they give a total answer for utilize 3SE as a productive transport answer for MIH. The arrangement consolidates a way determination algorithm and the utilization of MIH administrations to enhance 3SEs conduct. Reproduction comes about demonstrates that the proposed arrangement lessens the effect of packet misfortune and the occasion generation rate on the transmission delay, RSS measurements either with an expected lifetime metric or the accessible bandwidth of the WLAN candidate. We have two situations. In the principal situation when the mobile terminal moves from the scope region of a WLAN into a 3G, a handover to the 3G network is started. At the point when RSS normal of the WLAN association falls underneath a predefined edge, and the evaluated lifetime is not exactly or equivalent to the handover delay, the handover is activated. In the second situation when the mobile terminal moves towards a WLAN cell, the handover to the WLAN is activated if the normal RSS measurements of the WLAN flag are bigger than a limit and the accessible bandwidth of the WLAN meets the bandwidth necessities of the application.

Fig. 3: Analysis

An algorithm is proposed amongst WLAN and 3G which is based on correlation of the current RSS and a dynamic RSS edge when a mobile terminal is associated with a WLAN passage. A voyaging separation expectation based algorithm is produced to take out the pointless handovers which is introduced in the above strategy. The algorithm or fuzzy logic. The mobile gadget gathers highlights of accessible wireless networks and sends them

to a middleware called vertical handover administrator through the current connections. The vertical handover chief comprises of three primary components: network handling supervisor, highlight authority and ANN preparing/selector. A multilayer feed forward ANN is utilized to decide the best handover target wireless network accessible to the mobile gadget, based on the client's inclinations. A fuzzy logic based algorithm.

CONCLUSION

This examination is to transmit new bundles in transit that is in every way in better conditions, improving the probability of a powerful correspondence. In order to avoid visit way swaps, a period hysteresis of 60s is presented. remote fragment is a 802.11b WLAN. Associations have assorted points of confinement, aside from if by and large demonstrated, the restricted spread deferral is set to 40ms on the settled part and is unimportant on the remote channel. The 3SE fuses execution of Dynamic Address Reconfiguration and Integration with the MIH structure. The proliferation happens evaluating the vehicle of MIH messages by methods for 3SE and the impact of handover flagging deferrals. The present examination gives a one-stop writing store on rudiments of Handovers, Classifications, Algorithms, Factors influencing Handovers and appealing features of Handover systems for NGWN.

Definite Aims and Objectives of Teaching English Language

S. Shailaja¹, T. Satyanaraya², C. Goverdhan³, A. Srinivas⁴

¹Asst. Professor, ²Professor, ³Asst. Professor, Department of English, ⁴Faculty, S R Engineering College, Warangal, India

ABSTRACT

With regards to language learning, the part of a language teacher is to a great degree powerful in students' achievement. They should have serious information and careful understanding of the general and psychological principles that represent students nature and conduct particularly in connection to the students learning background. While teaching, they should remember the psychological capacity and the getting a handle on limit of the learners. Viable teaching of a language depends on specific principles. The paper manages the connection between teaching principles and learning abilities and likewise manages the effect of inspiration on learner's achievement.

Keywords: *teaching, principles, learning, language, students, classroom.*

INTRODUCTION

English is a global language talked by 700 hundred million individuals on the planet after Chinese language. It is officially perceived everywhere throughout the world. It is fascinating to take note of that it is a language of library, language of media, language of exchange, web, trade, business, worldwide transactions and higher education. It is the connection language in India. The correspondence between two nations and the two states happens just through English. Since English is a language of International correspondence, learning English Language is a shared objective for some individuals.

The point of teaching English in India is to empower the students to get command over the language. To empower the students to peruse, compose and communicate in English easily. Be that as it may, it is apparent that the greater part of the learners are not accomplishing their objective. Students can prevail in examination however they don't recollect that anything that they learned in their language classes nor do they get down to earth command over the language. Like history and science English isn't information subject it can't be learnt basically by retaining the words and standards of syntax. It involves hone. As Thompson and Wyatt expressed that the intensity of articulation in a language involves aptitude as opposed to of learning. It is a power that develops by practice not by knowing just implications or standards. Similarly as painting and

moving language is an ability subject that can be aced just by ceaseless practice. To show English language viably, the teacher should remember the accompanying principles of language teaching:

PRINCIPLE OF DEFINITIVE AIMS & OBJECTIVE

The teaching of English language winds up productive just when the teacher knows about positive points and targets. Without points and destinations teaching may not stay deliberate action. As per Thompson and Wyatt(1952)^[2]the teacher ought to recollect the four particular points while teaching English to students. They are:

- i. To understand communicated in English
- ii. To communicate in English
- iii. To understand composed English
- iv. To write in English

Thompson and Wyatt(1952)^[2] likewise commented that "it is fundamental that Indian individuals ought not just understand English when it is talked or composed yet additionally he should himself have the capacity to talk and compose it".

Principle of planning: Viable teaching requires legitimate arranging. Rule of arranging is a noteworthy

component of teaching learning framework. Powerful Planning includes five fundamental segments: very much outlined curriculum, learning targets, teaching and learning exercises, appraisal instrument, and assessment strategies to check the understudy understanding of the subject. Standard of arranging gives structure to fundamental learning so the teacher can't go amiss from the primary subject. It causes the teacher to know points and destinations of the course ahead of time with the goal that the teacher can be sorted out to finish the syllabus in the given time span. It can likewise help the teacher in opportune arrangement of the exercise and trust in conveyance.

Principle of motivation: The most vital factor in second language obtaining is inspiration. The accomplishment of an understudy relies upon the rate of teacher's inspiration of students. Language teachers can't show language viably on the off chance that they don't understand the connection amongst inspiration and its effect on language procurement. So the teacher's job is to make an agreeable domain in which every one of the students feel perceived and esteemed. Rouse the students by giving earlier year students' achievements. Language can be immediately learned if interest is made in it. Urge the students to set here and now objectives and help them to accomplish specific objectives. By knowing students by names teacher can customize classroom condition. Inspiration, both characteristic and extraneous is of preeminent essential in the accomplishment of students everything being equal. Teachers' supporting condition, unprejudiced criticism, neighborly air have extraordinary effect on language securing of students.

Principle of creativity: Creativity makes distinction in the classroom. During the time spent teaching learning the teacher ought to empower creativity in the classroom. Inventive classrooms give condition where students are urged to express their thoughts and thoroughly consider of the crate. In the realm of web teachers can fuse innovative learning by making enamoring exercises on different themes that lift students' capacity to think of creative thoughts.

Principle of feedback: Feedback is a basic component of enhancing the learning procedure of the students. Feedback is recognized as a crucial way to deal with encourage students' improvement as autonomous learners to screen, assess and control their own learning. (Ferguson,2011)^[3]. It has been demonstrated that feedback

upgrade learning and enhances students' results. Giving feedback is an essential ability for teachers in higher education and impacts the nature of the students' learning procedure (Hattie&Timperley,2007)^[4]. Feedback can be conveyed oral or composed and it can be given to singular understudy or to the entire class. Through appropriate feedback students can get direction and open doors for development by recognizing their downsides.

Principle of variety: Variety is likewise a standout amongst the most compelling variables to improve teaching learning process. Traditional strategies for teaching are obsolete at this point. The teacher can acquire variety the classroom by utilizing distinctive learning exercises, feedback strategies, assets, and different teaching ways to deal with make the classroom vivacious and interesting.

Principle of sensitivity and participation: Teaching learning is a helpful procedure. Teacher ought to give support and advance affable conduct in the classroom. If there should arise an occurrence of classroom disagreements teacher ought to develop unprejudiced standpoint and settles on a decision in light of the best interests of all.

Principle of self learning: Spoon-encouraging through thick addresses has been the customary strategy for teaching in the classroom (Boyer,1987)^[5]. Spoon-bolstering kind of teaching principally consists of teacher focused style of directions where the educator furnishes the students with the greater part of the data they have to know for the course bringing about controlling autonomous idea and action.(Collins American English Dictionary on the web, n.d.).In spoon nourishing sort of learning the teacher express precisely what he wishes to instruct. Students all to do is to take abundant notes, retain the material and they will have the capacity to finish the test with a sensible review (Dehler,2014)^[6]. In spoon-bolstering sort of teaching students wind up uninvolved learners and they don't assume any liability for their own particular learning and in the long run overlook what they realized when the course is finished. In understudy focused learning condition the teacher can establish the framework for free reasoning and critical thinking abilities.

Principle of group dynamics: Teacher ought to urge students to take an interest in group exercises and group assignments that advance focused soul, shared

understanding and individual inclination. Principle of group dynamics fortifies excitement in group exercises with the goal that students get more language practice as the majority of the exercises are done in sets or in groups. These group exercises likewise create certainty and free reasoning aptitudes among students.

Central of drill and Practice: As Palmer says, language learning is basically a propensity shaping procedure, a procedure amid which we get new propensities. At the point when students are learning a remote language they require adequate practice and drill to get rid of mother tongue since the hints of the new language is not the same as those of mother tongue. So it is essential for teachers to assist the students with mastering the structures and hints of English Language.

Principle of Repetition: Repetition is additionally one of the essential language learning systems. Propensities are framed through reiteration. During the time spent learning students have a tendency to overlook things with the progression of time. It has been demonstrated that things often rehashed are best recalled. So it is the obligation of the teacher to apply the idea of redundancy during the time spent learning.

Principle of activity (Learning by doing): In the customary classroom students are just detached beneficiaries of data. Presently the idea of teaching learning has been changed from teacher driven to the understudy driven. Activity based learning suggests that students learn by doing different exercises. The part of a teacher is not just restricted to be a teacher they have to assume distinctive parts, for example, classroom supervisor, a facilitator, a guide, communicator and screen to make the students effectively associated with different kinds of exercises that cultivate all round improvement. Activity based learning urge the students to be autonomous masterminds. The exercises assemble students' self certainty as well as create sound connection amongst students and students and teachers and students.

Principle of setting and circumstance: The main objective of teaching English language is to empower the learner to utilize it. Since the reason for the language is to empower the learner to utilize it then it must be practiced in appropriate realistic circumstances or envisioned circumstances. Language learning is not all that simple except if it is associated with handy life. Strict interpretation, mechanical drilling of words

and structures drilling as well as makes the language learning incapable. In situational language teaching every one of the words sentences become out of genuine circumstance so students can apply that information in everyday life circumstances.

Principle of rest & Recreation: Nowadays Technology has turned into a necessary piece of current age. They have turned out to be dependent on another technique for online correspondence through web based life, twitter or they are probably going to be seen watching T.V projects or playing videogames. There is no degree for rest and recreation that revive both personality and body. Teachers should assume liability for orchestrating recreational exercises for students. Recreation exercises like climbing, tree ranch, painting, drawing, sorting out school occasions, shows, plays and sports revive the psyche as well as builds up the compatibility between the teachers and students. These recreation exercises diminish pressure and help students to feel more invigorated to improve as an understudy.

CONCLUSION

The paper tosses light on the teaching principles and the part of a teacher in procedure of dynamic learning of students. It has been demonstrated that teaching principles are imperative devices so as to improve students' interest in language learning exercises. Teaching English Language has experienced huge changes in the previous two decades. New patterns and strategies have been worked out in the field of teaching English. However students are confronting such a significant number of difficulties in correspondence. The most widely recognized difficulties are: Problems in elocution, Problems in understanding and getting a handle on, poor listening aptitudes, issues in articulation and composing, and issues in communication has incredible negative effect on scholastic achievement. With regards to these issues the part of a teacher has turned out to be extremely pivotal in language learning. It is the obligation of the teacher to distinguish the fundamental connection between the principles of teaching and the language learning capacity and to apply them to improve learning aptitudes.

Designing a Collaborative Detection System for Detecting the Threats to the Cyber Security in Big Data

Goje Roopa¹, Dadi Ramesh¹

¹Assistant Professor, Department of CSE, S R Engineering College, Warangal, India

ABSTRACT

In the season of big data, it is a trouble to be unraveled for empowering the solid development of the Internet and the Internet+, mindful the data security of people, foundations and nations. Along these lines, this manuscript makes a shared discovering arrangement of cyber security threats in big data. At first, it clarifies the record aggregate model of Flume, the data store of Kafka, and the data strategy of Esper; at that point it designs one-to-many record compilation, reliable data store, CEP data method utilizing episode query and occasion show comparing. Future execution of this structure comes about great consistency and high capability. Besides, this framework execution additionally comes about reward of low cost and bendy activity.

Keywords: kafka, Big data, threat, Internet, cyber security.

INTRODUCTION

Now-a-days, there is a tremendous advancement in the Internet and in addition Internet clients which thusly builds the quick development of electronic trade, IT Finance, Internet industry etc(Internet+), Hence more attackers shows up which forces threats on cyber security. As per the report distributed by Akamai, about the internet advancement security in the second from last quarter of 2015, Cyber security threats expanded , different data spillages and cyber assaults are kept on rising, especially DDoS(Distributed Denial of Service) assaults are expanded to tremendous extent(i.e. upto 180%) which makes a record. Report likewise indicates if DDoS assaults expanded ceaselessly then it might incapacitate center switch of system administrators. Additionally, cyber assaults will cause genuine and noteworthy outcomes, for example, loss of salary, harm to notoriety and information frameworks, and taking of private data or client touchy data.

Particularly in the time of big data, there is an enormous assault on the data created at each minute, and conventional frameworks are to be overpowered in managing these assaults. Be that as it may, the big data innovation is broadly connected to different ventures, and it is simply started to use in the security business. In this manner, it will be an improvement pattern to recognize the cyber security threats by ideals of the big data innovation.

For example, Zuech R et al. presented the particular issues of big heterogeneous data combination, heterogeneous interruption recognition models, and security information and event management (SIEM) frameworks from a wide range of heterogeneous sources.

There are five models utilized as a part of big data innovation to process the data: an incorporated online constant examination complex event processing model which is called Esper^{[6][7]} proposed by Giuseppe Antonio Di Luna et al; a distributive and cluster processing model which is called Hadoop^[4] proposed by Dong Cutting et al; a distributive and continuous investigation model which is called Agilis^{[1][11]} proposed by Leonardo Aniello and Roberto Baldoni et al; a distributive blame tolerant online ongoing examination model which is called Storm^{[10][13]} proposed by Nathan Marz's et al; a distributive multi-cycle group processing model which is called Spark^[12] proposed by Michael Armbrust et al. These big data processing models give a decent specialized help to the discovery of cyber security threat. In any case, these models are just data processing models and can't be utilized as a total arrangement of free security threat identification framework. Consequently, it is extremely important to build a security threat identification framework by using the big data processing model.

Any assault on the Internet has a specific law, and it needs to utilize a specific innovation to find.

Diane Staheli et al. proposed a community oriented examination framework - CARINA, utilizing cooperative data investigation and revelation procedures to give better choices to organize investigation [14]. It has faith in Axiom 6 in that “A relationship dependably exists between the Attacker and their Victim(s) even it is removed, temporary, or backhanded.” Hence, a govern for recognizing the assault is created by the relationship, and the connection between the attacker and the victim is discovered by the assault rules. Besides, Esper engine is a data processing model for processing the data as per the assault rules. Along these lines, this paper builds a community identification arrangement of cyber security threats in big data by utilizing the Esper engine as the data processing model, the Flume as the reliable profoundly accessible huge log gathering, total and transmission and the Kafka as the data cache.

RELATED WORKS

A. Flume: For successful Collecting, Aggregating and Broadcasting substantial measure of log data, Flume is an anticipated and very accessible framework, delivered by Apache.

^[2] The reason for its activity is Agent, which is picked as the base autonomous task unit, and Event is utilized as a center unit of data processing. Every Agent comprises of three essential parts: Source, Channel and Sink.

From outside assets, Source gathers an event, changes over into some exact configuration and then sends this event into a solitary or numerous channels. It produces distinctive strategies to assemble data from data sources, for example, Request Procedure Call, reassure, content, syslog, executive, and so on.

As a Broadcasting channel, Channel stores the Event send by the Source until the point that Event has been taken by Sink. It gives many Channel composes, for example, Memory Channel, File Channel, Java Database Connectivity Channel and so forth.

As a data collector, Sink obtains the Event from the Channel, plays out the data perseverance for the event (for example, the event is stored into document frameworks, databases, or submitted to the remote server) or sends the Event into another Source. It additionally gives numerous

data getting modes, for example, support, RPC, content, HDFS, syslog TCP, and so on.

Flume influences an event to flow from Source to channel and then to Sink by utilizing this three parts. It gives three models: coordinated, one-to-many, many-to-one. In addition, for a similar Agent, Source and Sink are offbeat.

B. Kafka: Kafka is a conveyed makes buy in informing framework which is having high yield. It has the following qualities:^[3]

1. Fastness: A solitary Kafka hub can handle several uber bytes for every second from thousands of clients.

2. Scalability: It allows single bunch to be assumed as a key part of data for extensive organizations, and the development can be performed adaptably and straightforwardly without the downtime. The data stream is separated and scattered into the group, which influences the data to flow bigger than the limit of any one machine and accomplishes the bunch coordination.

3. Persistence: To defeat data misfortune messages are stored in a circle and duplicated in the group. With no adjustment in the execution every hub can handle one million Mega bytes.

4. Distribution: Kafka is a present bunch focus which gives heartiness and adaptation to internal failure.

It contains of three segments i.e. Maker, Consumer and Broker. Maker is a message distributer. It creates and sends the data to Broker; Consumer is a message endorser, it gets and then process the data from a Broke; Broker is a message stockpiling exhibit, the execution is improved in view of not keeping up the data utilization state. Furthermore, the three segments do the coordination of solicitations and sending through the Zookeeper^{[5][8]}.

Zookeeper is a conveyed coordination administration of utilizations, which depends on the Fast Paxos^[9]. It creates a pioneer through the race, and just the pioneer can present the proposer.

C. Esper: Esper is a flow of data processing technique for Complex Event Processing (CEP), it has the following highlights:^[6]

1. By utilizing Event Processing Language (EPL) questions of memory database complex events are handled. It has better processing and query execution when contrasted and conventional social database.
2. Event is handled by utilizing two components. State Machine is utilized to execute event mode coordinating in view of the articulation. The event processing strategy is to coordinate the event anticipated that would exist, the truant event or the blend of events; and the query of the event flow is actualized through the EPL proclamation. Channel, Slip window, total, joint investigation is the elements of event processing. The EPL receives the view to put the developed data into one event flow and to drive the flow of the data; and the data is handled amid the data flow procedure to acquire a last required outcome.
3. It gives numerous data processing techniques: POJOS (Plain Old Java Objects), MAP, SOCKET, XML, and so on.
4. 500 thousand events are handled every second and achieves 70Mbps information flow rate
5. When another threat arrives, recognition rationale is computerized powerfully by erasing/coordinating SQL query explanations.
6. The overhead is low.

The example of Esper is a decide that is made out of nuclear events and administrators. The nuclear events are altered events, and the example administrators are of 4 composes:

1. Repetition administrators: each, every-unmistakable, [num] and until
2. Logical administrators: and, or, not
3. Order administrator: - > (followed by)

4. Event lifecycle administrators: clock: inside, clock: inside max, while-articulation

The example administrators are like different administrators and additionally have the need. As per the need of the example administrators, the example articulation “a->b” alludes to that if event of an event b on the correct side follows the event of an event an on the left side, it enters an Esper engine. The example articulation “each a->b” implies that once an event B enters, all events A preceding the event B are coordinated, and on the off chance that it prevails with regards to coordinating, it enters the Esper engine.

The nuclear events are joined into various articulations by utilizing the example administrators in order to frame diverse examples, and the relationship between’s the events is investigated by the examples.

Design of Mutual Detection of Threat: In the mutual threat detection architecture, the data agreement is generally partitioned into five phases: data source, data accumulation, data cache, data processing, and data stockpiling. The data source is different system data bundles communicated on the system; the data gathering is to just handle and channel the system parcels, and is utilized as the maker of Kafka to make data; the data cache is to compose the Broker by resource of Zookeeper, so the data accumulation rate is reliable with the data allotment rate, and it supplies the consistency of the data; the data administration is utilized as the client of Kafka to expend the data amid the EPL query and model of Esper Engine, and it enacts the tuning in for the occurrence indistinguishable the model; the data stockpiling is to relentlessly store the data in the period of data accumulation and data processing, and to give the data for disconnected investigation and plan. The fundamental reproduction of the mutual hazard detection basic outline is represented in Figure 1.

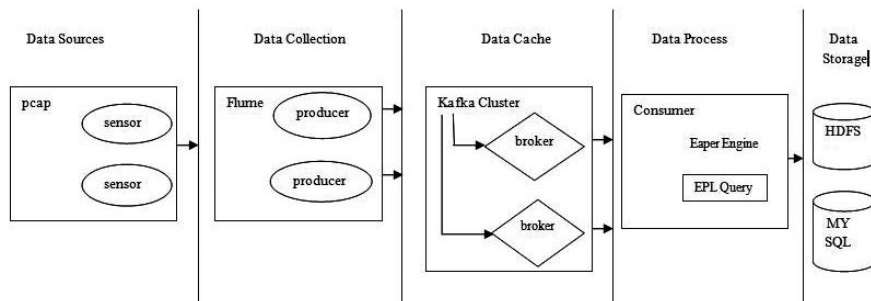

Fig. 1: Shows mutual threat detection architecture

CONCLUSION

With a specific end goal to advance solid and safe improvement of the Internet+, this paper builds a cooperative detection framework for distinguishing the threats to the cyber security in big data by utilizing the innovation of big data.

Firstly, it presents the included advancements - the arrangement of pacp bundles, the log gathering parts of Flume, the qualities and data accumulation segments of Kafka middleware, the memory database, the event stream query instrument and the example coordinating component of Esper, and the assault kind of DDoS. Besides, it outlines the data flow for parsing the system bundles, the one-to-many log gathering model of Flume, the steady data storing of Kafka and the CEP data processing of Esper, and additionally plans the general architecture model of the community threat detection.

Identifying the Evolution of Ways towards Thinking about the Students Mathematical Learning Process

R. Archana Reddy¹, G. Swamy Reddy²

¹Professor, ²Associate Professor, Department of Humanities and Sciences, S R Engineering College, Warangal, India

ABSTRACT

We depict an involvement with in-service teachers. In this experience the teachers composed instructional proposals to create students mathematical knowledge. This proposition was utilized to instruct a similar course a few times. After every execution the teachers talked about the experience. We watched the cycles of refinement when the teachers actualized the proposals and talked about the outcomes. In this process the teachers' originations about learning and teaching mathematics developed. The originations changed when the teachers shared and examined the outcomes among themselves. We utilized the Models and Modeling perspective to dissect instructional proposals. The documents delivered by the teachers were the base to recognize the development of mindsets about the students learning process. The teachers depicted in this paper are studying in a master's program in mathematics education.

Keywords: *In-service teachers, Modelling, Cycles of understanding.*

INTRODUCTION

Learning mathematics involves the improvement of mathematical knowledge and thinking. The students need to learn ideas, to create capacities, aptitudes, and propensities for the discipline. Also, they need to obtain capacities to exchange the knowledge and aptitudes to new assignments and learning settings. By what method should this be possible in the classroom? What kind of mathematics teachers are required? What kind of educational projects, tasks, and processes ought to be created? By what method should mathematics teachers be bolstered to incorporate exercises into their teaching hones that rouse students to focus on learning? When we talk about the need to enhance a teaching and learning process there are a few inquiries that emerge and identify with all levels of members – from students, to teachers, to designers, to specialists of the education framework. In this paper we talk about inquiries including: What kind of mathematical exercises and learning processes do teachers underscore in their mathematics instructional proposals when they need to include issues? How do teachers think students learn mathematics? How do teachers imagine their part and the part of their students during instruction? The outcomes introduced in this paper were gotten from a teachers' training program. This program includes

Models and Modeling and Problem Solving perspectives as procedures to educate mathematics.

LITERATURE REVIEW

The Models and Modeling perspective (MM) is our structure. It uncovers the intricacy of the teaching of mathematics, learning, and critical thinking (Lesh, 2010)^[2]. MM imagines the learning of mathematics as a process of improvement of calculated frameworks or models that are continually changing during the interaction between the individual and the issue or circumstance. The learning process involves a progression of cycles of understanding where the calculated frameworks are changing to more refined models. The early interpretation of the circumstance for the most part changes since subjects bit by bit see more important information. In these cycles the subjects think in various courses about givens, objectives, and the conceivable way from givens to objectives. The initial suspicions are incorrect or too much limiting. The early cycles are infertile and misshaped contrasted and the later interpretations. According to Lesh and Doerr (2003)^[3], models are: "Reasonable frameworks (consisting of components, relations, activities and principles governing interactions) that are communicated using outside documentation

frameworks". For instance, the students create models or calculated frameworks to portray or explain the conduct of a genuine circumstance or issue postured in the classroom. The students can likewise create models to make another issue or circumstance.

In the MM perspective the subjects create models to understand nature and circumstances where they are involved. According to this perspective, the process of externalization of the originations is an asset to understand the subjects' state of mind. The models give information about the subjects' originations of the circumstance. They demonstrate the early mindsets and how these advance (Lesh, 2010)^[2].

The subjects of the Models and Modeling perspective research can be students, teachers, designers, analysts (or instructors) themselves or other education chiefs. In this sense, the teachers ought to make models to understand the students' learning and teaching processes. Doerr and Lesh (2003)^[3] recommend that we need to make settings in which teachers can express and adjust their mindsets about the teaching and learning processes. MM perspective gives information about how teachers interpret their training, how their mindsets advance after some time and how these interpretations influence the educator's training.

Lesh (2003)^[1] recommends that teachers need to interpret circumstances with regards to their real practice. The teachers need to at the same time address mathematical substance, instructive methodologies, and mental parts of a teaching and learning circumstance; for instance, those perspectives identified with the applied learning in the individual and social settings. They should have the capacity to decide for themselves whether their interpretations and ensuing activities are moving towards wanted closures specifically settings.

METHODOLOGY

Six in-service teachers with involvement with the high school level participated in this process. Nonetheless, the information exhibited here were taken from two teachers (Kent and Jim). They were studying a master's degree program in Mathematics Education. The teachers had already discussed Problem Solving Perspective (Schoenfeld, 1994) among other mental hypotheses to understand the learning and teaching process. They had talked about the benefits of encouraging critical thinking in the classroom to advance mathematical knowledge

and thinking. They could separate between the routine and non-routine issues (Santos, 1997)^[4]. They examined the part of teachers and students in this perspective. They additionally had partaken in critical thinking encounters, as students of the master's program. The teachers were requested to outline an instructional proposition through genuine circumstances or issues that would encourage the students' improvement in mathematical knowledge and thinking. The teachers needed to actualize the proposals in the classroom. A few inquiries were raised: What mathematical knowledge and thinking should students display toward the finish of a mathematics course? The proposals were utilized as a part of courses instructed in various cycles by the teachers. The proposals were actualized, adjusted, refined maybe a couple times. We were interested in the process of advancement of the proposals made by the teachers since we were studying the teachers' models or mindsets about the students' learning process. In this sense we took every one of the documents created by the teachers. To begin with, we recognized two diverse mindsets about the students' learning process. We additionally recognized cycles of understanding of the proposals which were continually changing during the interaction among the teachers, the companions, the instructor, the classroom and the proposals. The correspondence was critical. The teachers had the chance to impart the proposals to their instructor. They talked about together the outline of the proposals, destinations, issues, instructive systems picked and mental parts of a teaching and learning circumstance as those said by Lesh (2003)^[1]. We watched the teachers' work during one year. The teachers were designing, modifying, implementing and refining the proposals. There were two implementations in the classrooms.

RESULTS AND DISCUSSION OF RESULTS

The didactic proposals were dissected and the part of the included problems. We distinguished two unique kinds of proposals. The objective was to utilize them like an instrument to assess the mathematical learning. We alluded to them as Problem as Assessment. The second kind included problems as a vehicle for promoting the improvement of mathematical knowledge and thinking. We alluded to them as Problem as Media Learning.

Didactic proposals: Problem as Assessment

There were three proposals portrayed by this compose. These proposals included mathematical definitions, properties, illustrations, and activities. The

part of the instructor was to present and open a few cases to show the utilization of the mathematical ideas and the properties. The teachers urged the students to rehash comparable exercises as we can find in Fig. 1 (taken from one of the instructional proposals). These exercises can be considered activities or routine problems since they were proposed after the educator explained how to take care of comparable problems. The setting of these exercises was the mathematics, i.e. the inquiries were about mathematical subjects.

The teachers supported the inclusion of activities in the didactic proposition. They suspected that the students needed to fabricate mathematical knowledge before solving problems. They additionally contended the need to include ideas before including methods.

Activity 1:

The teacher, in plenary, explains to the students how to manipulate and use the following equations

$$(x-h)^2 = 4p(y-k) \quad (y-k)^2 = 4p(x-h)$$

The goal is that students relate the equation with the graph.

Fig. 1: Example of the activities included in the first type of the proposals. This one was elaborated by one teacher who will be called Kent.

The teachers educated the students the prerequisite ideas and abilities in mathematical settings. They showed general substance and then they demonstrated to utilize preceding ideas, abilities and heuristics to take care of routine mathematical problems. In these proposals the teachers' part in the classroom was to initiate and answer inquiries from students and to control the exercises towards a few goals. The problems included in the proposition by the teachers were the supposed routine mathematical problems (Fig. 1). The non-routine problems were included toward the finish of the didactic proposition. The part of them was centered around the transfer of knowledge to new circumstances. The teachers utilized these last problems to assess the learning of mathematics. The problems were like those from course readings (Fig. 2). The teachers trusted the students could manipulate logarithmic articulations and utilize them to take care of problems in various settings (Problem 1 is an example).

Problem 1. The trajectory described by a projectile launched horizontally from a point situated y meters above the ground with a speed v m/s is a parabola whose equation is

$$y = -\frac{g x^2}{2v^2}$$

Where " x " is the horizontal distance from the launch site, and the value of g is approximately 9.81 m/s^2 . The origin is taken as the base of the projectile.

Under these conditions a stone is thrown horizontally from a point 3m above the ground with an initial speed of 50m/s. Calculate the horizontal distance to the starting point and draw the trajectory of the projectile.

Fig. 2: This is a non-routine problem included in Kent's instructional proposal. It is considered a non-routine problem because the teacher did not show the students how to solve it. The problem was a challenge for the students.

The constrained accomplishments of students in solving non-routine problems enabled Kent to analyze their didactic proposition and the instructional exercises. The discussion between the educator and the instructor allowed the instructor to recognize two processes that were not associated in the proposition: the learning of knowledge and the assessment. At the end of the day, the instructor had not associated the determination of exercises identified with the condition of the parabola and its diagram, and the process of solving non-routine problems associated with illustrative movement. The educator discovered that the assessment process of learning had turned into a process of mathematical learning. Solving the non-routine problems moved toward becoming for the students another phase of advancement of mathematical substance understanding.

After discussion with the instructors, the educator perceived that the problem solving process ought to be utilized to create learning instead of being utilized just to assess the procured knowledge. This state of mind enabled him to redefine the part of problems in the proposition, the targets and the idea of assessment and transference of knowledge. He altered the model or state of mind about the process of learning and he reorganized the instructional exercises previously implementing again.

Didactic proposals: Problem as Media Learning

There were three proposals portrayed by this write. One proposition of this write was outlined by Jim. The proposition was based on solving non-routine problems involving circumstances that were natural to the students. The composed non-routine problems involved the analysis of useful relations between quantities in various settings, for example, excursions, shopping, and telephone calls. The problems were introduced from the earliest starting point of the proposition until the finish of it. The educator explained that the point was to create mathematical understanding through problem solving.

The instructor actualized the proposition with students who had taken past conventional variable based math courses. The students worked individually to answer the inquiries proposed in the movement. Jim's part was centered around reviewing the answers given by students; he approved students' answers, and answered questions. In a few sessions Jim proposed to manipulate logarithmic articulations as homework, however he watched that students did not take part in this movement. The mathematical articulations proposed were not related with the principal action.

Jim discussed the outcomes obtained by the students with the instructor. This discussion enabled Jim to assess and refine the didactic proposition. He redefined goals and instructive technique to be sought after later. He audited the exercises included in the understudy's homework keeping in mind the end goal to associate them with the main action in the worksheet. He chose to incorporate work in sets and gathering discussions in the classroom. Jim built a second form (Fig. 3).

As a team complete the following table. Calculate the price to pay for x number of kilograms of tortillas, make a graph, and answer the questions. Consider that a kilogram of tortillas cost 12 pesos.

Kg of tortillas	Amount to pay
$\frac{1}{4}$	
2	
$3\frac{1}{2}$	
5	
7.5	
$8\frac{3}{4}$	
17	
25.5	

a) If a store produces 215.5 kg of tortillas a day. How much money is made if everything is sold?

b) Express the equation that allows you to calculate the cost of any number of tortillas: _____

c) Use this expression to calculate the cost of 51 kg of tortillas. Explain the procedure. _____

d) The following equation $\frac{2}{5}y - x = \frac{3}{4}$ is used to calculate the total cost of tortillas. The "x" represents the amount in kg of tortillas, "y" is the total amount due and the constant value is the cost of the paper to wrap the tortillas. What is the expression to calculate the total amount due "y"?

e) How many kg of tortillas can be bought with 780 pesos? _____

f) How many kg of tortillas can be bought with 20 pesos? _____

Fig. 3: Second version of the activity designed by Jim

Jim executed his second form of the didactic proposition with another class. He organized students in sets to help each other in the learning process. Problem solving and gathering discussions were gone for guiding the session to his targets for the exercise. His part as an educator changed and was never again centered just around crafted by individual students. In any case, when the instructor conveyed the consequences of the execution, he understood that his part had concentrated again on validating systems and answering inquiries, instead of questioning the knowledge of students, notwithstanding when they were doing the normal action.

Jim found that working in sets could assist the students with assessing and refine their answers to the

inquiries and understand the general circumstance in the movement. These settings imparted individual ideas, produce contentions, and assess ideas. The two sorts of proposals showed three important aspects: the part of the students, the part of the teachers and the mathematical knowledge. This way included the students did just a single kind of movement, for example, the reiteration of calculations and methods. The teachers did not consider the importance of developing capacities and propensities for thought in the classroom, for example, generating guesses, argumentation, and the meta-discernment process.

In the second form of the proposals the teachers demonstrated another cycle of refinement about their understanding of the students' learning process. They thought about the importance of developing capacities and propensities for thought in the classroom. The teachers distinguished the need to relate the applied knowledge and the capacity to utilize it in different circumstances in the classroom; in this way, they reorganized the exercises and problems in the didactic proposition looking for students to transfer their experience (Doerr and Lesh, 2003)^[1].

At the point when the teachers were involved in the plan and usage of the didactic proposals they displayed their originations about the mathematics and the mathematical learning process. These originations were changing while they were discussing the outcomes. According to Models and Modeling Perspective (Lesh, 2010)^[2], we require this kind of circumstance for teachers to uncover, demonstrate, revise and refine their thinking, and thusly to alter and broaden their origination of the mathematics and the mathematical learning process. The teachers need to interpret or assess the students' thinking, plan proper arrangements of instructional exercises, select and adjust or broaden tasks in the light of understudy understanding (Doerr and Lesh, on the same page).

CONCLUSIONS

The inquiries raised in this paper are: What kind of mathematical exercises and learning processes do teachers emphasize in the mathematics instructional proposals when they need to include word problems? How do teachers think students learn mathematics? How do teachers imagine their part and the part of their students during instruction? These are firmly identified with the sort of didactic proposals outlined and actualized by the teachers.

The chance to impart the proposition to partners and instructors, enabled the teachers to assess, revise and refine their thinking about teaching and learning mathematics. The teachers had the chance to problematize the didactic proposition and instructors had the chance to know their convictions about mathematical knowledge, the assessment and learning that mathematics teachers had.

Regarding the third inquiry postured in this paper we found that the teachers did not problematize the action of the students in the classroom to advance learning. The origination was diminished to answer the inquiries and approve the strategies. The chance to discuss the involvement with associates and instructors allowed teachers to understand the need to change the parts credited to the students and the educator. The teachers were analyzing the assessment of the understudy learning as well. Teachers began to understand that assessment was not just to see that “six students effectively answered and four did it incorrectly”. They are learning about how to make community situations to help the learning process. Instructors are additionally in the process of learning, creating models that permit an understanding of the advancement and improvement of the educator learning background. Instructors are sharing ideas in seminars, which serves to create models which bolster the advancement of teachers.

We concur with the Models and Modeling perspective that is worried about the many-sided quality of circumstances that teachers need to consider to be better teachers and about how they need to make models to depict, explain, manipulate, anticipate, and control their own teaching practice. Learning requires the adjustment of mental models that are made and altered when the subject can analyze and convey them to others. Cooperative conditions can bolster this process.

Impact of English Language Teaching in Technical Education

D.Santhosh¹, C. Goverdhan¹, Katyayani Sangam², S. Shailaja³, G. Roopa⁴

¹Asst. Professor, Department of English, S R Engineering College, Warangal, India; ²University of Hafar Al Batin, Kingdom of Saudi Arabia; ³Asst. Professor, Department of English, ⁴Faculty, S R Engineering College, Warangal, India

ABSTRACT

The achievement of any country to a great extent relies upon the ability, proficiency, learning and expertise of its HR. The entire education system is for the satisfaction of this future need. For this situation, the present education is the future probability of improvement of any country. By and by, technical education is intensely inclined towards its ability to advance students with information and skills in getting a lucrative activity. The technical education is driven towards business rivalry, which is forced by monetary powers. Engineering schools are begun developing like mushrooms all through India and particularly in Gujarat. The greater part of the students have obtained their school education in regional languages. They learned English however just as one paper to get some great imprints. In these conditions, English is an equivocal language for the regional language students. They have a tendency to confer syntactic blunders in their understanding, written work and discussion. In Technical education, students need to learn English just in 1 or 2 semesters. However, later on they go out their engineering, they at that point think that its hard to talk in English. They might be great in their center branches; they discover trouble in bantering and passing their insight and capacity. The vast majority of the schools are opened up by private financial specialists. Thus, to cut the use, they choose English instructors on impermanent address premise. Because of absence of clear approach by the administration, the two students and English instructors need to endure. The nature of the vast majority of the engineering organizations is sketchy. Because of the disappointment of giving employability skills, students especially and country in the vast setting need to endure.

Keywords: *English Teaching, English Language, Technical Education, Degree Engineering, Diploma Engineering.*

INTRODUCTION

The coming of new machines and technology acquired exceptional changes all kinds of different backgrounds, society and in our country. The world is considered as global village. Numerous multinational organizations come to India in most recent two decades. They build up gigantic production plants. Some Indian organizations additionally build up their production plants in India. In the production plants, they require substantial prepared work constrain. This cycle has enormous effect on education, particularly on technical education of India. Diploma Engineering and Degree Engineering give great chance to have a high salary job. Engineering field can give handsome salary instantly in the wake of securing the capability. An ever increasing number of understudies are pulled in towards

Engineering field. The greater part of the understudies have passed their school education in regional medium.

Growth of Technical Education in India: A Brief History: Technical education does not have long history like writing in India. The principal engineering school set up in U.P. in 1847, for the preparation of Civil Engineers. More three Engineering Colleges were opened in 1856. Later on, Pune College of Engineering and Guindy College of Engineering were begun in 1858. After 1880, the demand for mechanical and electrical engineering emerged, however just apprenticeship classes in these subjects were presented. The Victoria Jubilee Technical Institute, which was begun in Mumbai in the year 1887, offered such apprenticeship classes. Its goal was to offer preparing to licentiates in Electrical, Mechanical and Textile Engineering. In 1915, the Indian Institute

of Science, Bangalore, presented Certificate Program in Electrical Engineering. The credit of first beginning degree classes in mechanical and electrical engineering and in metallurgy goes to the University of Banaras in 1917. Many engineering universities began after August 15, 1947. It is because of the acknowledgment that India needs to wind up an extraordinary mechanical nation, and would require a far expansive number of designers. Amid the most recent two decades, an efficient and a wide system of technical establishments offers diverse kinds of projects like expert courses, specialist (diploma) courses, graduate and post-graduate courses, and so on. In most recent two decades, engineering schools are begun developing like mushrooms all through India and particularly in Gujarat.

Importance of English Language:

Any language is medium of correspondence. C. L. Wrenn characterizes language in the accompanying words:

Language is the statement of human identity in words, regardless of whether composed or talked. It is the all inclusive medium alike to convey the basic actualities and emotions. (Wrenn: 2001;^[3])

Despite the fact that English is just one language as different languages may be. Yet, in late time, English turns into the medium of correspondence everywhere throughout the globe in the time of globalization. One can't make due in this focused world without English and PC learning. One can't consider higher examinations without the learning of English. One can't impart his or her thoughts, sentiments and considerations without the assistance of English to the colossal mass. English turns into a dowager of the world in obvious sense.

The information of English language is one of the fundamental parameters in the enrollment criteria. As in the Indian setting, an engineering understudy's achievement in the on-grounds enlistment is for the most part in view of their show of relational abilities. As indicated by the National Association of Software and Services Company (NASSCOM), just 25 percent of technical graduates are reasonable for work in the outsourcing business in light of their absence of capacities to talk or compose well in English. (Karnik, 2007 as referred to in P'Rayan 2008:^[1]).

Scenario of English Language Teaching: The vast majority of the students originate from the regional foundation. They learned English yet just as one paper to get some great imprints. They don't have any individual around them with whom they can talk. The four parameters of Language taking in, those are perusing, composing, tuning in and talking are not under any condition satisfied. On the off chance that some individual attempts to talk with the understudy in English, he barely can banter. In these conditions, English is a questionable language for the regional language students. They have a tendency to submit syntactic mistakes in their understanding, written work and discussion. They have great learning of different subjects, however their capability in English is extremely poor. The following are a few purposes behind the poor capability in English of the students.

Problems faced by Students:

- Students originate from regional medium schools.
- Parents can't understand and talk in English.
- Even educators can't impart in English in classrooms.
- Less significance and accentuation is given to the English language in the examination when contrasted with the other technical subjects.
- Students additionally take this subject for simply getting passing imprints.

Problems faced by English Teachers:

- Over quality of the quantity of students in the classroom.
- Teaching talking abilities is extremely perplexing in the expansive classes.
- Students underestimate English Language teaching taken.
- Only for 1 or 2 semesters is the ideal opportunity for instructors to educate English.
- Most of the students are from regional medium, they anticipate from the speaker to show English in their regional medium.
- In the vast majority of diploma universities, there isn't Language Laboratory office.
- Minimum significance is given by the students and by the entire framework to the capability in English.

Impact of English Language Teaching: In above conditions, it is extremely troublesome both, from the understudy side and instructor's side to legitimize English subject. Students can't impart in English. Bit by bit, they surrender their examinations in English. They firmly like to learn just in their regional medium. By thusly, they close the window of the world. They restrain themselves to specific limits. They are not prepared to expand themselves unimaginably which is the primary point of entire education framework. On the opposite side, multinational organizations require individuals who can give finish bundle, which means learning, effectiveness and capability in all fields. Despite the fact that students are great in different subjects, because of absence of English information, they don't land great positions after the finish of degree.

Scope of Improvement: Initially, we need to acknowledge that educators need to procure particular teaching systems for tending to students in the English language classrooms. English is dependably a test for regional medium students. They need trust in eye to eye correspondence. It is exceptionally fundamental to make a strategy through which students can utilize English as a piece of regular day to day existence without perplexed of English. We should attempt to give them learning condition in the education foundation. The significance of English ought not exclusively be prerequisite, ought to be the need. The most amazing viewpoint is that none of us are instructed any sort of relational abilities whenever in our life, not in our schools, universities, home or society. As an English instructor, we should think out of box to educate the students. We ought to urge the students to listen English News, take an interest in gather discourses, to display something, ought to do pretends, to peruse understanding, to compose papers, to compose different kinds of Letters, Reports and so forth. Every one of these exercises certainly enhance students' English. Scholarly messages, similar to novel, short story or sonnet, may ingest and grasp the consideration of the students. Intriguing stories may include students during the time spent perusing and taking in new

words and articulations from the content. With the quick advancement of science and technology, with the utilization of media technology and its application like varying media impacts, movement impacts should likewise come in English class. Media technology may assume positive part in advancing exercises and activities of students.

CONCLUSION

Late daily paper investigation says that of each hundred meetings, just five met all requirements for employability. It isn't on the grounds that they need in technical aptitudes, yet they need in relational abilities. English is critical for technical qualified youths. In the realm of globalization, the worker is required to manage the global customers straightforwardly. The command over the language assumes indispensable part in the enrollment procedure. It is imperative to have great command on English language along the technical learning of the individual branches. Intriguing English teaching-learning procedure will by one means or another take care of this issue. More weight age ought to be given to the English subject.

ABSTRACT

This paper investigates the opportunities for applying deep learning networks to tumor classification. It finds that basic networks can be found to convey sensible performance, equivalent with mid-run entertainers on the same dataset. Model saturation is a significant issue which can be settled by a combination of limiting the quantity of parameters in the model, include ensuring that training data is adjusted amongst positive and negative perceptions, low learning rates, and iteratively biasing the input data towards cases that the model has mis-arranged after past training epochs.

Keywords: deep learning networks, CNN, tumour classification

INTRODUCTION

When diagnosing the seriousness of a destructive tumor, one core diagnostic method is for a pathologist to dole out a seriousness score in light of tallies of the rate of mitoses. High rates of movement have a tendency to be related with more awful results for patients^[1], and are critical for clinicians in determining the intensity of a course of treatment for patients.

Verifiably these tallies have been finished using visual inspection of slides arranged from tissue biopsies. Specialists have now started applying deep learning methods to growth diagnostics. Favorable circumstances of this approach include reproducibility, and the capacity to investigate whole slides in detail instead of focusing barely on particular zones of interest.

Noteworthy work has been effective at identifying the nearness of mitoses in little images with pre-chosen zones of interest picked via trained analysts, for example, that of Cirean et al.^[2]. Notwithstanding, late work by has tried to sum up these outcomes over the investigation of whole slides instead of particular pre-chosen zones. Rubadue et al.

^[2] have shown that deep learning calculations can accomplish human level pathologist levels of exactness

using convolution neural networks, for example, GoogLe Net and ResNet.

This paper tests the use of deep learning methods to the Tumor Proliferation Assessment Challenge 2016 dataset. In this test, members were solicited to accurately arrange the area from mitoses in slide images as a major aspect of a bigger test. This paper approaches the issue by trying to distinguish whether individual sub-tests of slides contain mitoses.

This paper additionally (unsuccessfully) endeavors to stretch out the base model to build up a general ill-disposed system and a completely associated organize for the reasons for generating a guide showing the likelihood that a tumor is available in any given area in a slide image.

RELATED WORK

Medical imaging is an assignment to which different analysts have connected deep learning methods as of late. Cirean et al.^[2] introduced an early case of this application as far back as 2013. Be that as it may, the utilization of handmade highlights has still been a typical research approach as of late as two years back^{[12][13]}

Late research has connected a wide range of model kinds to the issues of cancer cell discovery. Arevalo et

al. [9] made progress rates of up to 82% classification precision with basic three layer networks connected to histopathological determination. Working on a significantly bigger data set, Paeng et al [10] figured out how to accomplish best in class mitosis distinguishing proof exactness rates with a ResNet based model. Specialists have as of late worked with substantially bigger datasets and have created sophisticated algorithms that can be sent in different conditions. For instance, Esteva et al. [14] have as of late trained a system to distinguish skin cancer sores to dermatologist level exactness using a dataset with more than 125,000 perceptions, with the resulting model equipped for being conveyed on a cellphone. Other late research has focussed on using images at various resolutions to distinguish fine and coarse subtle elements that would be indicative of the nearness of a cancer cell [15].

This paper trains on a significantly littler dataset that probably the most late work notwithstanding, thus depends more on systems, for example, data expansion to create adequate fluctuation in the dataset, drawing on crafted by Paeng et al. [10].

DATA SOURCES AND PREPARATION

Dataset: Data for the investigation has been sourced from the Tumor Proliferation Assessment Challenge 2016 datasets. The crude data set contains slide images of cancer biopsies marked by clinical pathologists. The base training dataset contains images taken from 73 mitosis biopsy slides, split into around 650 images. Of these, around 530 are named with areas for mitotic cells. The images are provided principally as 2,000 x 2,000 pixel images in TIFF arrange, with names provided in reciprocal csv documents.

Labelling Data: Tumors are little with respect to the span of the general slide. One tumor might be somewhere in the range of 30 and 60 pixels across, and an image may contain numerous mitoses, with a run of the mill slide containing somewhere in the range of 2 and 5 mitoses.

Figure 1: Slide sample, and mitosis section

To train a model to distinguish cells in these images, the slide is separated into littler tiles for training. The two main tile sizes utilized as a part of this paper are 256 x 256 pixel and 64 x 64 pixel tiles. This splitting of the images can result in tiles where a tumor image breaks across numerous tiles. Be that as it may, the marks just distinguish a single point where the tumor is found. Since the model will learn highlights relating to the territories of the image surrounding the particular marked point it is imperative to guarantee that adjoining slides are named as positive if a mitosis is distinguished near the limit.

To address this issue the data is deciphered from a single point for every mitosis to a probability map for a more extensive territory around the point set apart by the pathologist. This mirrors the mitosis possesses a place in the image bigger than simply the single point recognized by the pathologist.

The probability map is produced in light of the Euclidean separation of a pixel from the named point. In the event that it is a point on the probability map, and is the named point, then

Figure 2: Translating a single point location of a mitosis to a probability map

At the point when the image is part into tiles, the probability map is likewise part and put away nearby the base image. This takes into consideration images to be labeled as containing a mitosis in view of whether they meet a minimum probability limit, with the edge ready to be set powerfully. The probability map likewise encourages further investigation of more sophisticated expository methods, for example, training pix2pix classifiers (Isola et al. [5]) and semantic segmentation classifiers (Shelhamer et al. [6]).

Slide Deconvolution: A noteworthy issue with performing investigation on slide image data is the changeability of the image resulting from manual arrangement of the slides by lab professionals. Images are stained with haematoxylin and eosin (H&E) to help pathologists in identifying mitoses, yet the manual

idea of the procedure implies that the final slides can change altogether in appearance, leading to false classifications. Different methods have been produced to consequently isolate H&E images from the base slide. The intent is to determine a partition framework that makes isolate H&E layers wherein every pixel in the original image is contributing principally either to the haematoxylin layer or the eosin layer.

Sophisticated methods exist for calculating a partition network that can neatly process such a deconvolution a slide into H&E layers. Scanty deconvolution (Xu et al. [7]) can accomplish an extremely exact partition, yet in preliminaries the recursive computation took around 10 minutes to perform on a single slide, so was not practical for application over a huge dataset. Instead, a linear principle segments method proposed by Macenko et al [7] was utilized, which can play out a detachment count using a single (non-recursive) estimation. Figure 3 represents the consequences of this H&E partition for a specimen slide, alongside the related probability map.

Figure 3: An original slide, and its associated probability map and hematoxylin and eosin deconvolutions

METHOD

The essential focal point of the examination was to train a binary classifier to identify whether an individual image segment contained a mitosis. Initial training utilized a straightforward three-layer convolutional neural system with a binary classifier in the final layer, with images broken into 256 x 256 pixel tiles.

Different internal structures were trialed with various channel sizes, utilization of cluster standardization and utilization of regularization. The essential internal structure of each convolutional layer included two convolution channels with group standardization and

ReLU enactments, trailed by a maximum pool layer. The thick layer included a single affine layer with dropout, trailed by the classifier.

Figure 4: Basic convnet structure

Loss functions utilized included binary cross-entropy and SVM hinge loss. Minor departure from the model structure were tried including system profundity, channel size and inclusion of regularization.

Training on the full, unaugmented dataset immediately prompted model saturation. An essential driver of this is probably going to be the scanty nearness of positive outcomes in the dataset. An ordinary slide contains 2-4 mitoses, so when part into tiles, just around 5% will contain positive observations. All things considered, the model can accomplish high accuracy during training basically by learning to order all images as negative.

A second method used to address saturation was specifically biasing the dataset being bolstered to the model. This approach is gotten from an approach utilized by Paeng et al. [10], yet embraces a procedure of updating the dataset during training rather than preselecting a particular training dataset to use in tuning the model.

In the method connected, in the wake of running the model through an initial age of training, the model classifier was then connected to the training dataset. All misclassified observations were then gathered into a “negative feed” dataset. This dataset was then increased with an irregular example of effectively classified observations, and twisted using arbitrary pivots and applying Gaussian noise.

The learning rate was additionally changed during testing to determine an ideal rate that would not cause untimely saturation.

The essential metric used to quantify accomplishment of the model was basic classification accuracy i.e. is a tile accurately classified as containing a mitosis. This

measure has been utilized by scientists as a base for measuring model accuracy (Arevalo et al. 2015^[9]), and gives a base measure of the usefulness of the model.

RESULTS

Initial Model Testing: Initial training was performed on the whole training dataset using the fundamental convnet structure outlined above, alongside Inception and Resnet models. Standard SVM hinge and binary cross-entropy losses were utilized for the classifier layer, and learning rates were set in the scope of 1e-2 to 1e-4. The dataset was part into 256 x 256 pixel tiles and all observations were initially utilized. Models were trained on a combination of H&E isolated inputs, and H&E inputs combined with the original RGB slide image (i.e. six layers in absolute). The Adam optimiser was utilized to control inclination drop, with its default settings of $\beta_1 = 0.9$ and $\beta_2 = 0.999$ and learning rate set to 1e-6.

Initial training affirmed the issue of model saturation. After a single age all designs of the model were converging to characterize all images as negative.

As a first reaction, the “binary uncommon hinge loss” method was introduced into the model, with the parameter “a” set at estimations of 2 and 4. This method demonstrated ready to moderate the rate of saturation to two epochs instead of one, yet it couldn’t keep saturation from occurring completely.

As a second reaction, the training dataset was pared back to contain around 2/3 negative images and 1/3 positive to drive the model to take in more highlights applicable to positive classification. The learning rate was likewise lessened to 1e-5 to 1e-6 decrease the degree of overfitting. These methods again demonstrated effective at slowing the rate of model saturation, however not stopping it altogether.

The final method that was introduced was the “negative feed” method portrayed previously. This approach finally brought about the “fundamental convnet” outline model beginning to produce classifications across the two classifications. ResNet and Inception structures still experienced saturation issues. Accordingly, it was chosen to continue with the fundamental convnet structure in conjunction with the negative data feed method for more point by point fine tuning.

Model Fine Tuning: Different model structures were then trialed, varying diverse highlights of the model including;

- Training on 256x256 images and on 64x64 images
 Varying channel sizes in the first and second conv layers, including $(3 \times 3)(3 \times 3)$, $(8 \times 8)(8 \times 8)$ and $(8 \times 8)(8 \times 4)$
- Varying the quantity of neurons in the affine layer to 512, 1024 and 2056
- Varying the quantity of channels as 32, 64 and 128

The binary uncommon hinge loss was tried, at the end of the day played out no superior to anything binary cross-entropy or SVM hinge loss. Given the hazard that with a more adjusted dataset this method may begin distorting the data, binary cross-entropy was chosen as the favored method for the model.

The table beneath outlines the outcomes that were created from the model. By a long shot the best performing model is the first in the rundown, where approval accuracy of 78% was accomplished. This performance is approaching that of Arevaloa et al^[9], who revealed model performance of 82% with a three layer organize on 150 x 150 pixel images.

Image Size	Filter Size	Affine Size	Filter Number	Validation Accuracy
256x256	(3x3)(3x3)	512	128,64	78%
64x64	(3x3)(3x3)	512	128,64	61%
256x256	(3x3)(3x3)	1024	128,64	55%
256x256	(3x3)(3x3)	2056	128,64	54%
64x64	(8x8)(4x4)	512	128,64	58%
64x64	(8x8)(4x4)	512	64,32	56%

However, other model specifications performed significantly worse than this. A general trend in the data is that models seem to perform worse as the ratio of parameters increases relative to the image size. The small size of the overall dataset may be a cause of this problem, as a dataset with a great many parameters may begin to suffer from problems with co-linearities and a lack of degrees of freedom to fit the model.

RESULTS AND COMPARISONS

The model sums up sensibly well to the training data set, scoring 72% accuracy. Figure 5 demonstrates

the perplexity framework for the test dataset. The model shows great accuracy in predicting genuine negatives, yet the genuine positive expectation rate isn't great. The general F1 score for the model is 0.42, placing it somewhat underneath the center of the performance table for members in the 2016 Tumor Proliferation Challenge.

Figure 5: Confusion matrix for test data (1 = negative classification)

When scaling up the general predictions to a whole slide, the model makes sensible predictions with regards to the area of tumors be that as it may. This is particularly the case given that it is trained in a situation where positive and negative images are generally adjusted as far as their pervasiveness, though in the test condition negative images are essentially more predominant.

To imagine this, Figure 6 demonstrates an anticipated probability map versus the ground truth for a perception from the test dataset (in this portrayal, dark squares speak to a positive prediction by the model). Two of the three predictions are in the right area, yet it misses one prediction and produces a false positive for a second one.

Figure 6: Probability Map versus Ground Truth Data-Test dataset

In the second case from the approval dataset, the model effectively distinguishes that one of the mitoses

parts across two tiles in the dataset, and recognizes it as being available in both the images (see the two neighboring dark squares). In any case, it again misses one mitosis, and has two false positive predictions.

Figure 7: Probability Map versus Ground Truth Data-Mitosis split across two tiles

CONCLUSIONS

Cell slide data shows a troublesome classification assignment. The sparsity of positive data makes critical challenges in creating the correct training environment for the model. This can be overwhelmed by using procedures including training with low learning rates, using negative feed data age and conceivably using models with littler quantities of parameters. The straightforward convolutional network trained in this paper performs well on predicting genuine negative observations, even give the way that it is trained in an environment where negative observations are moderately rare.

ABSTRACT

Internet of Things (IoT) has been a noteworthy research topic for very nearly 10 years now, where physical objects would be interconnected because of meeting of different existing innovations. IoT is quickly growing; anyway there are vulnerabilities about its security and privacy which could influence its practical advancement. This paper investigates the security issues and challenges and gives an all around characterized security architecture as a secrecy of the client's privacy and security which could result in its more extensive reception by masses.

Keywords: *IoT, Internet of Things, IoT security goals, IoT security architecture, IoT security challenges and issues.*

INTRODUCTION

The term, Internet of Things, a system of interconnected gadgets, was first proposed by Kevin Ashton in 1999 [1]. It is a noteworthy mechanical transformation that has refreshed the present Internet infrastructure to an idea of significantly more propelled registering network where all the physical objects around us will be particularly identifiable and pervasively associated with each other [2]. By this consistently rising innovation everything around us like TVs, coolers, autos and garments and so on will gather some valuable information with the assistance of different existing advancements, which will then be self-rulingly streaming the information to the concerned gadgets and based on which robotized moves will be made.

With various researches being completed, the vision of IoT is probably going to be a reality soon. As indicated by Gartner, around 25 billion remarkably identifiable objects are relied upon to be a piece of this worldwide figuring network constantly 2020 [3], which is stunningly a major number, anyway predominance of such a major network of interconnected gadgets will represent some new security and privacy dangers and put every one of those gadgets at a high danger of hackers as they grasp at the security holes to influence the gadgets to work for their own advantages.

GENERIC ARCHITECTURE

Generally, IoT has four main key levels as shown in Fig. 1, which are described below [7]:

Fig. 1: Generic Architecture of IoT

Perception Layer: This layer comprises of various types of information sensors like RFID, Barcodes or some other sensor network [8]. The fundamental reason for this layer is to recognize the interesting objects and manage its gathered information got from the real world with the assistance of its separate sensor(s).

Network Layer: The reason for this layer is to transmit the accumulated data acquired from the perception layer, to a specific data preparing system through existing correspondence networks like Internet, Mobile Network or some other sort of solid network [9].

Middle-ware Layer: This layer comprises of data preparing systems that take automated activities in view

of the aftereffects of handled information and connections the system with the database which gives stockpiling abilities to the gathered information. This layer is benefit arranged which guarantees same administration compose between the connected devices ^[10].

Application Layer: This layer realizes different commonsense applications of IoT in light of the necessities of users and various types of ventures, for example, Smart Home, Smart Environment, Smart Transportation and Smart Hospital and so forth ^[11].

Security Goals: The real security goals of IoT are to guarantee legitimate character confirmation instruments and give confidentiality about the data and so forth. The Security group of three or CIA set of three, a recognized model for the improvement of security systems, executes the security by making utilization of the three territories which are Data confidentiality, integrity and availability as appeared in the Fig. 2. A break in any of these regions could make difficult issues the system so they should be represented. The three zones are depicted underneath:

Fig. 2: The CIA Triad

Data Confidentiality: Data confidentiality is indistinguishable to giving flexibility to client from the outside obstruction. It is the capacity to give certainty to client about the privacy of the delicate data by utilizing distinctive systems to such an extent that its divulgence to the unauthorized party is forestalled and can be gotten to by the allowed users as it were. There are numerous security components to give confidentiality of the data including, however not constrained to, Data Encryption in which the data is changed over into ciphertext frame which makes it hard to access for the users having no legitimate approvals, the Two-advance verification, which gives validation by two ward parts and permits the entrance just if both the segments breeze through the confirmation test and the most widely recognized Biometric Verification in which each individual is exceptionally identifiable.

Data Integrity: Amid the correspondence, data could be modified by the cyber criminals or could be influenced by different elements that are outside human ability to control including the crash of server or an electromagnetic aggravation. Data Integrity alludes to the assurance of valuable data from the cyber criminals or the outside impedance amid transmission and gathering with some basic following strategies, so the data can't be altered without the system getting the risk ^[13]. The techniques to guarantee the exactness and creativity of data incorporates strategies like Checksum and Cyclic Redundancy Check (CRC) which are basic mistake finder components for a segment of data.

Data Availability: One of the significant goals of IoT security is to make data accessible to its users, at whatever point required. Data Availability guarantees the prompt access of approved gathering to their data assets in the typical conditions as well as in deplorable conditions. Because of reliance of organizations on it, it is important to give firewalls to countermeasure the assaults on the administrations like Denial-of-benefit (DoS) assault which can prevent the availability from securing data to the client end.

SECURITY CHALLENGES AND ISSUES

There have been numerous accomplishments in the research field of IoT, anyway there are still some open challenges that should be promotion dressed for the pervasiveness of this innovation. In this area a portion of the dangers in each architectural layer that requirements unique consideration are examined.

Perception Layer Challenges: Perception layer comprises of various sensor advancements like RFID which are presented to numerous sorts of dangers which are talked about beneath:

Unauthorized Access to the Tags. Because of the absence of appropriate confirmation instrument in countless systems, tags can be gotten to by somebody without approval. The attacker can't simply read the data however the data can be adjusted or even erased too ^[14].

Eavesdropping. In view of the remote attributes of the RFID it turns out to be simple for the attacker to sniff out the confidential data like passwords or some other data spilling out of tag-to-reader or reader-to-tag which makes it defenseless on the grounds that the attacker can make it to use in wretched ways ^[16].

Network Layer Challenges: Network layer comprises of the Wireless Sensor Network (WSN) which transmits the data from the sensor to its destination with reliability. The related security issues are examined underneath:

Sybil Attack. Sybil is a kind of attack in which the attacker manipulates the hub to exhibit different personalities for a single hub because of which an extensive piece of the system can be endangered resulting in false information about the redundancy^[19].

Sinkhole Attack. It is a kind of attack in which the enemy makes the traded off hub look appealing to the adjacent nodes because of which every one of the data spill out of a specific hub is redirected towards the bargained hub resulting in bundles drop i.e. all the activity is hushed while the system is tricked to trust that the data has been gotten on the other side. In addition this attack results in more vitality utilization which can cause DoS attack^[20].

Denial of Service (DoS) Attack. The kind of attack in which the network is overwhelmed with a futile parcel of activity by an attacker, resulting in an asset depletion of the focused on system because of which the network winds up inaccessible to the users^[22].

Middle-ware Layer Challenges: This layer is made out of data stockpiling advancements like cloud computing. The security challenges of this layer are examined beneath:

Unauthorized Access. Middle-ware Layer gives distinctive interfaces to the applications and data storerooms. The attacker can without much of a stretch reason harm to the system by forbidding the access to the related services of IoT or by deleting the existing data.

DoS Attack. It is like the DoS attack talked about in the past two layers i.e. it close down the system which results in unavailability of the services.

Malicious Insider. This kind of attack happens when somebody from the inside alters the data for individual advantages or the advantages of any outsider. The data can be effortlessly separated and then changed intentionally from the inside.

APPLICATION LAYER CHALLENGES

The related security issues of this layer are depicted underneath:

Malicious Code Injection. An attacker can use the at-attach the system from end-client with some hacking

methods that enables the attacker to inject any kind of malicious code into the system to take some kind of data from the client.

Denial-of-Service (DoS) Attack. DoS attacks these days have turned out to be complex, it offers a smoke screen to complete attacks to break the protective system and subsequently data privacy of the client, while deceiving the casualty into believing that the real attack is happening elsewhere. This put the non-encoded individual points of interest of the client at the hands of the programmer.

Sniffing Attack. An attacker can compel an attack on the system by introducing a sniffer application into the system, which could gain network information resulting in defilement of the system^[25].

SECURITY AT DIFFERENT LAYERS

There are many researches being completed to give a solid very much defined security architecture which can give confidentiality of the data security and privacy. W. Zhang et al.^[26] proposed an architecture for the security against the conceivable dangers, as appeared in Fig. 3.

Perception Layer: Perception Layer is the base layer of the IoT architecture which gives different security highlights to the hardware. It fills four essential needs which are Authentication, Data Privacy, Privacy of touchy information and Risk Assessment which are talked about underneath:

Authentication. Authentication is finished using Cryptographic Hash Algorithms which gives advanced marks to the terminals that could withstand all the conceivable known attacks like Side-channel attack, Brute force attack and Collision attack and so on

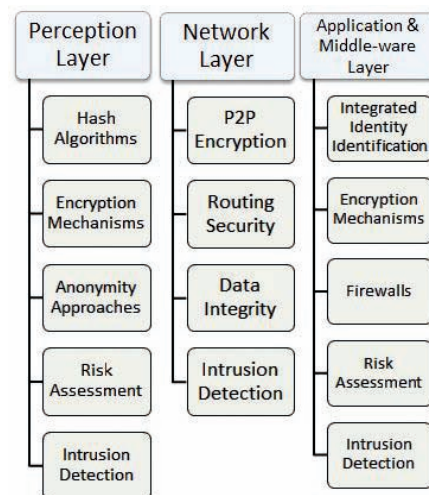

Fig. 3: Security Architecture of IoT

Data Privacy. Privacy of the data is ensured by symmetric and filter encryption algorithms, for example, RSA, DSA, BLOWFISH and DES and so on which keeps an unauthorized access to the sensor data while being gathered or sent to the following layer. Because of their low power consumption advantage, they can be easily executed into the sensors.

Risk Assessment. It is a key of IoT security which finds the new dangers to the system. It could help preventing the security breaks and determining the best security procedures. A case of it is the Dynamical Risk Assessment technique for IoT^[28].

Network Layer: The network layer which could be both wired or wireless is presented to different kinds of attacks. Because of the receptiveness of the wireless channels, interchanges can be checked effectively by a few hackers. The network layer security is further isolated into three kinds which are talked about beneath:

Authentication. With the assistance of an appropriate authentication process and point to point encryption, illicit access to the sensor nodes to spread phony information could be avoided^[30]. The most widely recognized kind of attack is the DoS attack which impacts the network by driving a great deal of futile movement towards it through various botnets filled by the system of interconnected devices.

Data Privacy. The wellbeing control instruments screens the system for any kind of intrusion and finally Data integrity methods are executed to ensure that the data got on the flip side is the same as the original one.

CONCLUSION

The main obstacle that stands in the method for the IoT improvement is the security and privacy issues. Security at all the levels of IoT is descriptive to the functioning of IoT. Fortunately, there as of now have been many research accomplishments in the IT security concerns and for powerful usage of a security infrastructure for IoT, these accomplishments must should be further expanded instead of focusing the consideration towards seeking the new conceivable security arrangements, to make IoT ready to give services to the cutting edge eager for data billions of devices with the capacity to upset the enemies. This paper talked about the security goals and conceivable security challenges and issues of the IoT

system. Then a very much defined architecture for the IoT security was displayed. Later on, more authentications, risk assessment and intrusion detection procedures in each architectural layer must be investigated in parallel to the execution of the security infrastructure using existing IT security highlights. In addition, legitimate structures, appropriate controls and strategies must be contrived to guarantee stable advancement of the secure technologies.

Relationship between Social Presence and Health Efficacy in VR Health Video

Han-Jin Jang¹, Ghee-Young Noh²

¹Dept. of Interaction Design, ²School of Media Communication, Hallym University, Korea

ABSTRACT

Background/Objectives: This research intended to systematically identify how a VR video aimed at improving recipients' health affects their health efficacy through structural equation modeling.

Method/Statistical analysis: The experiment was conducted with four participants simultaneously for 30 minutes at a time at the Virtual Reality and Health Research Center over approximately two weeks from May 1 to May 17, 2017. Data were collected using a self-report questionnaire. The final data used for the analysis were from 150 students consisting of 75 male and 75 female students.

Findings: Confirmatory factor analysis was performed to evaluate the construct validity of the scale using AMOS 22. The data analyzed included participants' responses on 22 items designed to measure five latents (social presence, arousal, message attention, message acceptance, health efficacy) constructs. Hypothesis 1 is whether social presence of VR Video is positively associated with arousal. SEM analysis indicated that social presence for VR Video is significantly associated with arousal, supporting the hypothesis. Hypothesis 2, 3 is whether arousal of VR Video is positively associated with message attention and acceptance. SEM analysis indicated that arousal for VR Video is significantly associated with message attention and acceptance, supporting the hypothesis. Hypothesis 4, 5 is whether message attention and acceptance is positively associated with health efficacy. SEM analysis indicated that message attention and acceptance for VR Video is significantly associated with health efficacy, supporting the hypothesis.

Improvements/Applications: This research is believed to contribute to the convergence and expansion of new theories as it approached the subject matter based on VR user experience, and demonstrated important contributors to health efficacy.

Keywords: *VR Video, Social Presence, Arousal, Message Attention, Message Acceptance, Health Efficacy*

INTRODUCTION

Visual, phonetic, linguistic information to activate the user experience and arousal of the recipient, who tries to understand what the information provider intends to deliver.¹ This sensory arousal allows recipients of such information to feel as though they are interacting with the actual physical world, and makes them feel as though they are connected to and dealing with real information.² Among others, a video message based on virtual

reality VR increases social interactions—specifically, increased feelings of intimacy and changes in recipients' perceptions and narrows spatial and psychological distance unlike regular video or voice messages.³

As such, VR expands the range of human perception unlike other media. For instance, while stimulation from a single message awakens an individual's latent experiences, or energy in reality, it is becoming increasingly possible that a message in VR delivers the experience an individual feels in reality as it is. This can be demonstrated by various health activities using VR. For example, a medical team at Hanyang University conducted a driving simulator experiment on 45 patients to treat their phobia. The experiment repeated various simulations of situations that caused the patients could feel fear; as the patients reported various physical symptoms

as they coped with these situations on their own, results showed that their anxiety symptoms declined over time.⁴ A 1-month exercise therapy using a VR workout system on chronic stroke patients whose recovery period was over proved that the therapy improved the function of brain regions involved with the patients' walking and increased their walking ability.⁵ As demonstrated above, VR can simulate situations that are difficult to make available in the real world relatively accessible to users and at the same time, it has huge potential to be used in many different research areas in addition to therapy as it provides a well-constructed situation by the computer.

THEORETICAL BACKGROUND

Social Presence: Social presence is an important factor to narrow psychological distance, which perceives emotional exchanges. In a VR simulation where an individual communicates with the computer-generated environment or with a particular object, even though the users are not physically in the location or situation they are seeing, hearing, and feeling, they feel as though they are.⁶ For this reason, social presence is regarded as the perception of an individual rather than the ability of a medium, and such social presence occurs in a mediated VR when users *feel* the experience of the shapes, sensory cues, and behaviors that represent the simulated objects; the level of social presence refers to the extent to which the other object is perceived as close to information or the intended meaning.⁷ A higher level of social presence means that users accept the medium more sociably, personally, and emotionally in a mediated VR and feel as if the object or environment is real even if it is not.⁸

The easiest way to increase social presence in VR is to use its unique features as a medium. Unlike other media, VR can easily provide nonlinguistic messages by enriching the information of the message it delivers.⁹ If social presence provided by VR is lacking, however, the medium tends to be less preferable, emotional, and personal, and feel more serious, official, and impersonal.¹⁰ People consider such environments to feel nonhuman and do not share many messages. Nevertheless, this does not explain why experiment participants experience different levels of social presence in the same environment. Therefore, social presence should be viewed as the users' psychological experience, not as the medium's feature.¹¹ In addition, it has been reported that the level of arousal increases when users feel more social

presence using media that evoked such social presence.¹² It was also reported that videos providing continuous movement increase social presence and arousal more so than still images.¹³ In this regard, this research intends to verify the following hypothesis on the correlation between social presence and arousal.

Hypothesis 1: A higher level of social presence felt in a VR video will lead to a higher level of a user's arousal experience.

Arousal: Arousal in social presence research refers to the degree of the user experience's reaction to the.¹⁴ Furthermore, arousal refers to a psychological state perceived by people when they feel interested in or curious about something.¹⁵ While arousal explains a behavior that has as its goal to emphasize the importance of intrinsic motivation in understanding the motivation of human behavior, the level of arousal also affects the attention or acceptance of a message. More notably, the level of arousal delivered from external stimulation works as some sort of important message in acceptance of the message and can alter people's judgement, information processing, or memory.¹⁶ For example, when people view a message providing a video that triggers a high level of arousal, it is more noted than one that leads to a lower level of arousal.¹⁷ When the level of arousal is higher, people are more likely to pay attention to and focus on the message that delivers the emotional arousal and accept the message;¹⁶ such a message is highly effective in changing the recipients' actual behavior when it contains social meaning.¹⁸ Therefore, arousal plays an important role; more arousal leads recipients to pay closer attention, to think about the delivered message more actively, and to changes their behavior in the direction suggested by the message. Based on this discussion above, this research aims to validate the following hypotheses:

Hypothesis 2: A higher level of arousal provided by a VR video will lead to a higher level of attention to the message.

Hypothesis 3: A higher level of arousal provided by a VR video will lead to a higher level of acceptance for the message.

Health Efficacy and Message: Health efficacy, a belief that individuals can control and manage themselves via improved lifestyle habits, has a huge effect on motivating individuals' health improvement behaviors and putting

them into practice—for example, identifying current health status and problems and establishing plans to keep themselves healthy—individuals with stronger belief in health efficacy are more likely to have efficient and active thoughts and behaviors to improve their health.¹⁹ As the level of health efficacy varies depending on an individual's characteristics, which have been formed based on one's ability and belief, the behavior result appears differently depending on how an individual develops his or her health efficacy.²⁰ In other words, since health efficacy can affect whether to start a new health behavior, stop the health behavior an individual has continued, and resume the discontinued behavior, it is an important concept that must be considered to alter health behavior.²¹

Variables that can have an effect on health efficacy have been found to include the effects of a message itself: attitudes toward health messages, cognitive reactions toward health messages, acceptances of health message, and attentiveness to health messages.²² The health message provided by the medium delivers not just a health message but the medium's feature or structure, which affects an individual's health efficacy. For this reason, the same message delivered via different media can have different effects on individuals, depending on the method or technology used to deliver it.²³ In the past, the basic type of health message to deliver information to individuals was a typical text, but this type of message has grown gradually into a health message containing images and texts, a video message containing movements and voices, and recently a VR message applying all of these: videos, voices, images and texts. In short, various types of health messages are used to enhance health efficacy. Nevertheless, exposed to these various sorts of messages, recipients pay more attention to some more than others. They take in the necessary information through a selective process called *message attention*, and only accept the messages they believe that they need to remember or act on.

This feature affects cognitive information processing as well as a message itself in accepting the message. The level of attention paid when a message is delivered changes the level of message acceptance. In contexts where positive messages are expected, negative messages draw higher levels of message attention; a positive increases attention to a message when a negative message is expected. This type of message is effective especially in health-related attitude or behavior,²⁴ and

can affect psychological perceptions about health.²⁵ In this regard, this research intends to examine the correlation between message attention and acceptance, which must be considered when it comes to changes in health efficacy, through the following hypotheses:

Hypothesis 4: The higher level of message attention provided by using VR video will lead to a higher level of health efficacy.

Hypothesis 5: The higher level of message acceptance provided by using VR video will lead to a higher level of health efficacy.

METHOD

Participants: This study recruited study participants from among male and female students at the Hallym University based in the Gangwon-do province. The experiment was conducted at the Virtual Reality and Health Research Center over approximately two weeks from May 1 to May 17, 2017. The study participants were informed of the experiment procedure and precautions. After answering the pre-survey questionnaire, the participants moved to a separate place and watched a film using a virtual reality device. Data were collected using a self-report questionnaire. In data analysis, uncooperative respondents were eliminated. The final data used for the analysis were from 150 students consisting of 75 male and 75 female students. Amos 20.0 software was used for analysis. The correlation coefficient of each variable and the significance level test results were examined through structural analysis model.

Experimental Procedure: The experiment was conducted by one researcher and one research assistant. As for the device used for the experiment, four Android mobile phones of the same model containing a virtual reality video and Head Mount Display (HMD) device for watching virtual reality (VR Boss) were used. The virtual reality video used in this experiment, "infectious disease prevention through washing hands," was produced for this experiment. The experiment was conducted with four participants simultaneously for 30 minutes at a time at the Virtual Reality and Health Research Center. The participants were seated with one meter or more between each other. Each wore a wireless virtual reality device over his or her head to ensure free movement and watched the video seated on a swivel chair, which allowed them to comfortably move their

body. To control external variables, the HMD device with stereo headphones was set at the maximum volume to block the noise from the surrounding environment. Additionally, the virtual reality video player application, VaR's VR Player PRO, was configured equivalently to allow the participants to control the screen themselves through head tracking. The participants watched the virtual reality video for about five minutes, comfortably seated on the chair and freely controlling the perspective by moving their bodies or heads.

Measures: The questions used by Kim and Biocca²⁶ to measure the level of social presence were reconstructed for the scale of social presence. There were three questions in total with each item measured on a 5-point scale, and the reliability coefficient was .657. The arousal scale questions by Champion²⁷ were reconstructed for the survey. Responses to each of the 3 questions were marked on a 5-point scale, and the reliability coefficient was .800. The questions by Jyotkia²⁸ were reconstructed for message attention and acceptance. Responses to each of the four questions on message attention and three questions on acceptance were marked on 5-point scale. The reliability coefficient of message attention was .832, and that of acceptance was .702. The questions by Dutta-Bergman²⁹ were reconstructed for health efficacy. Responses to each

of the four questions on disgust were marked on 5-point scale. The reliability coefficient was .826.

RESULTS

Measurement Model Analysis: Confirmatory factor analysis (CFA) was performed to evaluate the construct validity of the scale using AMOS 22. The data analyzed included participants' responses on 22 items designed to measure five latent constructs (factors): Social Presence, Arousal, Message Attention, Message Acceptance and Health Efficacy. The model-data fit was assessed with regard to both incremental and absolute model fit using multiple indices, such as root mean square error of approximation (RMSEA), standardized root mean square (SRMR), incremental fit index (IFI), Tucker-Lewis index (TLI), and comparative fit index (CFI). CFA analysis revealed that the fit of the model was fairly good— $\chi^2/df=1.236$, RMSEA=.040, SRMR=.053, IFI=.973, TLI=.965, and CFI=.972. The results of CFA confirmed that the unidimensional structure of each construct. [Table 1] shows factor loadings of the items, both unstandardized and standardized. All the standardized loadings were greater than .50 (range=0.538–0.910) and statistically significant at .05 alpha level, indicating adequate item reliability.

Table 1: Confirmatory Factor Analysis

Latent variable	Observed variable	Standardized Regression Weights	Regression Weights	Standard Error	Construct Reliability	Reliability
Social Presence	Q7_14	.538	1.000			.657
	Q7_11	.753	1.462	.273	5.358***	
	Q7_8	.594	1.118	.228	4.907***	
Arousal	Q6_8	.910	1.000			.800
	Q6_10	.711	.725	.081	8.918***	
	Q6_4	.681	.794	.093	8.526***	
Message Attention	Q5_3	.757	1.000			.832
	Q5_5	.792	1.098	.119	9.216***	
	Q5_7	.693	.918	.114	8.071***	
	Q5_9	.743	.834	.096	8.668***	
Message Acceptance	Q4_8	.600	1.000			.702
	Q4_2	.591	.716	.131	5.457***	
	Q4_6	.783	1.158	.185	6.274***	
Health Efficacy	Q1_1	.706	1.000			.826
	Q1_3	.701	1.153	.153	7.558***	
	Q1_5	.758	1.201	.149	8.080***	
	Q1_7	.789	1.328	.159	8.328***	

As addressed earlier, SEM is an appropriate tool for assessing the construct validity of a scale, more specifically, convergent and discriminant validity.³⁰ Convergent validity refers to the degree to which two measures designed to measure the same construct are related. Convergent validity was assessed using average variance extracted(AVE). Discriminant validity

refers to the distinctiveness of the factors measured by different sets of items.³¹ Discriminant validity of a scale is achieved when the AVE value of each latent variable is greater than its squared correlations with other latent variables in the scale.³² As shown in Table 2, all of AVEs are greater than squared correlation values, confirming the discriminant validity.

Table 2: AVE Discriminant Validity

Variable	Composite Reliability	Social Presence	Arousal	Message Attention	Message Acceptance	Health Efficacy
Social Presence	.597	.336				
Arousal	.836	.090	.633			
Message Attention	.886	.121	-.015	.660		
Message Acceptance	.776	.087	-.103	.274	.537	
Health Efficacy	.895	-.009	-.010	.220	.028	.495

Note: Boldfaced diagonal elements are the square roots of the average variance extracted; to demonstrate discriminant validity, boldfaced values should be higher relative to the correlation coefficients in the same row and column; AVE = average variance extracted.

The Structural Model and Hypothesis Testing:

After the construct validity of the scale was confirmed, structural equation modeling (SEM) was conducted to examine the predictive relationships among the five latent variables: Social Presence, Arousal, Message Attention, Message Acceptance and Health Efficacy. The fitted SEM model produced an acceptable fit — $\chi^2/df = 1.684$, RMSEA = 0.068, SRMR=.082, IFI=.916, TLI=.898, and CFI=.914.

Hypothesis 1 is whether social presence of VR Video is positively associated with arousal. SEM analysis indicated that social presence for VR Video is significantly associated with arousal, supporting

the hypothesis ($\beta=.74$, $t=5.12$, $p<.01$). Hypothesis 2 is whether arousal of VR Video is positively associated with message attention. SEM analysis indicated that arousal for VR Video is significantly associated with message attention, supporting the hypothesis ($\beta=.27$, $t=2.53$, $p<.05$). Hypothesis 3 is whether arousal of VR Video is positively associated with message acceptance. SEM analysis indicated that arousal for VR Video is significantly associated with message acceptance, supporting the hypothesis ($\beta=.25$, $t=2.63$, $p<.01$). Hypothesis 4 is whether message attention of VR Video is positively associated with health efficacy. SEM analysis indicated that message attention for VR Video is significantly associated with health efficacy, supporting the hypothesis ($\beta=.53$, $t=5.00$, $p<.05$). Hypothesis 5 is whether message acceptance of VR Video is positively associated with health efficacy. SEM analysis indicated that message acceptance for VR Video is significantly associated with health efficacy, supporting the hypothesis ($\beta=.25$, $t=2.46$, $p<.01$)[Table 3].

Table 3: Structural Equation Modeling Results

Variable	Standardized Regression Weights	Regression Weights	Standard Error	Construct Reliability	Hypothesis Testing
H1: Social Presence → Arousal	.736	1.021	.200	5.115***	Supported
H2: Arousal → Message Attention	.267	.212	.084	2.526**	Supported

H4: Message Attention → Health Efficacy	.528	.373	.075	5.001**	Supported
H4: Message Acceptance → Health Efficacy	.248	.166	.067	2.461***	Supported

DISCUSSION

This research intended to systematically identify how a VR video aimed at improving recipients' health affects their health efficacy through structural equation modeling (SEM). First, this research hypothesized that the higher level of social presence engendered by the use of VR video would lead to a higher levels of users' arousal levels, indicating excitement or interest in the message. The analysis showed that the increased social presence in the VR video does have a positive effect on arousal. This outcome was consistent with that of other research showing that individuals experience higher levels of arousal when their social presence was increased, evoking a higher level of social presence like VR videos.

Next, higher levels of arousal were found to have a positive effect on attention and acceptance of messages provided by VR. A message provided by videos with a higher level of arousal like VR ones made people pay more attention to messages provided using VR, which was in line with the findings of other research that a message provided by a video with a higher level of arousal was noted and accepted more than that with a lower level of arousal.³³ Therefore, arousal is an important factor for message attention or acceptance in message research, and more specifically, arousal in health-based VR videos present implications as to how to use a health message more actively. Last, it was found that the increased message attention and acceptance of VR videos aimed at improving health had a positive effect on health efficacy, a factor that directly affects for health-oriented behavior.

CONCLUSION

In conclusion, health messages provided in a VR environment were found to be more socially, personally, and emotionally effective than those provided in other medium environments, feel real even if they are virtual;⁸ VR health messages increase arousal levels and ultimately lead to a positive effect on health efficacy, which in turn can have a positive effect on recipients' intentions to improve their health, as this increased level of arousal makes individuals pay more attention to or accept more actively the message content. Nonetheless, the research did not consider various other variables related to individuals' basic psychological desires; therefore, future research might need to perform an additional analysis in this area. Despite this limitation, this research is believed to contribute to the convergence and expansion of new

theories as it approached the subject matter based on user experience, not VR's medium feature, and demonstrated important contributors to health efficacy.

The Effect of Presence, Physical Environment and Human Service on Revisit Intention in VR Theme Park: Focusing on the Mediated Effect of Delight

Young-Ku Hong¹, Munseok Cho², Joo-Sang Jeon³

¹Doctoral Student, Dept. of Smart Convergence Consulting, ²Assistant Professor, ³Professor, Dept. of Public Administration, College of Social Science, Hansung University, 116, samseongyoro16gil, Seongbuk-Gu, Seoul Metropolitan Government, 02876, Korea

ABSTRACT

Background/Objectives: In this study, we investigated how Presence, Physical Environment and Human Service of VR Theme Park effect on customer 's Revisit Intention through the parameter of Delight.

Method/Statistical analysis: The subjects of this study were individuals who have experience of using VR Theme Park. Data collection was conducted by questionnaire survey. The questionnaire consisted of 44 items including 9 general items, and the Likert 5-point scale was used for the measurement. Statistical analysis was performed by SPSS and AMOS programs. Basic statistical analysis, factor analysis, reliability analysis, and measurement model analysis were conducted. Regression analysis was also performed to test mediating effect by structural equation model analysis.

Findings: The effect of Presence on Delight and Revisit Intention was turned out to be significant ($\beta = .571, .250$). On the other hand, the Physical Environment did not have a significant effect, and the effect of Human Service on Delight was significant and the effect on Revisit Intention was not significant. As a result of the mediated effect analysis, Delight mediated the relationship that Presence effect on Revisit Intention, which was similar to advance research. On the other hand, Physical Environment and Human Service showed that the mediated effect of Delight was not significant, so it showed different results from advance research in general Theme Park. This showed the implications that the important factors that affect the customer's Revisit Intention in VR Theme Park differ from General Theme Park.

Improvements/Applications: Furthermore, it is necessary to study various operational and marketing fields considering VR Theme Park 's operation type and characteristics, separately from General Theme Park. In addition, by using Delight and Revisit Intention as the major influencing factors, deep concerns should be required about how to increase sales and profits of VR Theme Park.

Keywords: Presence, Physical Environment, Human Service, Delight, Revisit Intention

INTRODUCTION

In recent years, the fourth industrial revolution is emerging as a top issue. The 4th Industrial Revolution extends the range from artificial intelligence (AI) to self-driving car, Virtual Reality (VR) and augmented reality (AR), biotechnology, and recently to humanities¹. According to the 'Global Wise' analysis data, the industry that has looked out to be the most promising was counted as Virtual Reality¹.

Virtual Reality (VR) is a science and technology that makes people seem to interact with actual surroundings,

without experiencing in person that is difficult to experience every day.

The created virtual environment and situation etcetera are a human-computer interface that stimulates the user's five senses and allows them to freely navigate the boundaries between reality and imagination by allowing them to do spatial and temporal experiences that are similar to reality ².

Also, Theme Park is a creative amusement and cultural space that is directed and operated to enhance the mutual theme-related functions mainly on specific theme. And by directing a common story based on themes, it can be defined as a non-daily convergence cultural park that provide interest and Delight to Theme Park visitors ³.

VR Theme Park is a Theme Park put VR as a main topic, and it shows a fused form of VR and Theme Park. The VR market is expected to expand further to various content and software markets, according to Deloitte and Digi-Capital, it is expected to grow at the CAGR of 15%, \$ 30 billion by 2020, and VR Theme Parks will account for 12%, about \$ 3.6 billion in scale ⁴.

In the main advance research, the technology acceptance model asserts that through the concept of perceived usefulness and perceived ease of use, the more useful the technology or service is thought to be, the more favorable the attitude and intention to use it are appeared to be ⁵. Chang, Hyung-Jun (2017) studied the effects of VR characteristics on VR Presence, user characteristics, VR motion and persistent intention ⁶, and Nam, Sun-sook (2017) analyzed the effects of VR's device, perceived characteristics and Presence on pleasure and reuse-intention ⁷.

In terms of service scape, because of the Physical Environment provided by the firm, the consumer determines the overall impression depending on the experience or situation of the place or service ⁸. In this regard, Choi Mun-Yong (2014) studied the effect of Physical Environment, Human Services, congestion, and perceived waiting time on usage satisfaction in Theme Park ³.

Most of the advance researches have approached VR Theme Parks as technical concepts. However, considering the aspect of the Theme Park, it is also necessary to add service factors such as Physical Environment, Human Service, and enjoyment.

From this point of view, this study aims to analyze the effect OnRevisit Intention in the VR Theme Park, focusing on Presence, which is the main variable of the VR characteristics, and the Physical Environment, Human Service, which are the main variables of the existing Theme Park. We also analyzed the effect of Delight on Revisit Intention.

By analyzing the results of this study, we aimed to explain the relationship between the factors in an objective way and to derive implications to improve the direction of operation by increasing the Revisit Intention of VR Theme Park.

MATERIALS AND METHOD

Advance Research

Presence: Presence is created in a virtual environment with no physical contact, which means that it exists as the literal meaning of the etymology meaning of real feeling ^[6]. The US Webster dictionary defines 'Presence' as 'the fact or condition of being present' ^[7]. The definition of Wikipedia is limited to a space with a three-dimensional structure distinguished from commitment, another human cognitive phenomenon ⁹.

In the case of VR, it is Presence that is possible to explain the experience and psychological response of the media receiver very appropriately ¹⁰. The concept of commitment, which is a component factor of Presence, can be said to have originated from the recognition of the psychological phenomenon of human being deeply digging into or falling into something. It was said that people wanted to keep on being in a state of commitment when they experienced it, and if they did not stay in a state of commitment, it is said that they could make a negative assessment which they thought the current experience was annoying or boring and so forth, and they were trying to get out of their current state ¹¹. Chang, Hyung-Jun (2017) analyzed in his paper that VR Presence has a significant effect on contents satisfaction of user ($\beta = .162, p < .05$) and system satisfaction of user ($\beta = .466, p < .05$) ⁶. Lee, Soo-Kyung (2018) reported that Presence had a significant effect on Visit intention ($\beta = .470, t = 3.21$) in simple regression analysis, but it had not significant effect in multiple regression analysis ¹².

Physical Environment: The Physical Environment is defined as tangible commodities that facilitate

service execution or consumption, which refers to the environment in which services are created and interactions occur between the firm and the client¹³. Julie Baker (1987) observed environmental factors (temperature, humidity, noise, cleanliness), design factors (architecture, color, style, signboard), and social factors (customer appearance, behavior) in the Physical Environment¹⁴.

The concept of Physical Environment was widely supported by many scholars, and although it had intrinsically intangible character, it was shown that it was based on tangible or visible elements that existed around the service in terms of the customer who evaluated the service, the customer assessed what they could not see based on what they could see, and it presented theoretical basis that the Physical Environment mix has a significant impact on the customer during the service purchase process¹³.

Choi, Mun-Yong (2014) found that the effect of Physical Environment on use satisfaction ($\beta = .340$, $p < .05$) was significant³. In addition, Cha, Gil-Soo (1994) found that the consumer attribution on the location side changed by the level of the physical service environment ($p < .05$)¹³. Koo, Won-Il(2018) also noted that the effect of physical location of the virtual environment amusement facility on the user's revisit was significant ($\beta = .263$, $p < .05$)¹⁵.

Human Service: Service is to give Delight to the customer. These services are used as the meaning of economics, which is a means of generating profits, but on the other hand they are also seen as spiritual services, which means that there are no higher religions than services rendered to people or soul-based services, which originating from outlook on vocation³.

Lewis (1987) classified three types of services focused on service objects: Human Services, services related to goods, and services related to information. Among them, Human Services are categorized as guides, agency services, and sales services that rely on staff expertise knowledge³. In addition, Um, Seo-Ho (1994) classified the service quality of the Theme Park as physical service and Human Service. Among them, Human Service was explained as the employee dress, customer advertisement, kindness, customer guidance and employee behavior, and he found that employee's kindness had significant effect on service satisfaction ($\beta = .160$, $p < .05$)¹⁶.

About Human Service, Cha, Gil-Soo (1994) validated that consumer attribution changed variously by the level of service employee ($p < .05$), Choi, Mun-Yong (2014) validated that the effect of Human Services on user satisfaction was not significant ($\beta = .037$, $p > .05$)³.

Delight: Playfulness (voluntary interest) which is a feeling of fun and pleasure in the activity itself like a play (Webster & Martocchio, 1992) is an important scale in the flow experience and it can be called as a complex variable that includes individual fun, psychological stimulation and perception of interest (Csikszentmihalyi, 1990). In other words, although the definition of flow is different among scholars, it includes three elements in common: absorption, pleasure, and intrinsic motivation¹⁷. Entertainment contents such as dramas, movies, and games have the purpose of amusing people who experience it. The pleasure is that the user feels fun about the media message and give a demonstration of a pleasant emotional response⁷.

Kumar et al. (2001) proposed that there are two kinds of Delight depending on the type of joy felt by individuals. One way, consumers feel Delighted comprises joy and surprise, while the other way in which consumers experience Delight is when they are captivated by an experience which just evokes feelings of real joy¹⁸. Cho, Nae-Eul (2018) cited Frissen, & Raessens (2013) and discussed multimediality, virtuality, interactivity, and connectivity as features of digital media in relation to the concept of fun¹⁹.

Nam, Sun-Sook (2017) validated that Presence had a significant effect on Delight ($\beta = .506$, $p < .05$) [7]. Kim, Heung-Ryel et al. (2010) analyzed that the pleasure had a significant effect on customer behavior intention ($\beta = .238$, $p = 000$)¹⁷.

Revisit Intention: Continuous use intention refers to the continued use of the service being used due to service satisfaction or other reasons²⁰. Continuous use intention in the concept of loyalty is a deep commitment to the brand that makes it possible to continue to buy preferred products or services²¹. And it is defined as a favorable attitude toward services and repetitive purchasing behavior²².

The VR service can also be used to show whether the user's satisfaction after using VR contents in the same way as the advance studies appears as the intention to use continuously or not. In many media studies, the

improvement of satisfaction level appears to result in the improvement of the intention of continuous use. Therefore, it is important to improve the intention to use continuously for the success of VR content service²³.

Cho, Nae-Eul (2018) said that perceived fun of social platforms had a positive effect on sustained use intention ($\beta = .525$, $t = 6.510$, $p = .000$)¹⁹. In addition, Jianyu MA (2013) in her study validated that Delight became significantly related to Revisit Intentions ($\beta = .476$, $t = 11.956$, $p < .001$)¹⁸.

Research model and Methods

Research model: The research model of this study is shown in Figure 1. The independent variables are Presence, Physical Environment, and Human Service. The dependent variable is Revisit Intention and the parameter is Delight.

Figure 1: Research Model

In this study, we investigated how the independent variables of Presence, Physical Environment, and Human Service affect the dependent variable, Revisit Intention of firm that received diagnosis.

We also tried to find out how the parameters of Delight have a significant effect on relationship of Presence, Physical Environment and Human Service on Revisit Intention.

Hypothesis: The hypothesis according to the above research model is as follows

H1. Presence will have a positive impact on Revisit Intention.

H2. Physical Environment will have a positive impact on Revisit Intention.

H3. Human Service will have a positive impact on Revisit Intention.

H4. Presence will have a positive impact on Delight

H5. Physical Environment will have a positive impact on Delight

H6. Human Service will have a positive impact on Delight.

H7. Delight will have a positive impact on Revisit Intention

H8. Delight will mediate the relationship between Presence and Revisit Intention.

H9. Delight will mediate the relationship between Physical Environment and Revisit Intention.

H10. Delight will mediate the relationship between Human Service and Revisit Intention.

Data collection and Analysis methods: Data collection for this study was conducted by questionnaire method. The questionnaire consisted of two types of questionnaire, printout questionnaire and Google questionnaire. The questionnaire consisted of 44 items including 9 general items, and the Likert 5 - point scale was used for numerical data.

The questionnaire distribution was conducted from April to June 2018 for individuals with experience using VR Theme Park.

Statistical analysis was carried out using the SPSS and AMOS programs for total 194 pieces, excluding missing items and incorrect answers about the 209 pieces of collected questionnaire.

First, frequency analysis and descriptive statistics analysis were conducted. For the numerical data, we analyzed the validity and reliability of the variables. Confirmatory factor analysis was performed for single dimensionality test of each variables and analysis of measurement model was conducted to test the fit of research model.

Then, the structural equation model analysis was conducted to confirm the research hypothesis test, the mediated effect analysis, and the inter - group path difference test.

RESULTS AND DISCUSSION

Analysis Results

Basic statistical analysis: Frequency analysis was conducted to identify the demographic characteristics of the sample.

First of all, according to industry, other occupations account for 44%, were more than the service industry (36.1%) and the manufacturing industry. Other firms also accounted for 42.3% on the firm size, compared with 25.3% of large corporations and 23.2% of small and medium enterprises. In addition, younger age group under age 20 were 41.2% and the male group were 63.9%, which took the majority. Most of the education was made up of higher education (97.4%) who are higher than college graduates, so it was estimated that stable sample data would be obtained considering the understanding of respondents. Jobs were characterized by the majority of office workers (41.8%), college students (31.4%). And the classes of monthly income less than 2 million won occupied 38.7%.

The descriptive statistics analysis of the measure variables was conducted. The results of the descriptive statistics analysis of individual measured variables

showed that the standard deviation is larger than 3, the absolute value of the skewness was larger than 3, and the absolute value of the kurtosis is smaller than 8, so individual measurement variables could be considered to have a normal distribution²⁴.

Measurement Model Analysis

a. Confirmatory Factor Analysis: Confirmatory Factor Analysis (CFA) and measurement model analysis were performed for all measured variables of the already secured latent variables. However, analysis result of distinction standard of the first measurement model did not satisfy the fit index.

In order to satisfy the model fit index, the measurement variables were modified for the fourth time. The analysis results of the final measurement model and the model fit are shown in Table 1.

Table 1: Result of model fit analysis

Model Fit	p-value	X ² /DF	RMR	GFI	AGFI	NFI	TLI	CFI	RMSEA
measured value	.000	1.751	.045	.870	.832	.905	.949	.957	.062
standard	>.05	<3	<.8	>.8	>.8	>.9	>.9	>.9	<.08

In the model fit index’s analysis result of the fourth measurement model, because X² (P) is .000, which was below the acceptance standard, the null hypothesis that the measurement model was appropriate was rejected.

However, it was necessary to comprehensively consider other fit indexes to determine the model fit. As a result of analyzing the fourth measurement model, it was confirmed finally that all 9 standards except X² (P) were satisfied.

b. Validity and reliability evaluation: The convergent validity was analyzed by mean variance extraction method.

As a result of analyzing the Average Variance Extracted (AVE) value of each potential variable, Presence was 0.623, the Physical Environment was 0.721, the Human Service was 0.747, the Delight was 0.737, and the Revisit Intention was 0.605. Because all of them were over 0.5, so it could be said that convergent validity was secured.

In the analysis of Correlation, Covariance, ‘R ± 2 * SE’ was not all 1. In addition, because the

threshold value of X² between the constraint model and the non-constraint model for Delight and Revisit Intention having the greatest correlation coefficient was 21.418 and was larger than 3.84, it was confirmed that the discriminant validity was also secured.

Reliability analysis of the measurement model were performed. The Cronbach alpha values of the latent variables were 0.830 for the Presence, 0.928 for the Physical Environment, 0.937 for the Human Service, 0.933 for the Delight and 0.819 for the Revisit Intention. Because all of which were 0.7 or more, reliability could be assured.

Hypothesis test

a. Basic hypothesis test: Structural equation modeling has conducted based on pre-established measurement models. And the structural equation model was analyzed using AMOS.

The test results for the basic hypothesis were shown in Table 2.

Table 2: Results of basic hypothesis test

Hypothesis (path)	Standardized Coefficients	S.E.	C.R.	P-value	R ²	Choice
H1 (Presence → Revisit Intention)	.250	.079	3.185	.001	.825	adopt
H2 (Physical Environment → Revisit Intention)	-.108	.106	-1.067	.286	.825	reject
H3 (Human Service → Revisit Intention)	.043	.106	.437	.662	.825	reject
H4 (Presence → Delight)	.571	.096	6.587	***	.583	adopt
H5 (Physical Environment → Delight)	.104	.136	.870	.384	.583	reject
H6 (Human Service → Delight)	.240	.135	2.109	.035	.583	adopt
H7 (Delight → Revisit Intention)	.752	.092	7.480	***	.825	adopt

Because the p-values of H1, H4, H6, and H7 hypotheses were less than 0.05 and the Coefficients were a positive number (+), so H1, H4, H6, and H7 hypotheses were adopted.

However, Because the p-values of H2, H3, and H5 hypotheses were 0.05 or more, so that hypotheses were not significant, so the H2, H3, and H5 hypotheses were rejected.

In other words, the larger the Presence, the greater how much it effect on Delight and Revisit Intention, the larger the Human Service, the greater Delight, and the larger Delight, the greater Revisit Intention.

b. Mediated effect test: Test results of the mediated effect hypothesis were shown in Table 3.

Table 3: Results of Mediated effect test

Hypothesis (path)	Direct effect	p-value	Indirect effect	p-value
H8 (Presence → Delight → Revisit Intention)	.250	.015	.430	.010
H9 (Physical Environment → Delight → Revisit Intention)	-.108	.232	.078	.361
H10 (Human Service → Delight → Revisit Intention)	.043	.609	.180	.059

As the analysis result of the hypothesis of H8, indirect effect was considered to be statistically significant in the path between Presence and Revisit Intention (path coefficient = .430, $p < .05$), and so this hypothesis was adopted. In other words, Delight was shown that it mediated in the relationship between Presence and Revisit Intention.

However, because the p-values of the H9 and H10 hypotheses were larger than of 0.05, so the effects of the hypotheses did not significant, so the H9, H10 hypotheses were rejected.

CONCLUSION

Results and Implications: As a analysis result of this study, Presence was shown that had a significant effect on Revisit Intention. Also, it was shown that Presence affected Delight, and Delight had a significant effect on Revisit Intention.

On the other hand, Physical Environment and Human Service were shown that had no significant effect on Revisit Intention.

However, Human Service did not directly affect Revisit Intention but it had a significant effect on Delight, and Delight influenced Revisit Intention. So, it was shown that Human Service influenced Revisit Intention indirectly through Delight.

In the analysis of mediated effect of Delight, it was shown that Delight had a significant mediating role in the relationship between Presence and Revisit Intention. However, in the relationship between Physical Environment and Revisit Intention, the relationship between Human Service and Revisit Intention, Delight did not have a significant mediating role.

Here, we could gain some implications.

First, it was shown that Presence was significant in the effect relationship between Delight, Revisit

Intention. Similar results were reconfirmed in several advance studies of existing VR Theme Parks.

Second, the effect of Delight on the Revisit Intention was further enhanced by doing mediating role in the relationship between Presence and Revisit Intention. We need to examine a variety of ways to increase customer's revisit by further increasing the mediated effect of Delight.

Third, the analysis result of the relationship between Physical Environment, Human Service and Revisit Intention in VR Theme Park, which is one of the main purpose of this study, did not show the same results of advance studies on general Theme Parks. In VR Theme Park, which is smaller space than general Theme Parks, immersive potential factors such as Presence were important factors. But other important factors of general Theme Parks for customer's revisit such as Physical Environment, Human Service had not yet notable in VR Theme Parks. However, it should be noted that the Human Service factor has shown that it can increase customer's revisit when the variables of Delight operate in the middle.

Improvement: First of all, more expanded and detailed works are required in the conclusions and implications of this study. The initial VR Theme Park was introduced as the urban use, and it had strong image as 3D or 4D game room experiencing stereoscopic Virtual Reality in a small space. In the general Theme Park as well as VR Theme Park, the VR game zone has been developed and operated, but at the initial stage, It was only at the level of such comments merely that it provided a variety of experiences at low cost.

At present, however, VR Theme Parks which are used in the city are also becoming larger and expanding into various fields such as resorts, department stores, local government festivals and so on. As in the case of the East Valley of Science & Fantasy, the VR Theme Park which was opened in Guizhou, China in 2017, the VR Theme Park is gradually becoming larger and the VR program form is changing from a simple fixed experience facility to active experience facility similar to the general Theme Park attraction.

Therefore, it is necessary to study continuously the effect of Physical Environment and Human Service factors on VR Theme Park while doing simultaneously time series study with more time.

The most important thing is to find out various factors that can improve the customer's Delight and Revisit Intention, thereby we should increase the number of visitors to the VR Theme Park, increase sales by increasing value added, increasing profitability. Finally, it is necessary to heighten and expand the level of VR Theme Park's operation and marketing by doing so.

Ethical Clearance: Not required

Source of Funding: This study was supported by the study fund of the Graduate School of Hansung University.

Conflict of Interest: Focusing on the Mediated Effect of Delight

Psychometric Evaluation of Cost-Reduction Practice

Miyoung Lee¹, Mi-Kyoung Lee¹, Mi Ok Choi², Youngshin Song³

¹College of Nursing, Eulji University, 77, Gyeryong-ro, 771beon-gil, Jung-gu, Daejeon, Republic of Korea; ²Total Medical Co., Ltd, 12, Eulji-ro 14-gil, Jung-gu, Seoul, Republic of Korea; ³College of Nursing, Chungnam National University, 266, Munhwa-ro, Jung-gu, Daejeon, Republic of Korea

ABSTRACT

Background/Objectives: It is difficult to measure cost-effective nursing. Methodological study design was applied as to test the construct validity and reliability of cost reduction practice scale (15-item) in Korean nurses.

Method/Statistical analysis: Data were collected from 587 nurses who working at four hospitals located in S and D cities in Korea. Reliability and construct validity of the scale were conducted. Data were analyzed using the SPSS 23.0 program. Item analysis and exploratory factor analysis (EFA) were performed to evaluate the construct validity. The reliability of the scale was verified by Cronbach's alpha to confirm the internal consistency.

Findings: The former was used to calculate correlations between each item and total items. The latter was used to identify the structure of the factors that represent test items. Before the exploratory factor analysis, the data were confirmed with Kaiser-Meyer-Olkin test and Bartlett's sphericity test to determine if the data could be analyzed using factor analysis. As a result of item analysis, the item-total item correlation of the modified 12 items was .291-.499. The exploratory factor analysis using varimax rotation of principal component analysis yielded two factors that have an eigenvalue of one or greater. Ten items with factor loadings of .432 or greater were extracted as factor 1(consumable savings); eigenvalue and explanatory power were determined to be 3.36 and 27.99%, respectively. The factor loadings of the other two items were .886 or greater, and they were extracted as factor 2(equipment management). Their eigenvalues and explanatory power were 1.75 and 14.57%, respectively. The total variance was 42.56%. For reliability of the cost-reduction practice, Cronbach's $\alpha = .770$.

Improvements/Applications: The scale is expected to be helpful in determining the level of cost reduction practice of nurses at the hospital and searching for strategies.

Keywords: Nurse, Cost reduction practice, Scale, Validity, Factor analysis

INTRODUCTION

As competition intensifies in the medical profession, hospitals are constantly striving to strengthen their competitiveness by building an environment conducive to the improvement of hospital management. With the diversification and specialization of medical technology, hospitals are initiating efforts to make the management

more efficient; they are not only providing education for the improvement of expert knowledge that health care providers must have but also searching for methods for managing expensive medical equipment and expendable assets, such as medicine, materials, and consumables used in diagnoses and treatment^[1]. Labor, material, and management costs^[2,3] have been identified as the main factors influencing hospital profitability. Nurses are key personnel who provide medical services with the nearest proximity to patients; they account for more than a half of hospital staff and are in charge of managing medical equipment or ward assets. Thus, nurses can make efforts to improve nursing services and reduce costs^[4,5]; indeed, increased economic knowledge and an

Email: lmk@eulji.ac.kr

attitude with a sense of ownership^[6, 7] in nurses can be helpful in achieving the long-term goals and improving competitiveness of the hospital. Many nurses, however, still lack the ability to choose hospital resources and efficiently use them or the initiative to conduct cost-to-performance measurement^[8]. As such, despite the necessity of determining the level of nurses' cost-reduction practice, finding an objective tool to measure it is difficult. Previous studies have been limited to determining the economic knowledge or attitude of nurses^[1, 8] or reporting quality assurance activities for cost reduction or work improvement^[9]. An instrument for measuring cost-reduction performance developed^[10], but only the reliability and content validity of the overall items were established, and the usefulness of the instrument needed to be tested. Accordingly, the present study was conducted to establish the usefulness of the previously developed instrument^[10] by testing the reliability and validity of the instrument. The present study also aimed to provide basic data for establishing the cost-reduction practice methods by nurses.

METHOD

Study design and sample: This methodological research aimed to test the reliability and validity of the cost-reduction practice instrument^[10]. The participants were 587 nurses working at four hospitals with 500 beds or more located in S and D cities in South Korea. At the time of data collection, the purpose of the study was explained, and nurses who consented to participate in the study were instructed to complete the questionnaire.

Measurement: The initial content of the cost-reduction practice instrument was composed by the investigator based on the investigator's own clinical experience at the time of development. To increase the validity of the instrument, it was revised based on consultations with five head nurses and directors of nursing with five years or more of experience in managing wards, as well as one professor of nursing management. Afterward, the instrument was revised and supplemented through a preliminary survey among general-duty nurses. The instrument was composed of 15 items and responses were indicated using a four-point Likert scale. The instrument was developed to measure the practice level of cost reduction in actions that are generally performed in clinical practice, and contains items on the use and handling of equipment and consumables. A higher score

indicates higher cost reduction. The reliability of the instrument at the time of development measured by Cronbach's α was .769^[10].

Data analysis: The collected data were analyzed using SPSS 23.0. Frequency analysis was performed to identify the general characteristics of the participants. The reliability and validity of the instrument were determined by exploratory factor analysis. Correlations between each item and total items were calculated through item analysis, and items with a correlation coefficient of less than .30 were judged to be inappropriate to be included in the instrument and subsequently deleted. The reliability of the instrument was determined by Cronbach's α , which is used to determine the internal consistency of items. The construct validity of the instrument was determined by exploratory factor analysis. Before conducting the exploratory factor analysis, the results of Kaiser-Meyer-Olkin (KMO) and Bartlett's sphericity tests were checked to determine if the data were appropriate for factor analysis. Through exploratory factor analysis, items with an initial eigenvalue of one or greater and factor loading value of 0.4 or higher were selected.

RESULTS AND DISCUSSION

RESULTS

Demographics of participants: This methodological research aimed to test the reliability and validity of the cost-reduction practice instrument^[10]. The participants were 587 nurses working at four hospitals with 500 beds or more located in S and D cities in South Korea. At the time of data collection, the purpose of the study was explained, and nurses who consented to participate in the study were instructed to complete the questionnaire [Table 1].

Table 1: General characteristics of participants (N = 587)

Variables	Category	n	%
Gender	Male	10	1.7
	Female	577	98.3
Age (yr)	<30	401	68.3
	30-39	146	24.8
	≥40	40	6.9
Education	Associate degree	327	55.7
	Over bachelor's degree	260	44.3

Conted...

Clinical career (yr)	<3	176	30.0
	3-7	218	37.1
	≥7	193	32.9
Position	Staff nurse	501	85.3
	Over charge nurse	86	14.7
Department	General ward	264	45.0
	Special unit	229	39.0
	Other	94	16.0

Construct validity: The results of item and exploratory factor analyses were confirmed to assess the construct validity. The range of correlation coefficients between each item and the 12 total items (revised through item analysis of the 15 items) was .291 to .499. Although the correlation coefficient of item 12 was less than .30, this item was not deleted to avoid decreasing the Cronbach’s α coefficient; moreover, content review indicated that the item was appropriate for the composition of the instrument. Accordingly, 12 items were used for exploratory factor analysis.

Results of the KMO and Bartlett’s sphericity tests were checked before factor analysis to determine if the

data were appropriate for conducting exploratory factor analysis. The data were determined to be appropriate for exploratory factor analysis: KMO test result of .82 and Bartlett’s sphericity test result of $\chi^2=1412.18$ with the probability level of $p<.001$. The exploratory factor analysis using varimax rotation of principal component analysis yielded two factors that have an eigenvalue of one or greater. These two factors were confirmed to be appropriate by the inflection point of the scree graph, given in Figure 1. Thus, ten items with factor loadings of .432 or greater were extracted as factor 1; eigenvalue and explanatory power were determined to be 3.36 and 27.99%, respectively. The factor loadings of the other two items were .886 or greater, and they were extracted as factor 2. Their eigenvalues and explanatory power were 1.75 and 14.57%, respectively. Correlation coefficient between the factors was .23 ($p<.001$).

Factor 1 was named “consumable savings,” as it was composed of items related to the appropriate use of treatment materials and consumables. Factor 2 was named “equipment management,” as it included the use of equipment suitable for the intended purpose and management for the prevention of equipment failure. The two factors explained 42.56% of nurses’ cost-reduction practice [Table 2].

Table 2: Exploratory factor analysis of cost-reduction practice (N = 587)

Questions	Item	Mean ± SD	Item-total correlation	Factor	
				1	2
Q10	I have an experience of preparing excessive amount of lubricant when inserting a catheter and discarded the leftover.	3.13 ± 0.64	.478	.658	.004
Q9	I have used gauze, alcohol sponge, and surgical pad for cleaning or other purposes.	3.12 ± 0.60	.494	.654	.054
Q14	I have used dressing scissors and kelly for other than their intended purposes.	3.38 ± 0.68	.419	.622	.013
Q2	I have used sterile gloves when treating patients even though disposable gloves may have been sufficient.	3.29 ± 0.62	.468	.601	.081
Q4	I have an experience of opening the whole package of disposable syringes to prepare for injections and discarded unused leftover syringes.	3.38 ± 0.61	.499	.585	.204
Q8	Even if I needed only an injection needle, I opened a disposable syringe and used only the needle.	3.17 ± 0.71	.448	.585	.100
Q15	I have kept ward consumables in my possession for personal use.	3.47 ± 0.63	.482	.558	.240
Q11	I needed a 3-way cover, so I opened a new package but used only the cover.	3.05 ± 0.69	.417	.537	.134
Q6	I sometimes dispose of general waste in a medical waste container.	3.24 ± 0.63	.341	.512	-.076

Q3	I sometimes use various recording papers of the ward as general purpose printing paper or memo paper.	3.07 ± 0.78	.321	.432	.080
Q12	After using a portable EKG analyzer and defibrillator, remove gel or other foreign material on the cables and equipment right away.	3.11 ± 0.82	.291	.059	.903
Q13	If fluid or other foreign material falls on infusion pump, wipe it off immediately to prevent equipment failure.	2.95 ± 0.83	.343	.121	.886
Eigen Value				3.36	1.75
Total Variance				27.99	14.57
Cronbach's alpha, total: .770				.777	.789

Figure 1: Scree plot

Reliability: Cronbach's α coefficient, which indicates internal consistency, was determined to assess the reliability of the instrument. The Cronbach's α of the total 12 items of the cost-reduction practice instrument was .770, and those of the factors "consumable savings" and "equipment management" were .777 and .789, respectively.

DISCUSSION

Hospitals are heavily investing to survive and thrive in a changing medical environment, and accordingly, their interest in efficient management is increasing. Therefore, determining the level of cost-reduction activities of nurses, who serve significant roles in hospital management, is necessary. Nonetheless, finding a useful tool to measure it is difficult. Accordingly, the present study was conducted to test the reliability and validity of the cost-reduction practice instrument^[10]. This instrument was initially developed with 15 items without subfactors, but as a result of items analysis and

exploratory factor analysis in the present study, 12 items and two subfactors were extracted, and their explanatory power was determined to be 42.56%.

In the case of item 12, among the 15 items in the previous study, the correlation coefficient between each item and total items was .291, which was less than the criterion of .30. The item was not deleted because it describes the act of removing foreign material to prevent equipment failure and adjudged to be an item that should be included to measure the level of cost-reduction practice. Items 1, 5, and 7 were deleted as a result of the instrument validity test. Item 1 was "I have discarded leftover Betadine or alcohol pads after dressing," and item 7 was "I have collected E.O. gas bags, yellow paper, and nonwoven fabric used as instrument or wrapping paper of consumables in the central supply room and sent them for recycling." As items 1 and 7 were actions to be performed for infection control rather than as cost-reduction practice, their deletion was adjudged to be appropriate. Item 5 was "I have used patient urine specimen container as a drinking cup or drainage measurement container." As few nurses reported performing such behavior for cost reduction, deleting item 5 was also considered appropriate.

Items that constituted the two factors were as follows. The first factor consisted of items on whether nurses were using the consumables necessary for patient care for other purposes, and whether nurses were using the proper amount of consumables to perform nursing. The second factor included items specifically asking whether nurses were actively managing medical equipment used frequently in the hospital. Previous studies have also included such topics as cost reduction^[9] or material management^[5, 11] through the saving of consumables or hygienic material in nurses' cost-reduction efforts or

practice management indicators of nursing organizations. As nurse managers positively perceive the fact that their job performance includes the procurement and management of equipment^[12], the present instrument is judged to reflect properly the elements that measure the level of nurses' cost-reduction performance.

The cost-reduction practice of nurses, determined using an instrument that completed the final verification, showed mean scores ranging from 2.95 to 3.47 points; that is, the mean scores of all items were higher than the median score of the two points. This finding is similar to the result of 3.12 points^[7] measured using an instrument that is a modified and supplemented version of the instrument: many nurses show a positive level of performance on cost reduction. Among the cost-reduction practice items, the item "I have never kept ward consumables in my possession for personal use" scored the highest point of 3.47, which indicated the honesty of nurses and their self-restraint from taking hospital supplies for personal use. Among the 12 items, the lowest score of 2.95 points was obtained for the item "If fluid or other foreign material falls on the infusion pump, I wipe it off immediately to prevent equipment failure." Overall, it may be necessary to reinforce the guidelines for accurate equipment management practice, as the practice on consumable management is positive while that on equipment management is low. The reliability of both the current 12-item questionnaire and the 15-item questionnaire developed in a previous study^[10] measured by Cronbach's α was .769. Notwithstanding the fact that reliability increases as the number of items increases, owing to the increase in Cronbach's α , the reliability of the instrument was confirmed to maintain internal consistency despite the deletion of three items.

From testing the reliability and validity of the instrument, the cost-reduction practice instrument was determined to be composed of the use of consumables and equipment management practice. In addition, nurses generally used hospital supplies and equipment appropriate for their intended use when the level of cost-reduction practice was determined, and nurses were using these resources with a certain level of interest in management.

The significance of the present study lies in its confirmation of the usability of a cost-reduction practice instrument by testing the reliability and validity of the instrument, which was previously developed in

a situation where instruments to identify the level of nurses' cost reduction practice was lacking. Further, the advantage of the instrument is that it can be easily used because the instrument consists of only 12 items. The limitation of the present study is that criterion-related validity test, which determines relevance to a particular criterion, was not conducted. As the development of an instrument should be based on rational and logical evidence in terms of validity test, criterion-related validity test would be desirable for future studies.

CONCLUSION

The present study conducted item and exploratory factor analyses to test the construct validity of a previously developed instrument for measuring cost-reduction practice. The verified 12-item instrument consisted of 12 items categorized into the two factors of reduction in consumables and equipment management, with 10 and 2 items, respectively. The reliability of the instrument was tested by determining internal consistency, and the reliability of the instrument was confirmed, based on the high internal consistency of the items included in the two factors. Lastly, the content validity, construct validity, and internal consistency of the cost-reduction practice instrument were affirmed by the results of two previous studies. Therefore, the instrument is deemed appropriate for measuring the level of nurses' cost-reduction practice.

Periodontal Disease and CRP Relatedness in Korean Adults

Jin-ho Chun¹, Jung-hwa Lee², Yu-hee Lee³

¹Department of Preventive Medicine, Inje University School of Medicine, Korea; ²Department of Dental Hygiene, College of Nursing and Healthcare Sciences, Dong-Eui University; ³Department of Dental Hygiene, Taegu Science University, Daegu, Korea

ABSTRACT

Background/Objectives: Healthy teeth and oral health are essential to keep health. With more attention to oral health in the ageing era, periodontal disease, the main factor which impedes oral health, draws more attraction. This study tries to observe an association between periodontal disease and C-reactive protein (CRP) in Korean adults, to reevaluate the importance and necessity of oral healthcare in national health promotion, and to provide the grounds for follow-up research.

Method/Statistical analysis: From the raw data of the 6th 2015 National Health and Nutrition Examination Survey, 3,760 samples that meet the conditions of this study were selected as study subjects. With the use of SPSS (ver 22.0), weight based complex sampling analysis was conducted with the study subjects. Depending on the prevalence of periodontal disease, average value analysis, Chi-square test and OR (95% CI) were compared in terms of CRP. To evaluate the influence of CRP periodontal disease on a rise in a CRP value (more than 1.0 mg/L), multinomial logistic regression analysis was conducted.

Findings: Regarding CRP distribution, less than 1.0 mg/L accounted for 72.5%; more than 1.0 mg/L 27.5%; the average value (range) was 1.20 (0.09~20.01) mg/L. The average value of CRP was 1.38 mg/L when there was the prevalence of periodontal disease, and was 1.13 mg/L where there wasn't periodontal disease (P=.010). The rate (%) of more than CRP 1.0 mg/L was significantly higher when there was the prevalence of periodontal disease than when there wasn't periodontal disease (OR (95% CI) = 1.57 (1.32~1.87), P<0.0001). According to the multinomial logistic regression analysis, after the correction of the study subjects' characteristics, OR (95% CI) of high CRP (more than 1.0 mg/L) was 1.26 (1.04~1.53) when there was the prevalence of periodontal disease. The prevalence of periodontal disease significantly influenced a rise in a CRP value (P=.020).

Improvements/Applications: When there was periodontal disease, a CRP value increased. Periodontal disease is a typical oral disease which is not treated carefully despite its high prevalence rate. A rise in a CRP value can influence systemic health. Therefore, it is necessary to enhance the importance of periodontal disease care not only for oral health, but for systemic health promotion. It is urgent to come up with an active plan of periodontal disease care for the whole nation. In addition, it is required to develop a practical support program and activate relevant research.

Keywords: CPI, CRP, Oral disease, Oral health, Periodontal disease

INTRODUCTION

Healthy teeth and oral health are essential to keep health through proper nutrition intake¹, and especially are very important to keep life in the ageing era².

Along with dental caries, periodontal disease is a typical cause of tooth loss and other health disorders. According to Health Insurance Review and Assessment Service, gingivitis and periodontal disease were ranked

Corresponding Author:

Yu-hee Lee
Department of Dental Hygiene,
Taegu Science University, Daegu, Korea
Email: eu1983@naver.com*2

in the second position of insurance common diseases of outpatients³. The increase rate of periodontal disease reached 15.5%, and consequently the rising social and economic burdens for the disease are a critical issue.

Periodontal disease is an oral disease that occurs mainly with one's getting old. It is an inflammatory lesion that triggers tooth loss when the host reaction to the bio-film and bacteria generated in the tooth surface destroys periodontal tissues^{4,5}. Recently, there are many reports that toxin of bacteria, one of multiple causes for periodontal disease, is delivered to a blood vessel and thereby arouses bacteremia or systemic immunoinflammation, or the inflammatory mediator generated by periodontal lesion is moved to the whole body through blood current and influences systemic disease^{6,7}. Periodontal tissues play a role to store bacteria, their byproducts, and inflammation and immunity mediators, and their influence is given to other organs through blood vessels, and consequently they can become the risk factor of cardiovascular disease⁸.

In order to prove that inflammation serves as a critical role for pathological mechanism, inflammatory markers, such as C-reactive protein (CRP), fibrinogen, and serum amyloid A (SAA), are used. Nevertheless, CRP useful at actual clinical settings attracts attention as an objective marker^{9,10}. Sanders et al.^[11] and Fitzsimmons et al.¹² reported that CRP was found in periodontal disease patients' gingival cervical fluid and saliva. Paraskevas et al.¹³ revealed that patients with periodontal disease had a higher value of CRP in serum than patients without the disease. Periodontal disease is a chronic inflammatory disease. Reportedly, patients with periodontal disease had increased inflammatory markers like CRP and the treatment of periodontal disease reduced the degree of systemic inflammation¹⁴.

As such, with rising attention to periodontal disease, many relevant studies have been conducted. Nevertheless, there are a few reports about object big data using the inflammatory marker 'CRP'. Therefore, this study tried to utilize the big data of the 6th 2015 (3rd year) National Health and Nutrition Examination Survey in order to observe an association between periodontal disease and CRP in Korean adults and reemphasize the importance of oral health care including periodontal disease care in the pursuit of health promotion and thereby to suggest the grounds for follow-up research.

MATERIALS AND METHOD

Study subjects: The raw data of the 6th 2015 (3rd year) National Health and Nutrition Examination Survey was used. Of 7,380 samples, 5,945 adult samples were first extracted with the exception of 1,435 persons aged less than 19. And then, 2,185 adult samples with missing values in main variables were excluded. Finally, 3,760 adults were used as study subjects.

Research performance: This study was conducted after the review procedure of the Institutional Review Board of Inje University (INJE 2017-04-015).

From the raw data of the 6th 2015 National Health and Nutrition Examination Survey, oral healthcare types, values of periodontal status examination CPI, periodontal disease prevalence, and CRP measures were utilized.

Data analysis: Since the raw data of National Health and Nutrition Examination Survey were extracted by two-phase stratified cluster sampling, rather than simple random sampling, this study conducted complex sample analysis. In other words, complex sampling was conducted in the way of applying stratified and cluster variables and putting weight of questionnaire and examination survey.

To find the study subjects' oral healthcare patterns, periodontal disease prevalence, average CRP, frequency analysis and descriptive statistical analysis were conducted. To compare the average value of CRP depending on periodontal disease prevalence, independent sample t-test was conducted. To find a CRP value depending on periodontal disease prevalence, Chi-square test was conducted. To observe the influence of periodontal disease on a rise in a CRP value, regression analysis was conducted.

For statistical analysis, this study utilized SPSS ver 22.0 (IBM corp., Armonk, NY, USA).

RESULTS AND DISCUSSION

RESULTS

Oral health and care characteristics: The latest 1-year oral examination rate was 33.1%, and the experience rate of dental clinic visit was 53.5%. The latest 1-year gum disease treatment rate was 13.0%. Regarding the number of toothbrushing times, 0-1 time accounted for 9.4%; 2

times 16.9%; and more than 3 times 73.7%. Regarding the use of oral care products, dental floss accounted for 25.3%; interdental brush 21.2%; gargle 22.0% [Table 1].

Table 1: Oral health and care characteristics (N = 3760)

Variables	Group	N (%)
Oral examination	Yes	1228 (33.1)
	No	2532 (66.9)
Visit dental clinic	Yes	2038 (53.5)
	No	1722 (46.5)
Gum disease treatment	Yes	535 (13.0)
	No	3225 (87.0)
Toothbrushing frequency (times per day)	0-1	395 (9.4)
	2	607 (16.9)
	3	1333 (37.1)
	4 or more	1425 (36.6)
Use of floss	Yes	875 (25.3)
	No	2885 (74.7)
Use of interdental brush	Yes	724 (21.2)
	No	3036 (78.8)
Use of gargle solution	Yes	855 (22.0)
	No	2905 (78.0)

Values are presented as number (weighted %).

Morbidity of periodontal disease: As the result of CPI measurement, the CPI 3 (shallow periodontal pockets) and CPI 4 (deep periodontal pockets) of periodontal tissues were categorized in the periodontal disease prevalence group. When any of six measured regions was involved in shallow periodontal pocket group and deep periodontal pocket group, it was categorized in the periodontal disease prevalence group for all. According to the analysis, periodontal disease prevalence rate was 29.3% (1,254 study subjects) [Table 2].

Table 2: Morbidity of periodontal disease

Variables	Group	N (%)
Periodontal disease	No	2506 (70.7)
	Yes	1254 (29.3)

CRP results of the total subjects: Regarding CRP distribution, less than 1.0 mg/L accounted for 72.5%; 1.0-2.9 mg/L 19.5%; 3.0-9.9 mg/L 6.6%; more than 10

mg/L 1.5%. The mean was 1.20 mg/L. Based on the 1.0 mg/L which is the reference of normal range of a healthy person, less than 1.0 mg/L accounted for 72.5%; more than 1.0 mg/L 27.5% [Table 3].

Table 3: CRP results of the total subjects

CRP	N (%)
<1.0 mg/L	2670 (72.5)
1.0-2.9 mg/L	762 (19.5)
3.0-9.9 mg/L	264 (6.6)
≥10 mg/L	64 (1.5)
M±SE (Min.~Max.)	1.20 ± 0.04 (0.09~20.01)
<1.0 mg/L	2670 (72.5)
≥1.0 mg/L	1090(27.5)

Values are presented as number (weighted %)

CRP: C-reactive protein

Level of mean CRP according whether the periodontal disease: The average value of CRP was compared depending on periodontal disease prevalence. When there was periodontal disease prevalence, the average value of CRP was 1.38 mg/L; when there wasn't periodontal disease prevalence, it was 1.13 mg/L. Therefore, the average value of CRP when there was periodontal disease prevalence was significantly higher (P=.010) [Table 4].

Table 4: Level of mean CRP according whether the periodontal disease

Periodontal disease	CRP (mg/L)	P
No (n = 2506)	1.13 ± 0.05	.010
Yes (n = 1254)	1.38 ± 0.08	

Values are presented as mean±standard error

P by independent sample t-test.

The higher CRP rate (≥ 1.0 mg/L) whether the periodontal disease: The rate (%) of more than CRP 1.0 mg/L depending on periodontal disease prevalence was compared. As a result, the rate (%) of more than CRP 1.0 mg/L when there was periodontal disease prevalence was significantly higher than the rate when there wasn't periodontal disease prevalence (OR (95% CI) = 1.57 (1.32~1,87), P<0.0001) [Table 5].

Table 5: The higher CRP rate (≥ 1.0 mg/L) whether the periodontal disease

Periodontal disease	CRP higher (≥ 1.0 mg/L) [n/N (%)]	OR (95% CI)	P

No	662/2506 (24.8)	1.00	

The influence of periodontal disease on the rate (%) of more than CRP 1.0 mg/L: According to multinomial logistic regression analysis, in the condition that the study subjects' characteristics were corrected, when there was periodontal disease prevalence, OR (95% CI) of high CRP (more than 1.0 mg/L) was 1.26 (1.04~1.53). Therefore, periodontal disease prevalence significantly influenced the rate (%) of more than CRP 1.0 mg/L ($P=.020$).

When the study subjects were highly aged and involved in smoking group, and had a high BMI, OR (95% CI) of high CRP (more than 1.0 mg/L) was statistically and significantly high [Table 6].

Table 6: Influence of periodontal disease on the higher CRP rate (≥ 1.0 mg/L)

Variable		OR (95% CI)	P
Periodontal disease	No	1.00	.020

DISCUSSION

This study tried to observe an association between periodontal disease and CRP in Korean adults, and to reevaluate and emphasize the importance and necessity of oral healthcare in national health promotion.

Based on the result of CPI measurement, the prevalence rate of periodontal disease that needs treatment was 29.3% of the study subjects. According to Health Insurance Review and Assessment Service, gingivitis and periodontal disease were ranked in the second position of insurance common diseases of outpatients, and the number of patients who had treatment rapidly increased from 8,039,812 in 2011 to 13,435,655 in 2015¹⁴. According to the 2013 OECD statistics of dental expenditure, the average OECD rate was 55%, whereas the average rate in Korea reached 84%¹⁵. Many studies proved that the periodontal disease prevalence rate in Korea was serious. If there is no preparation, it is expected that the prevalence rate rises more and thereby social and economic burdens get heavier.

The average value of CRP was 1.38 mg/dL when there was periodontal disease, and was 1.13 mg/dL when there wasn't periodontal disease ($P=.010$). Therefore, the rate (%) of more than CRP 1.0 mg/dL was significantly higher when there was periodontal disease than when there wasn't periodontal disease (OR (95% CI) = 1.57 (1.32~1.87), $P<0.0001$).

It indicates that the prevalence of periodontal disease leads to a rise in a CRP value in body. Kim et al.¹⁶ and Han et al.¹⁷ reported that the inflammation caused by periodontitis was spread to the whole body through blood circulation and emphasized that periodontal tissues became the moving path of inflammation. Loss et al.¹⁸ conducted comparative research on CRP concentrations between 107 periodontitis patients and 43 persons as a control group and proved that periodontitis had a significant correlation with CRP. Domestically, Lee et al.¹⁹ classified a few of 11 persons into the health group and the experimental group with severe periodontal disease and then measured a CRP value, and consequently revealed that the experimental group had a higher CRP concentration than the health group. This result was consistent with the result of this research.

It was found that the prevalence of periodontal disease lead to an increase in a CRP value. Marcaccini et al.²⁰ reported that in case of a CRP value increased by

inflammatory response, after periodontal treatment, the values of inflammatory markers like MMP-8, MMP-9, and tissue inhibitor of MMP-2 were reduced. Konopka L et al.²¹ also presented the same opinion. Relevant studies showed that after the proper treatment of periodontal disease, a CRP value was decreased. In this study, the subjects who had the prevalence of periodontal disease were compared in terms of CRP depending on oral health patterns, but there was no significant result due to limited data. However, Park et al.²² revealed that calculus index was changed statistically and significantly depending on toothbrushing type. Based on the results of multiple studies, good oral health patterns for oral care is of importance and an effective method needs to be found.

According to multinomial logistic regression analysis, OR (95% CI) of the rate of more than CRP 1.0 mg/L was 1.26 (1.04~1.53) when there was the prevalence of periodontal disease. Therefore, the prevalence of periodontal disease significantly influenced a high CRP value (P=.020). It indicates that the prevalence of periodontal disease leads to an increase in a CRP in body after the correction of the study subjects' characteristics. This result is consistent with the results of many studies in references.

Given all, it was observed that periodontal disease had a significant association with CRP. Periodontal disease is considered to be a critical factor for a rise in a CRP value.

This study has some limitations. National Health and Nutrition Examination Survey, whose data was used in this study, was cross-sectional. There was a limitation to the explanation of causal relationship. Nevertheless, in the circumstance where there is not much research on CRP, this study is meaningful in the point that it first tried to observe an association between periodontal disease and CRP in Korean adults with the use of big data of National Health and Nutrition Examination Survey. In follow-up research, it is expected to utilize more data to overcome the limitations and make a good plan.

CONCLUSION

This study utilized the raw data of the 6th 2015 (3rd year) National Health and Nutrition Examination Survey and observed an association between Korean adults' periodontal disease and C-reactive protein (CRP). The results are presented as follows:

1. The number of patients with periodontal disease prevalence who needed treatment was 1,254(29.3%).
2. Regarding the average value of CRP, when there was periodontal disease prevalence, it was 1.38 mg/L; when there wasn't periodontal disease prevalence, it was 1.13 mg/L (P=.010). The rate (%) of more than CRP 1.0 mg/L was significantly higher when there was periodontal disease prevalence than when there wasn't periodontal disease (OR (95% CI) = 1.57 (1.32~1.87), P<0.0001).
3. According to multinomial logistic regression analysis, periodontal disease prevalence significantly influenced the rate of more than CRP 1.0 mg/L (%) (OR (95% CI)= 1.26 (1.04~1.53), P=.020).

Given the results, a CRP value increased when there was periodontal disease prevalence. Periodontal disease is a typical oral disease which is not treated carefully despite its high prevalence rate. It is necessary to enhance the importance of periodontal disease care not only for oral health, but for systemic health promotion. It is urgent to come up with an active plan of periodontal disease care for the whole nation. In addition, it is required to develop a practical support program and activate relevant research.

Effect of Simulation-based Training for Neonatal Care on Critical Thinking, Critical Judgement, and Problem Solving Ability in Nursing

Hyun A Nam¹, Ae Young Lee², Miok Kim³

¹Assistant Professor, Dept. of Nursing, Howon University, Korea; ²Assistant Professor, Dept. of Nursing, Gangneung Yeongdong University, Korea; ³Assistant Professor, College of Nursing, Dankook University, Korea

ABSTRACT

Background/Objectives: This study aimed to investigate the differences in their critical thinking, clinical judgment, and problem-solving ability between before and after the simulation training of nursing students.

Method/Statistical analysis: Convenience sampling was made among seniors at a single department of nursing who had acquired all the theories in the area of pediatric nursing and finished clinical training and understood the purpose of this study and consented to participation in the study. 46 students (21 experimental and 25 control) participated in Korea. The data was analyzed the SPSS WIN program.

Findings: The experimental group in the study showed greater increase in clinical judgment and problem solving ability in pre-test and post-test than the control group did. However, no statistically significant differences in critical thinking between groups were observed.

Improvements/Applications: It is therefore necessary to give nursing education through simulation training that enables nursing students to practice repetitively in a safe environment with the objective of promoting positive thinking based on knowledge.

Keywords: *Critical thinking, Clinical judgement, Problem solving ability, Simulation, Nursing, Student*

INTRODUCTION

As more severe diseases and a diversity of life-support systems based on the development of modern medical science led to the greater demand for a high-level nursing competence, supplying nursing workforce with competence necessary in clinical practice has become one of the important aspects of the changes in nursing education ^[1]. In this context, the Korean Accreditation Board of Nursing Education^[2] has specified a required curriculum, which includes at least 1,000 hours of clinical training as well as various types of theoretical knowledge needed by nurses, and recommended clinical training in specialized institutions of a certain size

or larger in pursuit of good-quality clinical training. However, training institutions need to bear a heavy burden so that clinical training can meet such a demand at the changing clinical sites^[3], and it is actually difficult for nursing students to perform nursing personally at clinical sites due to patients' better sense of rights and the safety issues.

Nursing training institutions are searching for diverse methods to achieve learning performance, paying attention to the improvement in nurses' critical thinking, in clinical judgment regarding nursing priorities in many different situations^[4], and in problem-solving methods of promoting the ability to settle those situations. As a dynamic process of combining practice and theory by representing a clinical situation similar to the actual one to promote nursing students' participation in a safe environment since the 2000s^[5], simulation-using training has been utilized as an alternative or complementary type of training to clinical training for repetitive training in skills, which nursing students can hardly apply to patients,

and proven to be effective in improving confidence in clinical competence, critical thinking, and problem-solving^[6,7]. This is also highly evaluated because it can make up for the limitations that it is impossible to standardize the experiences of every student in clinical training and that it is impossible to make developmental feedbacks or discussions about the situation concerned right after the experience with the patient^[8].

Nurses are required to be equipped with critical thinking^[9] and clinical judgment, which are important elements affecting the evidence-based decision-making process in many different clinical situations. It is possible to improve these elements through the learning process of using conventional and innovative methods to clarify diverse views concerning different types of unfamiliar issues and finding and asking core questions, which may lead to better solutions, through simulation training^[10].

As the number of high-risk newborn infants is on the increase in the area of pediatric nursing during diverse types of clinical training^[11] and an emergency situation can definitely change the patient's prognosis due to time for treatment by the medical staff and quality nursing^[12], there is a great demand for competent nurses in a newborn emergency situation. However, it is even more likely to be limited not only because of the decrease in the number of patients due to the drop in the birthrate but also because of the ethical issue of a latent threat to the patient's safety^[13]. In particular, it is unlikely to improve competence through personal nursing training for high-risk newborn infants at specific sites in case of hospitalization for artificial ventilation, including oxygen treatment, body temperature maintenance, nutrition, and infection control.

This study aimed to develop a scenario that represented a newborn emergency situation for nursing students about to graduate after acquiring all the theories in the area of pediatric nursing and finishing clinical training, apply it to simulation training, and determine its effects on their critical thinking, clinical judgment, and problem-solving ability.

MATERIALS AND METHOD

Research design: This is a quasi-experimental study of two-group pretest-posttest design that aimed to determine the effects of high-risk newborn nursing simulation training using Newborn Simulator (Newborn Hall human simulator, Gaumard, Miami, Florida, USA).

Simulation-based Training for Neonatal care: This study is simulation Training applied in the second term for seniors with the theme of a situation requiring cardiopulmonary resuscitation due to breath loss at the early stage of nursing for a meconium-stained newborn infant in a delivery room. This theme was chosen not only because early nursing for newborn infants is crucial but also because the most important type of primary nursing is to get breathing started on the basis of the fact that respiratory arrest is an emergency situation that frequently occurs in an intensive care unit for newborn infants and requires nurses to exert their competence.

Two professors of pediatric nursing drafted the scenario by analyzing medical records together with a nurse manager in a newborn room of a university hospital in Seoul and, then, by revising it with the advice of the medical staff in the ward; it was designed to enable them to experience simulation in a similar situation to the clinical site by creating an environment that allowed them to experience a similar situation to the clinical site. The scenario included a delivery model simulator in a delivery room and a standardized patient serving as a doctor and focused on utilization of the newborn simulator following the process of delivery. The simulation template for students, which contained the theme of this simulation, explanation of the situation, the purpose of the training, preparation items, and the training environment, was given to the students concerned before the fourth week of the training. This course was reviewed by a professor majoring in pediatric nursing as well as by two nursing professors full of experiences in simulation.

The program was composed of three sessions-orientation, skill training, and operation and evaluation-and its details are as follows:

Orientation: The first session was composed of orientation and pretest; it contained the explanation of the entire process of simulation and the scenario and the introduction to how to do simulation training test along with test for the core theories in the area of neonatal nursing.

Skill training: Skill training constituted the second session. At this stage, training in core nursing practice required by the scenario was performed in a total of six groups, each of which was composed of three or four persons. For the skill training, three instructors gave the students core skill training in a basic nursing room.

Operation and evaluation of simulation-based training for neonatal care: In the third session, a newborn simulator was used to allow individual students to experience simulation training and evaluate it. It took about 10-15 minutes for each student to get evaluated, and the students were asked to stay in the waiting room before and after the test with the objective of preventing contamination among them. They experienced early neonatal nursing and coping with an emergency situation and were enabled to prepare for presentation necessary for debriefing in the waiting room after the training. During the debriefing session, all the students had time for getting together at a certain place to make presentations and discussions about their own experiences and strengths and weaknesses, consolidate the simulation situation, and give explanation and advice about their coping.

Participants and Data collection: Convenience sampling was made among seniors at a single department of nursing who had acquired all the theories in the area of pediatric nursing and finished clinical training and understood the purpose of this study and consented to participation in the study. 43 students (93.5%) were female and 3 (6.52%) were male; every participant had got simulation training in other subjects. 46 students (21 experimental and 25 control) in a nursing college who met the purpose of this study were finally sampled; the proper sample size for this study was 34 persons, as determined by principal statistical testing using a G*power 3.10 program at the significance level (α) of 0.05, testability ($1-\beta$) 80%, and the medium effect size (d) of 0.5. Of 47 students to whom the same curriculum was applied and who applied for the subject for pediatric nursing simulation training, one who gave no consent to participation in the study was excluded; the post-hoc test found that the sample size was at a proper level with testability 96% and the effect size 0.89. Testability 80% was based on Lee and Kim [6], who analyzed the effects of simulation training in the area of obstetrical nursing. For data collection, the researcher gave the participants explanation about the purport and methods of the study, about the fact that it would not be revealed or used for any other purpose than that of this study, and about confidentiality and anonymity and asked them to give their consent to the participation before starting simulation training; measurement was performed using a self-administered questionnaire before and after starting the training.

Instruments

Critical thinking: The instrument developed by Yoon [14] was used to measure critical thinking. It had a total of 27 items on a five-point scale in seven areas—sound skepticism, intellectual fairness, objectivity, systemicity, carefulness, intellectual enthusiasm/curiosity, and self-confidence—with a higher score meaning a higher level of critical thinking. Cronbach's α was .84 in Yoon [14] and .93 in this study.

Clinical judgement: LCJR, which had been developed by Lasater [15], translated by Shim [16], and adapted by Hah [17], was used to measure clinical judgment. It had a total of 11 items: 3 in the area of cognition (focused observation, differences from expectation, and information pursuit), 2 in the area of interpretation (priority in data and data comprehension), 4 in the area of reaction (calm and confident attitude, clear communication, well-planned intervention/fluency, and skillfulness), and 2 in the area of retrospection (evaluation/self-analysis and willingness to improve). The score for each item ranged from 1 to 4, with the total score of 11-44; the higher score, the higher level of clinical judgment about nursing. Cronbach's α was .88 at the time of its development, .74 in Hah [17], and .87 in this study.

Problem solving ability: Personal-Problem Solving Inventory, which had been developed by Heppner and Petersen [18] and translated and adapted by Kang, Song, and Park [19], was used to measure problem-solving ability. The sub-areas of problem-solving ability were self-confidence, access-avoiding style, and self-control. The instrument had a total of 32 items on a six-point likert scale, with the scores ranging from 1 totally disagree to 6 totally agree; the scores for all the items were added up and divided by the number of the items to obtain the mean, with a higher score meaning better problem-solving ability. For reliability of this instrument, Cronbach's α was .89 at the time of its development and .94 in this study.

Data Analysis: The collected data were statistically processed using SPSS WIN 23.0 and were analyzed as follows:

1. Descriptive statistics, which involved the real number and percentage, was used to analyze the participants' general characteristics.
2. The mean and standard deviation were used to analyze the nursing students' critical thinking,

clinical judgment, and problem-solving ability before and after simulation training.

3. T-test was performed to analyze the differences in the nursing students' critical thinking, clinical judgment, and problem-solving ability before and after simulation training.

RESULTS AND DISCUSSION

The differences in critical thinking, clinical judgment, and problem-solving ability of nursing students between before and after simulation training are as presented in Table 1.

Table 1: Difference of critical thinking, critical judgement, and problem solving ability of nursing students (N= 46)

	Range of scale	Range of score		Pre-test	Post-test	Difference	t (p)
				Mean ± SD	Mean ± SD	Mean ± SD	
Critical Thinking	1~5	27~135	Exp.	64.61 ± 10.13	68.52 ± 11.93	3.90 ± 12.90	.038 (.970)
			Con.	67.87 ± 13.23	72.00 ± 9.07	4.12 ± 16.67	
Critical Judgement	1~4	11~44	Exp.	28.28 ± 4.45	30.90 ± 4.80	2.61 ± 5.08	2.512(.018)
			Con.	36.00 ± 2.82	33.25 ± 3.77	-2.75 ± .31	
Problem Solving Ability	1~6	30~180	Exp.	79.37 ± 7.65	86.75 ± 2.91	7.37 ± 8.21	-2.774(.010)
			Con.	77.14 ± 14.73	68.61 ± 15.43	-8.52 ± 15.27	

Exp. =Experimental group (n=21), Con. = Control group (n=25)

Simulation-based training is a new approach that enables one to use high-level thinking^[20] and is applied to improve clinical competence with a scenario based on an actual clinical situation along with a manikin, medical equipment, and healthcare and education professionals so that participants and students can learn a complicated situation with no serious problem in a safe environment.

While no statistically significant difference was found in critical thinking among the nursing students before simulation training, the score for critical thinking rose by 3.90±12.90 from an average of 64.61±10.13 (ranging from 27 to 135) before the training to 68.52±11.93 after the training in experimental group (t=.038, p=.970). This result seems to be due to the emphasis on critical thinking as principal training performance among the core abilities of nurses to perform principal roles in nursing education at the similar level to the previous studies at the above-average level of critical thinking^[21]. Critical thinking is a sub-area of the foundation skills, competencies, and character qualities, which are core skills required in the era of the Fourth Industrial Revolution, and is emphasized as an area of 4Cs (Critical thinking, Communication, Collaboration, and Creativity), which have been drawn as cognitive competence of the foundation skills^[22]. For nurses, in particular, it is an important factor for clinical competence in evidence-based decision-making^[9]; it is necessary to give continuous education to solve a given problem in pursuit of the best judgment in a clinical situation.

Simulation training made statistically significant differences in clinical judgment, which improved by 2.61±5.08 from an average of 28.28±4.45 (ranging from 11 to 44) before the training to 30.90±4.80 after the training in experimental group (t=2.512, p=.018). This result was at a lower level than 36.44 in Lim^[23], who used the same instrument to train seniors in nursing colleges to do respiratory aspiration nursing, and at a higher level than 25.32 in Kyung and Choi^[24], who applied simulation to deathbed nursing, supporting Jeffries's^[25] ideas that clinical judgment results from critical thinking and that simulation is a realistic, safe method of enabling nursing students to develop clinical judgment. Nursing education institutions aim to produce nursing professionals equipped with clinical competence based on scientific knowledge so that they can promptly exert problem-solving ability through correct clinical judgment when faced with a person having a health problem in many different situations. This study is significant in that simulation training in a similar environment to actual clinical practice has also improved clinical judgment among nursing students in the area of newborn emergency nursing; it is necessary to apply it in diverse and continuous ways so that knowledge acquired from conventional lectures can be utilized at clinical sites.

Simulation training made significant differences in the nursing students' problem-solving ability, which

improved by 7.37 ± 8.21 from an average of 79.37 ± 7.65 (ranging from 30 to 180) before the training to 81.75 ± 2.91 after the training ($t = -2.774$, $p = .010$). This result was at a lower level than 102.42 in Kim and Kim^[26], who used the same instrument to measure problem-solving ability of sophomores in a nursing college taking a lecture regarding basic nursing, and then 3.97 in Cho^[27], who used a similar instrument to measure nursing students' problem-solving ability. However, it is in the same context as Song^[28], who applied simulation with the theme of delivery and found problem-solving ability improved. Problem-solving ability, which requires capability to cope elastically with different levels of problem situations, can depend on grades and themes. However, problem-solving ability is the key to effective coping with and solution to any problem situation, is also considered an essential ability in many different occupation groups, and is particularly emphasized in nursing education^[29]. It is therefore necessary to give nursing education through simulation training that enables nursing students and participants to practice repetitively in a safe environment with the objective of promoting problem-solving ability through positive thinking based on knowledge. To put these results together, applying simulation training to newborn emergency nursing has positively improved the nursing students' critical thinking, clinical judgment, and problem-solving ability. It is said that one may become used to training, including clinical training, and continue with it, feeling that experiences are accumulated for themselves^[30].

CONCLUSION

Several repetitive sessions of training may enable learners to acquire skills and perform with confidence even in a difficult situation. Clinical training has an educational limitation that every student cannot be given standardized experiences of training due to the diversity of participants and situations. Also, more severe diseases and the development of medical technology have required nurses to become more competent. In such a situation, while there are a diversity of complicated attempts and tasks to change nursing education, instructors of nursing students need to make positive reviews and efforts to reach the utmost level of education; to do this, they need to develop and apply a diversity of simulation scenarios positively.

Moderating Effect of Depression on the Relationship between Subjective Health and Quality of Life in Patients with COPD

Young-Sook Kwon

Associate Professor, Department of Nursing, Joongbu University, Korea

ABSTRACT

Background/Objectives: Chronic obstructive pulmonary disease (COPD) is a chronic disease that deteriorates quality of life (QoL). This study examined how depression moderates the influence of subjective health on QoL in COPD patients.

Method/Statistical analysis: Data set from the 2014 and 2016 Korean National Health Examination Survey (KNHANES) was used. Subjects were 815 COPD patients, aged 41 to 80 years old. QoL was evaluated with EuroQol 5-dimension (EQ-5D). Depression was measured using the Patients Health Questionnaire-9 (PHQ-9). Moderation analysis was performed using depression as a moderator of the relationship between subjective health and QoL.

Findings: The mean EQ-5D index score of participants was 0.93. Disease-related (COPD) characteristic was not significantly related to QoL. The final model (model 3) in regression explained 33.1% of variance in QoL in COPD patients. Subjective health status was a very important factor influencing QoL. Subjective health status \times depression interaction was significant for QoL after adjusting control variables. Depression moderated the association between subjective health and QoL in individuals with COPD.

Improvements/Applications: Early screening and continuous care for depression in patients having COPD in the community could be helpful to alleviate depression and improve QoL.

Keywords: *Quality of life, Subjective health, Depression, Moderating effect, Chronic obstructive pulmonary disease.*

INTRODUCTION

Chronic obstructive pulmonary disease (COPD) involves airflow limitation and respiratory symptoms of the airway and alveolar caused by exposure to deleterious particles or gaseous materials. The most commonly occurring illnesses include cough, dyspnea, and sputum production¹. COPD ranks third among the top 10 global causes of death in 2016². According to cause-of-death statistics of Korea in 2016, chronic lower respiratory diseases including COPD ranked seventh with a death rate of 13.7 per 100,000 population³. In Korea, COPD prevalence is found in 18.0% of adults over 45 years of age⁴. Nevertheless, research efforts on the quality of life (QoL) of COPD patients are lacking in Korea. The global population is aging and exposure to risk factors is expected to increase, leading to an increase in morbidity and mortality. Since COPD is an irreversible chronic disease, it is necessary to establish measures to improve and maintain QoL of patients.

The self-rated health (SRH) is accepted as barometer of health⁵. Previous study⁶ has demonstrated that SRH was significantly related to QoL. It is known to be an important factor affecting QoL among Korean adults. Chronic diseases are associated with poor SRH⁷. According to Jackson et al.⁸, subjects having COPD demonstrated significantly worse SRH in contrast to non-COPD subjects. In Korea, SRH has been utilized to assess the all-inclusive health status of individuals through the Korea National Health and Nutrition Examination Survey (KNHANES) since 1998. Two previous studies^{9,10} using data from the KNHANES has demonstrated that various factors are related to impaired QoL among patients with COPD; however, they did not consider the effect of the degree of subjective health. Evaluating subjective health status in COPD patients living in the community would be useful for comprehensively assessing their overall health status. Nevertheless, studies on the correlation between subjective health and QoL among COPD patients are limited in Korean populations.

Depression is common in COPD patients¹¹. Depression prevalence in COPD is known to range from 18.8%¹² to 41.6%¹³, varying between studies. But it is either untreated or overlooked in persons with COPD¹⁴. Inadequate treatment of depression is associated with poor QoL in COPD patients¹⁵. Thus, monitoring the mental status of COPD patients is of relevant importance. The identification of moderators capable of improving QoL is an important issue in chronic diseases like COPD. Depression was investigated using the Patient Health Questionnaire-9 (PHQ-9) from the 2014 KNHANES, which made this study possible. Therefore, this study was conducted to examine the effect of depression as a link between subjective health and QoL in COPD patients.

MATERIALS AND METHOD

Study participants: The data for this study was extracted from the KNHANES conducted in 2014 and 2016. In 2015, PHQ-9 was not investigated, so the data for 2015 were not used in the analysis. Total participants were 15,700. Of these, 6,641 subjects who received a pulmonary function test (PFT) were selected. In 2014, PFT was performed in adults aged 40 years or above and under 80 years of age. In 2016, PFT was targeted at people aged 40 years or more. For those aged 80 years or older, only those who can be examined were enrolled. The measurements for forced expiratory volume in 1 second (FEV_1), $FEV_1\%$ predicted, and forced vital capacity (FVC) were obtained. The diagnosis of COPD is derived from on the Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines¹, which correspond post-bronchodilator FEV_1/FVC of < 0.7 . Using this criteria, a total of 904 peoples were classified as COPD patients. 89 subjects with missing answers were additionally excluded. Thus, 815 COPD patients were finally included in the analysis.

Research instruments: Quality of life (QoL) was utilized as the dependent variable. The EuroQol 5-dimension (EQ-5D)¹⁶ developed by EuroQol Group in 1990, was used to evaluate the level of QoL for participants. EQ-5D calculates the measurement about 5 dimensions (self-care, mobility, pain/discomfort, anxiety/depression, and usual activities). For each aspect, subjects pick out one of 3 severity magnitude (1, no problem; 2, some/moderate problems; 3, severe/

extreme problems). The dimensions are weighed and converted as EQ-5D index. EQ-5D index was administered by Korea Centers for Disease Control and Prevention in 2007. Hong et al.¹⁷ demonstrated that EQ-5D was a practical instrument for evaluating the QoL of COPD patients in Korea. The independent variable included subjective health status. Subjective health status was scored as 1 point for “very good”, 2 points for “good”, 3 points for “normal”, 4 points for “bad”, and 5 points for “very poor” in regards to how the participants thought about their own health. Higher scores indicated worse subjective health status. Depression was utilized as the moderating variable. Depression was estimated using PHQ-9¹⁸, which is a 9 item questionnaire used in primary care for depression screening. From among the questions, “How often did you suffer from the symptoms listed in the last two weeks?” was scored as 0 for “not at all”, 1 for “several days”, 2 for “more than a week”, and 3 for “almost every day”, and the total score ranged from 0 to 27. Higher scores indicated higher degrees of depression. Since the survey on depression (PHQ-9) was not conducted in 2015, 2015 data were excluded from analysis. For the control variables, socio-demographic characteristics (gender, age, marital status, education, household income), health-related characteristics (obesity, smoking, comorbidity, perceived stress, activity limitation), and disease-related characteristic (airway limitation) were included. Comorbid diseases such as hypertension, myocardial infarction, angina, stroke, tuberculosis, asthma, diabetes, renal failure, liver cirrhosis, rheumatoid arthritis, and osteoarthritis were included. Perceived stress was categorized into low (I rarely feel it, I feel a little bit) and high (I feel a lot, I feel very much), in response to the question, “How much stress do you usually feel in your daily life?”. Airway limitation as severity of COPD was divided into four classifications (mild, moderate, severe and very severe).

Statistical analysis: Data were analyzed descriptively to examine characteristics of participants and levels of subjective health status, depression, and QoL. To evaluate differences in QoL by characteristics of participants, t-test or one-way analysis of variance was computed. Hierarchical multiple regression analysis was performed using depression as a moderator for the relationship between subjective health status and QoL. The IBM Statistical Package for the Social Sciences (SPSS) version 24.0 was employed for all data analyses.

RESULT

Socio-demographic characteristics of participants are shown in Table 1. Of the 815 patients total, 70.6% (n = 575) were male and 29.4% (n = 240) were female. For participant age, 38.3% (n = 312) were in their 70s and 35.6% (n = 290) were in their 60s. The mean age was 66.29 years (SD = 9.32). For marital status, 83.2% (n = 678) were living with their spouse, and 4.8% (n = 39) were widowed. 37.8% (n = 308) of participants had graduated

from elementary school or lower, and 32.4% (n = 264) were quartile 1 (lowest) for household income. The relationship between socio-demographic characteristics and QoL of study subjects also are summarized in Table 1. QoL was significantly associated with gender, age, marital status, education, and household income ($p < .001$). Females, aged 80 years and over, who were not living with their spouse, and participants with lower than elementary school education and the lowest (Quartile 1) household income, had significantly lower QoL.

Table 1: Quality of life according to socio-demographic characteristics of participants (N = 815)

Characteristics	Categories	n(%)	M (±SD)	t/F	p
Gender	Male	575(70.6)	0.94 ± 0.10	3.77	< .001
	Female	240(29.4)	0.90 ± 0.13		
Age (year)	40-49	54(6.6)	0.97 ± 0.07	7.44	< .001
	50-59	128(15.7)	0.95 ± 0.08		
	60-69	290(35.6)	0.94 ± 0.10		
	70-79	312(38.3)	0.91 ± 0.13		
	≥ 80	31(3.8)	0.89 ± 0.15		
Marital status	Married, lived with spouse	678(83.2)	0.94 ± 0.10	7.62	< .001
	Separated	4(0.5)	0.83 ± 0.11		
	Divorced	94(11.5)	0.89 ± 0.12		
	Widowed	39(4.8)	0.89 ± 0.17		
Education	≤ Elementary school	308(37.8)	0.89 ± 0.13	16.82	< .001
	Middle school	155(19.0)	0.94 ± 0.10		
	High school	214(26.3)	0.95 ± 0.09		
	≥ College	138(16.9)	0.96 ± 0.10		
Household income	Quartile 1	264(32.4)	0.89 ± 0.14	13.06	< .001
	Quartile 2	226(27.7)	0.93 ± 0.10		
	Quartile 3	158(19.4)	0.95 ± 0.07		
	Quartile 4	167(20.5)	0.96 ± 0.10		

The health- and disease-related (COPD) characteristics of participants are shown in Table 2. 34.1% (n = 278) had obesity (BMI 25 kg/m² or more), 24.5% (n = 200) were current smokers. 58.3% (n = 475) had one or more comorbid disease. 16.3% (n = 133) of subjects reported that their stress felt high. 9.9% (n = 81) of the subjects stated that they are currently limited in daily life or social activities due to health problems or physical or mental disabilities. The severity of COPD measured by airflow limitation was mild in 52.0% (n = 424) and moderate in 43.4% (n = 354). The results of

examining differences in QoL according to health-related and disease-related characteristics also are summarized in Table 2. As for health-related characteristics, there were significant differences by comorbid disease, perceived stress, and activity limitation ($p < .001$). Subjects who had comorbid disease, higher perceived stress, and activity limitation had worse QoL. Obesity and smoking were not significantly associated with QoL. As for disease-related characteristic, there was no difference in QoL by airflow limitation.

Table 2: Quality of life according to health-related and disease-related characteristics of participants (N = 815)

Characteristics	Categories	n(%)	M (±SD)	t/F	p
Obesity (BMI ≥ 25.0 kg/m ²)	Yes	278(34.1)	0.92 ± 0.13	1.95	.052
	No	537(65.9)	0.93 ± 0.10		
Smoking	Yes	200(24.5)	0.93 ± 0.11	-0.26	.789
	No	615(75.5)	0.93 ± 0.11		
Comorbid disease	Yes	475(58.3)	0.91 ± 0.13	-7.18	< .001
	No	340(41.7)	0.96 ± 0.87		
Perceived stress	Low	682(83.7)	0.94 ± 0.10	4.03	< .001
	High	133(16.3)	0.88 ± 0.16		
Activity limitation	Yes	81(9.9)	0.79 ± 0.18	7.40	< .001
	No	734(90.1)	0.94 ± 0.09		
Airflow limitation (FEV ₁ % predicted)	Mild (≥ 80)	424(52.0)	0.93 ± 0.10	0.99	.114
	Moderate (50-79.9)	354(43.4)	0.93 ± 0.11		
	Severe (30-49.9)	31(3.8)	0.88 ± 0.20		
	Very severe (≤ 29.9)	6(0.7)	0.93 ± 0.07		

Means of subjective health status, depression, and QoL are shown in Table 3. The mean of subjective health status was 2.97 (±0.92), means of depression and QoL were 2.42 (±3.86) and 0.93 (±0.11); respectively.

Table 3: Means of subjective health status, depression, and quality of life (N = 815)

	Minimum	Maximum	M (±SD)
Subjective health status	1	5	2.97 (±0.92)
Depression	0	24	2.42 (±3.86)
Quality of life	0	1	0.93 (±0.11)

Table 4 presents correlations among the studied variables. As shown in Table 4, subjective health status ($r = 0.395, p < 0.001$) correlated positively with depression. Subjective health status ($r = -0.421, p < 0.001$) and depression ($r = -0.386, p < 0.001$) correlated negatively with QoL.

Table 4: Correlations of subjective health status, depression, and quality of life (N = 815)

	Subjective health status	Depression	Quality of life
	r (p)	r (p)	r (p)
Subjective health status	1		

Conted...

Depression	.395 ($p < .001$)	1	
Quality of life	-.421 ($p < .001$)	-.386 ($p < .001$)	1

Table 5 presents the results of moderation analysis by regression analysis of variables at three hierarchical steps. As shown in Table 5, gender, age, marital status, education, household income, comorbid disease, activity limitation, and perceived stress were introduced in step 1 as control variables and accounted for 25.8% of the variance in QoL. In step 2, subjective health status was included as the independent variable and depression was included as moderator. These accounted for 32.6% of variance in QoL. Subjective health status × depression was entered in step 3. The final model (step 3) in regression illustrated 33.1% of the variance in QoL. The results demonstrated that subjective health status ($\beta = -.227, p < 0.001$) was significantly and negatively related with QoL after adjusting for control variables. Depression ($\beta = -.096, p < 0.05$) was an independent predictor for QoL. The interaction of subjective health status × depression did reach the conventional level of significance ($\beta = -.094, p < 0.05$). Depression significantly moderated the influence of subjective health status on QoL.

Table 5: Results of regression analysis for moderation (N = 815)

Variables	Step 1		Step 2		Step 3	
	β	t	β	t	β	t
Gender	-.066	-1.958	-.024	-.753	-.028	-.862
Age	-.110**	-3.086**	-.120***	-3.499***	-.123***	-3.602***
Marital status	-.033	-.961	-.022	-.679	-.022	-.667
Education	-.106**	-3.037**	-.083*	-2.467*	-.080*	-2.397*
Household income	-.053	-1.555	-.007	-.198	-.007	-.199
Comorbid disease	-.114***	-3.518***	-.074*	-2.353*	-.076*	-2.447*

Depression			-.159***	-4.491***	-.096*	-2.189*
Subjective health status \times Depression					-.094*	-2.367*
R ²	.258		.326		.331	
ΔR^2			.068***		.005*	

Note: Dummy variables = gender (0 : male, 1 : female); marital status (0 : married, lived with spouse, 1 : separated, divorced, widowed); education (0 : middle school, high school, \geq college, 1 : \leq elementary school); household income (0 : quartile 2 - quartile 4, 1 : quartile 1); comorbid disease (0 : no, 1 : yes); activity limitation (0 : no, 1 : yes); perceived stress (0 : low, 1 : high).

Dependent variable is quality of life.

* $p < .05$, ** $p < .01$, *** $p < .001$

It was found that subjective health status \times depression interaction model was significant for QoL after controlling for gender, age, marital status, education, household income, comorbid disease, activity limitation, and perceived stress. Also, depression was a significant predictor of QoL. Therefore, depression was shown to have quasi-moderating effect on the relationship between subjective health status and QoL. The relationships between aforementioned variables are shown in Figure 1.

* $P < .05$, *** $P < .001$

Figure 1: Quasi-moderating effect of depression

To interpret specific moderating effects, regression equations were calculated for the relationship between subjective health status and QoL, according to depression. The negative β for subjective health status \times depression implied that the relationship between subjective health status and QoL was strengthened in the high depression group. Subjective health status and QoL by depression are shown in Figure 2. In the high depression group, QoL among patients who perceived their subjective health condition as bad was lower than that of patients who perceived their subjective health condition to be good.

Figure 2: Subjective health status and quality of life by depression

DISCUSSION

The present study was executed to identify the level of QoL and to investigate the moderating effect of depression as a link between subjective health and QoL in 815 patients with COPD. The mean score of EQ-5D index of COPD patients was 0.93 (SD 0.11) in this study. This was similar to the result (0.92) of a previous study¹⁹, which measured QoL in COPD patients based on the KNHANES (2007-2012). Zhou et al.²⁰ reported that health utility for COPD according to EQ-5D ranged from 0.64 to 0.80 in the Chinese population. They also showed that HRQoL of COPD patients in four studies through a systematic review was lower than those with diabetes mellitus (0.79-0.94) and hypertension (0.78-0.93). Females, elderly, and patients with lower education and household income amounts had a lower EQ-5D index score in this study. These results correspond to those of a study¹⁷, which measured QoL using EQ-5D, targeting 2,356 Korean COPD patients. In regression analysis, age and education level remained as variables influencing QoL. As age increased, the self-care fulfillment rate was lower and daily living ability decreased. These results indicate that more nursing interventions are needed for older, less educated COPD patients. In terms of patient characteristics, COPD is more prevalent among the elderly. Education level among the elderly is often low; therefore, it is necessary to construct contents of health education for elderly COPD patients to make them easier to comprehend. Repetitive education will also be helpful. One-quarter (24.5%) of the subjects are currently smoking. In this study, smoking was not associated with QoL. However, smoking constitutes a major risk factor for COPD and is also found to be associated with depression. Therefore, health care providers should actively educate COPD patients to quit smoking. Comorbid diseases appeared to negatively affect QoL among COPD patients^{17,19}. Presence of a comorbid disease was significantly associated with impaired QoL in this study. Therefore, attention should be paid to management of comorbid disease. Activity limitation and poor QoL were strongly associated in this study. Jones²¹ showed that activity limitation was a determinant of impaired QoL in COPD, which was consistent with the consequences of this study. In a study²² carried out in urban China, determinants of QoL among 678 COPD patients included age and disease severity. Some studies^{17,19} showed that severity of airflow obstruction influenced QoL in Korean

COPD patients. However, in this study, COPD severity evaluated by airway limitation was not associated with worse QoL. The majority (95.5%) of subjects had mild to moderate COPD, which accounted for the difference in results. The results of another study¹⁰ showed that, like the results of our study, there was no relationship between airway limitation (FEV₁% predicted) and EQ-5D. Because of the differences in results between studies, further investigation is needed that takes into account various covariates.

With respect to regression analysis, this study ascertained the association between subjective health status and QoL. Moreover, subjective health most strongly predicted QoL. The single-item self-rated health (SRH) question was useful in assessing health condition of COPD patients in the community. Farkas et al.²³ conducted the SRH in 135 stable COPD patients. They reported that 20% of subjects showed poor/very poor SRH, and poor/very poor SRH in patients was associated with depression (CES-D score). However, there are few studies on the connection between SRH and QoL in COPD patients. Studies in other chronic disease, such as rheumatoid arthritis²⁴ have demonstrated an association between subjective health and QoL. Support and heed should be given to COPD patients who evaluate their health condition as not good. Various interventions to improve health status should be implemented to enhance the QoL of patients suffering from COPD.

Lee and Jee⁹ reported that depression was the most important factor related to QoL in male patients with COPD. They suggested that utilization screens and minimization of depression could be beneficial action plan to improve QoL of COPD patients. Depression was a predictor of QoL in the present study. Higher depression of patients correlated to lower levels of QoL. There is another study supporting the results of this study, albeit with a different QoL assessment tool. According to Jang et al.²⁵, depression had influence on both the physical component summary (PCS) score and mental component summary (MCS) score of Short Form 36 (SF-36) Health Survey in severe COPD patients. This study confirmed that the PHQ-9 was useful as a screening implement to identify the degree of depression in patients with COPD in the community. The goal of this study was to verify the moderating effect of depression between subjective health and QoL in COPD patients. The main finding of the present study was that depression moderated a link

between the degree of subjective health and QoL for COPD patients. This implies that patients with higher depression may experience lower QoL given their worse perceived subjective health. Depression impairs health and increases the risk of hospitalization. Repeated hospitalizations result in lowers QoL for patients. Depression often increases as symptoms worsen in patients suffering from chronic illnesses. Therefore, it is recommended that psychological counseling be performed at the time of intervention for symptom control of COPD patients. In addition, we hope further research will proceed to evaluate the moderating effect of depression on the relationship between factors influencing QoL and QoL in COPD patients.

CONCLUSION

In this study, we discovered that the main determinant of QoL in Korean COPD patients was subjective health status. Depression contributed to lower QoL and also played a role as the moderating factor between subjective health and QoL in COPD patients. These findings propose that health care providers caring for COPD patients should make efforts to relieve depression by providing intervention programs and improving QoL.

The Effect of Muscle Activity according to Pelvic Angle in Different Positions: Randomized Crossover Trial

Sang-Pill Park¹, Hyeon-Ji Son², Dong-Yeop Lee², Ji-Heon Hong², Jae-Ho Yu², Jin-Seop Kim²

¹Student, ²Professor, Dept. Sunmoon University, Korea

ABSTRACT

Background/Objectives: The purpose of this study was to investigate the most effective pelvic tilt exercise in different posture.

Method/Statistical analysis: This study included twenty healthy adults. All subjects performed an different pelvic tilt during sitting and standing in static posture, the experiment was performed three times each, respectively. The angle of the pelvis was measured using a 3D motion analysis system, and muscle activation was measured by EMG. For the data analysis, one way repeated ANOVA was used to compare the muscle activity with changes in pelvic tilt angle, and bonferroni was used for posttest for differences between variables.

Findings: As a result, in the anterior pelvic tilt, the activity of the erector spine muscle was the highest, while the posterior pelvic tilt, transverse abdominis muscle was the most active, when comparing the standing and sitting posture, both erector spinae muscles and both semitendinosus muscles were dominant in a static anterior pelvic tilt, and posterior pelvic tilt posture, for the posterior pelvic tilt in sitting posture, both transverse abdominis muscles were dominant.

Improvements/Applications: It is recommended to perform a pelvic tilt exercise in the correct posture to strengthen muscles. These results may be helpful in selecting more effective exercise methods for clinical treatment.

Keywords: Pelvic, Pelvic tilting, Electromyography, Couple force, Gravity, Position

INTRODUCTION

In modern society, lumbar lordotic angle is increasing due to imbalance of sitting or sustained posture for a long time during work, and the number of people complaining back pain is increasing. Increased lumbar lordotic angle was found to be one of the major causes of back pain, and generally a pelvis tilt exercise is used for lumbar alignment of patients with chronic back pain¹. To reduce back pain, it is important to avoid postures that increase the lumbar lordotic angle. Anterior pelvic inclination posture increases the lumbar lordotic angle while posterior pelvic inclination posture decreases the lumbar lordotic angle. Therefore, posterior pelvic inclination

posture is used as a rehabilitation method to improve the lumbar alignment because it reduces the lumbar lordotic angle that causes back pain^{2,3,4}. The lumbar lordotic angle also brings changes to nearby local muscles. According to studies by Andrew et al. (2009), when the lumbar lordotic angle changes, muscle activity changes when the lumbar lordotic angle changes in the iliocostalis muscle, longissimus muscle, and iliocostalis thoracis muscle transverse abdominis muscle⁵. The previous reported an increase in lumbar lordotic angle when anterior pelvic tilt occurred and a decrease in lumbar lordotic angle when posterior pelvic tilt occurred³. Walker et al. (1987) also examined the relationship between lumbar lordosis and abdominal muscles and pelvic inclination, and it was reported that the back tilt of the pelvis is made by the abdominal muscles and the back tilt of the pelvis reduces the lumbar lordosis⁶. Therefore, it is said that correcting the body by exercising in the correct posture is important for rehabilitation, because it is most effective in improving muscle strength of the abdominal muscles⁶. studies compared the muscle activity of the surface muscle and the deep muscle in the standing posture during pelvis tilt, and in the anterior pelvic inclination posture, the erector spinae muscles were the most active, while in the posterior pelvic inclination posture, transverse abdominis muscle was the most active. In addition, since the pelvis tilt affects the lumbar lordotic angle and the nearby surface muscles and deep muscles according to the posture, it is possible to know which muscles are most activated when the pelvis tilt is performed. Therefore, correcting the body and balancing strength by exercising to change the lordotic angle is especially important for rehabilitation⁷. In many previous studies, muscle activity during pelvis tilt was compared. Drysdale et al. (2004) investigated the activity of abdominal muscles in relation to pelvis tilt⁸. Floyd et al. (2000) reported a change in muscle activity of the erector spinae muscles when tilted in front of the pelvis, suggesting that the erector spinae muscles were activated when tilted in front of the pelvis⁹. Anderson et al. (1995) reported that the iliopsoas muscle increased muscle activity in anterior pelvic tilt using wire electrodes¹⁰. Hodges et al. (1999) reported that the abdominal muscle activity and response rate change with the exercise posture of the limbs¹¹. Workman et al. (2008) investigated the relationship between abdominal muscles and flexor muscles according to pelvic position, and as a result, in the tilt posture in front of the pelvis, the muscle activity of the bending of the hip flexion was increased and the muscle activity of the abdominal muscle was increased in the tilt posture of the pelvis¹². Previous studies have examined the deep muscle and surface muscle activity in pelvis tilt. However, there is a lack of studies comparing the changes in muscle activity of the deep and surface muscles with changes in posture during pelvis tilt. Therefore the purpose of this study was to compare the changes in muscle activity of standing posture and sitting posture during pelvis tilt to show that muscle activity in deep muscles and surface muscles change with the change of posture, to present the basic data to find the most effective posture in exercise therapy in the future.

SUBJECT AND METHOD

Subject: This study was performed on 20 healthy male and female students (10 males and 10 females) attending Chungnam S University. For recruitment of subjects, after being explained the purpose and method of the study, those who voluntarily wrote consent were chosen for the study. The criteria for selection of the subjects were healthy men and women aged 20-30 years who had no experience of back pain and back surgery, and exclusion criteria were 1. have spinal-related disease or experienced disease 2. spinal-related surgical experience 3. neurological disease 4. those with difficulty in daily life due to back pain 5. those with difficulties with pelvis tilt. The physical characteristics of the subjects are shown in Table 1.

Procedures: This study was conducted as a single group study with no control group. In order to prevent compensatory action and to measure the angle of tilt of the pelvis accurately, the subjects were instructed on the front posture and back posture of the pelvis in standing posture and sitting posture. Prior to the experiment, the subjects were measured for height and weight using an automatic BMI measuring stadiometer (BSM 370, Korea, 2011) for modeling using the Visual 3D program, and for 3D motion analyzer marker recognition, body and pelvic thighs were exposed using short tops and shorts. In order to reduce the skin resistance at the electromyographic measurement site, shavings were performed on the measurement site, dead skin was removed with sandpaper, and then cleaned with alcohol cotton. EMG pads were attached to both erector spinae muscles, transverse abdominis muscles, and semitendinosus muscles to measure muscle activity in the subjects' pelvis tilt, and 16 motion analyzer markers were attached to the pelvis and thigh femur bones for pelvis tilt angle measurement.

Different positions: In a standing posture, the distance between the legs was extended to the subject's shoulder width, and after measuring the value in a static posture with both arms crossing the chest, it was proceeded in the order of anterior, and then posterior pelvic tilt. In the sitting posture, as described above, the subject was seated and the distance of the leg was spread to the subject's shoulder width, and both arms were crossed to the chest before proceeding in the same order as the standing posture. The pelvis tilt was performed for 5 seconds and the pelvis tilt was maximized in the last 5 seconds in Figure 4.

Measurement: This study used a three-dimensional motion analyzer (Qualisys system-Qualisys Medical AB 41113, Gothenburg, Sweden) to investigate the dynamic changes of the pelvis tilt angle, and a total of 6 motion capture cameras (Qualisys Oqus 300) were used to measure the motion of the markers in Figure 2. Spherical passive markers reflecting infrared light were used in Figure 3. Marker attachment points were 16 markers, including both sides of anterior upper iliac spine, posterior upper iliac spine, condylar on the lateral femoral bones, condylar on the inner femoral bones, and four each on both sides of the thigh in Figure 5 [13].

OQUS100 (Zero WIRE, Italy, 2009) was also used to examine muscle activity of transverse abdominis muscle (upper anterior iliac spine interior 2 cm), semitendinosus muscle (intermediate between ischial tuberosity and intra-articular bony atrophy), and erector spinae muscles (3 cm lateral side of lumbar vertebrae 3) according to the slope of the pelvis in Figure3. Electromyographic analog signals collected from a total of six-gun channels were sent to the MP150 system and converted to digital signals, then signal analysis and data processing were performed using sEMG software myoresearch 1.06.44 software. For the EMG measurement, the sampling rate was set to 2000 Hz, and the band pass filter was set to 20 to 500 Hz.

according to the pelvic inclination angle of the posture, Bonferroni test was used for the posthoc analysis for the differences between variables, and all statistical significance levels were set at $p < 0.05$.

Figure 2: Motion capture and EMG

Figure 3: 3D marker

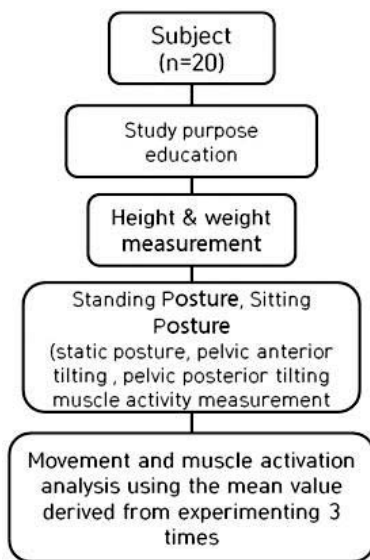

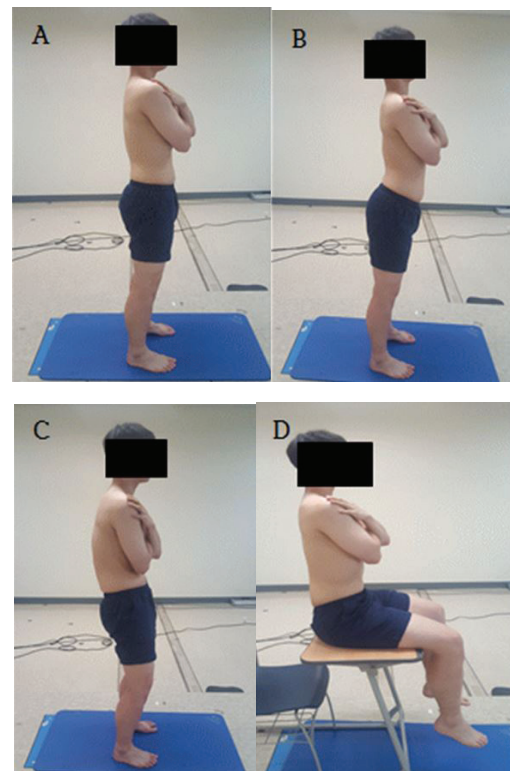

Figure 1: Flow chart

Data analysis: The data were analyzed using IBM SPSS/PC ver.22.0 for window program. The normality test was conducted with Shapiro-Wilk, and the normality test was satisfied. The general characteristics of the subjects were analyzed using distribution and frequency analysis, one way repeated ANOVA was used to compare muscle activation of the transverse abdominis muscle, semitendinosus muscle, and erector spinae muscles

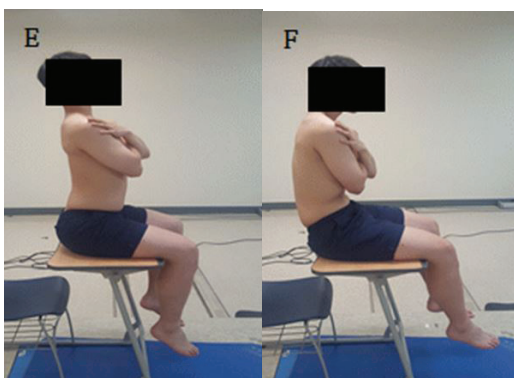

Figure 4: Different posture

RESULTS AND DISCUSSION

The right transverse abdominis muscle showed the highest muscle activity in posterior pelvic tilt in sitting posture with 13.87 ± 3.89 in Table 3. The right transverse abdominis muscle showed statistically significant difference in each posture ($p < 0.05$), however there was no significant difference between standing static posture and sitting static posture ($p > 0.05$) in Figure 5. The right semitendinosus muscle showed the highest muscle activity at standing posture with 6.38 ± 3.10 at posterior pelvic tilt in Table 3. There was no statistically significant difference between standing static posture and sitting static posture, standing static posture and sitting anterior pelvic tilt posture, sitting static posture and sitting anterior pelvic tilt posture ($p > 0.05$), and all other postures showed significant differences ($p < 0.05$) in Figure 5. The right erector spinae muscles showed the highest muscle activity in the anterior pelvic tilt in standing posture with 14.12 ± 7.01 in Table 3. In addition, the right erector spinae muscles did not show any significant difference in standing static posture and sitting static posture, standing static posture and sitting posterior pelvic tilt posture, sitting static posture and sitting posterior pelvic tilt posture ($p > 0.05$), and all other postures showed significant differences ($p < 0.05$). The left transverse abdominis muscle showed the highest muscle activity in posterior pelvic tilt in sitting posture with 14.06 ± 4.07 in Table 3, and each posture showed significant difference ($p < 0.05$) in Figure 5. The left semitendinosus muscle showed the highest muscle activity at standing posture with 6.01 ± 3.03 at posterior pelvic tilt in Table 3. There were no statistically significant differences between standing static posture and sitting static posture, standing static posture and anterior pelvic tilt posture, sitting anterior pelvic tilt posture and sitting posterior

pelvic tilt posture, sitting static posture and sitting anterior pelvic tilt posture ($p > 0.05$) and all other postures showed significant differences ($p < 0.05$) in Figure 5. The left erector spinae muscles showed the highest muscle activity at standing posture with 14.40 ± 6.80 in anterior pelvic tilt. There were no statistically significant differences in standing static posture and standing posterior pelvic tilt posture, standing static posture and sitting static posture, standing static posture and sitting posterior pelvic tilt posture, sitting static posture and sitting posterior pelvic tilt posture ($p > 0.05$), and the other postures showed significant differences ($p < 0.05$) in Figure 5. The average range of anterior pelvic tilt in standing posture was 11.87 ± 7.14 , and the average range of posterior pelvic tilt was 5.37 ± 3.35 . The average range of anterior pelvic tilt in sitting postures was 8.09 ± 4.71 , and the average range of posterior pelvic tilt was 7.74 ± 5.99 in Table 3. The purpose of this study was to evaluate the muscle activity of pelvis tilt angle and slope during pelvis tilt in various postures to investigate muscle activity that change by posture. Measurements were done in static posture in standing posture, anterior pelvic tilt posture, posterior pelvic tilt posture, static posture in sitting posture, anterior pelvic tilt posture, and posterior pelvic tilt posture. Also the muscle activity of both sides of transverse abdominis muscle, semitendinosus muscle, and erector spinae muscles was measured, and changes according to pelvis tilt were explained by comparing the muscle activity by posture. As a result, in the anterior pelvic tilt in standing posture, the left erector spinae muscles showed the highest muscle activity, and second, the right erector spinae muscles showed a significant increase in muscle activity. There was also a significant difference in comparing in standing static posture and standing posterior pelvic tilt posture. At posterior pelvic tilt in the standing posture, the left transverse abdominis muscle showed the highest muscle activity, and second, the right transverse abdominis muscle showed a significant increase. There was also a significant difference in the muscle activity of transverse abdominis muscle in standing static posture and standing anterior pelvic tilt posture. As above, there was a significant increase in erector spinae muscles in anterior pelvic tilt and transverse abdominis muscle in posterior pelvic tilt. The reason for this is that the erector spinae muscles are activated at anterior pelvic tilt as it is attached to the back of the pelvis and the transverse abdominis muscle is activated at posterior pelvic tilt as it is attached to the anterior surface of the pelvis^{14,15,16}. Takaki et al. (2016)

used EMG wire electrodes in standing posture to compare muscle activity in local muscles such as transverse abdominis muscle and multifidus muscle during pelvis tilt, and as a result, in anterior pelvic tilt, the erector spinae muscles and multifidus muscles showed the highest muscle activity and in posterior pelvic tilt, the transverse abdominis muscle showed the highest muscle activity⁷. These results indicate that local muscles such as transverse abdominis muscle and multifidus muscle are involved in anterior pelvic tilt and posterior pelvic tilt⁷. Urquhart et al. (2005) compared the muscle activity of the transverse abdominis muscle, the internal oblique abdominal muscle, and the rectus abdominis muscle of the abdominal muscle using the EMG wire electrode while changing the posture in supine posture and posterior pelvic tilt posture¹⁷. As a result, it was reported that in posterior pelvic tilt, transverse abdominis muscle showed significantly higher increase than external oblique abdominal muscle, internal oblique abdominal muscle, and rectus abdominis muscle¹⁷. The results of previous studies are similar to those of the present study, suggesting that the erector spinae muscles are activated at anterior pelvic tilt in standing postures and transverse abdominis muscles are activated at posterior pelvic tilt. The sitting posture also showed a similar pattern to the standing posture, and anterior pelvic tilt in sitting posture showed the highest muscle activity in the left erector spinae muscles and there was significant increase in the right erector spinae muscles. There was also significant difference when compared with sitting static posture and sitting posterior pelvic tilt posture. In posterior pelvic tilt, the muscle activity increased in the order of the left transverse abdominis muscle and the right transverse abdominis muscle and there was a significant difference when compared to sitting static posture and sitting anterior pelvic tilt posture. As above, sitting posture showed the same result as standing posture. The reason for this is that although there is a difference in the slope of the pelvis between the sitting posture and the standing posture, it seems that the above results are obtained because the position of the active muscle is not changed during anterior pelvic tilt or posterior pelvic tilt^{18,19,20}. In standing posture and sitting posture, standing static posture and sitting static posture were significantly different only in the left erector spinae muscles and it was more dominant in standing static posture. However, there were no significant differences in both transverse abdominis muscles, both semitendinosus muscles and

right erector spinae muscles. When comparing standing anterior pelvic tilt posture with sitting anterior pelvic tilt posture, there was a significant difference in all muscle groups, the left erector spinae muscles showed the highest muscle activity, and all muscle groups including both transverse abdominis muscle and semitendinosus muscle were dominant in standing anterior pelvic tilt posture. When comparing the standing posterior pelvic tilt posture with sitting posterior pelvic tilt posture, it was significant in all muscle groups, and in sitting posterior pelvic tilt posture, the left transverse abdominis muscle showed the highest muscle activity. Both erector spinae muscles and both semitendinosus muscles were dominant in the standing posterior pelvic tilt posture and the right transverse abdominis muscle was dominant in the sitting posterior pelvic tilt posture. As a result, muscle activity in the standing posture is higher than that in the sitting posture. However, in the posterior pelvic tilt posture, it showed higher muscle activity of transverse abdominis muscle in sitting posterior pelvic tilt posture than standing posterior pelvic tilt posture. Looking at previous studies, Munoz et al. (2011) described the relationship between center of gravity, gravity, and trunk muscles when the center of gravity changes and the muscle activity of the body changes as the center of gravity changes by changing torso slope in the sitting posture²¹. As a result, it was reported that muscle activity of the trunk muscles increased as the body slope increased²¹. In addition, according to Takaki et al. (2016), anterior pelvic tilt is relatively easier than posterior pelvic tilt due to posterior pelvic tilt and posterior pelvic tilt, but there are individual differences as posterior pelvic tilt reacts to gravity⁷. In other words, because the posture changes in this study, the muscle activity changes according to the change. Also, because the posterior pelvic tilt is a movement that reacts to gravity, although there is a difference in individual muscle strength, it is thought that the effect of gravity changes as the posture changes, which is closely related to the results of this study. Olson et al. (2005) investigated the effects of gravity on flexion relaxation on standing posture and supine posture on muscle strength²². EMG was attached to the erector spinae muscles, abdominal muscles, and hamstring muscles, and flexion was performed on the standing posture and the supine posture, and the muscle activity of each muscle was measured and compared²². The results showed that the standing posture showed significant muscle activity in the back muscles such as the erector spinae muscles and the hamstring muscle and

significant muscle activity in the abdominal muscles in the supine posture. In other words, when the posture changes, the direction of gravity acting on the body changes, and thus the muscle activity of each muscle is different²². Based on the results of previous studies, In this study, erector spinae muscles and semitendinosus muscle were more active in standing posture than in sitting posture, and this is thought to be because each posture of the standing posture would have activated the back muscles erector spinae muscles and semitendinosus muscles to counteract gravity, and because the force was relatively weaker in sitting posture than in standing posture. Urquhart et al. (2005) reported that the middle and lower transverse abdominis muscles progressed horizontally or downwardly inside the lumbodorsal fascia, inguinal ligament, iliac crest ring, and pubic bone¹⁷. It was reported that the attachment point of the transverse abdominis muscle is consistent with the orientation of the posterior pelvic tilt and the posterior pelvic tilt is caused by the activity of the transverse abdominis muscle²³. In addition, Mansour et al (2011) reported that when the pelvic tilt occurs, motion occurs due to the action of force-couple, anterior pelvic tilt is caused by the trunk muscles and the hip flexor muscles, and posterior pelvic tilt is caused by abdominal muscles and hip joint extensor muscle²⁴. In the present study, transverse abdominis muscle and semitendinosus muscle showed high muscle activity when posterior pelvic tilt was performed, and it is consistent with the previous study where the transverse abdominis muscle was activated when the posterior pelvic tilt occurred and activated with the hip joint muscle by force-couple action. Also, posterior pelvic tilt in sitting posture showed higher muscle activity in transverse abdominis muscle than posterior pelvic tilt in standing posture, and this is thought to be due to the fact that in posterior pelvic tilt in sitting posture, the semitendinosus muscle is less active than the standing posture, and the transverse abdominis muscle is activated on posterior pelvic tilt due to force-couple action. This study has a number of limitations. First, it is difficult to generalize at all ages because it only consisted of adults in their 20s. It is also difficult to generalize as a result of adults of this age group because of the small number of subjects. Second, since the transverse abdominis muscle is the core muscle in the abdomen, it is necessary to measure the result with the wire electrode EMG for the accurate experiment, but accurate measurement may not have been made with the surface electrode EMG. Therefore, it is difficult to

generalize the results of this study. Thirdly, supine posture had to be excluded from 3D motion analyzer due to its characteristics. The supine posture cannot be used because the marker cannot be positioned in the supine posture when the marker of the motion analyzer is attached to the pelvis. It is thought that adding supine posture to the experiment would provide more diverse results of deep and surface muscles in pelvis tilt according to posture. Therefore, continuous study of deep muscles and surface muscles in pelvis tilt supplementing this is needed.

Figure 5: Activity graph of each muscle by posture
A : right transverse abdominis, B : left transverse abdominis, C : right semitendinosus

ST_S : standing static, ST_A : standing anterior tilting, ST_P : standing posterior tilting
SI_S : sitting static, SI_A : sitting anterior tilting, SI_P : sitting posterior tilting

CONCLUSION

As a result of the study, when performing pelvis tilt in standing posture and sitting posture, erector spinae muscle was most active at anterior pelvic tilt, and transverse abdominis muscle was most active at posterior pelvic tilt. Also, when standing posture and sitting posture were compared, significant difference was found in each posture and in standing posture, in pelvis tilt, sitting posture showed higher muscle activity than pelvis tilt. However, at posterior pelvic tilt in sitting posture, standing posture was more dominant than posterior tilt in transverse abdominis muscle. Therefore, when the posture changes, the muscle activity varies, and it is determined that if posture is selectively applied, such as using anterior pelvic tilt in standing posture to strengthen the erector spinae muscles during pelvis tilt exercise and using posterior pelvic tilt in sitting posture to strengthen transverse abdominis muscle, it will be possible to obtain better treatment results.

The Changed of Muscle Activation During Different Visual Sign in Bridging Exercise: Randomized Controlled Trial

Young-Hyen Lee¹, Bo-Eun Lee², Dong-Yeop Lee², Ji-Heon Hong², Jae-Ho Yu², Jin-Seop Kim²

¹Student, ²Professor, Dept. Sunmoon Uninversity, Korea

ABSTRACT

Background/Objectives: The purpose of this study is to propose the effective posture of bridge exercise by comparing and analyzing the muscle activity of the internal oblique abdominal, external oblique abdominal, rectus abdominal and transverses abdominals, when performing bridge exercise with visual blocking and varying the stance.

Method/Statistical analysis: Muscle activity was measured by EMG. the study conducted a study of 30 people who do not have neurological disorder such as fracture, damage to the muscle and ligament, etc. for past 6 months For the experimental group, the stance was set to 100%, 50% and 150% of the shoulder width, the muscle activation was measured total 6 exercises by dividing into visual blocking and the stance and all the measured values were analyzed using ANOVA repeated measurement.

Findings: In the results of this study, all the internal oblique abdominal, external oblique abdominal, rectus abdominal and transverses abdominals showed higher muscle activation during the bridge exercise with visual blocking and representing significant difference. When the bridge exercise was performed with the stance of 50% shoulder width, the muscle activation was the highest and the difference by muscle according to the breadth of foot was varied.

Improvements/Applications: In conclusion, it is deemed that the bridge exercise with visual blocking and narrow foot width will be the more effective posture to improve the muscle activation and to stabilize the body.

Keywords: Base of support, Bridging exercise, Muscle activity, Visual blocking, core muscle, abdominal muslce

INTRODUCTION

Low back pain is the common disease that 80% of modern populations are suffering by the social changes and leading to dysfunction and affects the quality of life^{1,2}. The most important in the prevention and treatment of low back pain is the stability of the vertebra, which is achieved with simultaneous muscle activity. For low back pain, the lumbar stabilization exercise is performed a lot³. The transverse abdominis is the muscle that contributes to the lumbar stabilization a lot with the posture of maintaining the balance of the body and contributes to the stability by contracting first

during the activity. The balance, which is the ability to adapt within base of support, is the process to maintain continuously the posture stability by maintaining the center of gravity. The balance is related to the ability to adjust the body posture within the space⁴. To adjust the balance, the interaction among the vestibular function, sight, proprioceptive sensibility, musculoskeletal system and cognitive ability is required, among which the sight has the greatest impact on the balance^{5,6,7}. As the sensory information of forecasting the posture, this visual information can perceive not only the distance with the hazardous factor from the surroundings and the motion of articular surface occurred in the body but also is the basic element in the daily life, it is the matter to be considered first when treating the patient with Low back pain. When treated, the visual blocking is used a lot, the dependency on the vestibular sense and the propioceptive sensibility, for which it brings the improvement of the vestibular sense and the proprioceptive sensibility. The muscles

Email: skylove3373@sunmoon.ac.kr

involved in the stabilization of the body keep the balance when the body is moving and stabilize the lumbar^{8,9}. In the lumbar stabilization, the rectus abdominis and transverse abdominis have great influence and activating the transverse abdominis muscle relieves the pain in the patients with low back pain³. Moon reported that the lumbar stabilization exercise including the contraction of the transverse abdominis muscle and internal oblique abdominis increases the stability of vertebra and is more effective than other therapeutic methods like abdominal exercise, which decrease the pain and dysfunction in the aspect of controlling and improving the neuromuscle¹⁰. The stabilization exercise not only provides the exercise efficiency and is useful to maintain the balanced posture and to improve the muscle strength by increasing the stability of the vertebra and the pelvis when performing the functional posture and the exercise¹¹. In addition, Lehman emphasized the needs of bridge exercise and explained the stabilization exercise is important in the rehabilitation exercise, which requires the body muscle activation with low intensity. Jeon claimed that the bridge exercise is performed to absorb the external forces applied to the lumbar and to prevent the repeated damage to the surround muscles during the movement of four extremities¹². The bridge exercise is the form in the supine position with knees drawn up, is the important motion to perform the kneeling position with the weight loading on the feet, and is useful to promote the pelvic exercise developing the adjustment of sit to stand. In addition, according to O' Sullivan, it reinforces the bottom of vertebra and the extensor of hip joint to prepare the stance phase of walking³, and as a body stabilization exercise having influence both on the upper extremity and the lower extremity, particularly, effective for the activation of abdominal muscle, recently, it plays the important role to adjust the spinal segment and to provide the stability focusing on the treatment for the instability of spinal segment and the lumbar stabilization exercise is applied to the abdominal muscle reinforcement as a new kinematics of the Low back pain. The effects of the bridge exercise are related to the base of support. The bridge exercise showed that its effect is greater by maintaining the stability increasing the activation of transverse abdominis when it is narrow foot width plane than the wide foot width plane³. Since the wider foot width plane, the higher the stability of the body becomes and it is easy to put the center of the body within the base of support, the stability is increased¹³. In addition, it was reported that when the voluntary movement in the

unstable state that the base of support becomes narrow, the adjustment of posture is complex using many muscles and the high muscle activation is shown¹⁴. There are lots of researches on the effects of bridge exercise to improve the Low back pain but the research that identified the effect of the bridge exercise with the visual blocking and width of plane are not sufficient. Therefore, in this study, the efficient bridge exercise method will be proposed by comparing the muscle activation of internal oblique abdominis, external oblique abdominis, rectus abdominis and transverse abdominis by various widths of feet and the visual blocking when exercising bridge.

SUBJECT AND METHOD

Subject: The subjects of this study were 30 participants who do not have musculoskeletal system and neurological disorders such as fracture and the damage to the muscle or ligament, etc. for past 6 months out of the healthy adult male and female students attending S University located in Asan, Chungnam. Before participating in this study, the subjects were told about the contents and the purpose of the study and signed the consent to participate in this experiment. The general characteristics of the subjects are as follows in Table 1.

Table 1. Subject Characteristics

(n = 30)

Characteristics	Value
Gender (Male/Female)	15/15
Age (year)	20.2 ± 0.92
Height (cm)	168.8 ± 11.48
Weight (kg)	68.9 ± 13.72

All values are mean ± standard deviation

Table 2: Classification of bridge exercise

	Exercise Method
EOGL	Eyes open and spread generally legs
EONL	Eyes open and spread narrowly legs
EOWL	Eyes open and spread widely legs
ECGL	Eyes closed and spread generally legs
ECNL	Eyes closed and spread narrowly legs
ECWL	Eyes closed and spread widely legs

Experimental procedure: It is performed in the supine position after attaching the pad on IO, EO, RA and TrA

of the subjects to be measured. When the correct posture was taken, all exercise was performed for 5 seconds and was measured three times for increase the reliability. The muscle activity for 3 seconds was measured excluding beginning and ending 1 second. In addition, to prevent the muscle fatigue of the subjects, 5 minutes of rest were given after 3 interventions. The exercise was performed with 6 postures; the base of support of 100%, 150% and 50% of shoulder width without non-visual blocking and the base of support of 100%, 150% and 50% of shoulder width with visual blocking in Table 2. When performing the bridge exercise, the subjects were instructed to perform pelvic anterior tilting both hands on the floor and to contract S4~S5 of dermomyotome strongly in order to tighten the muscle and the measurer kept instructing to maintain correct bridge exercise. Bridge exercise is raises the waist and hip upward after bending the knees 90° watching the ceiling in the straight supine position. When the waist and the hip were raised, the smooth grade line should be made and the caution should be taken in order not to raise the shoulder bone. In addition, to maintain the

neutral position, the subjects were instructed to maintain straight line from the head, shoulder bone, waist, pelvis, knee to ankle, not to raise the ankle for the stable balance and the exercise was performed with barefoot to maintain same condition. First, the measurement was made in the condition that the exercise was performed standing with feet 100% shoulder width apart without visual blocking. Second, the measurement was made in the condition that the exercise was performed standing with feet 50% of shoulder width apart without visual blocking. Third, the measurement was made in the condition that the exercise was performed standing with feet 150% of shoulder width apart without visual blocking. Fourth, the measurement was made in the condition that the exercise was performed standing with feet shoulder width apart with visual blocking. Fifth, the measurement was made in the condition that the exercise was performed standing with feet 50% of shoulder width apart with visual blocking. Sixth, the measurement was made in the condition that the exercise was performed standing with feet 150% of shoulder width apart with visual blocking in Figure 1, Figure 2.

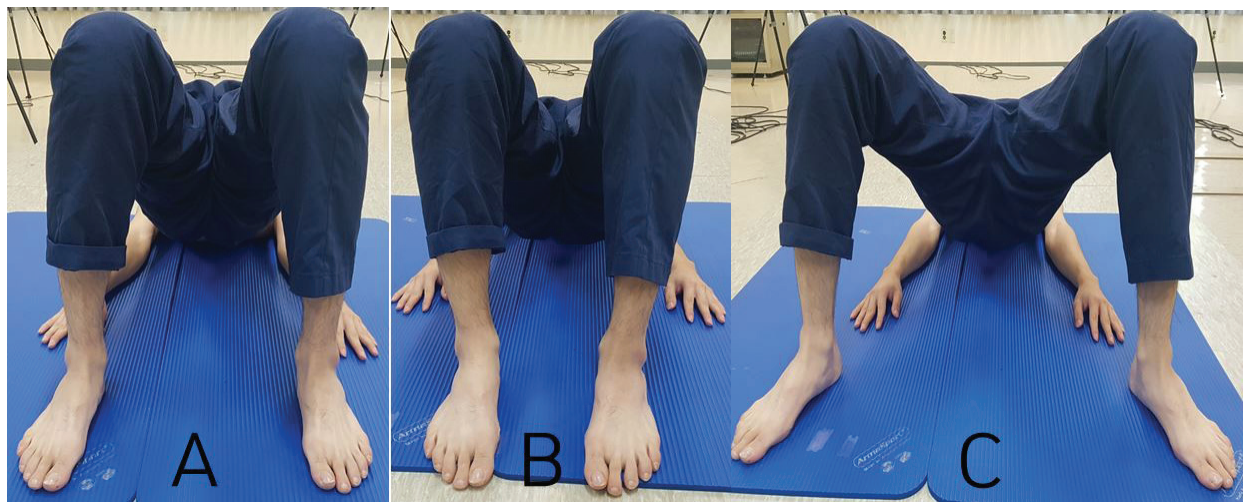

Figure 1: Leg width for Experimental

A : base of support of 100% of shoulder width, B : base of support of 50% of shoulder width, C : base of support of 150% of shoulder width

Measurement: In this study, the EMG (QUS100, Zero Wire EMG, Italy, 2009) was used to measure the muscle activation of IO, EO, RA and TrA while the subjects took posture in Figure 3. Muscle Activation Measuring Equipment (EMG) To measure the muscle activation of IO-TrA(2cm inside of spina iliaca anterior superior) EO(15cm to the lateral from the naval) and RA(2cm to the lateral from below the naval), the EMG QUS100 (Zero Wire EMG, Italy, 2009) was used. To reduce the skin

resistance of the EMG, the EMG was attached on each muscle after shaving the area. The areas attached with the EMG are shown in Figure 4. When the measuring the surface EMG, the sampling rate was 1024Hz, the EMG signal was amplified by 1785 times, the band-pass filter was 20~450Hz and the notch filter was processed with 60Hz. The collected EMG signal was recorded with root mean square (RMS) after full wave rectification.

DATA ANALYSIS

or the data analysis, IBM SPSS/PC ver 22.0 for windows program was used. To find out the muscle activation in the research subjects by visual blocking during bridge exercise, ANOVA repeated measurement was used and for the difference between each variable, Bonferroni method was used as post hoc analysis. The statistically significance level was set to $p < .05$.

Figure 2: Aspects of the bridge exercise

RESULTS AND DISCUSSION

The difference in the muscle activation of the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transversus abdominis muscle was compared according to the visual blocking during the bridge exercise ($p < .05$) in Figure 3, Table 3. In the internal oblique abdominal muscle, the significant difference was found between ECNL/EOGL, ECNL/EOCL, ECNL/EOWL, ECNL/ECGL ($p < .05$) and the statistically significant difference was not found between ECNL/ECWL ($p > .05$) In Figure 4, Table 3. In the external oblique abdominal muscle, the statistically significant difference was found between ECNL/EOGL, ECCL/EONL, ECNL/EOWL, ECNL/ECGL, ECNL/ECWL ($p < .05$) in Figure 4, Table 3. In the rectus abdominal muscle, the statistically significant difference was found between ECNL/EOGL, ECCL/EONL, ECNL/EOWL, ECNL/ECGL, ECNL/ECWL ($p < .05$) in Figure 4, Table 3. This study was intended to compare the impact of the bridge exercise on the

subjects according to the visual blocking and the stance and the difference in the activation of the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transversus abdominis muscle. In the results, all the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transversus abdominis muscle showed the higher muscle activation when performing the bridge exercise with visual blocking than without visual blocking and when the experiment was conducted by dividing the stance into 100%, 50% and 150% of the shoulder width, the muscle activation was the highest when narrowing the stance into 50% of shoulder width. As such, in the results of exercising all 6 methods by one person, when reducing the stance to 50% of shoulder width with visual blocking, the muscle activation was highest. In general, the muscle activation was higher under unstable condition, which the visual blocking was applied than the stable condition without visual blocking, it is coincided with the preceding studies that the activation of the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle become higher when it is performed in the stable ground than in the unstable ground¹⁵. However, not all muscles showed the significant difference when there is a difference of visual blocking. All the muscles except the internal oblique abdominal muscle did not show the significant difference between EONL and ECWL. All the muscle except the rectus abdominal muscle did not show the significant difference between EONL and ECGL. In addition, the transversus abdominal muscle and the rectus abdominal muscle did not show the significant difference between EOWL and ECGL. In this study, when the stance was reduced to 50% of shoulder width for both with visual blocking and without visual blocking, the muscle activation was the highest. When the stance was reduced, the hip joint is gathered, and as the adductor muscle of hip joint is originate from the to the proximal of pelvis to the bottom of ischium, it served to support or fix the truck muscles attached to the pelvis or fixes or promote the contraction of the muscle inside of abdomen^{15,16}. It contracts strongly the adductor muscle of hip joint and if the bridge exercise is performed, it seems to contribute to the stabilization of truck movement. In addition, it may occur by the difference of the sensory input information due to the difference of supporting area. The somatic sense input is the element having

influence on maintaining the balance. Since in the posture of 150% of shoulder width, two feet are supported with wide area of the floor, lot of sensory input is possible but when the stance is reduced to 50% of shoulder width, as maintaining the balance is difficult due to reduction of supporting area, the activation of internal oblique abdominal muscle and the external oblique abdominal muscle is deemed to be increased. The results of this study showed that the muscle activation was higher in the same stance when the visual blocking was applied than when the visual blocking was not applied. Coddege reported that the balancing ability of the body is increased more when the visual blocking is applied than when it is not applied ¹⁷. Potter and Silverman asserted that the visual system and the somatosensory system work organically for the balance control and if one sensory system may be damaged, other sensory system will work to enable the balance control, through which the body uses the exercise experience and the sensory information organically to adjust the posture and if one information may not be available, it can maintain the posture control by adjusting the dependency to other information ¹⁸. In addition, in the results of research on the posture control according to the sight by Won et., al. the difference in the visual information by the visual blocking has influence on the dependency on the proprioceptive sensibility for dynamic balance control on the balance system and as the visual blocking condition causes the increase of posture sway, it influences on the muscle activation for hip joint and trunk strategy. For such reason, the significant difference in the activation value of the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transverses abdominal muscle is deemed to be shown when the base of support was reduced by reducing the stance. When comparing the muscle activations with the difference in the base of support by the visual blocking and the stance, the significant difference in the internal oblique abdominal

muscle is deemed to be shown because the influence of the contraction of adductor muscle of hip joint by the narrow base of support and the influence of insufficient sensory information on the balance control are similar. The significant difference was not shown in the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transversus abdominis muscle because the sense of balance was provide when visual blocking was not applied and the stability of struck was complimented when the base of support was increased. This study has several limitations. First, the signal of surface electromyogram was measured assuming that it would be the muscle activation but signal noise would be generated by the movement of muscle during the exercise for the characteristics of the surface electromyogram. Second, since in this study, the muscle activation of the stabilizing muscle of the trunk was evaluated from 30 healthy and normal adults of 20s, it cannot be generalized for the patients with low back pain. In addition, additional research should be conducted with the diverse age group not with 20s. Therefore, additional research conducted with the patients with low back pain in diverse age group is deemed to be necessary. Finally, since this study is not the study conducted on the bridge exercise long-term but is the study measured and compared the muscle activation through temporary posture, the research on the muscle activation change will be needed through the long-term exercise.

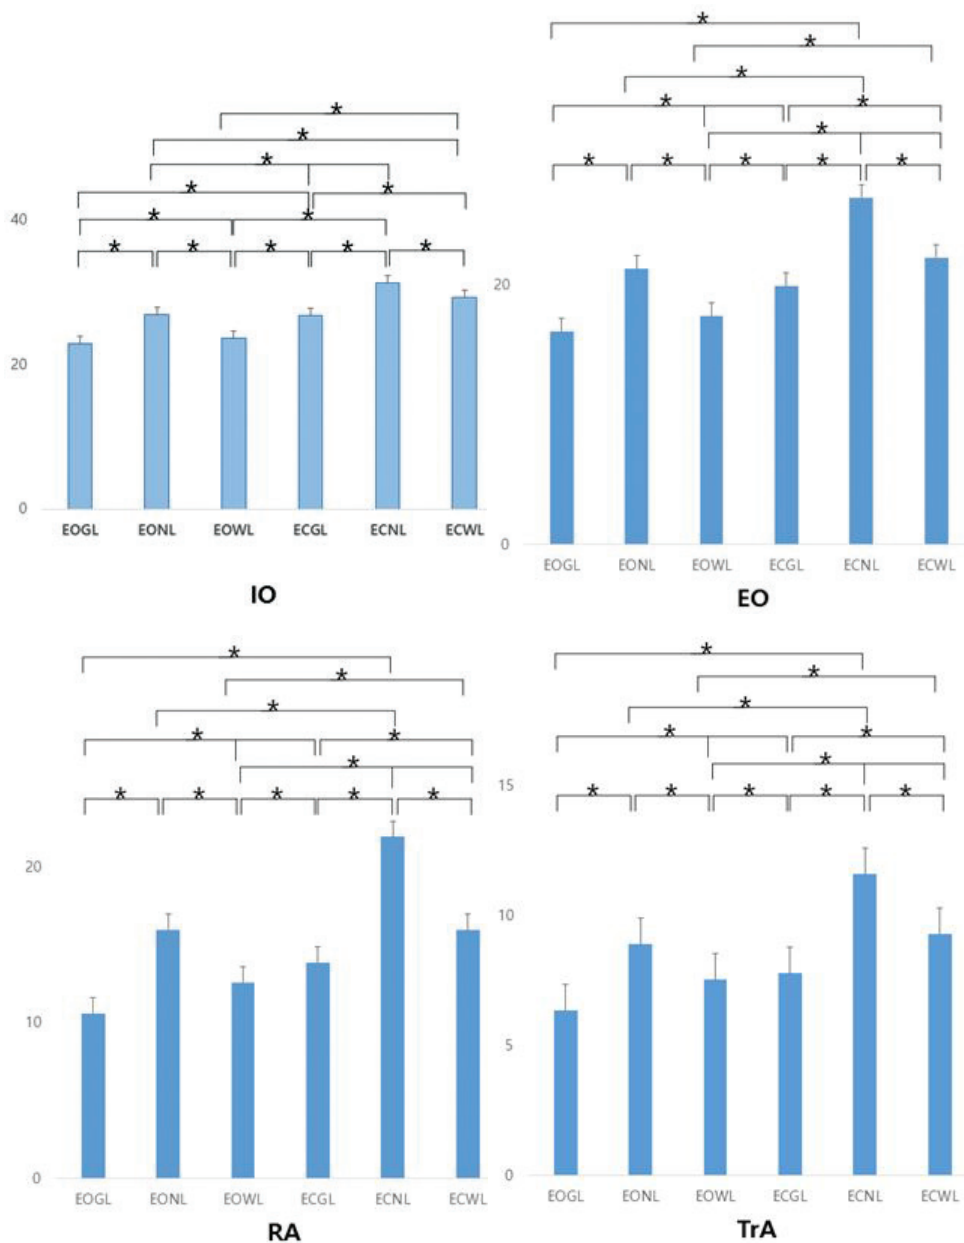

Figure 4: Electromyography activities of abdominis during varying bridge exercise *P<0.05,

CONCLUSION

This study was conducted to find out the influence of the visual blocking and the stance on the muscle activation during the bridge exercise with 30 male and female adults. In the results, when the visual blocking was applied, the activation of the internal oblique abdominal muscle, external oblique abdominal muscle, rectus abdominal muscle and transverses abdominal muscle was increased and when the stance was reduced to 50% of shoulder width, the muscle activation was increased. In the patients with low back pain, the muscles around the vertebra and the abdominal muscles

contributing to the stability of the trunk experience the muscle contraction, too. Therefore, it is expected that the bridge exercise method for stabilization of trunk would be proposed by adding the posture of narrow stance with visual blocking when exercising the bridge for the patients with low back pain.

ABSTRACT

Background/Objectives: This study was conducted to compare muscle activity of quadriceps muscles during open and closed kinetic chain and plyometric exercise using electromyography.

Method/Statistical analysis: 30 Healthy people agreed to participate in this study to collect data the activity of muscles. Measured data were converted into maximum voluntary isometric contraction percentages and ratio of individual muscles to the sum of each muscle.

Findings: The open-chain exercises, closed-chain exercises, plyometric exercises all showed significant differences ($P < .05$).

Improvements/Applications: As a result of muscular activity, rectus femoris was the most effective in an open-chain exercise, and vastus medialis oblique was the most effective in a closed-chain exercise. The results were thought to be used as a scientific basis for the selective knee extension exercise.

Keywords: *Open-kinetic chain, Closed-kinetic chain, Plyometric exercise, Vastus medialis, Vastus lateralis, Rectus femoris*

INTRODUCTION

A knee joint was a joint responsible for weight bearing, and was one of the largest joints in the body. The role of extra-articular soft tissues such as ligaments, membranes, and muscles was very important because of the high risk of injury due to the unstable and mid-position of the lower extremity¹. In addition, the knee joints provided dynamic and static stability in support of weight in daily life. The stability of the knee was obtained by the soft tissues such as muscles, skin, joints, tendons, and ligaments rather than the structural arrangement in which the bones are located². During activity of daily living such as walking, running, and stair climbing, the knee joint was loaded with more than the weight³. There have been a lot of researches that the knee joint function is weakened and muscle strength

is weakened due to the above reasons. Knee joints were stable only with ligaments and muscles, so they show severe movements and they were a part where injury due to external force was very common. Therefore, general knee-related rehabilitation aimed to prevent joint damage caused by instability⁴.

Excessive use of the knee joint and abnormal movement of the patella reduced the ability to coordinate between the vastus lateralis (VL) and the vastus medialis obliquus (VMO). As a result, it caused patellofemoral pain syndrome (PFPS) and degenerative arthritis of the knee joint⁵. It was important to manage on their own as chronic diseases were caused by PFPS⁶. Quadriceps was one of the most important muscles of the knee joint muscles. This muscle acted as a knee extensor and provides the stability of the lower limb during gait and standing, and was a very important muscle in terms of providing stability of the knee joint⁷. In addition, VL of quadriceps acted more strongly than VMO during lower limb movement, which caused imbalance of external and internal forces during exercise. This imbalance caused lateral displacement of the patella⁸. Therefore, the persistent imbalance between VL and VMO led to PFPS⁹.

When the open kinetic chain (OKC) exercise of the knee joint was applied, the force of the quadriceps increases and the shearing force increases. This exercise was used because of the reduced contact surface between the knee and femur¹⁰. Conversely, closed kinetic chain (CKC) exercise caused co-contraction of the quadriceps, resulting in less shearing force¹¹. It also increased the compression force of the joints and provided a functional muscle recruitment pattern by various joint movements¹². It also used functional muscle recruitment patterns and was said to be functional because it stimulated a proprioception^{3, 13}. In addition, plyometric exercise of quadriceps has been reported to be effective in stabilizing the knee and preventing knee injury¹⁴. During a plyometric exercise, many muscles performed their work for a short time. The activated muscle properly formed a stretching cycle that occurs when the action of fast concentric muscles was switched from fast eccentric muscle action (deceleration)¹⁵.

Previous studies have shown that OKC and CKC exercise are commonly used for rehabilitation in patients with knee pain. However, there was no study to compare the ratio of muscle activity of quadriceps during OKC, CKC and plyometric exercise. Therefore, in this study, the ratio of muscle activity of the VMO, VL and rectus femoris (RF) was compared during OKC, CKC and plyometric exercise.

MATERIALS AND METHOD

Participants: Thirty normal adults (15 males, 15 females; mean age 20.93 ± 1.36) were recruited. The physical characteristics of subjects were as follows [Table 1]. The exclusion criteria for this study were knee ligament, cartilage, or cartilage injury, a history of the knee joint injury or surgery, a traumatic injury of the patellofemoral pain syndrome, a knee dislocation or subluxation history, inflammatory arthritis. This study was conducted according to the protocol approved by the Institutional Review Board of Sun Moon University.

Table 1: Physical characteristics of subjects

Variable	Male (n = 15)	Female (n = 15)
Age(year)	21.6 ± 2.26	20.26 ± 0.45
Height(cm)	175.5±5.82	160.2 ± 3.53
Weight(kg)	78.8 ± 18.25	54.8 ± 8.6
mean ± standard deviation		

Procedure: Subjects participated in three exercise methods. All exercises were performed three times each and mean values were used in the results. The resting between each trial provided a 30-second rest in the OKC and CKC exercise, and a 10-second in plyometric exercise. Before performing OKC exercise, 1 repetition maximum (RM) of each subject was measured using isokinetic exercise equipment (CSMI, Humax Co, USA, Italy, 2010). Each subject performed knee extension for 3 seconds with 60% strength of maximal strength in sitting position. The squat was used to perform OKC exercise. The subject was asked to maintain a squat posture of 0 to 90 degrees of the knee joint for 3 seconds. The depth jump to vertical jump was used for plyometric exercise [Figure 1].

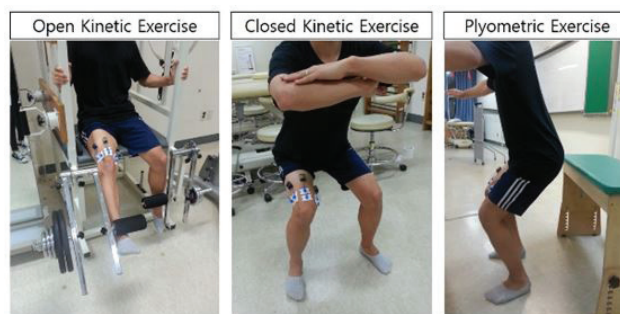

Figure 1: Three exercise methods

Measurement: In our study, surface electromyography (EMG) was used to measure muscle activity during each exercise. Disposable bipolar Ag/AgCl surface electrodes were attached parallel to the muscle fibers of the VMO, VL and RF with a distance of 2 cm between electrodes [figure 2]. The band-pass filter was set at 20-500Hz. Before attaching the electrodes, the skin surface was shaved, and the skin was wiped with ethyl alcohol to reduce the impedance. The obtained muscle activity values were averaged after calculating the root mean square (RMS), and were obtained as the ratio (% MVIC) of the maximum number of muscle contraction of each muscle on the basis of the muscle strength evaluation posture. In order to determine the muscle ratio, the RMS average of each muscle was added up and then quantified as a percentage (%).

Figure 2: The placement surface electrodes of muscles

Statistical analysis: All data was analyzed using SPSS/PC ver. 22.0 for Windows program (SPSS Inc., Chicago, USA). Measured data were converted into maximum voluntary isometric contraction percentages (MVIC %) and ratio of individual muscles to the sum of each muscle (RMS %). One-way ANOVA was used to determine the ratio of muscle activity to muscle activity according to the three exercise methods, and post-test (LSD) was performed. Significance level of all statistics were set as $p < .05$.

RESULTS AND DISCUSSION

Muscle activity: The VMO showed a significant difference in the three exercises, $11.4 \pm 6.16\%$ in the OKC, $17.76 \pm 8.76\%$ in the CKC and $23.03 \pm 14.41\%$ in the plyometric exercise ($p < .05$). The VL showed a significant difference in the three exercises, $15.27 \pm 6.53\%$ in the OKC, $14.14 \pm 7.07\%$ in the CKC and $23.48 \pm 10.38\%$ in the plyometric exercise ($p < .05$). The RF showed a significant difference in the three

exercises, $23.45 \pm 11.05\%$ in the OKC, $17.26 \pm 7.42\%$ in the CKC and $32.59 \pm 21.1\%$ in the plyometric exercise ($p < .05$). Overall, the plyometric exercise had the highest muscle activity [Table 2].

Table 2: The muscle activity (% MVIC) according to each exercise

Muscle	Exercise	%MVIC
VMO*	OKC	11.4 ± 6.16
	CKC	17.76 ± 8.76
	PLY	23.03 ± 14.41

	PLY	32.59 ± 21.10

Mean \pm standard deviation, * $p < .05$, VMO: vastus medialis oblique, VL: vastus lateralis, RF: rectus femoris, OKC: open-kinetic chain, CKC: closed-kinetic chain, PLY: plyometric

According to post-test results, there was a significant difference in VMO between OKC and CKC ($p < .05$). However, there was no significant difference between RF and VL ($p > .05$). There was also a significant difference in all muscles in the OKC, CKC and plyometric exercise ($p < .05$). In the CKC and plyometric exercise, there were significant differences in RF and VL ($p < .05$). However, there was no significant difference in VMO ($p > .05$). During plyometric exercise, all muscles showed the greatest force [Table 3].

* $p < .05$, VMO: vastus medialis oblique, VL: vastus lateralis, RF: rectus femoris, OKC: open-kinetic chain, CKC: closed-kinetic chain, PLY: plyometric

Ratio of muscle activity: VMO was $22.24 \pm 6.67\%$ in the OKC, $32.99 \pm 1.70\%$ in the CKC, and $27.97 \pm 6.67\%$ in the plyometric exercise. There was a significant difference between each exercise ($p > .05$). There was a significant difference between the three exercises in RF ($46.89 \pm 9.92\%$ in the OKC, $33.68 \pm 2.74\%$ in the CKC and $41.01 \pm 10.92\%$ in plyometric exercise.) ($P > .05$). However, there was no significant difference in VL ($30.86 \pm 6.79\%$ in the OKC, $33.06 \pm 1.09\%$ in the CKC, and $31.01 \pm 7.62\%$ in the plyometric exercise) ($p > .05$) [Table 4]. According to post test results, the muscle activity ratio showed a significant difference between the VMO and RF three exercises, respectively. ($p < .05$). However, there was no significant difference in VL ($p > .05$) [Table 5].

This study was conducted to compare muscle activity of quadriceps muscles during OKC, CKC and plyometric exercise. As a result, there was a significant difference between muscle activity of VMO, VL and RF. In the ratio of muscle activity, VMO, RF showed significant difference in OKC, CKC and plyometric exercise. However, there was no significant difference in the VL. The quadriceps consist of the VMO, VL, RF, and vastus intermedius, which is a group of muscles placed in front of the thigh¹⁶. RF was the main muscle of knee extension and played an important role in walking or standing posture⁷. The VMO contributed to the stabilization of the patella when the patella slid or passed through the intercondylar groove of the femur¹⁷. VL acted as a cooperative force on knee joint movement¹⁵. If the stability and balance of the muscles supporting the knee joint was reduced, a reduction of the contact area of the VMO, VL and imbalance of the patella occurred and was associated with various diseases¹⁸. In the OKC, joint movement was independent. Therefore, movement occurred at the distal part of the joint axis and concentric contraction was dominant at muscle contraction. In addition, more traction and rotational forces were generated, and stability was provided by external means¹⁹. In our results, RF showed the highest ratio of muscle activity and muscle activity in the OKC. This muscle was the primary extensor of the knee joint. It exerted 33% of the force when hip flexion. These functions were mainly used for heel strike during the gait cycle. Also, it had a great influence on stepping motion such as stair climbing and jumping²⁰.

In the CKC, movement of the joints was interdependent, so movement in the distal and proximal joint axes was expected. Recruitment of muscle contraction was simultaneous contraction for dynamic muscle stability. The eccentric contraction was dominant. Many joint compressive forces reduced joint shear forces and provided joint safety. Mechanical receptors were sensitive to change in pressure of the capsules, which increased the firing intensity over the entire range of activity and the activity of mechanical receptors limited moving joints¹⁶. In addition, compression and reduction of translation of tibiofemoral joint²¹ had been reported to include functional features such as the knee joint rehabilitation was more widely applied¹⁸. Irish (2010) found that the ratio of VMO to VL in the OKC and the CKC was 11.8: 1 in the squat exercise, one of the CKC. As a result, it has been reported effective for selective

strengthening of the VMO¹⁷. In this study, VMO showed the highest ratio of muscle activity in the CKC than the OKC. The VMO was one of the weakest physiologically and muscles that appear prematurely²². This muscle was also the main muscle acting actively and directly on patella stability, knee extension, and lateral movement of the patella²³.

Plyometric exercise was intended to provide a higher level of muscle strength by applying greater tension than the normal maximum muscle tension. When expressed in kinetic energy of chemical energy stored in muscles, the elastic properties of muscle were used to enhance the contractility by stretch reflex²⁴. Hakkinen et al. (1989) reported that a group with vertically high jump, a plyometric exercise, was more effective in isokinetic strength and flexibility than the control group. It also reported improved muscle power and muscular strength^{25, 26}. In this study, when the vertical jump was performed, VMO, VL, RF showed the highest muscle activity. On the other hand, there was no significant difference in VL in the ratio of muscle activity and there was a significant difference in VMO and RF. The VL was a knee extensor and served to stabilize the knee joint by balancing and cooperating with the VMO to prevent flexion of the knee joint during heel off^{17, 27}.

By increasing the distance from the axis of the knee joint to the quadriceps tendons, the internal moment arm was formed longer and consequently the role of the lever, which increases the knee extension moment, was changed. PFPS and osteoarthritis were commonly found in knee joints that were more weight-intensive than other joints²⁸. Increased load on the joint resulted in intensified degenerative changes^{29, 30}. Messier et al. (2005) reported that the increase in lower limb weight was closely related to the amount of the knee joint load³¹. Quadriceps weakness occurs in 50-60% of patients with knee disease. In particular, VMO was the first to show atrophy and slow to recover. This weakening led to an imbalance within the quadriceps, which increased the lateral movement of the patella^{26, 32}. Muscle imbalance occurred because the VMO could not counteract the reaction forces produced by the VL and iliotibial bands³³. In other words, the imbalance of the muscles supporting the knee joint caused many diseases.

Therefore, it is necessary to know the ratio of muscle activity of VMO, VL and RF during each exercise compared in this study. The selective enhancement of

the VMO was effective in the CKC, and RF had proved effective in the OKC. Plyometric exercise was also effective to uniformly strengthen the three muscles.

CONCLUSION

The purpose of this study was to compare the muscle activity ratios of the VMO, VL and RF with OKC and CKC, and plyometric exercise. As a result, there was a significant difference in the muscle activity of the VMO, VL and RF between the three exercises. The RF showed the highest muscle activity during the O, while the VMO had the CKC. VL showed similar muscle activity during the three exercises.

The Relationship between Social Problem-Solving and Self-Regulation Abilities according to Clinical Practice Experience in Nursing Students

Young-Hee Kim¹, Jung-Hee Jeon²

¹Associate Professor, ²Assistant Professor, Department of Nursing, University of TongMyong, 428 Sinseon-ro, Nam-gu, Busan, Korea

ABSTRACT

Background/Objectives: This study was to investigate the social problem solving ability and self-regulation ability in nursing students according to clinical experience.

Method/Statistical analysis: A self-report questionnaire or face to face interviews were used to collect data from 156 nursing students. In order to measure the social problem-solving ability it used a measuring tool D'zurilla and Nezu had developed. For an assessment tool of the self-regulation ability it used a measuring tool Volition Composite Index that Kuhl and Futhrmann had developed. The statistical method used for data analysis was SPSS windows 21.0 program.

Findings: The main research findings were as follows. Social problem-solving ability of subjects was average $3.15 \pm .33$ points, and self-regulation ability was average $2.48 \pm .29$ points. Social problem solving ability was higher in the students with clinical practice experiences ($3.26 \pm .33$) than those with no experiences ($3.15 \pm .27$), and the difference was statistically significant ($t=2.12, p=.036$). The group of the students with clinical practice experiences showed higher scores in the sub-factors of Negative Problem Orientation ($3.17 \pm .70$), Rational Problem Solving Style ($3.52 \pm .47$), Impulsivity-Carelessness Style ($2.91 \pm .59$), and Avoidance Style ($2.91 \pm .70$), but there were no statistically significant results. The relation between social problem-solving and self-regulation abilities was a significant degree of correlation ($r=.370, p<.001$).

Improvement/Applications: As a result of the research, clinical practice experience is related to social problem-solving and self-regulation ability. This study could help curriculum developments to improve clinical performance ability of students.

Keywords: nursing, students, clinical practice, social problem-solving ability, self-regulation ability

INTRODUCTION

Nursing education is an integrated curriculum of theoretical and practical learning experiences aims to provide students with knowledge, skill, and attitudes required for future professional practice [1]. Clinical practice is a essential element of the baccalaureate nursing education. Nursing students who have experienced clinical practice can integrate theoretical

knowledge and skill needed to solve client's problems with critical thinking and professional intervention [2]. Clinical practices require a great deal of concentration and a strict code of conduct as they are normally performed in hospitals and directly related with human health. One's clinical competency is more dependent on problem solving abilities under diverse circumstances than on superficial knowledge. Social problem solving ability means that to solve problems in the most efficient way possible in everyday life [3]. As one's ability to deal with difficulties that may occur in real life, the social problem solving ability is a cognitive, emotional and behavioral process through which one can adapt to situations encountered in daily lives [4].

According to D'Zurilla and his colleagues [4], social problem solving abilities consist of two components, problem orientation and problem-solving styles. The problem orientation component contains negative and positive elements. Positive problem-oriented person

Corresponding Author:

Assistant Professor, Department of Nursing,
University of TongMyong, Korea
Email: jjh@tu.ac.kr

often consider their issues as a challenge and think of them as motivators to seek solutions to their issues. Individuals showing a negative problem orientation tend to involve variable dysfunctional cognitive styles that form their assessment of a problematic situation. A negative orientation is also clearly linked to continuing negative emotions, such as moods, worry and health complaints. According to the study, poor problem solving skills are associated with more sedentary behaviors and increased alcohol consumption [5].

While having clinical practice education in a complicated hospital setting, nursing students often suffer considerable stress. The clinical practice education at hospital has been a major cause of stress [6]. Such stress can have negative effects on one's study. Actually, there have been a lot of students who suffered extreme stress from clinical practices, lost self-confidence in nursing patients, and even dropped out of school [7].

Human beings sometimes give up or avoid circumstances they are not familiar with. This behavior occurs because self-regulation, among one's internal qualities, responds differently to a situation, depending on individuals [8]. The self in self-regulation refers to the one who takes an essential and leading role in striving for one's goal. Adolescents who have difficulty with self-regulations are more likely to exhibit problematic behaviors such as Internet game addiction, drug addiction and other delinquencies [9], with high levels of depression and social anxiety [10, 11].

Therefore, the purpose of this study is to explore the relationship between clinical practices of nursing students and their social problem solving abilities and self-regulation, and to present empirical data on whether one's social problem solving ability can be improved through self-regulation.

METHOD

Study design: This descriptive study aims to explore the relationship between nursing students' experiences of clinical practices and their social problem solving and self-regulation ability.

Participants: This study conducted a survey with male and female students of the nursing department at four-year universities in Pusan. The number of samples was calculated using the G*power 3.1.2 program. With a significance level (α) of .05, a test power ($1-\beta$) of 80%,

an effect size (f^2) of .15, and the number of predictor variable being 12, multiple regression analysis was conducted in order to find the appropriate sample size. The analysis showed the requirement of 156 subjects, but considering the number of dropouts, 150 students were included in the study.

Instruments

Social Problem-Solving Inventory: The scale of social problem solving ability used in this study is the adaptation by Kim and Kim of the scale developed by D'zurilla and Nezu [4], which consists of two major scales: the Problem Orientation Scale (POS) and the Problem Solving Skills Scale (PSSS). It contains 40 items, and higher scores reflect greater social problem solving abilities. The instrument has a reliability of Cronbach's $\alpha = .90$.

Self-Regulation Ability: For the scale of self-regulation, this study used the simplified version of the Volitional Components Inventory (VCI) by Kuhl and Futhrmann [12], which was adapted by Yoon for factor analysis [13]. The scale is composed of 21 items under the sub-factors of self-regulation and volitional inhibition modes. Higher scores on the scale indicate that a person is more likely to act in accordance with a self-directed plan. The instrument has a reliability of Cronbach's $\alpha = .79$.

Reliability of the Tools: The Cronbach's alpha for the reliability of the social problem-solving ability tool was .814, and the self-regulation ability tool was .782 [Table 1].

Table 1: Reliability of the research tool

Tool	Cronbach's alpha
Social Problem Solving Ability	.814
Positive Problem Orientation	.685
Negative Problem Orientation	.757
Rational Problem Solving	.881
Impulsivity-Carelessness Style	.801
Avoidance Style	.743
Self-Regulation Ability	.782
self-regulation mode	.799
volitional control mode	.747

DATA ANALYSIS

Using the SPSS/WIN 21.0 statistical program, data analysis for the collected data was conducted as follows:

- The levels of social problem solving ability and self-

regulation are calculated with frequencies, percentages, mean values and standard deviations.

- The t-test is performed to analyze how closely related clinical experiences are to social problem solving ability and self-regulation.
- The relationship between social problem solving ability and self-regulation is analyzed with Pearson correlation.

RESULTS AND DISCUSSION

The results of research showed that social problem solving ability level of 3.15±.33 (range 1-5) points. In subcategories, subjects scored 3.56±.54 points for Positive Problem Orientation, 2.94±.68 points for Negative Problem Orientation, 3.48±.44 points for Rational Problem Solving, 3.14±.54 points for Impulsivity-Carelessness Style, and 3.19±.68 points for Avoidance Style [Table 2].

Table 2: Social Problem-Solving Abilities Level

Variable	Range	M ± SD
Problem Orientation Scale		
Positive Problem Orientation	2.00~5.00	3.56 ± .54
Negative Problem Orientation	1.40~4.80	2.94 ± .68
Problem Solving Skill Scale		
Rational Problem Solving	2.35~5.00	3.48 ± .44
Impulsivity-Carelessness Style	1.80~4.70	3.14 ± .54
Avoidance Style	1.57~5.00	3.19 ± .68
Social Problem Solving	2.20~4.20	3.15±.33

The results of research showed that self-regulation ability level of 2.48 ± .29 (range 1-4) points. In subcategories, subjects scored 2.46 ± .47 points for self-regulation mode, and 2.50 ± .44 points for volitional inhibition mode [Table 3].

Table 3: Self-regulation Abilities Level

variable	Range	M ± SD
Self-Regulation Ability	1.77~3.03	2.48 ± .29
self-regulation mode	1.00~3.70	2.46 ± .47
volitional inhibition mode	1.64~3.82	2.50 ± .44

The results of the examination of the relation between social problem-solving abilities, self-regulation abilities and clinical practice are as show in Table 4.

Social problem solving ability was higher in the students with clinical practice experiences (3.26±.33) than those with no experiences (3.15 ± .27), and the difference was statistically significant (t = 2.12, p = .036). The group of the students with clinical practice experiences showed higher scores in the sub-factors of Negative Problem Orientation (3.17 ± .70), Rational Problem Solving Style (3.52 ± .47), Impulsivity-Carelessness Style (2.91 ± .59), and Avoidance Style (2.91±.70), but there were no statistically significant results.

A survey of college students in a study revealed that those with higher self-esteem and less stress tend to have greater social problem solving abilities [14]. A study involving nurses showed that social problem solving ability performs an important role in settling problems by helping the nurses make accurate and prompt decisions [15]. It was also found out that a nurse with higher social problem solving ability is less likely to suffer burnout [16]. These studies demonstrate that one with high social problem solving ability is capable of finding efficient alternatives to deal with difficulties.

Higher scores in the self-regulation mode reflect that one is more likely to stick to a self-directed plan, while higher scores in the volitional inhibition mode mean that one tends to refrain from inefficient and excessive self-control in striving for one’s goal.

Table 4: Social Problem-Solving and Self-Regulation Abilities according to Clinical Experience

Variable	Clinical practice (+)		Clinical practice(-)		t	p
	M	± SD	M	± SD		
Social Problem Solving	3.26	± .33	3.15	± .27	2.12	.036*
Problem Orientation Scale						
Positive Problem Orientation	3.56	± .52	3.57	± .57	0.16	.877
Negative Problem Orientation	3.17	± .70	3.02	± .80	.20	.234
Problem Solving Skill Scale						
Rational Problem Solving Style	3.52	± .47	3.44	± .39	1.23	.221

Conted...

Impulsivity-Carelessness Style	2.91	± .59	2.80	± .48	1.29	.200
Avoidance Style	2.91	± .70	2.74	± .74	1.43	.154
Self-Regulation Ability	2.55	± .35	2.40	± .35	2.63	.009*
Self-regulation mode	2.46	± .42	2.45	± .52	0.11	.910
Volitional inhibition mode	2.62	± .45	2.38	± .39	.53	.001*

In this study, the group with clinical practice experiences had higher scores in both self-regulation and volitional inhibition modes than the group with no experiences did. This finding suggests that compared to the students with no clinical experiences, those who have performed clinical practices make more varied plans and strategies and refrain from inefficient self-control while achieving their goal.

There was positive correlation among social problem solving ability and self-regulation ability (Table 5).

Table 5: Correlation among social problem-solving and self-regulation abilities

Variable	PO	NO	RPS	IC	AS	SRM	VIM
PO	1						
NO	-.273**	1					
RPS	.527***	-.035	1				
IC	-.087	.377***	-2.85***	1			
AS	-.338***	.575***	-.216**	.612***	1		
SRM	.481***	-.254**	.299***	.080	-.173*	1	
VIM	-.004	.387***	.129	.206**	.365***	.183*	1

Note: significant at * $p < .05$, ** $p < .01$, *** $p < .001$

PO=Positive Problem Orientation, NO-Negative Problem Orientation, RPS=Rational Problem Solving Style, IC=Impulsivity-Carelessness Style, AS= Avoidance Style, SRM=self-regulation mode, VIM=volitional inhibition mode.

CONCLUSION

The purpose of this study is to present basic data necessary to improve problem solving abilities of student nurses at hospital by examining the effects of nursing students' experiences of clinical practices on their social problem solving abilities and self-regulation. A survey was conducted with 156 college students of the nursing departments at four-year universities. As a result of it, social problem solving ability and self-regulation ability were above average. In the subcategories of social problem solving ability, the highest level of positive problem orientation was recognized as a challenge rather than as a threat, and the self-regulation ability showed the highest level of volitional inhibition mode. This means ineffective and excessive control self-regulation to achieve the goal. The higher the social problem

solving ability, The higher the self-regulation ability. Social problem solving ability and self-regulation are essential skills for nurses who are required to work in urgent medical situations. To improve such abilities, clinical practice education needs to have a curriculum that enables students to face diverse circumstances, make decisions, and present solutions by themselves. Clinical nursing practice is as equally important as theoretical nursing education. Therefore, it is necessary to develop a program that can improve self-regulation ability in order to cultivate talented people with problem-solving abilities required by society.

ABSTRACT

Background/Objectives: In recent years, instead of traditional impression methods, have been developed and used as digitalized clinical methods in which computers and machines are responsible for using an oral scanner.

Method/Statistical analysis: A questionnaire survey were conducted on 116 dental hygiene students who agreed to the study by using the self-filling questionnaires method to change awareness and preference before and after oral scanner use. The collected data were analyzed using the SPSS 19.0 program.

Findings: The most important step in the dental practice area is to reproduce the shape of the oral cavity to create a replicate model, which should be accurately impression of the oral condition, and should be satisfied at the same time with less inconvenience and time saving.

In comparison with before use of the oral scanner, it was found that the awareness improved, the treatment process became easier, the oral scanner was more favorable to the use of the oral scanner, and the oral scanner was more effective than the conventional impression I thought it would be correct. People who thought that managing the model before using the oral scanner was not more comfortable and did not care about getting the patient's attention thought that it would be uncomfortable before using the oral scanner. In other words, the preference of oral scanner differs according to recognition difference.

Improvements/Applications: This study confirmed the awareness and prediction inconvenience of dental hygiene students' oral scanner. These results can be used as basic data in the field of dental hygiene education and digital dental education.

Keywords: Oral-scanner, Dental scanner, Digital dentistry, CAD-CAM, dental hygiene

INTRODUCTION

Traditionally, as a method for manufacturing the dental prosthesis, a dental hygienist mixes the impression material with the removed abutment, and then the model material is poured into the impression material considering the elastic recovery time. When the tooth model was sent to the dental laboratory, dental technicians through waxing and casting produced final dentures. In recent years, instead of traditional

impression methods, impression making, modeling, and prosthesis manufacturing, except tooth preparation, have been developed and used as digitalized clinical methods in which computers and machines are responsible for using an oral scanner. In particular, impression making is one of the most important processes in dental practice by creating a replica model that reproduces the appearance in the oral cavity, and it is a process in which accuracy and efficiency must be satisfied at the same time.

Oral scanner is a device for converting patient's oral environment into data, and is an essential tool for digitizing the manual work of impression materials. The oral scanner is divided into an intra-oral scanner that directly scans the patient's oral cavity and surrounding hard tissue and soft tissue, and an oral scanner that scans the patient's oral cavity.

The task of oral scanning is a very important step in gathering information in the oral cavity. In the past, we mainly used the model scanner method, which is an out-of-oral scanning method. Model scanners are classified as contact type and non-contact type, and they function as a principle of scanning while directly touching the object to be measured. Contact scanners tend to damage the model during repetitive scans, or less accurate at points smaller than touch points¹. Recently non-contact, direct intra-oral scanning makes used scanners. The method of measuring is to scan the object by recognizing the distance of the object using the light source of the scanner. Triangulation method, confocal laser measurement method, and active wavefront extraction method, and the difference in the extraction method of images is different². It is also divided into ways of taking pictures and editing images.

The image file which is impressed with the oral scanner is designed by computer using CAD/CAM (Computer Aided Design / Computer Aided Manufacturing) to determine the shape of the prosthesis, its adjacent value and its relative value, This is possible. This method has the great advantage of making and installing the prosthesis on the same day.

Guth³ stated that the virtual model obtained by the oral scanner is more accurate than the existing model produced by the impression, and the use of the oral scanner is generalize based on this accuracy. Another researchers proposed that in-office system with CAD software and milling machine could make the restoration after making various impressions in the library after setting the margins by using CAD software after making impressions in the oral cavity⁴. Moreover, it is expect that the use in the dental office will be gradually expand. In addition to the process of making all-ceramics using zirconia, the use of CAD/CAM in the provision of temporary restorations is gradually expanding, so that dental hygienists are required to use oral scans. However, the intra-oral scanning method has a problem that it is necessary to position a camera in the oral cavity within a limited oral cavity, to control complicated environmental factors such as moisture in the oral cavity and saliva, and to ensure accuracy of the data Practical training on use is necessary³.

In order to produce accurate prosthesis using an oral scanner, it is necessary not only to scan the teeth accurately but also to take oral tissue soft tissue

and stability of occlusion in the state of stable central occlusion. In the dental office, many dental hygienists in dental clinics and clinics perform the use of the oral scanner. In the dental clinic, many roles are required for the use of the dental hygienist's oral scanner through duties sharing with the dentist. In the existing dental hygiene education and practical education of the oral scanner is not done properly.

The purpose of this study was to investigate the perception and preference of dental hygiene students about the oral scanner which is gradually being used and to suggest the future direction in dental clinical education.

MATERIALS AND METHOD

Research subjects: In this study, 5 of the second grade students who were not participating in the pre-survey study were pre - investigated, and the structured questionnaire was prepared by supplementing the post-questionnaire.

A questionnaire survey was conducted on 116 dental students and students who agreed to the study by using the self - filling method to change perception and preference before and after oral scanner use.

Methods and data analysis: The collected data were analyzed using the SPSS 19.0 program (SPSS Inc. Chicago, IL, USA). The pre-learning difficulty, prediction discomfort, and preference score of the oral scanner were calculated and the pre- and post- recognition scores of the oral scanner were compared. The results of the one-way ANOVA were used to estimate the difference in prediction discomfort according to the perceived level before and after using the oral scanner. In addition, multiple regression analysis was conducted to analyze the preference factors that affected the predictive discomfort of the oral scanner. The explanatory power of the model was determined through multiple decision coefficients (R²).

RESULTS AND DISCUSSION

Table 1 shows the pre-learning difficulty and the predicted inconvenience of the oral scanner. When comparing the method of using the oral scanner with the method of using the rubber in the impression taking

method, the difficulty predicted by the oral scanner impression was 'Easy' (50.0%). Compared with the impression method using the oral scanner and alginate, the difficulty predicted by the oral scanner impression was the highest (54.3%) in 'Easer'.

Among the impression methods using the oral scanner and rubber, the easiness to predict the oral scanner's impression was 'Easy' (52.6%). Compared with the impression method using alginate, the predicted inconvenience was 'Easy' (56.9%).

Table 1: Difficulty and unpredictability of oral scanner before learning

Variables	Classification	N	%
Difficulty compared with Rubber impression material(Q2-1-1)	Easy	58	50.0
	Same	24	20.7
	Difficult	34	29.3
Difficulty compared with Alginate impression material(Q2-1-2)	Easy	63	54.3
	Same	20	17.2
	Difficult	33	28.4
Discomfort compared with Rubber impression material(Q2-2-1)	Easy	61	52.6
	Same	31	26.7
	Difficult	24	20.7
Discomfort compared with Alginate impression material(Q2-2-2)	Easy	66	56.9
	Same	23	19.8
	Difficult	27	23.3
Total		116	100.0

Table 2 shows the preference of the oral scanner. 90 people (77.6%) responded positively to the question "Do you want to continue to receive information about the digital oral scanner if you have the opportunity?", "You have a positive opinion about the digital oral scanner 97 people (83.6%) responded positively to the question "Do you think it is worth learning even if you invest my time?" In addition, 101 people (87.1%) said, "Do you intend to continue using the digital oral scanner?", "Do you prefer the impression method using a digital oral scanner compared to the conventional impression method?" 97 people (83.6%), 80 people (69.0%) said, "Do you think that there are differences in accuracy between expert and beginner when making a digital impression?", "Do you think that digital impression taking is necessary in school curriculum? 85 people (73.3%) responded positively.

Table 2: Preferences of oral scanner

Variables	Classification	N	%
Do you want to continue to receive information about your digital oral scanner if you have the opportunity?	Yes	90	77.6
	Neutral	24	20.7
	No	2	1.7
2. Do you think it is worth learning even if you invest my time in a digital oral scanner?	Yes	97	83.6

Total		116	100.0

Table 3 shows the average perception of pre-and post-use oral scanner. The overall average of pre- use oral scans was 2.66, and the overall average of post- use perception was 2.84. Recognition improved by 0.18 after use of oral scanner.

In the pre-use awareness of oral scanner, the item ‘I think the entire treatment process would be simpler’ was the highest at 2.76, and the item ‘I think it was more accurate than the impression method using alginate’ was 2.52 low.

In the post-use awareness of the oral scanner, the question “I am most interested in making an impression using a digital scanner in clinical practice” was the highest at 2.88, and the item “I think it is more accurate than the impression method using rubber” And 2.74 points, respectively.

Table 3: Comparison of perceptual averages before and after using oral scanner

Variables	Before	After
	M ± SD	M ± SD
1. I think it is more accurate than the impression method using rubber.	2.54 ± 0.64	2.74 ± 0.51
2. I think it is more accurate than the impression method using alginate.	2.52 ± 0.68	2.76±0.52
3. I think that model management is more convenient.	2.73 ± 0.48	2.85 ± 0.38
4.I think it can save time than the impression made with rubber.	2.75 ± 0.51	2.83 ± 0.44
5. I think that it can save time than impression making using alginate.	2.75 ± 0.49	2.83 ± 0.44
6. I think the entire treatment process will be simpler.	2.76 ± .047	2.84 ± 0.39
7. I think it will be useful to get the patient’s attention.	2.68 ± 0.54	2.86 ± 0.37
8. I think I can get the patient’s trust.	2.63 ± 0.57	2.85 ± 0.38
9. I think I will be able to master and master in a short time.	2.61 ± 0.60	2.87 ± 0.36
10.I think the degree of proficiency will affect accuracy.	2.63 ± 0.60	2.84 ± 0.44
11.I think overall impression making using a digital scanner is useful in clinical practice.	2.71 ± 0.46	2.87 ± 0.36
12. Overall, I am impressed with the impressions made with digital scanners in clinical practice.	2.66 ± 0.49	2.88 ± 0.35
Total	2.66 ± 0.54	2.84 ± 0.41

Predictive inconvenience by recognition the difference between before and after use of oral scanner is shown in Table 4. Predictive discomfort according to pre-use of oral scanner was significantly different in ‘I think it would be more convenient to manage the model’ and ‘I think it would be useful to get the patient’s interest’ ($p < 0.05$). In other words, before the use of the oral scanner, the subjects were more likely to predict the model inconvenience than those who thought it would be more convenient to get the patient’s attention ($p < 0.05$). There was no significant difference in predictive discomfort according to the degree of recognition after using the oral scanner ($p > 0.05$).

The most important step in the dental practice area is to reproduce the shape of the oral cavity to create a replica model, which should be accurately impression of the oral condition, and should be satisfied at the same time with less inconvenience and time saving.

Importantly when applying the digital oral impression technique clinically, it is important to note

that the trueness of how accurately the oral impression data expresses the shape of the actual abutment and the precision of the accuracy of the instrument’s repeatability, And the restoration of the restoration through the CAD-CAM fabrication process⁵. Most of the existing studies approached the technical problems such as the accuracy of the prosthesis using the oral scanner. According to previous studies, the recognition of clinicians has greatly

influenced the use of new digital devices and products in the dental field until they are introduced into the clinic⁶. Therefore, dental practitioners will need to acquire education and skills so that they can think positively about digital equipment in the rapidly developing and changing dental field and utilize them for medical treatment. The purpose of this study was to compare the differences in perception and preference between before and after using the oral scanner for the current dental hygiene students. We predicted that only about 50% would be easy to use before using the scanner directly, and the rest predicted that it would be difficult or difficult to obtain the same impressions as the existing ones. Here was no difference in difficulty between rubber impression material and alginate impression. The preference of oral scanner was very positive and it showed preference to continue using it.

In comparison with before use of the oral scanner, it was found that the awareness improved, the treatment process became easier, the oral scanner was more favorable to the use of the oral scanner, and the oral scanner was more effective than the conventional impression I thought it would be correct. According to many studies, the internal fit and marginal fit of the oral scanner are within the error range, and the reliability and accuracy of the digital impression are confirmed⁷⁻⁹. People who thought that managing the model before using the oral scanner was not more comfortable and did not care about getting the patient's attention thought that it would be uncomfortable before using the oral scanner. In other words, the preference of oral scanner differs according to recognition difference. If you are willing to continue using your mouth scanner, it affects the preference of your mouth scanner. This suggests that the preference for the oral scanner is increase as the user tries to use it continuously in advance.

Patient satisfaction with chair side digital system in dentistry, recognition of dental technician for CAD/CAM, attitude and recognition of Canadian orthodontist for digital photography and digital radiography have been reported both in Korea and abroad. In the study of Park etc.¹⁰, dental hygienists working in dentists were required to recognize and educate digital equipment. In addition, as the number of dental workers demanding the education of dental digital equipment increases, the education of dental digital equipment of dental workers should be activated.

Changes in the pattern of dental care will surely advance rapidly, and thus, it is inevitable that there will be an area destruction of the new treatment area and competition for the new treatment area. Therefore, it is natural that the principle education for the traditional medical treatment method should be practiced. However, it is natural that the school education for the understanding and utilization of the digital dentistry should be performed in parallel with the paradigm change period in which the day is changing differently^{11,12}.

The limitation of this study is that it is not possible to extend the results of the study to the whole dental hygiene department students in some areas. It is difficult to expand the number of the study subjects to expand the sample size, to supplement the diversity of the subjects, and a comparative study is need¹³.

CONCLUSION

The most important issue for the whole period of dentistry is 'the change of dental care by the digital dentist age'. Of these, the fastest rate of change has been introduced clinically and the dental industry's attention is focused on the introduction of 'chairside digital systems'. Especially, the impression through the oral scanner is different from the analog impression system using the impression material and the tray, and the digital impression is a method of directly acquiring the oral information of the patient by using the oral scanner. Due to the continuous supply of oral scanners, CAD-CAM work is being done with only scanned digital data without a clinical model. Therefore, this study confirmed the perception, preference, and prediction inconvenience of dental hygiene students' oral scanner. These results can be used as basic data in the field of dental hygiene education and digital dental education in the future.

A Reinforcement Method of Healthcare Information System

Seong-Hoon Lee¹, Dong-Woo Lee²

¹Division of Information&Communication, Baekseok University, 115, Anseo-dong, Cheonan, Korea;

²Dept. Of Computer Information, Woosong University, 226-2, Jayang-dong, Dong-gu, Daejeon, Korea

ABSTRACT

Background/Objectives: The health care service environment is changing from existing treatment center to preventive center, from hospital center to home center, from disease center to health center.

Method/Statistical analysis: In this study, we analyzed the current status of domestic and external healthcare information systems and the operation cases of existing healthcare information systems in order to derive strategies for smart healthcare and healthcare information systems. In addition, the standard status of international standards organizations related to medical informatization was also investigated and analyzed.

Findings: The purpose of this study is to develop the information system related to various smart systems to provide patient - centered services along with the development of computing environment, and to establish a smart health care system such as a clothing health management system, a home care system, respectively. This is expected to contribute to the realization of health-care and preventive-oriented service-oriented medical information system, not telemedicine and medical care in future ubiquitous and smart cloud environments.

Improvements/Applications: The service - oriented medical information system proposed in this study will strengthen the competitiveness of hospitals in addition to the rationalization of hospital management, the medical decision - making of medical staff and the support of managerial decision - making.

Keywords: Smart, Healthcare, Information system, Medical service, Mobile computing.

INTRODUCTION

Currently, information technology (IT) is developing into a convergence system by combining related technologies. In particular, medical information industry in ubiquitous environment has attracted new interest in mobile medical information service^{1,2-4}. With the recent development of smart devices, the information environment of mobile users has been developed rapidly and convenience has improved. Recently, the mobile computing environment is becoming commonplace due to the launch of many mobile terminals such as netbook, notebook, iPhone, Galaxy S, iPad and so on. Smart Healthcare refers to a smart device-based healthcare service in consultation. Extensive smart health care refers to all user-centric health care systems and components.

In the medical field, it is necessary to utilize IT to enhance competitiveness and enhance service. With the advancement of computing technology, attention and technology development for telemedicine and home medical care are being activated. Some medical information is being shared through E-Hospital, a hospital information-oriented business centered on large hospitals. The government has created a plan to activate U-Healthcare using information technology infrastructure. In 2008, the Ministry of Health and Welfare also established a mid- and long-term comprehensive plan to activate U-Healthcare^{1,5}.

Medical service refers to various useful services provided to patients and healthcare providers based on their medical activities in relation to disease prevention and treatment activities. Medical care means the enforcement of medical technology, such as medical care, preterm birth, and nursing, performed by a medical person Article 25 of the Medical Law. That is, the term medical treatment refers to an experience and function based on medical expertise, such as examination,

E-mail: dwlee@wsu.ac.kr

optometry, prescription, medication, and surgical operation. Examples of medical practices include diagnosis, medication, injection, transfusion, anesthesia, surgery, treatment, immunization, and patient care.

In recent years, based on electronic medical records (EMRs), domestic hospitals have become increasingly industrialized. In order to provide various statistics and researches of hospitals that are distributed and operated independently in each region, (DW: Data Warehouse). Medical informatization started from electronic medical records. EMR is a solution that can provide the same level of medical services to other medical institutions through informative data such as patient medical records and related DBs even if the patient who is being treated moves to the hospital by informing doctor's medical records.

Medical information is information that is produced and utilized in the process of prevention, diagnosis, analysis, and treatment of diseases in healthcare institutions. As medical science data is digitized, hospital management, medical service, system operation work is shifted to information technology base. And the importance of medical information has been greatly emphasized.

Electronic medical information means that medical records recorded by a medium such as paper, microfilm or optical disk are recorded in the form of an electronic medium without changing the structure of its business processing structure, information range, or information contents. (Medical Image Storage and Transmission System), OCS (Prescription Delivery System), LIS (Clinical Pathology Information System), etc, because it is obliged to keep records of establishments or medical services of medical institutions for the period stipulated in Article 14 of the Enforcement Regulations of Medical Law. , A medical adverse effect monitoring system, a medical imaging system (cardiology), a 3D workstation, and a radiation information system (RIS)¹³.

Today, medical service policy changes and the development of information technology (IT) have led to a new era of environmental change. In other words, the demand for quality improvement of medical services is increasing due to income level and improvement of education, aging of population, improvement of social welfare, change of perception of medical service as basic rights of the people. Moreover, the paradigm of information communication is ubiquitous, smart, cloud

computing environment which can send and receive desired information in real time regardless of anyone, anytime, anywhere, any device , Domestic medical institutions are also investing and interested in Internet-based remote medical services that provide services such as prevention, diagnosis, treatment, and follow-up management at any time and anywhere by connecting these information and communication technologies with medical information systems have. It is expected that customer satisfaction will be improved by realizing accurate point-of-care (POC) of customers in real-time, making accurate diagnosis using various personal care data of customers, and transmitting the information to customers again.

In this paper, we propose a more efficient information system to provide medical service in mobile computing environment and provide medical service in ubiquitous computing environment to achieve such future healthcare service. In the mid / long term, various medical institutions and smart u-Health devices will be linked by using the cloud computing system base, and optimal treatment for individual customers and elderly care services will also be customized. In order to provide smart healthcare services, integration with various information systems of medical institutions linked with various information systems should be integrated.

The composition of this study is as follows. In Chapter 2, the current situation of healthcare information service is reviewed. In Chapter 3, the structure and improvement strategy of smart healthcare and healthcare information system are described. Section 4 discusses conclusions and future research directions.

Background of Change for Medical Information System

Domestic cases: Since the early 1990s, the information technology in the domestic medical and health care system has been promoted, and the computerization of the general hospitals has been almost universal in 2000. As of 2005, digitalization of medical information (EMR, PACS, etc.), which is the core of practical hospital work, is being promoted in dairy information system.

The remote medical field is a medical service that provides medical treatment, diagnosis, consultation, treatment, delivery of medical information, and health education using data communication such as telephone line, private line, ATM, By transmitting radiographic

images, clinical pathology test results, endoscopic images, etc. to each other, medical knowledge and treatment techniques are supported or advised on the treatment direction and the patient is treated according to the guidelines.

In the field of home healthcare services, home healthcare services using home information technology and prevention of illness are becoming more and more possible with the development of ubiquitous technology such as RFID.

From the institutional perspective, the legal environment for medical informatization was created in 2003 by legislating electronic medical records, electronic prescriptions, and telemedicine. This enables electronic records of medical records and prescriptions, and provides the basis for providing remote medical services by eliminating legal barriers to telemedicine.

The Korea IT Industry Promotion Agency (KIDA) reported that in the “Medical Information System Market with Global Competitive Environment,” medical expenditures increased from USD 780 in 2000 to USD 1,318 in 2005, 1.4 times higher than in 2000, “He said. The domestic medical information industry market grew 16.3% in 2006 to about KRW 250 billion in 2007, and it has increased to about 300 billion KRW in 2008 and is continuing to increase. Currently, the domestic medical information system market is dominated by medical image storage and delivery system (PACS), electronic medical record (EMR), and prescription delivery system (OCS).

Meanwhile, the rapid development of IT technology has accelerated the advancement of the medical service industry, and medical information system solutions such as PACS, EMR and OCS have been introduced to medical institutions such as medical clinics. And it is contributing greatly to enhance the convenience of patient’s medical use by rapid processing.

The healthcare information system industry is not limited to the informatization of medical institutions, but it is developing into a total healthcare industry that includes medical devices, solutions, and services as networks for patients, medical institutions, and governments.

Domestic medical information systems companies are accumulating their experience and know-how in developing, constructing and servicing advanced IT

infrastructure and medical information solutions. If you take advantage of these advantages, you will be able to develop U-Healthcare and smart healthcare industry It is expected that it will be able to demonstrate competitiveness in competition with global medical information service companies as well as with global IT companies.

As a major player in the domestic healthcare market, BitComputer, SK Ubiqua, EasyCare, and Infinite Healthcare are among the leading players. In addition, major subsidiaries such as Samsung SDS and LGCNS are making inroads, and GE Healthcare and IBM are adding to this.

Foreign cases: In April 2010, 227 companies, including Intel in the US, Omron in Japan, Panasonic and Sharp, organized a group called Community Health Alliance (CHA), and are actively promoting IT in the following medical sectors. It is looking for a way to utilize the communication module in various medical devices such as blood pressure monitor, electrocardiogram, and scale to observe patient’s condition in real time and share analysis data and use it in treatment method. To this end, we decided to unify communication standards and protocols of various devices.

In Japan, Softbank is focusing on urgent telemedicine services using iPhone. Imaging data can be sent to the doctor’s specialist in the field for immediate advice on the patient’s condition, or a specialist at a university hospital can provide services to novice and other physicians in real time.

The u-Health market in the United States is growing mainly in large companies related to IT, telecommunication, and medical sector. Venture companies are leading the field of medical informatization. The U-Health service market in the United States is about \$ 2.1 billion as of 2010 and is expected to surge more than five times in the next five years, exceeding \$ 10 billion.

The global healthcare market grew from about \$ 3.8 trillion in 2005 to about \$ 4.5 trillion in 2010, to about \$ 6.3 trillion in 2020 and about \$ 8.8 trillion in 2030 Is expected to expand (Medistat Ltd.). The global healthcare market is expected to expand to around \$ 5.9 trillion by 2012, with the u-health market accounting for around \$ 400 billion, an average annual growth rate three times higher than other general healthcare markets (Frost & Sullivan). Developed countries such

as the United States and Japan predict that u-health will become one of core services as the cloud environment is settled in advance, and government, business, , Ultra-small computer, and IPv6.

Healthcare Information System and Smart Healthcare

Status of Healthcare Information Standard:

Representative international standards organizations related to medical informatization are DICOM, IEEE, ISO and CEN, HL7, WHO and SNOMED. In addition, in ITU, medical data notation and messaging-based technologies are being studied in UN / CEFACT and OASIS on wireless communication protocols for medical information.

DICOM was developed by the NEMA / ACR committee as a standard video signal protocol operating on TCP / IP for transmission of medical digital images and incidental medical integrated information, and there are currently 16 standardization standards⁸.

ASTM is a standards body that deals with the certification of product producers and users to use such materials easily by testing the use and characteristics of almost all the products and materials distributed in the US and standardizing the quality of the product. Currently, the E31 Technical Committee is leading healthcare standardization ⁹. ASTM standardization is a standard in the United States, and international standardization standards such as IEEE, ISO, HL7, DICOM, and IETF are applied rather than development of new technical standard for medical informatization.

ISO/TC215 is a medical information technology committee that aims to develop interoperability and compatibility of data between medical devices and to develop standards necessary for digitalization of medical records. 8 working groups (WG) are active as follows¹⁰.

HL7 is a standards body for establishing standards for access to hospital information systems and medical equipment. It currently has 29 branches, including Korea, and is the ANSI de facto standard for electronic exchange of medical information ^{6,7}. HL7 stands for the seven layers of ISO / OSI, which is the highest level. It is a standard that can perform data transmission between systems as efficiently as possible for processing large amount of information of distributed medical information, In order to achieve the goal. Figure 1 shows HL7 standard architecture.

Figure 1: HL7 Standard Architecture

Among the standards for standards interoperability, HL7 and DICOM are the standards related to data transmission. Contents of EMR contents are defined in ASTM. IEEE1073 discussed the framework and transmission and data standards that enable data transmission and sharing between heterogeneous medical devices for the purpose of providing real-time plug-and-play interoperability between medical devices. Currently, ISO / TC215 ISO / IEEE 1073 work is in progress ^[11]. IHE has been established to perform harmonization among these standards, re-interpretation of standards conformance to ensure implementation guide and interoperability. IHE is a kind of facilitation organization for the realization of medical information standardization jointly promoted by HIMSS and RSNA, has more than 100 vendors ¹². Figure2 is a access standard for information sharing of IHE.

Figure 2: Access Standard for Information Sharing of IHE

Smart healthcare System: The real-time medical system is constructed according to the patient’s mobility and urgent state by checking (sensing) the patient’s condition in real time ^[5]. In the medical and health field, development of services that utilize cloud computing and smart phones is being actively pursued. It automatically collects information related to patient’s behavior or health using sensor of cloud-related terminal and enables real-time information sharing between doctors, patients and disease management providers, thereby enabling customized treatment optimized for individual patients. For example, a variety of health monitoring systems such as a door-eye examination system for a door, a blood

pressure monitor for regular blood pressure monitoring, a health meter for measuring exercise amount, and a fallacy sensing mat are under development.

Personal health guidance, and so on, and it can be treated as a kind of 'information medicine' as a prescription medicine product. The development of portable and mobile medical devices and the development of telemedicine information devices are the strategies to strengthen the emergency medical system, so that the patient's intelligence can be determined intelligently. We want to build a medical information infrastructure to provide medical services.

Apparel Health Management System: In recent years, research and development of a future apparel-type bio-signal measurement system emphasizing the mobility of a patient or a patient's family is actively under way. The development of various types of bio-information measurement modules such as shoes, belts, rings. There is an attempt to do so.

Attempts have been made to incorporate the latest information and communication technologies into the u-health field, such as the development of attachment-type bio-signal detection systems in NASA, HP, and MIT. A remote health diagnosis system capable of communicating with a wearable computer, and a clothing type health diagnosis system such as LifeShirt and LifeGuard capable of measuring and analyzing a biological signal using smart accessories are being developed.

In recent years, research investment related to development of micro devices and micro systems for the purpose of bio-medical information communication applications has been actively made. U-Health e-service platform based on mobile phone and u-Health application service program to measure and manage stress, obesity, and blood sugar are actively being developed in medical related SMEs and venture companies.

Home Care System: Home-care system is required to manage the health of the customer and transmit related data to the service center by using the home bio-information measuring device directly at home, continuously monitoring the health condition, and coping with the emergency situation.

The remote monitoring platform developed by Philips can easily measure body weight, blood pressure, electrocardiogram, blood sugar, etc. using the equipment provided at home and transmit the related biometric

information to the remote station and store it on the data server in the service center via the Internet. The person in charge monitors and manages health.

Welch Allyn of the United States developed a mobile terminal capable of monitoring biometric information and used it as a patient management device. Honeywell HomMed, Viterion, etc. developed a home bio-information measuring instrument and provided various home care services.

Telemedicine using NGI (Next Generation Internet) is being piloted by R & D programs of various federal agencies. TAC (Tactile Air Command) Teleradiology Project in the United States demonstrates remote telecommunication systems using existing telephone lines and suggests the possibility of telemedicine diagnosis.

The company NHS in the EU has started digitizing medical images since 2003 and provides health information through media such as telephone, online, and digital satellite TV through the NHS Direct website.

Medical Expert System: In order to perform accurate professional medical practice, medical information should be shared among professional medical staff and systematically constructed medical care know-how of medical staff. The systematic support of various medical treatment support alternative options for professional medical staff to carry out correct measures according to the condition of the individual patient to improve the narrowed medical treatment, Prevention or reduction of accident rate.

And if the medical information system has been used up to now as it accumulates medical information, the medical expert system extracts new medical information based on accumulated medical information and provides an alternative system for finding improved medical treatment methods do.

Issues and Development Directions: This section looks at the ongoing issues in terms of the technical aspects of medical information and medical services in order to establish a future medical information system and suggests directions for development of medical information services. We will consider the following issues in order to build a stable healthcare information system that is continuously improving and to maximize the utilization of existing systems.

1. Medical Information Standard Process Definition: Static basic process, dynamic selection process, virtual integration process. A static process is a fixed and constantly organized health information process. A dynamic process is an alternative process that is dynamically selected depending on the customer and system context. A virtual process is an unlimited process that is configured to support both static and dynamic processes and an integrated user and developer interface.
2. Development and definition of medical information scenario: We want to find out all application scenarios to support medical information users and normalize them. Accordingly, the function of the healthcare information system is continuously expanded.
3. Definition and Improvement Strategy of Healthcare Information System: We propose an alternative to stabilize the structure of healthcare information system such as distributed structure of health information system, concentrated structure, load balancing structure, and defect recovery structure.
4. Definition of medical information user interface: We want to develop and provide a more structured and convenient interface for various user needs such as system administrator, medical information service user, and medical information demand user with more detailed user configuration.
5. Identification and definition of medical information service environmental monitoring system: Automatically collecting requirements of continuously changing medical information buyer, or detecting, collecting, analyzing, defining, developing, Supply and the like. In particular, we intend to strengthen the healthcare information service by comprehensively gathering information such as healthcare information system environment and healthcare user environment, and constructing system interaction. There is also a need for an information pathway that supports the feedback process to strengthen the healthcare ecosystem.

In order to fix the current smart health welfare policy toward users (health care beneficiary), system administrator (developer and operator), field users (health welfare person), etc., There is a need to

strengthen. Smart Device Utilization Information The need for smart devices in the current policy situation is in terms of convenience, immediacy (real-time performance), efficiency (maximization of investment versus utilization).

Therefore, the Strategy for Strengthening Smart User Health and Welfare Information Service (3S) should be strengthened as follows.

1. Enhance smart app and interface system to realize smart user system.
2. Establish smart database accessibility, establish smart information system, establish linkage with big data, and create roadmap to strengthen utilization and accuracy of analysis and evaluation of healthcare information.
3. Improve social welfare staff terminals and programs to strengthen the smart health welfare field. Furthermore, to propose the optimal alternative of on - site health welfare, we intend to strengthen the smart expert system by presenting intelligent health welfare policies and administrative alternatives in real - time as selective alternatives.

CONCLUSION

Future health care environment is shifting from conventional care to preventive center, from hospital center to living center, from disease center to health center. In addition, the necessity of establishing a service-oriented smart medical information system to support patient-centered smart medical services such as customer-oriented medical care and medical care support that provides services of preventive, diagnostic, therapeutic, and follow-up management anytime and anywhere do.

In this paper, we focus on the six aspects of technology that are needed to support interoperability between various systems to provide patient - centered services and existing systems in hospitals, along with the development of computing environment. Management system, 2) home care system, and 3) medical expert system.

The proposed healthcare information system issue and smart health welfare information policy direction will help to strengthen the competitiveness of the hospital along with the rationalization of the hospital

management, the medical decision making of the medical staff and the decision making of the manager, and the future ubiquitous, smart, We expect to contribute to the realization of telemedicine in the cloud environment and health care centered not on medical care, but also on realization of preventive service centered medical information system.

The Affects of Pulmonary Function after Gym Ball Exercise for Sedentary Behavior Students: Randomized Controlled Trial

Hyuk-Goo Chung¹, Yong-Soon Kim², Dong-Yeop Lee², Ji-Heon Hong², Jae-Ho Yu², Jin-Seop Kim²

¹Student, ²Professor, Dept. Sunmoon University, Korea

ABSTRACT

Background/Objectives: The purpose of this study is to examine the affects of pulmonary function after gym ball core exercise for university students with sedentary behavior.

Method/Statistical analysis: Thirty university students with sedentary behavior were recruited. They randomly assigned to SEG or NEG. they also agreed to join this study. Subjects trained for 15minutes, 3days per week for 3weeks. We measured the value before the exercise and after the exercise. We used paired t-test to compare between NEG and SEG. For statically analysis, Independent t-test was used.

Findings: here were no significant differences between pre-exercise and post-exercise in NEG, and PEF, MVV had significant differences in SEG. Also variations in the group showed that significant differences at PEF, MVV statistically.

Improvements/Applications: These results indicate that gym ball exercise had an effect on respiratory function of university students with sedentary behavior.

Keywords: *sedentary behavior, respiratory function, gym ball exercise, core muscle, spirometer*

INTRODUCTION

With the development of information and communication technology, the population working in the tertiary industry has increased as well. This has led many to live a sedentary lifestyle which has brought an increase in patients with diseases that come from the lifestyle. A sedentary lifestyle is when a person spends most of his time excluding sleeping time sitting down. And it refers to all the actions that cause energy consumption sitting down or leaning at something^{1,2}. It usually refers to actions such as using a computer, reading a book, or driving for a long time. In modern society, many diseases derive from the sedentary lifestyle as it causes deterioration to the respiratory function. The most common diseases are back pain, weakness

of the abdominal, dorsal and lower limb muscles, and decreased respiratory function³. Respiratory function plays a very important role in human life, just like heart function. On average, adults have about 4500ml of lung capacity, which is the sum of one breathing volume, inspiratory reserve volume, and breath reserve volume. However, the long sedentary lifestyle can reduce respiratory function, and the posture while one is sitting down lowers the respiratory function which decreases the satisfaction of life⁴. According to previous studies, it is necessary to maintain the correct posture to prevent respiratory depression. Bad postures can lead to failure of body function^{1,2}. The muscles needed to breathe are shortened or stretched and weakened, which can cause problems in the respiratory system. The muscles of the thoracic and abdominal muscles involved in ventilation can be classified into main muscles and secondary muscles. The muscle between the diaphragm and the rib is in the main muscle group, and these muscles are activated both during normal breathing and also while exercising^{5,6}. Minor muscles are activated when breathing and ventilation demands increase. They help the main muscles such as the diaphragm and intercostals

muscle. Scalene muscle, sternocleidomastoid muscle, pectoral muscle, abdominal muscles are representative minor muscles. Abdominal muscles are composed of transversus abdominis muscle, external oblique abdominal muscle, internal oblique abdominal muscle, rectus abdominis muscle, abdomen, and abdominal muscles. Abdominal muscles help to breathe more quickly than normal, as ventilation demands increase. Especially during exhalation, the increased pressure of the abdominal cavity can help one exhale, acting on the increased airway requirement^{2,7,8}. Core muscle refers to the complex of the trunk-pelvic-hip joint muscles⁹, which can be divided into the global muscle and the local muscle. The global muscles are apparent and broad muscles such as the rectus muscle, erector spine muscles, external oblique abdominal muscles that are spread out in the abdominal and waist region. These muscles are mainly involved in the movement of the torso. Local muscles are muscle transversus abdominis, multifidus muscle, and multifidus muscle located in the abdominal walls¹⁰. Local muscles are mainly involved in the movement of the whole body and body alignment as well as stability of the waist segment. Core muscles not only aid in stabilization of the trunk, but also include a large number of respiratory muscles. Thus, to improve respiration strengthening exercises is essential. Core muscle strengthening exercise is a very effective treatment for increasing the upper limb

balance of patients with acute, subacute, and chronic periodic paralysis¹¹. According to previous research, it was reported that amongst the various exercise methods core muscle exercise using gym ball strengthens muscular strength of abdominal muscles and improves respiratory circulation function¹². Gym balls are often used as physical therapy tools and can be used safely and entertainingly regardless of age. Additionally, gym balls can be used virtually anywhere while being relatively low in price. Patients can expect the effect of muscle strengthening, flexibility and endurance improvement by doing various postures on the gym ball at the time of treatment¹³. Previous studies performed eight types of core muscle strengthening exercises using gym balls and found that muscle activity was higher when exercise was done utilizing gym ball than general core muscle strengthening exercises¹⁴. However, most of the previous studies only mentioned the comparison of the efficiency of exercise methods using gym balls and its effect on muscle activity¹². Research on how core muscle strengthening exercise utilizing gym balls effect the respiratory system has not been conducted yet. The purpose of this study was to investigate the effects of core strengthening exercise using Gym balls on the respiratory function of college students who have a sedentary lifestyle and to provide reference material for the study of physiotherapy in the respiratory system.

SUBJECT AND METHOD

Subject: In this study, we recruited male and female students in their twenties of S college located in the city C who had a sedentary lifestyle and had a full understanding of the experiment's purpose by having listened to the detailed explanation it. There were a total

of 30 participants and the subjects of the experiment did not have any cardiopulmonary, neurosurgical or psychological illness. In order to not violate the research ethics, all subjects were fully informed about the study as shown in table 1. The participants then signed the study participation agreement prior to engaging in the experiment.

Intervention: The subjects were randomly divided into the Gym ball Exercise group (SEG) and the Non Exercise group (NEG). The Gym Ball Exercise Group (SEG) exercised three times a week for three weeks. They exercised five different types of exercises and did 3 sets of each of them. The subjects were given 15 seconds rest after a single set and a minute of break after one full session. The Gym ball of the subjects was selected based on if the participant could maintain 90 degrees of hip joint bending and 90 degrees of knee joint bending when sitting on the ball. The Gym ball selection of the subjects is shown in Figure 1. Gym ball exercise is follow in Figure 2. (a) Straight arm crunch with curl up: The subjects held their head straight with their arms extended straight for 15 seconds while lying on the gym ball, (b) Shoulder bridge on gym ball: The subjects layed on the ground floor with their arms spread out and on the ground. Then they held the bridge posture for 15 seconds with both feet on the gym ball, (c) Back extension exercise on gym ball: The subjects lied face down on the gym ball and lifted their upper body up with their arms extended forward. The posture was held

for 15 seconds, (d) Roll-out with plank exercise using gym ball: The subjects put their arms on the gym ball in a sitting position with their knees, rolled forward, and held the plank posture for 15 seconds, (e) Alternative arm and leg extension: The subjects lied face down on the Gym ball for 15 seconds with one arm and the other leg extended straight. They did the same exercise on the opposite side.

Measurement: The forced vital capacity (FVC), forced expiratory volume at one second (FEV_1), and the one second rate (FEV_1/FVC), peak expiratory flow, (PEF), and maximal voluntary ventilation, (MVV) were measured using SPIROMETER, Pony FX, A-M system, Europe. All subjects performed preliminary exercises to understand spirometry measurement. Spirometry measurement was repeated three times and the highest value was selected. A 5-minute rest period was provided considering fatigue between measurements. The method

of measuring the spirometry was carried out according to the manual of the manufacturer of the apparatus as follows [Figure 3]. The forced vital capacity (FVC), forced expiratory volume at one second (FEV_1) at one second, the one second rate (FEV_1/FVC), and peak expiratory flow, (PEF) were measured while subjects were allowed to sit comfortably in their chairs with the mouthpieces comfortably put on their lips. After normal breathing was carried out 3 times, they inhaled as fast as possible, and then maintaining a maximum exhale for 6

seconds. The maximal voluntary ventilation (MVV) was measured by repeating the maximum expiration and the maximum inspiration for 12 seconds while comfortably being seated on a chair.

Figure 3: Spirometry measurement

Data analysis: Data analysis of this study was done using SPSS ver. 22.0 and presented with mean and standard deviation using descriptive statistics to identify all measurements and general characteristics of subjects. For the comparison of the measured results, the corresponding sample t test was used and the independent t-test was used to compare the differences between the groups. The significance level was 95% confidence level.

RESULTS AND DISCUSSION

The changes in respiratory function between the groups with the group which performed the core muscle strengthening exercise on the gym balls and the group without intervention were measured. The significance level was analyzed using the paired t-test and the independent t-test as shown in table 2. There was no statistically significant difference in the Non Exercise Group (NEG) in all the measurements ($p > 0.05$). In the Gym ball Exercise Group (SEG), there was not a significant difference in forced expiratory volume at one second (FEV_1) and one second rate (FEV_1/FVC) ($P < 0.05$), but there was a significant increase in the forced vital capacity (FVC) and peak expiratory flow (PEF). ($p < 0.05$) When comparing the difference rate between the two groups there was a increase in the forced vital capacity (FVC), but the increase was not significant. There

was any significant difference in the forced expiratory volume at one second (FEV_1) and one second rate (FEV_1/FVC) between the two group. (>0.05) The measurement of peak expiratory flow (PEF) showed a significant increase with pre-intervention values (6.07 ± 2.96) 47.68) and after intervention value (7.73 ± 3.30). There was also a significant increase in the maximal voluntary ventilation (MVV) with pre-intervention values (128.96 ± 47.68) and after intervention value (145.99 ± 41.01), respectively [Table 2]. The purpose of this study was to investigate the effects of strength exercise using gym balls on the respiratory function of the 30 college students who had a sedentary lifestyle. A significant difference could not be seen in the Non exercise group. The measurement of the Gym ball exercise group did not display a significant difference in forced expiratory volume at one second (FEV_1) one second rate (FEV_1/FVC), and forced vital capacity (FVC). However, there was a significant increase in maximal voluntary ventilation (MVV) and peak expiratory flow (PEF). When comparing the results of both groups, both groups did not show a significant difference in forced vital capacity (FVC), forced expiratory volume at one second (FEV_1) and one second rate (FEV_1/FVC). However, there was a significant increase in the peak expiratory flow (PEF) and maximal voluntary ventilation (MVV) within the gym ball exercise group (SEG). Previous studies have shown that the core muscle strengthening exercise in healthy adults has increased the expiratory flow (PEF) maximal voluntary ventilation (MVV) which matches this research^[4]. In a previous study, they researched patients in their teens with scoliosis who did exercises on the gym ball and patients with chronic stroke who performed the core muscle stabilization exercises. Both scoliosis and chronic stroke patients showed an increase in forced vital capacity (FVC) and forced expiratory volume at one second (FEV_1). 22 women in their twenties who underwent a specific respiratory and general abdominal muscle-strengthening exercise did not show a significant difference in forced expiratory volume.

Table 2: Comparison of respiratory function of Gym ball Exercise group (SEG) and the Non Exercise group (NEG)

	Non Exercise Group (NEG)			Gym ball Exercise Group (SEG)			Significance Level
	Before Intervention	After Intervention	t	Before Intervention	After Intervention	t	Independent t
FVC(L)	3.85 ± 1.03 ^a	3.89 ± 0.87	-.515	3.89 ± 0.93	3.99 ± 0.99	-2.582*	-.739
FEV ₁ (L)	3.05 ± 0.89	3.13 ± 0.80	-1.013	3.36 ± 0.76	3.34 ± 0.81	.283	.891
FEV ₁ /FVC(%)	96.47 ± 10.62	96.40 ± 9.65	.026	98.60 ± 9.92	99.00 ± 8.96	-.187	-.141
PEF(L/sec)	6.53 ± 2.68	6.92 ± 2.41	-1.276	6.07 ± 2.96	7.73 ± 3.30	-4.107*	-2.531†

*p<0.05 paret t test value. †p<0.05 independent t test value ^aAll values are mean value± standard deviation(SD) FVC: Forced vital capacity, FEV₁: Forced expiratory volume at one second, FEV₁/FVC □ One second rate, □PEF: Peak expiratory flow, MVV: Maximal voluntary ventilation

at one second (FEV₁) and one second rate (FEV₁/FVC). There was a slight increase in forced vital capacity (FVC) which was in agreement with this research. As a result of the previous studies, the minimum intervention period was 8 weeks. Therefore, it seems necessary to apply the intervention period and the application time longer. Greer, et al., has suggested that physical activity should be increased by doing various exercises using apparatus to reduce problems that may arise from a sedentary lifestyle. The results of this study suggest that having a sedentary lifestyle may lead to bad body posture which leads to a possible deterioration of function of bodily function. To prevent such deterioration, there must be an increase in physical activity ^{1,17}. Examples of studies on respiratory-related physical activity include a study on observation of asthma patients from 6~12 who performed breathing exercises and a study on healthy college students from ages 26~36 who performed the maximal expiratory exercise (MEE). Through their research they found out that performing the breathing exercises not only increased the respiratory functions, but also the endurance and thickness of the abdominal muscles⁷. These findings confirm that the abdominal muscles are used when respiration is performed on subjects whose respiratory function is impaired, thus supporting the fact that the core muscle strengthening exercise affects respiratory function. It was also found that the relationship between respiratory function and core muscles was confirmed in subjects with respiratory system problems and subjects without problems. Previous studies have reported increased activity of muscle such as the rectus abdominal muscle, external oblique abdominal muscle, when performing core

muscle stabilization exercises using Gym balls^{7,14,18}. This suggests that strengthening the muscular strength and increasing the activity of the lumbar and abdominal muscles stabilizes the diaphragm according to the joint exercise¹⁹ and that the enhancement of the abdominal pressure to assist the respiratory function may also affect the respiratory function. In another previous study, 18 male college students in their 20s were performed a gym ball exercise to strengthen their expiratory muscle, and the results showed that the effect of the exercise on the gym ball to enhance expiratory muscle was effective in improving respiratory function. These studies provide evidence that core muscle strengthening exercises using Gym balls in this study affect respiratory function including aerobic function. Therefore, we can predict that core strengthening exercises using the gym ball may be helpful to improve the respiratory function on subjects with a sedentary lifestyle. The limitations of this study were that it was not possible to control the activities of daily activities of the subjects other than the exercise time. Additionally, the follow-up study was not performed so the follow-up period after the intervention was not confirmed accurately. In addition, there are limitations that do not take into account the physique and physical fitness of the subjects. The intervention period was set to a short period of three weeks. It is also difficult to generalize the results of studies on various age groups by conducting research on university students which is relatively a small age group. We can expect to provide better treatment for respiratory system physiotherapy by studying and comparing more effective and efficient intervention methods through various future studies.

CONCLUSION

The purpose of this study was to investigate the effects of gym ball exercise on the respiratory function of university students who have a sedentary lifestyle. The results showed that exercise with gym ball had a positive effect on the improvement of respiration function of college students with a sedentary lifestyle. Therefore, it is expected that future studies will show various ways of exercising with the gym ball to improve respiratory function of people a sedentary lifestyle.

ABSTRACT

Background/Objectives: Evaluate the gene expression of the human dental pulp cells harvested from supernumerary tooth through the passages by using quantitative reverse transcription PCR.

Method/Statistical analysis: Stem cells were harvested from the extracted supernumerary tooth. Primary cells were incubated at 37°C for 7 days. When the cells reached 80% confluency, they were subcultured for the next passage. The same subculture was performed until the 16th passage. Total RNA of dentin sialophosphoprotein(DSPP), ALP, dentin matrix acidic phosphoprotein 1(DMP-1), osteocalcin, and osteonectin were extracted and quantitative reverse transcription PCR was used to measure gene expression.

Findings: The supernumerary tooth is surgically removed at a relatively early age. The tooth can be obtained in an aseptic condition, and it could be extracted at a scheduled time so it could be a new donor of tooth stem cell harvesting. We performed this study using dental stem cells collected from supernumerary teeth. From the 1st passage to 16th passage, more DMP-1 was observed in early passage compared to late passage. More ALP, Osteocalcin, Osteonectin were observed in late passage compared to early passages. DSPP showed constant expression during all passages. Gene expression of ALP, Osteonectin, Osteocalcin, DMP-1, and DSPP showed no difference in the undifferentiated and differentiated groups and between passages through 1st to 16th also.

Improvements/Applications: Stem cells from supernumerary tooth showed high gene expression potential although it reached more than the 8th passage.

Keywords: *sDPSCs, supernumerary tooth, gene expression, qRT-PCR, passage*

INTRODUCTION

Stem cells are unspecialized cells that has a property of self-renewal and it differentiates into various special cells¹. These stem cells exist in adult tissues like blood, skin, adipose tissues, bone marrow, hair follicles, and dental pulp cells²⁻⁷. Because of usefulness in regenerative treatment, there are increasing studies about mesenchymal stem cells. The mesenchymal stem cell

can be obtained from the embryonic or adult stem cell. But obtaining stem cell from the embryo can face ethical issues so in tissue regeneration studies, using adult stem cell takes up a lot^{8,9}. Dental pulp is one of the sources where mesenchymal stem cells(MSCs) can be obtained and from previous studies MSCs can differentiate into many cell types. Dental pulp stem cells(DPSCs) can be the source of induced pluripotent stem cells(iPSCs)¹⁰.

Until now periodontal ligament, dental pulp, apical papilla, exfoliated deciduous teeth, and dental follicle were used as a source of tooth-derived stem cell. The impacted supernumerary tooth is surgically removed at a relatively early age. A Surgically extracted supernumerary tooth can be obtained in aseptic condition, and it could be extracted at a scheduled time

so it could be a new donor of tooth stem cell harvesting. Most of all extracted supernumerary tooth has the dental follicle, pulp, periodontal ligament, and apical papilla. We performed this study using dental stem cells collected from supernumerary teeth to evaluate the gene expression of the human dental pulp cells harvested from supernumerary tooth through the passages by using quantitative reverse transcription PCR.

MATERIALS AND METHOD

Supernumerary tooth extraction: We studied 6- year-old who came to Dankook University Dental Hospital for supernumerary tooth extraction. The patient had no systemic disease or medical history. After receiving approval (H-1506/006/001) from the Institutional Ethics Committee of Dankook University, we conducted supernumerary tooth extraction for dental pulp harvesting. The extraction was performed by a skilled surgeon. After the supernumerary tooth extraction tooth were immediately soaked into the α -minimal essential medium (α -MEM; Gibco BRL, Grand Island, NY, USA) and were transferred to the laboratory.

Isolation and culture of cell: The lower part of the cemento-enamel junction was sawed until it reached close to the pulp using a high-speed handpiece. To prevent infection and tissue damage, sawing was performed under sterile saline. When the high-speed handpiece reached near pulp, breakage was performed to expose pulp. The pulp was harvested using a hand file.

Harvested pulp tissues were finely ground to 1.0 mm³, and then soaked into 3.0 mg/mL Type I collagenase (Sigma-Aldrich Co., St. Louis, MO, USA) and 4.0 mg/mL Dispase (Sigma-Aldrich Co., St. Louis, MO, USA) solution. Pulp tissues were kept in incubator at 37°C with shaking motion for 1 hour and then filtered through a 70 μ m Falcon strainer (CORNING Inc., NY, USA). Filtered cells obtained from Falcon strainer (CORNING Inc., NY, USA) were cultured in α -MEM (Gibco BRL, Grand Island, NY, USA) medium supplemented with 20% FBS (Gibco, Life Technologies Corporation, Carlsbad, Calif., USA), 100 U/mL penicillin, 100 μ g/mL streptomycin (Gibco BRL), 2 mL-ascorbic acid (Sigma, St. Louis, Mo., USA) was added and incubated for 4-6 days. Incubation was done at 37°C with CO₂ level of 5% until a 70 - 80% confluency was achieved. Obtained cells were named as supernumerary dental pulp stem cells (sDPSCs). After 48 hours, every 2-3 days the medium was changed according

to the degree of confluency, and the cells not attached to the culture container was washed with phosphate buffered saline (PBS). When the cells attached to the bottom of the container showed 80% saturation, the cells were separated from the bottom with Trypsin-EDTA (Corning Inc., N. Y., USA) and subcultured in 1/4 of each other. In the same manner, the cells were cultured up to 16th passage.

Application of hard tissue forming differentiator: To evaluate the differentiation amount, harvested stem cells were incubated at a bone morphogenic media. 10 mL α -MEM (Gibco BRL, Grand Island, NY, USA), 10% FBS (Gibco, Life Technologies Corporation, Carlsbad, Calif, USA), 5 mM β -glycerophosphate (Sigma-Aldrich Co., St. Louis, MO, USA), 100 nM Dexamethasone (Sigma-Aldrich Co., St. Louis, MO, USA) and 100 μ M Ascorbic acid (Sigma-Aldrich Co., St. Louis, MO, USA) were mixed. Every 3 days the culture solution was changed. The induction of differentiation was performed for 8 days.

Total RNA extraction and cDNA: Easy-spin total RNA extraction Kit (iNtRON Biotechnology, Gyeonggi-do, Korea) was used to extract Total RNA^{23, 24}. After the extraction, Nanodrop ND-2000[®] (Thermo Scientific, Waltham, MA, USA) was used for total RNA quantification. Total RNA 1 μ g was added to qPCR RT Master Mix kit (TOYOBO Co., Osaka, Japan) and Nuclease-free water was added until it reached 20 μ l. cDNA was synthesized at the temperature of 65°C for 5 minutes, 4°C for 5 minutes and 95°C for 5 minutes.

Real-time polymerase chain reaction (Real-time PCR): Real-time PCR was done from the first passage to the 16th passage stem cells. Additionally, each passage was divided into two groups: one group treated with the differentiator and the other treated with nothing. The RNA expression pattern of alkaline phosphatase (ALP), dentin sialophosphoprotein (DSPP), dentin matrix acidic phosphoprotein 1 (DMP-1), osteocalcin, and osteonectin were analyzed. The relative expression level of each mRNA before and after differentiation was analyzed based on glyceraldehyde 3-phosphate dehydrogenase (GAPDH). Dilution was made up to 25 ng with sterile distilled water. 0.5 μ L of forward and reverse primers (10 pmol/ μ L) and 5 μ L of 2x SYBR Premix Ex Taq[™] (Bio-Rad Laboratories, Hercules, CA, USA) were added. Amplification and fluorescence detection were performed using StepOnePlus[™] Real-time PCR

(AB Applied Biosystems by Life Technology, Waltham, Mass., USA). At the amplification process, initial denaturation was carried out at 95 °C for 20 seconds, annealing was carried out at a suitable temperature. Each primer had 40 cycles with 1 minute each, after

the annealing dissociation was done from 65 °C to 95 °C. The melting curve analysis was also performed. Table 1 shows the used primers. Data were analyzed using StepOnePlus™ (AB Applied Biosystems by Life Technology, Waltham, MA, USA).

(GAPDH: glyceraldehyde 3-phosphate dehydrogenase, ALP: alkaline phosphatase, DMP-1: dentin matrix acidic phosphoprotein 1, DSPP: dentin sialophosphoprotein)

RESULTS AND DISCUSSION

Cell morphology after application of hard tissue forming differentiator: Using the optical microscope cell morphology of undifferentiated and differentiated group were observed with the interval of 7 and 14 days. In the early passages, cells grew with the tendency of aggregation in spite of the differentiation inducement. But after 10th passages, the morphology of cells grew similar to fibroblasts with a spindle shape with the constant direction.

Quantitative Reverse Transcription Polymerase Chain Reaction, qRT-PCR: In this study, difference in the ALP between the cells differentiated for 8 days and the undifferentiated was not observed [Figure 1]. Osteocalcin and osteonectin, which are bone formation maker, showed a slight difference in gene expression through passages [Figure 2, Figure 3]. Dentin marker DMP-1 and DSPP showed no significant difference between undifferentiated cells and cells differentiated cells [Figure 4, Figure 5].

Figure 1: The changes of ALP expression. RT-PCR was used to analyzed the marker. There was little difference between the two groups through all passages. ALP: alkaline phosphatase

Figure 2: The changes of osteocalcin expression. There was little difference between the two groups through all passages.

Figure 3: The changes of osteonectin expression. There was little difference between the two groups through all passages.

Figure 4: The changes of DMP-1 expression. There was little difference between the two groups through all passages. (DMP-1: dentin matrix acidic phosphoprotein 1)

Figure 5: The changes DSPP expression. There was little difference between the two groups through all passages. (DSPP: dentin sialophosphoprotein)

Although there is growing interest and research in tissue regeneration, the number of cells used for tissue regeneration is limited, and in order to overcome the lack of such cells, this study was performed. The source of mesenchymal stem cell can be obtained from the embryonic or adult stem cell. But obtaining the stem cell from the embryo can face ethical issues so in tissue regeneration studies, using adult stem cell takes up a lot^{8,9}.

Adult stem cell can be obtained from many tissues, but harvesting stem cell without tissue damage was a difficult problem. Pulp tissue originates from neural crest but it is similar to mesenchymal stem cell from bone marrow¹¹. Stem cell harvested from tooth is left undifferentiated until adult so multifunctional and primitive cell can be gained from the tooth¹². Above all, tooth-derived stem cell harvested from the 3rd molar, supernumerary tooth, and exfoliated primary tooth are less invasive because extraction is essential. Instead of throwing it away it can be reused. Among the stem cells harvested from the tooth, the stem cell which is gained from the 3rd molar, it is reported that it has less differentiation potential than the stem cells harvested from the supernumerary tooth¹³. And the stem cell harvested from the primary tooth can't complete the dentin-pulp-like complex¹⁴.

Supernumerary tooth is an additional tooth, occurring at a prevalence of 1.0-3%¹⁵. It is recommended that the supernumerary tooth is surgically removed at an early age because it can induce delayed eruption of the adjacent permanent teeth, malocclusion such as rotation, dislocation, and cyst formation¹⁵.

In the previous studies, dental pulp originated stem cells proliferate over 25 passages and has an ability to control the immune system¹⁶.

The purpose of this study was to use supernumerary tooth that has been extracted early ages. The stem cells were cultured until 16th passages and differentiation potential was measured using differentiator.

The mean time taken to cross the passage was 2-3 days, which was considerably shorter than the time spent in the previous study using the impacted third molar. For third molar, it took 7-10 days to cross the passage¹⁷. From these studies, it can be assumed that sDPSCs has young and vigorous differentiation ability.

In *in vitro* situation, ALP activity is commonly used as a tool to measure bone morphogenetic ability. ALP is found in a precursor of osteoblast, as the cells grow

it marks the cells that differentiate to osteoblast¹⁸. In the process of bone formation, the formation of type I collagen starts first. After the matrix maturation stage ALP, osteocalcin and osteonectin appear.

In this study, qRT-PCR showed no difference between the undifferentiated and differentiated group. These results are in contrast to the study which was performed by Lee¹⁹. According to the study by Lee, the ALP activity of DPSCs increased in proportion to the increase in time after 7 days, 14 days, and 21 days. In the study done by Lee, the result was measured 14 days after differentiation, but this study we only had 8 days so it could be assumed that time for the complete differentiation was not enough²⁰⁻²².

CONCLUSION

From the result of this study, sDPSCs has self-renewal ability and it could be a source of stem cell. From the 1st passage to 16th passage, more DMP-1 was observed in early passage compared to late passage. More ALP, Osteocalcin, Osteonectin were observed in late passage compared to early passages. DSPP showed constant expression during all passages. Gene expression of ALP, Osteonectin, Osteocalcin, DMP-1, and DSPP showed no difference in the undifferentiated and differentiated groups and between passages through 1st to 16th also.

ABSTRACT

Background/Objectives: The purpose of this study is to provide basic data for improving the creativity and personality of early childhood teachers by examining the social perception of creativity and personality of early childhood teachers through keyword network analysis.

Method/Statistical analysis: Based on the Big Data provided by Textom, we collected rawDATA with the keyword ‘early childhood teacher + creativity + personality’. The collected data were subjected to a first and second refinement process, and 200 keywords were selected based on the extracted word frequency. A 1-mode matrix was created and a keyword network analysis was conducted.

Findings: As a result of the research, it was found that ‘education’, ‘teacher’, ‘personality’, and ‘creativity’ were common keywords in the social awareness of creativity and personality of early childhood teachers. The results of this study suggest that the social awareness of creativity and personality of early childhood teachers is related to factors related to teacher education (education, teacher, program, professor), creativity and personality related factors (creativity, science, play), personality related factors (personality, parents), It was closely related. Based on these results, we suggested implications for the support for the improvement of creativity and personality of early childhood teachers.

Improvements/Applications: In the future research, it is proposed not only to grasp the tendency, but also to introduce various programs related to creativity and personality in the field of early childhood education

Keywords: Creativity, Personality, Childhood Teacher, Big Data, Network Analysis

INTRODUCTION

In the era of the Fourth Industrial Revolution, it is required to be able to produce new values by fusing various disciplines and technologies. This ability is not an undergraduate education but an area where children can think and learn by themselves and cultivate. This is the time when the need for creativity and personality education to study and learn on their own based on the potentials of children and their right values is becoming more important.

In creativity of creativity, ‘creativity’ emphasizes creative and positive artifacts in the fields of science and arts^[1] or emphasizes the interaction of individuals and the environment^[2,3]. ‘Humanity’ is similar in scope to personality, personality, character, etc.^[4]. In recent years, the importance of moral judgment has been raised by the combination of creativity and humanity through the organic combination of creativity and personality, rather than distinguishing between creativity and personality, and the importance of fusion education has emerged^[5,6,7]. It is arguing for creativity education to cultivate creative talents.

In particular, ‘creative and personality education basic plan’ also teaches creativity and personality education ‘education that is the essence and ultimate goal of future education that fosters talented person who creates new value and livelihood at the same time and comprehensiveness^[8]. In order to improve the

character education of infants, we emphasize focusing on improving basic lifestyle abilities so that free and creative expressions can be made by running basic infant lifestyle and experiential play education course in infancy^[8]. In other words, the necessity of creativity and personality education from the kindergarten education in which the first education is made in early childhood is cultivated in order to cultivate human resources with creativity and personality in the age. In order to raise the personality of creativity, And to strengthen the creativity capacity of the early childhood teachers who are struggling with it. Therefore, it is necessary to discuss basic ideas for improving the creativity and personality of early childhood teachers and ways to further enhance creativity and personality.

The results of this study are as follows. First, the research on the relationship between creativity and personality, personality and specific variables of early childhood teachers^[9,10,11], the perception of early childhood teachers about creativity and personality education^[3, 12], and a program study based on creativity and personality^[13,14]. However, there are few studies on the keyword network based on the big data about creativity and personality of early childhood teachers. There are only a few studies that have analyzed the personality education of young children as big data in early childhood education^[15].

It is important to see how the early childhood teacher in the field perceives and practices the creativity and personality of early childhood, which is the basic stage of education, in keeping with the demands of the times that emphasize creativity. This may be a factor. In this study, we conducted a frequency analysis and a network analysis method focusing on the centrality and the ego network in order to provide basic data for enhancing creativity and personality of early childhood teachers by looking at the social perception of early childhood teacher's personality.

Especially, in this study, it is aimed to provide basic data for enhancing creativity and personality of early childhood teachers by examining the social perception of creativity and personality of early childhood teachers through keyword network analysis. The purpose of this study is to suggest the implications of teacher education for enhancing creativity and personality of early childhood teachers. In order to achieve the purpose of this study, What is the keyword network analysis of the creativity and personality of early childhood teachers as seen through Big Data?

MATERIALS AND METHOD

Research data: In this study, raw DATA was collected around web DATA, which is provided in three domestic and foreign portal sites and two SNS sites using Textom, a big data analysis solution of The IMC^[16]. The collection period is eight years from April 17, 2010 to April 17, 2018, starting in 2010, when meaningful discussions on creativity education in the field of education began to be made. Raw DATA was collected as a core keyword of 'early childhood teacher + creativity + personality'. The collected data is 1,221 web pages of portal site, 1,084 blogs, 1,049 news, 1,030 cafes, 37 knowledge books, 80 articles 27 nodes are large-scale nodes (Node = 4,528) data^[17].

Analysis Tools: This study used Textom, a big data analysis solution developed by 'The IMC', to collect and refine data on creativity and personality of early childhood teachers. In addition, UCINET and NetDraw were used to analyze the network structure between the early childhood teachers' creativity and personality related keywords^[18].

Analysis Tools: For the purposes of this study, data cleaning was performed to derive meaning from rawDATA collected from Textom, and text mining was performed on the first refinement. In addition, Textom's 'Quick Edit' function is used to remove keywords that are not relevant to key keywords, or that are inappropriate for analysis due to single, multiple, or spacing. In the second refinement, synonyms or similar words were nominalized and used for analysis based on representative keywords

Data analysis: In this study, data on the creativity and personality of early childhood teachers were collected using Textom and the 1st and 2nd refinements were conducted through text mining. The frequency analysis was performed based on the refined data through data cleaning, and the top 200 nodes were selected and a 200×200 1-mode matrix data set was created^[18]. The network analysis was divided into a micro level and a macro level^[19], and the procedure is as follows. First, node, density, average connection distance, number of components, diameter, and network centralization were analyzed to identify network attributes. Second, a single sample mean test using bootstrapping was conducted to test the statistical significance of the creativity and personality network of early childhood teachers^[14]. Third, in order to understand the structural characteristics

among the nodes in the network, we analyzed degree centrality, closeness centrality, betweenness centrality, and eigenvector centrality. Fourth, ego network analysis was conducted to analyze the network formed by core keyword, and NetDraw was used to visualize each network.

RESULTS AND DISCUSSION

The frequency of the children’s teacher’s creativity and personality related keywords: As a result of the big data analysis on the creativity and personality related keywords of the early childhood teachers, a total of 7,233 keywords were extracted and the target nodes were selected based on the top 200 keywords. [Table 1] shows the frequency analysis results of the top 50 keywords among the selected keywords.

Table 1: Frequency Analysis of Early Childhood Teachers’ Creativity and Personality Related Keyword (Top 50 Keywords)

Rank	Keyword	N	Rank	Keyword	N	Rank	Keyword	N	Rank	Keyword	N	Rank	Keyword	N
1.	education	8,859	10	body	963	21	parents	653	31	learning	559	41	summer	485
2.	teacher	5,130	12	training	790	22	book	643	32	picture book	558	42	nose	483
3.	personality	3,750	13	activity	775	23	daycare	623	33	literature	554	43	series	481
4.	creativity	2,683	14	guidance	734	24	support	622	34	speciality	528	44	human body	475
5.	science	1,726	15	ability	723	25	professor	614	35	foundation	523	44	olfactory sense	475
6.	kindergarten	1,437	16	development	715	26	sex education	603	36	vacation	519	44	tongue	475
7.	course	1,294	17	manage	710	27	society	594	37	preliminary	517	47	graduate school	466
8.	referrals	1,040	18	important	689	28	instruction	592	38	experience	516	48	training	465
9.	program	1,010	19	study	685	29	school	572	39	eyes	490	49	center	461
10.	institution	963	20	knowledge	660	30	play	568	40	sight	486	50	college	457

As shown in [Table 1], the frequency of the children’s creativity and personality related keywords in the early childhood teachers showed the highest frequency of education(8,859), followed by teachers (5,130), personality (3,750), creativity (2,683), science (1,726), kindergarten (1,437), course (1,294), referrals (1,040), program (1,010) and institution (963). The most important keywords among the top 50 keywords are teacher education related factors (education, teacher,

program, and professor), creativity related factors (creativity, science, and play), personality related factors (personality, parents, and support).

A full network analysis of the creativity and personality of the early childhood teachers

Macro-level overall network analysis of creativity and personality of early childhood teachers: The overall network structure for the creativity and personality of early childhood teachers is shown in [Figure 1].

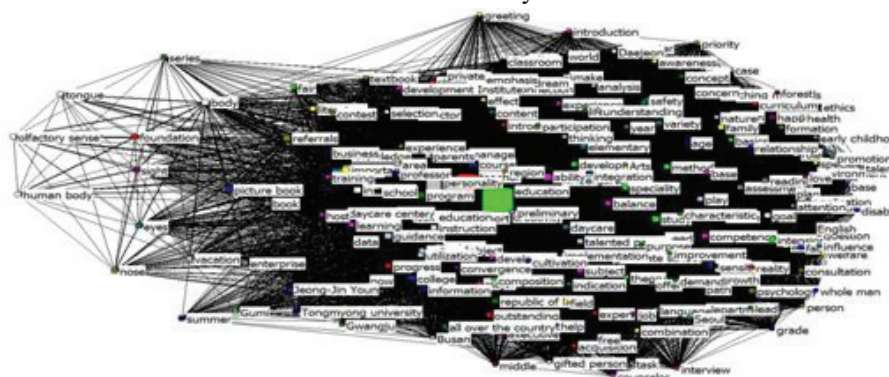

Figure 1: The overall network structure for the creativity and personality of early childhood teachers

As a result of analyzing the structural characteristics of the network for the creativity and personality of early childhood teachers, the nodes were 200, the density was .795, the average connection distance was 158.275, the number of components was 2, the diameter was 2, and the network centralization was 5.700%.

The statistical significance of the whole network on the creativity and personality of the early childhood teachers: As a result of testing the statistical significance of the network for the creativity and personality of early childhood teachers, the average sampling distribution of the network data was 32.2341 and the standard error

was 0.7882. As a result of calculating the Z-score, the probability that the network data for the creativity and personality of early childhood teachers are greater than the Z-score is 0.0002 at $Z = 6.1113$, and the relationship between the network data at the significance level of 5%.

Micro-level whole network analysis of early childhood teacher’s creativity and personality: In order to examine the micro-level network characteristics of early childhood teachers’ creativity and personality, we conducted a centrality analysis of the top 20 keywords, and the results are shown in [Table 2].

Table 2: Analysis of the centrality of early childhood teachers’ creativity and personality (top 20 keywords)

Rank	Degree		Closeness		Betweenness		Eigenvector	
1	education	5.976	education	.992	institution	.538	activity	.840
2	teacher	3.631	personality	.992	science	.486	ability	.820
3	personality	2.636	institution	.992	important	.475	guidance	.790
4	creativity	1.927	teacher	.990	knowledge	.465	education	.570

20	picture book	.534	ability	.975	training	.170	sex education	.063

As shown in [Table 2], the results of the centrality analysis of the whole network on the creativity and personality of the early childhood teachers were based on the top 20 keywords and the standardized values were used to take into account the influence of the network scale. The keywords with the highest degree centrality were education (5.976), followed by teachers (3.631), personality (2.636), creativity (1.927), science (1.515), courses (1.056), referrals (.952), Kindergarten (.959), body (.916), and institution (.911). These keywords can

be regarded as keywords with high connection strength within the network for the creativity and personality of early childhood teachers. Especially, the referrals and the body were higher than the frequency ranking in the top 10, and the connection strength was relatively high. The keywords with the highest closeness centrality were education (.992), personality (.992), and institution (.992), followed by teacher(.990), creativity (.990), and activity (.990), course (.987), society (.987), program (.985), and sex education (.985). These keywords are

located at the shortest distance from other keywords and can be regarded as keywords that are likely to be at the center of the network. Especially, in the top 10, personalities, institution, activities, society, and sex education were more influential in the center of the network than the frequency ranking. The keywords with the highest betweenness centrality were institution (.538), followed by science (.486), important (.475), knowledge (.465), book (.365), literature (.323), referrals (.319). These keywords can be regarded as keywords that are likely to act as mediators among multiple keywords. In particular, institution, science, important, knowledge, book, literature, referrals, and picture book in the top 10 are relatively key intermediaries among the other keywords with higher than frequency ranking. The keywords with the highest eigenvector centrality were activity (.840), followed by ability (.820), guidance (.790), education (.570), teacher (.454), personality (.372), creativity (.268). These keywords can be regarded as keywords that are highly related to highly centralized keywords. Especially, it was found that keywords with high activity, ability, and guidance in the top 10 were higher in frequency than those in the top 10.

Analysis of ego network for creativity and personality of early childhood teachers: In order to analyze the relationship between the core keyword and the other keywords in the network, frequency analysis and centrality analysis were performed on the main keywords 'education', 'creativity', and 'personality'.

First, as a result of analyzing the structural properties of the ego network for 'education', the number of nodes was 196, the number of connection lines was 31168, and the density was .815. Also, as a result of analyzing the centrality based on 'education', the degree centrality was 5.976, closeness centrality was .992, betweenness centrality was .229, and eigenvector centrality was .570. Teacher (10,518) was the highest keyword with the highest level of connection with education, followed by personality (8,387), creativity (5,115), course (3,141), kindergarten (2,889). Second, as a result of analyzing the structural properties of the ego network for 'creativity', the number of nodes was 195, the number of connection lines was 31100, and the density was .822. As a result of analyzing the centrality based on 'creativity', the degree centrality was 1.927, closeness centrality was .990, betweenness centrality was .198, and eigenvector centrality was .268. Teachers (10,518) were the most frequently cited keywords with 'creativity', followed

by personality (8,387), and creativity (5,115). Third, As a result of analyzing the structural properties of the ego network for 'personality', the number of nodes was 195, the number of connection lines was 31100, and the density was .822. As a result of analyzing the centrality based on 'creativity', the degree centrality was 1.927, closeness centrality was .990, betweenness centrality was .198, and eigenvector centrality was .268. Education (8,387), teacher (4,290), and creativity (2,253) were the most frequent keywords in terms of personality and connection strength.

CONCLUSION

The purpose of this study is to provide basic data for improving the creativity and personality of early childhood teachers by examining the social perception of early childhood teacher's personality. To do this, we collected rawDATA for 'early childhood teacher + creativity + personality' and conducted network analysis focusing on frequency analysis and centrality and ego network. The results of this study are as follows.

First, the frequencies of children's creativity related keywords were found to be in the order of education, teachers, personality, creativity, science keywords also showed significant factors such as factors related to teacher education (education, teacher, program, and professor), creativity related factors (creativity, science, and play) and personality related factors (personality, parents, and support).

Second, the results of the whole network analysis on the creativity and personality of early childhood teachers are summarized in three. First, analysis of structural attributes for the whole network analysis showed 200, density of .795, average connection distance of 158.275, component number of 2, diameter of 2, networks centralization of 5.700% respectively. Next, in the statistical significance test of the whole network for the creativity and personality of early childhood teachers, the sampling distribution of the network data was 32.2341 and the standard error was 0.7882. In particular, the Z-score was calculated as $Z = 6.1113$, and the probability that the network data about the creativity and personality of early childhood teachers showed a larger absolute value than the Z-score was 0.0002. In addition, 'education', 'institution', and 'activity' among the keywords that appeared in the creativity and personality of early childhood teachers are high in the centrality indicators such as connection centrality, proximity center,

respectively. In addition, keywords such as 'science' and 'creativity' are the main keywords with high degree centrality and betweenness centrality, and 'guidance' is the main keyword with high degree centrality, closeness centrality, and eigenvector centrality. In other words, the main keywords of the creativity and personality of early childhood teachers can be seen as 'education', 'institution', 'activity', 'science', 'creative', and 'guidance'. Based on these keywords, we can identify keywords with high connection strength to personality.

Third, the result of ego network analysis on the creativity and personality of early childhood teachers, the results of this study are as follows: First, 'science' and 'activity' are important keywords in all ego networks. In addition, we found that the frequency of children's creativity and personality was significantly higher in both groups. In other words, activities related to creativity and personality of early childhood teachers means that education should be done through appropriate instruction of teachers in creative activities such as science.

The quality of education does not exceed the quality of teacher. In ego network analysis, 'education' has the strongest connection with 'teacher', and 'creativity' has a close relationship with the creativity and personality of 'teacher' Finally, 'personality' has a strong connection with 'education', so personality needs to be formed through education.

In this study, it is meaningful to grasp the key keywords related to creativity and personality by using keyword network analysis and to grasp specific tendency of creativity personality of early childhood teachers. Future research suggests that rather than just grasping the tendency, it suggests programs related to creativity and creativity in the field of early childhood education. In addition, it is suggested that a creativity and personality program for early childhood teachers should be provided in order to enhance the creativity and personality of not only infants but also teachers.

The Influence of Social Support on Stress Coping among Nursing Students

MiJin Kim¹, Younghee Jeong²

¹Assistant professor, Dept. of Nursing Science, Daejeon Institute of Science and Technology, Korea;

²Associate professor, Dept. of Nursing Science, Woosong College, Korea

ABSTRACT

Background/Objectives: This study was conducted to investigate the differences of social support and stress coping in terms of gender and the effect of social support on stress coping among nursing students.

Methods/Statistical analysis: 135 college students were the respondents of the study. The scales used were social support tool, modified by Moon, which was developed by Park and a Korean version of the Stress Coping Strategy (K-CSI) developed by Amir Khan. Independent t-test and hierarchical multiple regression were used to analyze the data with SPSS 23.

Findings: The results of this study showed no gender difference of social support and stress coping in nursing college students. The support of parents, friends, and professors who were social support explained 27.1% of stress coping. Parental support ($t=2.033$, $p=.044$) and friends' support ($t=2.493$, $p=.014$) were found to have a positive effect on coping with stress. On the other hand, the support of the professor was positive but not statistically significant ($t=1.72$, $p=.086$), respectively. Assessing the relative impact of variables that can improve stress coping, the support of a friend ($\beta=.257$) showed the greatest influence on stress, followed by parent support ($\beta=.183$), and the support of the professor ($\beta=.175$) came third.

Improvements/Applications: Therefore, to improve the coping ability of nursing college students, it is necessary to establish a social support system that is to maintain friend support and finding strategies to improve the support of the parents and professors as well.

Keywords: Social support, stress, coping skill, nursing students, adaptation

INTRODUCTION

The number of male nurses has been increasing steadily due to increased awareness of professionalism of nursing profession, increase job opportunities, job stability, and high pay, and the number of students who want to be in the nursing department has also been increasing for the past years, regardless of gender¹. As far as research is concerned, male nursing college students as a minority group have experienced much more stress due to gender role conflict, alienation, female-oriented nursing education environment, and

competitive atmosphere and this situation leads to practical maladaptation^{2,3}. In addition, due to the social stereotypes of females due to the characteristics of nurses, it is reported that male nursing college students do not have a high level of adaptation to college life⁴. However, in recent years, the increase in the admission rates of male nursing students and the public perception of male nurses are improving⁵ and it is necessary to examine whether there is still a difference in stress coping between male and female nursing students.

Regardless of sex, it is important to cope with stress because if not properly controlled, because it could negatively affect college life adaptation with decrease learning motivation and grades as well⁶, thus it is necessary to cope with stress properly more than anything. Adaptation to college life means an appropriate response to the demands of college life in terms of academic, interpersonal, and emotional aspects

while living in a university environment⁷. Adaptation is a very important issue for college students because adaptation to college life is not only for the development of intellectual functioning but also for improvement of personality formation and social assimilation ability before going out to society.

On the other hand, it is reported that social support has a high impact on stress coping and coping style, and it is reported that the more social support is received from the significant others, the more actively cope with the problem situation^{8,9}. Social support is also an important variable that helps nursing students adapt to the new environment and actively prepare for their careers and affects their ability to cope with stress¹⁰. The improvement of coping ability to stress is the most influential variable in the adaptation of college life¹¹ so that it is necessary to examine the impact of social support in detail to improve coping skills for successful college life.

Therefore, the purpose of this study was to examine the difference between social support and stress coping in terms of gender of nursing college students and to examine the effect of social support on stress coping. In particular, social support has been used as a basic data to improve the coping ability to stress for college life adaptation by examining whether the meaning of support of others is more influential on stress coping.

MATERIALS AND METHOD

Research Design: This study is a descriptive study to investigate the effect of social support of nursing college students on stress coping and 135 nursing students included in the study. The structured questionnaires were distributed who agreed to participate in the study and signed the consent form accordingly. The analysis was conducted using SPSS 23, and independent sample T-test was used to examine differences in social support and stress coping among male and female nursing students in terms of gender. The hierarchical multiple regression analysis was used to examine the effect of significant social support among others.

Measurement Tool

Social Support: To measure social support, Park Ji-won¹² developed a social support measurement tool, modified by Moon Jae-young¹³, and verified the validity and reliability. A total of 12 items consist of three subscales: parent support, teacher support, and friendship support. It is composed of 5 point Likert scale from 'not at all' to 'very agree' 5 points and the higher the score, the higher the degree of social support. In this study, Cronbach's α was .94 ~ .97 as shown in Table 1.

Table 1: The Composition of Measurement Tools for Each Variable

Measurement Tool	Sub Factor	Item Number	Number of questions	Reliability
Social Support	Parents' support	1, 2, 3, 4	4	.964
	Professors' support	5, 6, 7, 8	4	.937
	Friends' support	9, 10, 11, 12	4	.972
	Total		12	.942
Stress Coping	Seeking Social Support	1,5,6,12,14,19,23,24,25,31,32	11	.87
	Problem Solving	2,3,8,9,11,15,16,17,20,29,33	11	.87
	Avoidance	4,6,10,13,18,21,22,26,27,28,30	11	.93
	Total		33	.972

Stress Coping: Stress coping was measured using the Korean version of the Stress Coping Strategies (K-CSI) developed by Amirkhan (1990)¹⁴ and adapted by Shin Hye-jin and Kim Chang-Dae (2002)¹⁵. This tool consisted of total 33 items and there are 11 items of the Seeking Social Support, 11 items of the Problem Solving, and 11 items of the Avoidance. The participants were asked to recall and respond about one of the stress incidents that occurred during the last six months. The avoidance 11 items were calculated by inverting the

negative items. The higher the score, the higher the level of stress coping. The reliability of the instrument in this study was .87 ~ .90 in Cronbach's α as shown in Table 1.

RESULTS AND DISCUSSION

Results of the Research

The General Characteristics of the Participants: The average age of the nursing students participating in this study was 21.04 years, 57 (42.2%) male and 78 (57.8%)

female students as shown in Table 2. The social support perceived by respondents was 45.91 for male and 44.3 for female respondents and it was found that those male students were somewhat higher. The stress coping of males (M = 70.77) were higher than that of females (M = 69.8).

Table 2: The General Characteristics of the Participants

Variables	Category	N(%)	M(SD)
Age			21.04 (2.558)
Gender	Male	57 (42.2)	
	Female	78 (57.8)	
Grade	Freshman	36 (26.7)	
	Second	78 (57.8)	
	Senior	21 (15.6)	
Social Support	Male		45.91 (9.18)
	Female		44.3 (7.72)
Stress Coping	Male		70.77 (6.55)
	Female		69.8 (7.71)

The Differences in Social Support and Stress Coping by Gender: As shown in Table 3, the results showed that there was no significant difference in social support and stress coping in terms of gender.

Table 3. The Differences in Social Support and Stress Coping by Gender

	Mean (SD)		t	p
	Male (n = 57)	Female (n = 78)		
Social Support	45.91 (9.18)	44.3 (7.72)	1.100	.273
Stress Coping	70.77 (6.55)	69.8 (7.71)	.763	.447

The Effect of Parent Support, Professor Support, and Friend Support on Stress Coping: The effects of social support on stress were divided into sub-variables of parent support, support of professor, and support of friend, and we examined the effect of hierarchical regression on stress coping as shown in Table 4. Model 1 explained 16.2% of parents' support for stress coping. This means that the higher the level of parent support, the better the stress coping (t = 5.086, p = .000). Model 2 is an additional regression of the support of the professor in Model 1, which is 7.3% better than Model 1. In addition, parent support (t = 2.823, p = .005) and Professor support (t = 3.555, p = .001) had a positive effect on stress coping. Model 3 explained that 27.1% of stress coping as a result of further regression of the support of friends in Model 2 and the result found to be 3.5% better than Model 2. It was also found that the parent support (t = 2.033, p = .044) and friend support (t = 2.493, p = .014) were found to have a positive effect on stress coping and the support of the professor was positive, however, it was found to be not statistically significant (t = 1.72, p = .086).

Table 4: The effect of Parent Support, Professor Support, and Friend Support on Stress Coping

Independent Variables	Model 1			Model 2			Model 3			
	SE	β	T(p)	SE	β	T(p)	SE	β	T(p)	Tolerance limit
Constant	2.64	-	21.554 (.000)	2.93	-	17.669 (.000)	2.955	-	16.976 (.000)	
Parent Support	.162	.404	5.086 (.000)	.18	.248	2.823 (.005)	.184	.183	2.033 (.044)	.688
Professor Support				.206	.312	3.555 (.001)	.239	.176	1.73 (.086)	.536
Friend Support							.222	.257	2.493 (.014)	.524
Statistic	R ² =.163, Adjusted R ² =.157, F=25.866, p=.000			R ² =.236, Adjusted R ² =.224, F=20.386, p=.000			R ² =.271, Adjusted R ² =.254, F=16.199, p=.000, Durbin-Watson=1.802			

When the relative influence of variables that could improve stress coping was assessed, friend support (β = .257) was the most influential variable for stress and the followed by the parents' support (β = .183) and the third was the support of the professor (β = .175).

The tolerance limits are all 0.1 or more, which means that there is no problem in multi-collinearity. Durbin-Watson is 1.802, very close to the reference value of 2 and not close to 0 or 4, which means that there is no correlation between the residuals. Therefore, it can be interpreted that regression model was appropriate.

DISCUSSION

The purpose of this study is to investigate whether there is a difference in social support and stress coping between male and female college nursing students and to examine the effects of social support on coping with the stress of successful university life.

The results showed that there was no statistically significant difference in the social support and stress coping between male and female nursing students. This is not consistent with previous studies^{2,3} and⁴, which reported that male nursing college students experienced more stress and had lower levels of adaptation to college life in women-centered nursing. This reflects the social reality in which the number of male nurses in Korea as well as the United States continues to increase, in line with the social atmosphere of choosing a career in accordance with their aptitudes¹⁶ and the problem that the male nurse has still difficulty in adapting to their job as a nurse. There is still some room for rethinking that being a nurse is still an inherent occupation for women. With the increasing number of male nurses, the university is now developing a practical environment and curriculum for male students, and in a hospital where male nurses are naturally accepted as occupations, it is necessary to continue doing research on the stress, social support and work adjustment of male nursing college students and male nurses.

It was also found that the social support of nursing college students had a very positive effect on stress coping. Especially, the support of parents, professors, and friends who are meaningful others constituting social support is the most influential variable. This is because social support plays a decisive role in improving mental health throughout life and it suggests that the important sources of social support may vary according to the stages of development¹⁷. In other words, parental support is most important at the beginning of life, and the same peer groups are an important source of social support in the late childhood and early adolescence. In adulthood, social support has been diversified as spouse, friend, and colleagues. The results of this study are

supported by the fact that college students are the source of important social support from friends and colleagues at the beginning of adulthood. Therefore, it is necessary to investigate the ways to increase the support of friends who are important sources of social support for university life by enhancing adaptation to college life.

CONCLUSION

This study has shown that the social support of nursing students has a positive effect on stress coping and nursing students' social support positively influenced stress coping regardless of gender, and their coping and support is the same. Among social support, friend's support was the most influential variable. Continuous research is needed to find ways to increase the support of parents and professors as well as the support of friends in order to improve college life adaptation and stress coping.

Antimicrobial Activity of Various Solvent Extracts of *Auricularia auricula-judae* Against Oral Bacteria

So-Ra Han¹, Sang-Cheol Yu¹, Joo-Ho Lee², Sang-Hee Jung³, Kun-Ok Lim⁴, Tae-Jin Oh^{1,2,5}

¹Department of Life Science and Biochemical Engineering, Graduate School, SunMoon University, Korea;

²Genome-based BioIT Convergence Institute, Korea; ³Department of Dental Hygiene, Gangneung Yeongdong University, Korea; ⁴Department of Dental Hygiene, ⁵Department of Pharmaceutical Engineering and Biotechnology, SunMoon University, Korea

ABSTRACT

Background/Objectives: The present study was conducted to investigate the antimicrobial potential of acetone, ethanol and ethyl EA of *A. auricula-judae* against the growth of nine oral bacteria that cause dental caries and periodontal diseases.

Method/Statistical analysis: The extracts of *A. auricula-judae* showed the antimicrobial activity against the tested oral bacteria. EA extract showed more antimicrobial activity than acetone and ethanol extracts. The highest antimicrobial activity of ethyl acetate extract from *A. auricula-judae* was obtained against *A. viscosus*, which resulted in an inhibition zone of 11.68 to 14.40 mm. This extract exhibited MIC values ranging from 0.23 to 3.75 mg/ml.

Findings: The present study aimed to verify the roles of *A. auricula-judae* as a natural product with antimicrobial potential for oral diseases by investigating the antimicrobial activities of various solvent extracts of *A. auricula-judae* against oral bacteria causing dental caries and periodontal diseases. The ethyl acetate extracts from *A. auricula-judae* showed the antimicrobial activity against nine oral bacteria better than different solvent. The present study aimed to verify the roles of *A. auricular-judae* as natural product with antimicrobial potential for oral diseases by investigating the antimicrobial activities of various solvent extracts of *A. auricular-judae* against oral bacteria causing dental caries and periodontal diseases.

Improvements/Applications: This *Auricularia auricula-judae* may be considered as an effective natural source of antimicrobial agent for the prevention of oral pathogens.

Keywords: Antimicrobial activity, growth inhibition, *Auricularia auricula-judae*, minimum inhibitory concentration, oral pathogen

INTRODUCTION

The human oral cavity harbors many different microorganisms, some of which are oral pathogens that cause bad breath and pain due to dental caries, cavities, and periodontal diseases. In Korea, oral diseases are the

second most common disorder. The prevention and post-treatment management of dental caries and periodontal diseases are particularly important, as these conditions can cause permanent damage to oral health^[1]. Recent studies reported a correlation between oral pathogens and pneumonia, cardiovascular diseases, and other general diseases in the human body, indicating that specific care is needed for periodontal health^[2, 3]. In addition to the most well-known oral pathogen *Streptococcus mutans*, numerous other bacteria including *Streptococcus sobrinus* and *Actinobacillus actinomycetemcomitans* are known to cause various oral diseases such as cavities, dental caries, gingivitis, and periodontitis^[4,5]. Dental caries are caused when oral bacteria, including

Corresponding Author:

Tae-Jin Oh

Professor, Department of Pharmaceutical Engineering and Biotechnology,

SunMoon University, Korea

Email: tjoh3782@sunmoon.ac.kr

S. mutans adhere to the dental surface where they produce acid during growth, and periodontitis occurs when gingivitis is untreated, leading to the destruction of alveolar bones^[6,7]. Additionally, in dental caries, *S. mutans* produces glucan from sugar molecules used as substrates to adhere to the tooth surface and causes tooth decay. When glucan attached to the tooth surface is left untreated, it becomes more difficult to remove by brushing, and as glucan interferes with the diffusion of organic acids produced by bacteria, the development of dental caries is promoted^[8]. Although oral diseases may affect the health of not only the oral cavity but also the human body, most people tend to overlook the importance of oral health, indicating the need for increased awareness and appropriate measures for preventing and treating oral diseases.

To prevent and treat oral diseases, it is essential to inhibit the growth and activities of pathogens in the oral cavity. Currently, physical methods such as brushing or use of floss are common, but in most cases, the growth and activities of pathogens are inhibited by chemical methods such as antibiotics which control plaques or enhance inhibitory effects^[9]. However, continuous use of antibiotics may lead to resistance in the oral cavity and resident bacteria are removed with the pathogens. Thus, to develop methods for inhibiting only the pathogens and not the resident bacteria, many studies have focused on natural extracts^[10,11].

Mushrooms are consumed as food and contain abundant nutrients such as proteins with essential amino acids, carbohydrates, lipids, and vitamins. Globally, they are used for a variety of purposes, and recent studies have examined the bioactivities of mushrooms. Lingshi mushrooms have been studied for their antioxidant effects and ability to suppress tumor cell growth^[12], and *Sparassis crispa* were examined for their effects on immunocyte activation and their anticancer effects^[13]. In addition to studies of medicinal mushrooms, common edible mushrooms including *Lentinus edode* have been evaluated for their antiplatelet and antithrombotic effects^[14] and *Hericium erinaceum* was shown to prevent dementia and is involved in nerve cell development^[15].

Auricularia auricula-judae belongs to the family *Auriculariales* in the phylum Basidiomycota. This species is mainly found in the wild growing on old broad-leaved trees across Asia, mostly in Korea, Japan, and China. *Auricularia auricula-judae* are often used as

a functional food ingredient, as they are rich in proteins as well as potassium, calcium, phosphorous, and fibers. Numerous studies have examined the bioactivities of *A. auricula-judae* in the prevention of osteoporosis^[16] and cardiovascular diseases^[17]. Recently, the antimicrobial and antioxidant activities of *A. auricula-judae*^[18] were reported. The present study aimed to verify the roles of *A. auricula-judae* as a natural product with antimicrobial potential for oral diseases by investigating the antimicrobial activities of various solvent extracts of *A. auricula-judae* against oral bacteria causing dental caries and periodontal diseases.

MATERIALS AND METHOD

Materials: The sample of *A. auricula-judae* used in this study was in powder form and purchased from Chamsolwon agricultural association (Gyeongbuk, Korea).

Preparation of *A. auricula-judae* extracts: A 48-h solvent extraction at room temperature was carried out with 50 g of *A. auricula-judae* powder dissolved in 400 mL solvent. After filtration (Advantec No. 2, Advantec MFS, Inc., Tokyo, Japan), a rotary evaporator (EYELA A-1000S, Tokyo Rikakikai Co., Tokyo, Japan) was used to concentrate the sample. The solvents used were acetone, ethyl acetate, and ethanol; dimethyl sulfoxide was used as the concentrate to maintain a constant volume. The extracts were uniformly prepared at a minimum concentration of 50 mg/mL and stored at 4°C prior to the experiments to ensure accuracy.

Evaluation of antimicrobial activity against oral bacteria

Microbial strains: All oral bacteria strains used in this study are presented in Table 1. The nine representative strains of oral bacteria were purchased from the Korean Collection for Type Cultures (KCTC, Jeollabuk-do, Korea) and used in the experiments. The medium from Brain-Heart Infusion (BHI, BD Biosciences, Franklin Lakes, NJ, USA) and Trypticase Soy Broth (TSB, BD Biosciences) were used, and an optimum condition for each strain was selected for cultivation. All strains were inoculated into the broth and cultured at 37°C in an anaerobic incubator (5% CO₂) for 24 h and diluted prior to the experiments.

Table 1: List of microorganisms used for anti-microbial activity

Strain	KCTC No.	Media
<i>Staphylococcus aureus</i>	1927	BHI
<i>Streptococcus mutans</i>	3065	BHI
<i>Streptococcus sanguinis</i>	3284	BHI
<i>Streptococcus sobrinus</i>	3308	BHI

<i>Actinomyces israelii</i>	9054	TSB

BHI: Brain-Heart Infusion, **TSB:** Trypticase Soy Broth using from BD Biosciences

Disk diffusion method: The antimicrobial potential of *A. auricula-judae* was evaluated by the disk diffusion method. The nine strains precultured following inoculation into the broth were uniformly diluted to a standard turbidity of 0.5 McFarland (approx. 1.0×10^8 CFU/mL) and then smeared on prepared agar plates using sterilized cotton buds. Next, 30 μ L extract was placed on a paper disk (ϕ 6 mm, Whatman AA discs, Whatman International, St. Louis, MO, USA) (2.1 mg/disc) for absorption, and the disk was dried and placed on the smeared agar plate for adherence. After more than 12-h cultivation in an anaerobic incubator, the size of the inhibition zone formed around the disc was measured. From the measured sizes, the results were obtained using a Vernier caliper (0–150 mm, Color World, China). The experiment was repeated three times to confirm the antimicrobial activity of the *A. auricula-judae* extracts. As a positive control, 100 μ g/mL of ampicillin was used.

Estimation of growth inhibition rate and minimum inhibitory concentration against oral bacteria: For the nine strains of oral bacteria against which the extracts showed antimicrobial activities, the minimum inhibitory concentration (MIC) was determined using the broth dilution method. The concentration of each solvent extract of *A. auricula-judae* was prepared at a maximum of 15 mg/mL using sterilized distilled water, after which two-fold serial dilution was carried out until a minimum concentration of 0.03 mg/mL was reached prior to the experiments. For the experiments, each precultured strain was prepared in a concentration of 5×10^5 CFU/mL. Next, 100 μ L of the diluted strain was aliquoted into

the wells of a 96-well plate and then 60 μ L of extract and 40 μ L of broth were added. After 24-h cultivation at 37°C in an anaerobic incubator, the optical density was measured at 600 nm. The concentration at which the optical density revealed microbial inhibition was determined as the MIC.

Inhibition curve of oral bacteria: Various solvent extracts of *A. auricula-judae* were added to the nine strains of oral bacteria, and growth inhibition curves were drawn according to concentration and time. The solvent extracts with MIC values of 3.75, 2.63, 1.88, and 0.04 mg/mL were used, and the method described above was used for MIC estimation. The optical density was measured at 600 nm at 3, 6, 8, 10, 12, and 24 h of incubation. As a positive control, dimethyl sulfoxide was used.

Statistical analysis: For statistical analysis, the significance was evaluated at $p < 0.05$ by analysis of variance and Duncan's multiple range test using SPSS Statistics 23 (SPSS, Inc., Chicago, IL, USA). All experiments were repeated three times, and the results were expressed as the mean \pm standard deviation.

RESULTS AND DISCUSSION

Solvent extraction yield of *A. auricula-judae*: Various solvent (acetone, ethanol, and ethyl acetate) extracts of *A. auricula-judae* were used to test for antimicrobial potential. The results showed different extraction yields for each solvent extract: 1.64% for acetone extract; 1.50% for ethanol extract; 0.86% for ethyl acetate extract. Thus, various solvents exhibit clearly different final extraction yields despite the use of equal amounts of powder. Among the three solvents, acetone showed the highest yield, while the use of ethyl acetate led to the lowest extraction yield.

Evaluation of antimicrobial activity against oral bacteria

Antimicrobial activity of solvent extracts from *A. auricula-judae*: In the disc diffusion assay, inhibition zones were created by the various solvent (acetone, ethanol, and ethyl acetate) extracts of *A. auricula-judae* against the nine strains of oral bacteria, and the sizes of the inhibition zones were measured; the results are presented in Fig. 1. The results show inhibition zones of over 10 mm in diameter which were visually discernible

for all three solvent extracts against the nine strains of oral bacteria. Notably, all three extracts of *A. auricula-judae* exhibited the strongest antimicrobial activity against *A. viscosus*. Although the ethyl acetate extract displayed the highest activity of 14.40 ± 2.75 mm, closely followed by 14.17 ± 3.92 mm of acetone extract and comparatively lower activity of 11.81 ± 1.44 mm by ethanol extract, our results confirmed that all three extracts showed the strongest antimicrobial activities against the *A. viscosus* strain. Furthermore, when the activity against *A. viscosus* was compared with that against the control (100 µg/mL of ampicillin), no significant difference was observed for any of the extracts.

Figure 1: Anti-microbial activity of solvent extracts from *Auriculariaauricula-judae* against oral bacteria.

† The results represent the Mean±SD of values obtained from three independent experiments. Ampicillin (100 ug/ml) was used as a positive control. Ace: acetone, EtOH; ethanol, EtAc: ethyl acetate, KCTC; Korean Collection for

Type Cultures. a,b,cMeans with different letter are significantly different at $p < 0.05$ by Duncan’s multiple range test

Estimation of MIC: To determine the MIC to inhibit the growth of oral bacteria, the broth dilution method was used. Each solvent extract of *A. auricula-judae* was diluted by 2-fold to 0.03–15.00 mg/mL before 24-h cultivation. The optical density was measured, and the minimum concentration at which microbial growth was inhibited was considered as the MIC. The results are shown in Table 2. Although the MIC differed according to the tested strain and solvent used, the inhibitory effects were mostly within the range of 0.23–3.75 mg/mL. Among the three extracts, the ethyl acetate extract, displayed the lowest MIC of 0.23 mg/mL against *A. viscosus*, while the MICs of ethanol and acetone extracts were 0.94–1.88 mg/mL, which are slightly higher than that of the ethyl acetate extract. In accordance with the results of the disc diffusion experiments, all three extracts exhibited lower MICs against *A. viscosus* compared to other strains, but their MICs against *S. mutans* were identical at 3.75 mg/mL. For *S. aureus*, *S. ratti*, *S. sanguinis*, *S. sobrinus*, *S. viscosus*, and *A. israelii*, the acetone and ethanol extracts showed identical MICs, while the ethyl acetate extract showed a lower MIC. In summary, the ethyl acetate extract exhibited the lowest MIC, and all three extracts showed the lowest MIC against *A. viscosus*, supporting the results of the disk diffusion experiments.

Table 2: Minimum inhibitory concentration (MIC) of solvent extracts from *Auriculariaauricula-judae* against oral bacteria

Bacterial Strain (KCTC No.)	MIC (mg/ml)		
	Acetone	EtOH	EtAc
<i>S. aureus</i> (1927)	1.88-3.75	1.88-3.75	0.94-1.88
<i>S. mutans</i> (3065)	3.75	3.75	3.75
<i>S. sanguinis</i> (3284)	1.88-3.75	1.88-3.75	0.94
<i>S. sobrinus</i> (3308)	3.75	3.75	1.88
<i>S. criceti</i> (3640)	0.94-1.88	1.88-3.75	0.94-1.88
<i>S. ratti</i> (3655)	1.88-3.75	1.88-3.75	1.88
<i>S. anginosus</i> (3983)	1.88	1.88-3.75	0.94-1.88
<i>A. viscosus</i> (5531)	0.94-1.88	0.94-1.88	0.23
<i>A. israelii</i> (9054)	1.88	1.88	0.47-0.94

Inhibition curve of oral bacteria: Based on the results of the disk diffusion experiments and MIC estimation, the extracts of *A. auricula-judae* exhibited the highest

antimicrobial activity against *A. viscosus*. Thus, by drawing an inhibition curve, the inhibition rates according to the extract concentration and time were

determined. Each solvent extract at 3.75, 1.88, 0.94, and 0.03 mg/mL determined as MICs was cultivated with the bacteria for 3, 6, 8, 10, 12, and 24 h, and optical density was measured at each time point. As a positive

control, the same method was used in the absence of extract. Figure 2 shows a comparison of the results for the control and test groups.

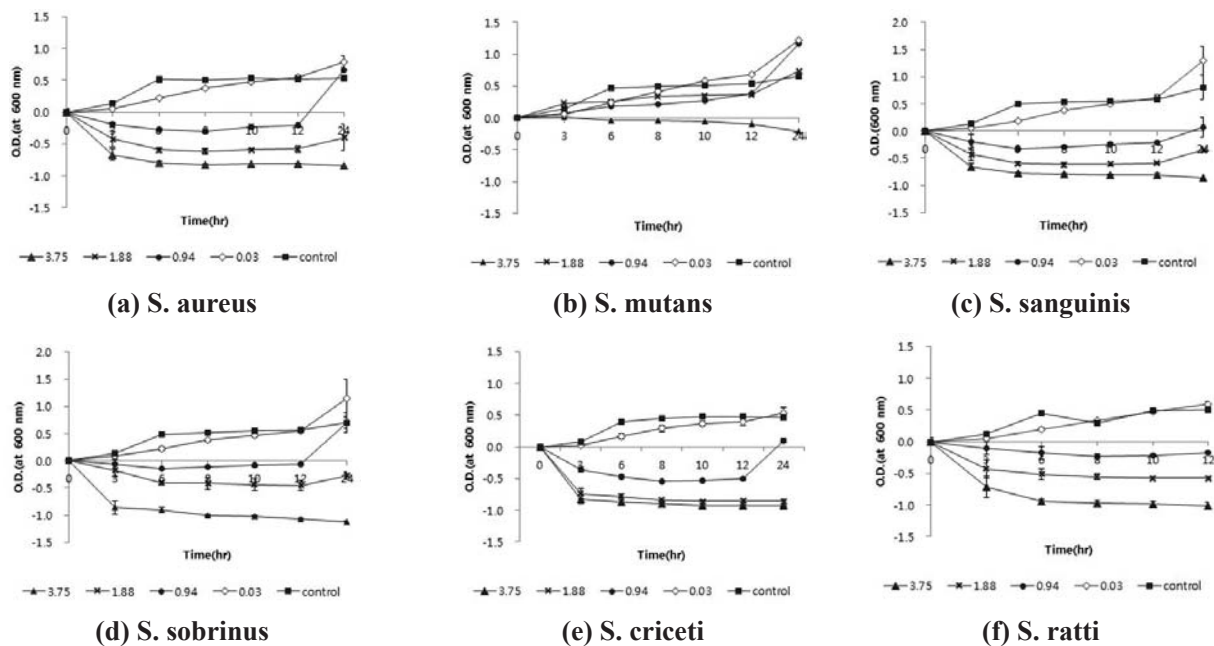

Fig. 2: Inhibitory effect of solvent extract from *Auricularia auricula-judae* on growth of *A. viscosus* among oral bacteria

The control group to which the extracts of *A. auricula-judae* were not added showed steady growth of bacteria until 3–6 h, reaching a plateau after 8 h. In contrast, the groups to which acetone extracts or ethanol extracts were added showed clear inhibitory effects on microbial growth from the early phase of cultivation at concentrations 3.75 and 1.88 mg/mL. Nevertheless, although the growth inhibition of *A. viscosus* at concentrations 0.94 and 0.03 mg/mL continued until 12 h, no inhibition was observed after 12 h. The ethyl acetate extract strongly inhibited microbial growth at concentrations of 0.94–3.75 mg/mL; however, at 0.03 mg/mL, slow bacterial growth was observed in the absence of inhibitory effects. Among the three extracts, the ethyl acetate extract exhibited slightly stronger inhibition of certain strains. Thus, inhibition curves were drawn for the eight strains other than the *A. viscosus* strain. The inhibitory effects of ethyl acetate extract on the eight strains over time are shown in Fig. 3. For *S. aureus*, the ethyl acetate extract clearly inhibited microbial growth at concentrations greater than 1.88 mg/mL. While the initial growth was inhibited at 0.94 mg/mL, the bacteria displayed exponential growth after 12 h. At 0.03 mg/mL, despite the inability to completely block microbial growth, growth was lowered until 12 h compared to the control group. The concentration of ethyl acetate extracts which strongly inhibited oral bacteria from the early phase of cultivation was determined. For the strains *S. sanguinis*, *S. criceti*, *S. ratti*, and *A. israelii*, strong inhibition was observed at concentrations greater than 0.94 mg/mL. Strong inhibition against *S. sobrinus* and *S. anginosus* was observed at concentrations greater than 1.88 mg/mL, and against *S. mutans*, inhibitory effects were detected at 3.75 mg/mL.

DISCUSSION

In the human oral cavity, several known strains of resident bacteria prevent other pathogenic bacteria from inhabiting the oral cavity while strengthening the immune system to ensure constant immunity. However, as certain specific bacteria cause oral diseases such as dental caries and periodontal diseases, it is essential to inhibit the growth of oral pathogens to prevent and treat such diseases [19, 20]. However, continuous use of antibiotics for preventing oral diseases may lead to resistance in the human body and is likely to drive not only pathogens but also beneficial resident bacteria away from the oral cavity. Thus, many studies have attempted to develop diverse methods for inhibiting only the pathogens using natural extracts [21].

The present study was conducted to investigate the antimicrobial potential of acetone, ethanol, and ethyl acetate extracts of *A. auricula-judae* against the growth of nine oral bacteria that cause dental caries and periodontal diseases. All extracts of *A. auricula-judae* strongly inhibited the nine oral bacteria. Particularly, the strongest antimicrobial activity was observed against *A. viscosus*, a representative periodontal pathogen reported to cause periodontitis during dental plaque formation [22]. An inhibition zone similar to that of the control (100 µg/mL of ampicillin) was observed for *A. viscosus*. Compared to the strong antimicrobial activity against *A. viscosus* exhibited by the extracts of *Lentinusedodein* a previous study performed by our lab [23], the extracts of *A. auricula-judae* showed far stronger inhibitory effects on *A. viscosus* and other strains of oral bacteria.

Based on the results of measuring antimicrobial activities, the MIC for oral bacteria was determined. The experiments tested each solvent extract with a two-fold serial dilution using distilled water until concentrations of 0.03–15.00 mg/mL were reached. The results showed

that a minimum concentration of 3.75 mg/mL was required for the extracts to inhibit the growth of all nine tested oral bacteria. Additionally, in agreement with the results of the disk diffusion experiments, the ethyl acetate extract showed the strong inhibition against *A. viscosus* at concentrations as low as 0.23 mg/mL. These results suggest that the *A. viscosus* strain requires a minimum concentration of 0.03 mg/mL of *A. auricula-judae* extract for its inhibition; compared to the results of our previous study of *Coriolus versicolor* [24], the extracts of *A. auricula-judae* showed stronger antimicrobial activities. Furthermore, examining the inhibition rates from the ethyl acetate extract of *A. auricula-judae* against other oral bacteria confirmed that most oral bacteria were inhibited at a minimum concentration of 3.75 mg/mL.

Mushrooms have potential activities against dental caries, and studies have reported that various mushrooms exhibit not only regulatory effects on the formation of plaque or calculus on dental surfaces but also inhibitory effects on glucan elongation that may cause calculus. Mushrooms have also been reported to contain several phenolic compounds that can suppress glucosyltransferase [25]. Most studies of *A. auricula-judae* have investigated its antioxidant effects in addition to its bioactivities towards polysaccharides using DPPH (1,1-diphenyl-2-picrylhydrazyl), total polyphenol content, and ferric reducing ability of plasma assays [26, 27]. Previous studies support the strong antimicrobial potential of *A. auricula-judae* on oral bacteria, as shown in this study. Thus, *A. auricula-judae* shows outstanding potential as an eco-friendly antimicrobial material for the development of products based on natural substances including cosmetics and oral products. The present study investigated only the presence or absence of antimicrobial activities of *A. auricula-judae* extracts against oral bacteria, and future studies are needed to identify the antimicrobial substances contained in *A. auricula-judae* by isolating these molecules from the extracts.

CONCLUSION

The present study was conducted to investigate the antimicrobial potential of acetone, ethanol and ethyl EA of *A. auricula-judae* against the growth of nine oral bacteria that cause dental caries and periodontal diseases. All extracts of *A. auricula-judae* strongly inhibited the nine oral bacteria. Particularly, the strongest antimicrobial activity was observed against *A. viscosus*, a representative periodontal pathogen reported to cause periodontitis during dental plaque formation. An inhibition zone similar to that of the control (100 µg/mL of ampicillin) was observed for *A. viscosus*. Compared to the strong antimicrobial activity against *A. viscosus* exhibited by the extracts of *Lentinus edode* in a previous study performed by our lab, the extracts of *A. auricula-judae* showed far stronger inhibitory effects on *A. viscosus* and other strains of oral bacteria.

The Effect of Oral Spray Mist Containing Pine Needle Extract in Reducing Halitosis and Compounds Inducing Halitosis

Jung-Eun Park¹, Jong-Hwa Jang²

¹Research Scholar, Dept. of Preventive and Social Dentistry, School of Dentistry, Kyung Hee University, Republic of Korea; ²Associate Professor, Dept. of Dental Hygiene, College of Health Science, Dankook University, Republic of Korea

ABSTRACT

This study aimed to assess the effect of oral spray containing pine needle extract in suppressing halitosis, by analyzing the concentration of volatile sulfur compounds (VSCs) inducing halitosis and organic acids within saliva. The concentration of VSCs inside the oral cavity after the spray usage was measured using Sensor Gas Chromatograph ODSA- P2, and the analysis of organic acids within saliva was performed using HPLC Dionex ion chromatography system (GP50 gradient pump, ED 50 conductivity detector) with mobile phase under following conditions: NaOH 100mM with flow rate of 1.0mL/min, injection volume of 10 μ l, and temperature of 20°C. In the experimental group, the levels of H₂S and CH₃SH were remarkably reduced by 80.87% and 89.42% respectively. In addition, the analysis of organic acids within saliva showed suppressive effect by 63.46-97.05% after 4 weeks. Therefore, it seems that using oral spray mist containing pine needle extract can partially suppress VSCs and organic acids within saliva that are associated with halitosis.

Keywords: HPLC, halitosis, oral spray, pine needle extract, saliva

INTRODUCTION

Bad breath, also known as halitosis, is caused by volatile sulfur compounds (VSCs) being released during exhalation. This chemical compound is composed of hydrogen sulfide (H₂S), methyl mercaptan (CH₃SH), and dimethyl sulfide (CH₃)₂S^{1,2}. In the modern society, halitosis is becoming an important issue attracting more attention, as it can induce both social and emotional disorder at individual level. To remove foul odor within the oral cavity, both physical method with removal of bacteria attached to the biofilm and chemical method applying antibiotic materials are performed in parallel. With harmfulness of different chemical compounds being reported, the utility of natural compounds is steadily increasing recently^{3,4}. The natural compounds included in mouthwash and oral health-related

products include the extracts from various materials such as manuka honey⁵, clove oil⁶, propolis⁷, ginger⁸, and pine needles^{9,10}. Especially pine needle extract, like inorganic elements such as potassium, calcium, magnesium and phosphorus and vitamin A, C, K, enzyme, and minerals, pine needle extract among them contains useful substances for discharging waste from the body and improving metabolism¹¹. Accordingly, it is widely known that the pine needle extract has cell antioxidant effect to decrease active oxygen in the body¹² and antibacterial effect against gram-positive and negative bacterium¹³. Thus, the extract is good for removing oral halitosis in a mouth due to antibacterial effect against gram-positive and negative bacterium and removing inflammation owing to antioxidant effect in oral mucosa. Based on these previous observations, the evaluation of oral spray containing pine needle extracts as a suppressant of halitosis should be performed. The measurement of halitosis can be done using traditional tools such as halimeter¹⁴, oral chroma¹⁵, B&B checker¹⁶, and gas chromatography¹⁷.

Since multiple variables may exist in the process of obtaining gas from oral cavity and analyzing the sample, we aimed to simultaneously perform the analysis of

VSCs inside the oral cavity and the assessment of compounds within saliva that can induce halitosis, in order to objectively evaluate the effect of oral spray in suppressing halitosis.

If the concentration of organic acids in the oral cavity is evaluated from these perspectives, we can more objectively evaluate the suppressive effect of oral spray containing pine needle extracts.

Therefore, in this study, we aimed to evaluate the effect of pine needle extracts in suppressing oral halitosis by analyzing the concentration of VSCs (hydrogen sulfide (H_2S), methyl mercaptan (CH_3SH), and dimethyl sulfide ($(CH_3)_2S$)) after oral spray usage and assessing the organic acids (lactate, acetate, propionate, formate, butyrate, and pyruvate) within saliva that can induce halitosis

MATERIALS AND METHOD

Subjects: The subjects of this study included 10 healthy adults (male and female), who do not have dental implants, dental caries, diabetes, gingivitis, or metabolic syndromes, divided into two groups: 5 subjects in the control group and 5 subjects in the experimental group. This study was approved by the institutional research ethics board of Dankook University, Republic of Korea (No. 2017-03-033). Quantitative analysis of the concentration of VSCs and organic acids within saliva (lactate, acetate, propionate, formate, butyrate, and pyruvate) was performed before and after the oral spray usage.

Synthesis of oral spray: The oral spray containing pine needle extract was fabricated for the experimental group, which consists of a base solution (100g) including 10% glycerin, 5% xylitol, and 350 μ l peppermint/lemon scent solution, 5% pine needle extract and 2% Japanese apricot extract. The oral spray for the control group only included the base solution of the spray used for the experimental group. The subjects were instructed to spray 3 times into the oral cavity 1 hour after their meal and brushing their teeth. VSCs measurement and saliva collection were performed 30 minutes after the spray usage.

Measured of sensor gas chromatograph: The contents of volatile sulfur gas such as H_2S , CH_3SH and $(CH_3)_2S$

was measured by Sensor Gas Chromatograph ODSA-P2 (FIS Inc., Hyogo, Japan). In order to collect the oral gas, subjects bite syringe during for 30 seconds. After syringe pumping for 2 times, 2 ml of collect the patient's oral air and inject to machine after stabilizing for 1 hours. The measurement of concentration (ppb) of each sulfur compound took for 4 minutes.

Saliva collection and pre-treatment: After the VSCs measurement has been completed, the subject's saliva (500 μ g) was collected in an Eppendorf tube. Collected saliva was centrifuged under 1200 rpm for 5 minutes, and the supernatant was diluted by 15-fold in distilled water. This solution was then treated using syringe filter (hydrophobic polytetrafluoroethylene (PTFE) membrane; pore size: 0.20 mm; Advantec MFS, Inc., Tokyo, Japan) to eliminate bacteria and enzymes.

Analysis of organic acids using HPLC: Standard organic acid products (lactate, acetate, propionate, formate, butyrate, and pyruvate) and mobile phase (NaOH 100mM) were purchased from Sigma Aldrich (St. Louis, MO, USA). Deionized water ($\geq 18 \mu\Omega$) used for mobile phase synthesis and sample dilution was synthesized using MILLI-Q Water system from Millipore (Bedford, MA, USA). The equipment used for the analysis of organic acids was Dionex ion chromatography system (GP50 gradient pump, ED 50 conductivity detector), and the software used for analysis was Chromeleon version 6.8. The column used for the analysis was Dionex IonPac AG11-HG column (50mm \times 4mm), protected by the guard column of IonPac AS11-HG (250mm \times 4mm). The mobile phase used was NaOH 100mM, with flow rate of 1.0 mL/min, injection volume of 10 μ l, and temperature of 20°C.

RESULTS AND DISCUSSION

The outcome for validation of analysis method for organic acids is shown in Table 1. The linearity of calibration curve for concentration range of 0.12 – 2.5mM assessed by R^2 value was ≥ 0.971 , indicating that the regression model based on coefficients of determination for each ingredient – obtained by the concentration and area values – exhibits $\geq 97\%$ linearity.

Table 1: Linear range, linear equation and correlation coefficient (r^2) for organic acid.

Compound	Linear range(mM)	Linear equation	r^2
Lactate	0.12 - 2.5	$y = 0.0023x + 0.6273$	0.9868
Acetate	0.12 - 2.5	$y = 0.0012x + 0.4722$	0.9816
Propionate	0.12 - 2.5	$y = 0.0011x + 0.4499$	0.9718
Formate	0.12 - 2.5	$y = 0.0031x + 0.295$	0.9990
Butyrate	0.12 - 2.5	$y = 0.0011x + 0.3542$	0.9816
Pyruvate	0.12 - 2.5	$y = 0.001x - 0.0036$	0.9980

* $y=ax+b$ y is the peak area and x is sample concentration

The concentration of VSCs in the oral cavity before and after the use of oral spray containing pine needle extracts is shown in Table 2. In both the control group and experimental group, concentrations of all chemical compounds with exception of $(CH_3)_2S$ were reduced 4 weeks after the usage. More specifically, the experimental group exhibited remarkable reductions of H_2S by 80.87% and CH_3SH by 89.42%. On the other hand, the concentration of $(CH_3)_2S$ was increased in both the control group and the experimental group at 4 weeks after the usage.

Among volatile sulfur compounds, only $(CH_3)_2S$ makes a difference depending on the involved bacteria and environment inside the mouth as a cause to affect the result of experiment. According to the conventional theories, gram-negative anaerobic bacteria like *Porphyromonas gingivalis*, *Tannerella forsythia*, *Treponema denticola*, and *Fusobacterium nucleatum* related to a periodontal disease causes most of VSCs^{18,19}, but it is newly reported that the bacteria inside the mouth such as *Solobacteriummoorei* gram-positive bacterium^{20,21} and *Actinomyces* living in biofilm attached to a tongue cause halitosis in the mouth²². Thus the difference between the subjects in the distribution of bacteria in their mouths and the health condition in their periodontal tissues leads to the difference in the result. It turns out that VSCs decreased more in the experimental group than in the control group.

Table 2: Mean concentration (ppb) of volatile sulfur compounds before and after using oral spray for 10 subjects

	Compound		1 week	2 weeks	4 weeks
	Control	H_2S	mean \pm SD	68.68 \pm 40.98	59.28 \pm 77.31
$\Delta^a(\%)$				13.70	58.65
CH_3SH		mean \pm SD	3.00 \pm 4.26	5.10 \pm 7.20	2.16 \pm 2.12
		$\Delta^a(\%)$		-70.00	28.00
$(CH_3)_2S$		mean \pm SD	7.62 \pm 6.84	28.40 \pm 18.36	10.24 \pm 8.89
		$\Delta^a(\%)$		-272.70	-34.38
Experimental	H_2S	mean \pm SD	63.04 \pm 58.48	19.24 \pm 28.38	12.06 \pm 14.09
		$\Delta^a(\%)$		69.48	80.87
	CH_3SH	mean \pm SD	16.26 \pm 36.36	19.40 \pm 33.16	1.72 \pm 3.85
		$\Delta^a(\%)$		-19.31	89.42
	$(CH_3)_2S$	mean \pm SD	10.52 \pm 16.90	2.44 \pm 3.34	11.48 \pm 2.98
		$\Delta^a(\%)$		76.81	-9.13

^a Increment and decrement concentration of volatile sulfur compounds compared to 1 week

In the experimental group, we observed reduction in several organic acids by 42.51 – 100.00% in Week 2 compared to Week 1. However, this value was decreased to 63.46 – 97.05% in week 4. These results were in agreement with the outcome that the reduction of $(CH_3)_2S$ among VSCs was greater in week 2 compared to week 4.

Furthermore, the suppressive effect of organic acids was observed in week 2 and 4 even in the control group, suggesting that the base solution contained in both oral sprays may exhibit fermentative effect of the microbes associated with halitosis or induction of halitosis.

In addition, there were differences among different organic acids. In week 4, we observed larger amount of acetate and formate being suppressed in the experimental group compared to the control group. Therefore, the oral spray containing pine needle extract can exhibit antibacterial effect in larger area and suppress more organic acids compared to the spray used in the control group.

The result of analyzing volatile sulfur compound and various organic acids shows that both volatile sulfur compound and organic acids decrease more coincidentally in the experimental group than in the control group and the decreased

amount for a week interval is almost equal. It is revealed based on the result that VSCs and organic acids are related each other as a metabolite to the bacteria inside the mouth.

However, due to small number of subjects in this study, there may be limitations in generalizing our findings. Moreover, there were subjects with no butyrate or pyruvate found in their saliva. As reported in the previous study, various biological factors among different individuals may cause these differences²³.

In addition, many variables occur in collecting saliva and gas in the mouth. Individual habit, ingested foods, bacteria distribution inside the oral and other variables can make a difference of the result. Thus, if considering halitosis, environment inside the oral and bacteria together in the next experiments, the more objective result will be drawn.

Table 3: Mean concentration of organic acids before and after using oral sprays for 10 subjects

	Compound		1week	2weeks	4weeks
Control	Lactate	mean ± SD	2.65 ± 5.43	1.99 ± 3.78	0.06 ± 0.13

^a Increment and decrement concentration of volatile sulfur compounds compared to 1 week N.D. not detected.

CONCLUSION

This study analyzed VSCs and organic acids in saliva using quantitative analysis in order to check the effect to eliminate halitosis after using the oral spray containing the pine needle extract. After 4 weeks in the experimental group, the result of analyzing VSCs shows that H₂S (80.87%), CH₃SH(89.42%), (CH₃)₂S (-9.13%) fell and organic acid inside the oral, Lactate (96.52%), Acetate (63.46%), Propionate (70.07%), Formate (86.22%), Butyrate (97.05%), Pyruvate (not detected) also dropped.

In sum, the findings show that the halitosis spray containing the pine needle extract used in this experiment reduces volatile sulfur compound and the substances causing halitosis.

Upper Arm Muscle Activation During Rowing Exercise According to Different Pulling Positions

Da-HyeGu¹, Ayano Vargas¹, So-Yun Jin¹, Dong Yeop Lee², Jae Ho Yu², JinSeop Kim², Ji-Heon Hong²

¹Student, ²Professor, Dept. Physical Therapy, Sun Moon Univeresity, Republic of Korea

ABSTRACT

Background/Objectives: The purpose of this study is to compare the muscle activation of the upper limb muscle according to the position changes when performing rowing ergometer exercise.

Method/Statistical analysis: 20 healthy males who voluntarily agreed with the sufficient explanations about the purpose and method of this study were participated. Subjects were given a Navel, Chest, and Neck position. They did warm up for 20 seconds, rowing for 1 minute and cool down exercise for 30 seconds. Also they were given resting time for 1 hour between each of the pulling positions. One-way ANOVA was used to analyze the study data and LSD correction was used for the Post-hoc.

Findings: There was no significant difference in flexor and extensor carpi radialis when three of the positions were compared, but there was a significant difference in posterior deltoid, middle deltoid and biceps brachii. Every muscle showed with highest activation in the Neck position.

Improvements/Applications: In conclusion, the position can be selectively applied to increase muscle strength of the upper limb muscle considering the change of the specific muscle activation according to the change of position.

Keywords: Rowing Ergometer, Muscle Activation, Upper Limb, Electromyography

INTRODUCTION

A rowing ergometer was a device made to approach the motion of rowing and developed to reenact the loading conditions of rowing athletes^{1, 2}. This machine was designed for rowing athletes, used as standardized tests, research equipment, and utilized for land-based training^{1, 3, 4}. In rowing, there were two ways to row and one of them was called sculling. Rowing ergometer was commonly used by rowing athletes as a sculling ergometer, in a manner in which they used two paddles to increase the thrust of a rowing boat⁵. Jones (2010) reported that many scholars were interested in researches about the biomechanics of elite level rowing, however, it had not been enlarged to researches about

rowing ergometer for recreation and amateur users⁶. More studies were required on how to use the rowing ergometer to determine which muscles were activated while using this device, and not the training required for accelerating rowing speed or injury prevention of athletes. The difference between rowing ergometer and rowing in the water was that the sheet of flywheel and foot stretcher had a fixed base while the seat moves back and forth on the rail⁷. There was a difference between the terms in a contribution of the body during the exercise phase. At the starting and ending point of the catch phase, the rowing ergometer was relatively stronger in pulling the oars¹. In the catch phase, full flexion of the lower limb, as well as the lumbar spine and the full extension of upper limb joints, had shown according to the detailed analysis of the position of exercise in the rowing ergometer.

As the elbow and shoulder joints bend, the ankle, knee, hips and lumbar spine were stretched at the same time during the driving phase. Therefore, the full extension of the lower limb and lumbar spine, and the

full flexion of the upper limb was the finishing phase of this exercise. While in the recovery phase, the flywheel was moving from the finish phase to the catch phase and this process was repeated from the beginning^{2, 5, 6}. Biomechanically, when comparing the body that was the main axis of force during the catch phase, the lower leg started with the contribution of 50% and it gradually increased to 40~50% in the latter half, as well as the beginning stage of arm reaches almost 80%, the contribution then raised to 60% while pulling the flywheel^{1, 8}. Therefore the activation of the arm happened for a short period of time, however, the researches of the arm was insufficient due to the reason that most of the researches were more interest in the kinematics and activity of the leg and body. In the case of rowing ergometer, it was important to know the speed, height, and pulling angle when determining the physical fitness requirements for work of rapid pulling, as the motion of the flywheel could pull out the movement freely comparing it to the rowing⁹. In addition, when Herring (2007) observed the impact of maximum static force during a push or pull motion depending on how the height and distance of the hand from the body differs, the strength of the muscles was influenced as the distance and height increased¹⁰. According to these prior articles, it was necessary to analyze and compare the muscle activation of the upper limb according to the angle of arm movement in rowing ergometer. The total of the muscles used during rowing ergometer exercise were 23, including the upper and lower extremity muscles, on the other hand, the muscles in the upper extremity were only 9 of them was being used^{4, 11}. There was a certain similarity of elbow flexors in a reaction of the shoulder, elbow extensor, and shoulder extension¹². Tomasz (2015) found that the muscle response was placed in the activated muscle of shoulder and elbow joint¹². However, studies on the activation of the wrist muscles during exercise were inadequate.

Most researches respondents were mainly professional rowing athletes, however, there were only a few cases of researches about muscle efficiency of non-athletes. In addition, despite the high flexibility of arm positions, researches about the different kinds of arm movement was insufficient. Therefore, the purpose of this study was to compare and analyzed the activation of the arm muscles which vary according to the positions of pulling during rowing ergometer exercises.

MATERIALS AND METHOD

Participants: In this study, 20 healthy male adults were present. Before taking part, all subjects were given sufficient explanations about the purpose and method of this study. Then, those who voluntarily acceded to the conditions participated in this study. The characteristics of the subjects are as follows [Table 1]. The study was conducted in accordance with the procedure approved by Sunmoon University Institutional Review Board.

Table 1: General Characteristics (n = 20)

Division	Subject
Age (year)	22.75 ± 2.51
Height (cm)	173.85 ± 4.67
Weight (kg)	67.95 ± 10.47

All values are mean ± Standard Deviation(SD)

Experiment Procedures: This study was conducted as a single group. In order to minimize the resistance or friction of the electrode before the experiment, a short-sleeved t-shirt was suggested to wear during the experiment. To prevent unnecessary amplification, the EMG cables were taped on the assigned muscles and then using an EMG marker (EMG marker: Posterior deltoid – 2 cm below the scapular spine, and parallel position to the muscle fibers¹³. Middle deltoid about 3cm below the acromion, parallel to the muscle fibers¹³. Biceps Brachii - middle of muscle fiber and in parallel side¹³. Flexor carpi radialis - 1/3 point from styloid process of radius to medial epicondyle of elbow¹⁴. Extensor carpi radialis - 3cm point away from distal side of lateral epicondyle with forearm in pronation position¹⁵. the maximum voluntary contraction (MVC) was measured [Figure 1].

The subjects were asked to sit on rowing ergometer with their ankles and feet fixed using a strap and educated about each position to perform while doing the experiment. The basic positions and timing of arm when pulling the handle of rowing ergometer are divided into 3 positions; the Neck position that reaches until Adam's apple, the Chest position that reaches until the body of the sternum, and the Navel position that reaches until the belly button of the participants. Each position had been educated before starting the actual experiment [Figure 2]. After doing warm-up exercise with Neck position for 30 seconds, the participants then perform the experiment using the rowing ergometer as strong and fast as they can

during 1 minute to measure the maximum activity of each muscles using EMG then they did the cool down exercise for 30 seconds and lastly, to avoid muscle fatigue after exercise, 1 hour of rest time given before proceeding to the next position and was given between each position.

Figure 1: The attached location of EMG electrodes

Measurement Equipment: In this study, a Water-rower rowing machine and Electromyography (EMG, QUS100, Zero WIRE EMG, Italy, 2009) were used [Figure 3]. All subjects asked for wore short sleeve t-shirts and the EMG were attached to each muscle. The maximum voluntary contraction of the subjects was measured, and after educating the participants about the positions, they performed the rowing ergometer exercise with each position and the muscle activation during the exercise was recorded.

Figure 2: The position of exercise A: starting position B: Neck position C: Chest position D: Navel position

Figure 3: Instrumentation A: Water-rower rowing machine B: Electromyography (EMG)

Data Analysis: For the analysis of the study data, SPSS / PC ver.18 for windows program (SPSS INC, Chicago, IL) was used. We used one-way ANOVA to compare the muscle activations for every position when performing rowing ergometer through electromyography device. The basic positions and timing of the arm when pulling the handle of rowing ergometer were divided into 3 positions which were the Neck position that reaches until Adam’s apple, the breast position that reaches

until the body of sternum, and the Navel position that reaches until the belly button of the participants had been educated before starting the actual experiment.

RESULTS AND DISCUSSION

According to different types of rowing position, the muscle activation of some muscles showed a significant difference. Through the SPSS ver. 18 programs, we used one-way ANOVA to analyze the significant difference of muscle activation in each muscle. [Table 2] shows the mean and difference of the percentage of muscle activity. As shown in the statistical analysis, the posterior deltoid, middle deltoid, and biceps brachii were significantly different when three of the positions were compared ($p < .05$). On the other hand, Flexor Carpi Radialis and Extensor Carpi Radialis did not show any significant differences according to the different pulling positions ($p > .05$). Via post-hoc results of the three muscles that show significant differences in variance analysis, the posterior deltoid did not show any significant difference between Chest and Navel position ($p > .05$). However, there was a significant difference between the Neck and Chest position, as well as the Neck and Navel position ($p < .05$). Also, the middle deltoid and Biceps brachii showed significant differences between Neck and Chest position, Chest and Navel position, Neck and Navel position ($p < .05$) [Table 3].

The purpose of this study was to compare the muscle activation of the arm muscles, which vary according to the pulling position during rowing ergometer exercise. During rowing ergometer exercise, 20 healthy men adults were performing with three positions which divided into Neck, Chest, and Navel position, at the same time using surface EMG, the muscle activation of the posterior deltoid, middle deltoid, biceps brachii, flexor carpi radialis, and extensor carpi radialis were compared. As a result, there were significant values according to each position in several muscles.

In middle deltoid showed significant differences in Neck and Chest position, Neck and Navel position, and Chest and Navel position. Witt et al. (2014) suggested that deltoid muscle activation theoretically increased when the external moment arm increases, as the function of this muscle were shoulder abduction and elevation¹⁶. Rebecca L. et al. (2010) reported that the activation of middle deltoid increased when the angle of the shoulder flexion increased and showed high activation of the muscle when it was approximately at 90 degrees¹⁷. This study proposed that there was a difference in activation as the angle of shoulder abduction increases from the lowest position which was the Navel position, to Chest and the highest position, Neck position. Escamilla et al. (2009) reported that the posterior deltoid muscle showed high activation in shoulder external and internal rotation, respectively. Furthermore, there was no effect in abductor through the difference of moment arm at 0–90degree angle of shoulder abduction, however, as

the contribution of movement was greatly changed as the angle increases¹⁸. The handle of a rowing ergometer was pulled with the movement of shoulder internal rotation and forearm pronation. In this study, the angle of shoulder abduction gradually increased in the order of Navel, Chest, and Neck position, and the position in finish phase was approaching to the horizontal abduction from shoulder extension. Therefore, the posterior deltoid showed high activation in all positions, especially in Neck position. Although, the difference between the Chest and Navel position was not statistically significant for reason that the angle of the shoulder between the two positions was within the range that could not sufficiently decrease the moment arm.

The same as the middle deltoid, biceps brachii that showed significant differences in Neck and Chest position, Neck and Navel position, also Chest and Navel position through the post-hoc test result. Antony et al. (2010) observed that the activation of biceps brachii increases when the angle of shoulder abduction and flexion also increased¹⁷. David et al. (2000) reported that the biceps brachii showed less activation in internal rotation, however more activation was shown in external rotation¹⁹. In addition, Sakurai et al. (1998) confirmed that the angle of the shoulder and elbow various abduction, as well as flexion during shoulder internal and external rotation, shows the activation of biceps brachii²⁰. The biceps brachii showed high activation in the external rotation than in internal rotation in most of the shoulder movements. The same as the two previous muscles, it

seems that the activation of biceps brachii activates with the angle of shoulder abduction from Navel to Neck position. On the other hand, as the position of arm get higher, the hand during finish phase increases together with shoulder external rotation. For that reason, it shows that there are a significant difference and increases in activation of biceps brachii.

Flexor and extensor carpi radialis showed high activation in every position, but no significant difference was found. Domizio et al. (2010) reported that the activation of flexor and extensor carpi radialis includes the forearm muscles increases when the pulling strength is used for gripping and defecting²¹. In addition, the activation increases when conducting it in pronation compare to neutral and supination. Koshland et al. (2010) observed that the elbow and wrist flexor including flexor carpi radialis were activated in similar order when the wrist is fixed then flexing the elbow²². High activation was observed in flexor and extensor carpi radialis through gripping the handle of rowing ergometer and pulling it and flexing the elbow at the same time. However, there were differences in activation but not significant among the three positions of this study. The reason for this is the angle of elbow flexion and extension influenced by the two muscles showed differences. It seems that the angular change of the wrist did not occur significantly in every position.

The results of this study showed that there was no significant difference in muscle activation between the flexor and extensor carpi radialis in each position. However, there were significant differences between deltoid and biceps brachii as the position changed. For this reason, it was found that Neck position is more effective for the alternative strengthening of the deltoid muscle and biceps brachii.

A limitation of this study would be although it was conducted with 20 healthy adult men, there were difficulties in examining the changes of muscle activation in women and generalizing the whole age group. The same result may not be obtained in the non-dominant arm since only the muscle activation of a dominant arm is measured. There is a limitation in obtaining the objectively results of this study because the subjects could not present an objective and quantified angle of shoulder abduction. The aim of this study was to observe the muscle activation of upper limb muscles according to different pulling positions, however since only specific

muscles were measured, there is a need to study the activation or relationship of other muscles.

CONCLUSION

The purpose of this study is to compare the muscle activities of the posterior deltoid, middle deltoid, biceps brachii, flexor carpi radialis, and extensor carpi radialis according to the position changes when performing rowing ergometer exercise, and to propose which position is more effective when it comes to strengthening the muscle. As a result, deltoid and biceps brachii muscles showed the highest activation in the Neck position, while in the Navel position shows lower activation. The flexor and extensor carpi radialis show high activation in all of the 3 pulling positions, nonetheless, there was no influence on muscle activation when changing the position. Therefore, in this study, the position can be selectively applied to increase muscle strength of the upper limb muscle considering the change of the specific muscle activation according to the change of position.

ABSTRACT

Background/Objectives: Students are increasing their obesity rates due to decreased physical activity and increased instant food intake due to study. The purpose of this study is to investigate the effect of stepping exercise on body composition and blood lipid in order to find a way to participate at any time with pleasant music.

Method/Statistical analysis: In this study, 16 obese middle school students with body fat percentage of over 30% were divided into 8 stepping group and 8 control group. The stepping exercise group participated in the exercise for 1 week 45 minutes and 5 times a week for 10 weeks. The control group continued their daily lives without participating in any specific exercise program. All data measured in this study were averaged and standard deviations were calculated for all variables using the SPSS win12.0 statistical program. The difference test before and after intervention was compared by T-test. The difference between groups was analyzed using repeated measures analysis. The statistical significance was $p < .05$.

Findings: After 10 weeks of exercise, fat free mass was significantly increased in the exercise group ($p < .01$). Body weight and % body fat were significantly decreased ($p < .01$) as the exercise duration was longer, and also significantly ($p < .05$) between groups. Changes in blood lipids significantly decreased total cholesterol (TC), triglyceride (TG) and low density lipoprotein cholesterol (LDL-C) in the exercise group ($p < .01$). High density lipoprotein cholesterol (HDL-C) increased significantly after exercise ($p < .01$), and differences between exercise groups ($p < .05$) also appeared.

Improvements/Applications: The results of this study showed that changes in body composition and blood lipids that were not observed after 5 weeks of exercise were changed after 10 weeks of exercise. However, it suggests that students should also change their dietary habits with exercise to achieve complete obesity.

Keywords: Female obese students, Stepping exercise, Aerobic exercise, Body composition, Blood lipid

INTRODUCTION

Today, rapid economic growth and technological advancement have positive effects such as abundant and convenient living and disability in modern people, while obesity has been triggered due to decreased movement and excessive nutrition^[1]. The Ministry of Education of the Republic of Korea^[2] showed that the

obesity rate of elementary, middle, and high school students rapidly increased from 11.2% in 2008 to 14.7% in 2012, 16.5% in 2016 and 17.3% This growth rate is due to the increase of instant food intake which is low in physical activity due to the development of modern society and education centered on entrance examination, and high calorie but low nutrition. In particular, obesity in female students causes gonorrhoea and increases the risk of small stature, breast cancer, obesity, diabetes and cardiovascular disease. The Ministry of Education has decided to add HDL-C, LDL-C, and TG along with blood glucose, TC, and GPT to the National Obesity Management Comprehensive Measures(2018-2022)^[3]. In order to make changes, we decided to expand the

school club food service standards revision and sports club support to match the level and interest of girls with low physical activity.

However, in spite of various policies, the decline in physical fitness and the rate of obesity continue to increase, making the policy less effective^[4]. The reasons for this are: lack of exercise due to decreased physical activity of adolescents, low budget compared to national policies, lack of time and space to participate in obesity related programs, lack of professional leaders to carry out obesity related programs, And lack of time due to study^[5]. Especially, adolescent middle school students show changes in appearance and body shape due to hormonal changes due to secondary sex. In this case, weight and fat increase, and thus they do not fit with physical and social needs, resulting in lack of self-confidence due to loss of self-esteem^[6].

As a method of exercise for preventing obesity, fat should be used as an energy source at low intensity and exercise frequency should be high^[7]. It has been reported that regular participation of aerobic exercise improves the risk factors such as cholesterol, hypertension and obesity and improves cardiovascular function to prevent cardiovascular diseases such as coronary artery disease, arteriosclerosis, hypertension and heart disease and improve health and fitness^[8]. It has been reported that

participation in regular exercise programs significantly reduces body fat and body weight, and improves fat, muscle strength, and oxygen uptake^[9].

There are walking, jogging, jump rope, aerobics, dancing, swimming, and bicycle^[10] and which can participate in time, place, object, and climate regardless of climate, and can be economical and simple^[11]. In the low intensity exercise of about 50% of the VO² max, exercise of about 200~300kcal energy consumption is suitable for obesity resolution^[12]. Because of Regular aerobic exercise is used because body fat is used to improve blood lipid levels and energy during low intensity exercise^[13].

The purpose of this study is to propose a stepping exercise with low risk of injury, which is not related to the environment such as the weather, as a physical activity method, to obesity middle school students as a method of reducing obesity in adolescents.

MATERIALS AND METHOD

Subjects: The subjects were female students with over 30% obesity. And 8 stepping exercise group and 8 control group were selected by simple radio assignment method. The physical characteristics of the subjects are shown in [Table 1].

Table 1: Physical characteristics of subjects

Group \ Item	Age (years)	Weight (kg)	Height (cm)	Fat (%)
E.G	15.38 ± .51	64.60 ± 4.56	160.80 ± 3.83	36.58 ± 1.72
C.G	15.08 ± .72	63.71 ± 8.48	162.21 ± 5.06	36.38 ± 3.53

E.G : Exercise Group ; C.G : Control Group

Exercise program: The stepping exercise group participated in the preliminary experiment one week before the experiment to adapt to The movement exercise, and after 45 minutes(08:15~09:00), 5 times a week(Mon, Tue, Wed, Thu and Fri) and stepping exercise for 10 weeks. Exercise program 0~5 weeks from 20.3cm step box to 51~60% HRmax level, march basic step to 9 basic movements, 6~10 weeks to 61-70% HRmax level turn basic step, over the step 16 kinds The exercises were mixed and exercised to exciting music(100~110bpm). [Figure 1].

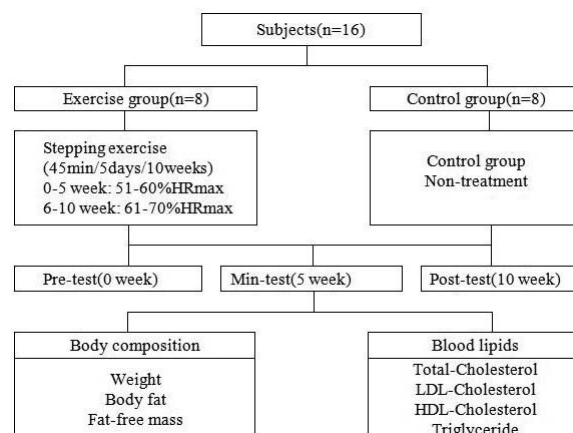

Figure 1: Experimental Design

Exercise intensities were determined by using the telemetry heart checker system($THR = [HR_{max} - HR_{rest}] \times THR\% + HR_{rest}$). The control group continued their daily activities without participating in any special exercise program during the experiment. Measurements and analyzes were carried out at 3 weeks, 0 weeks, 5 weeks, and 10 weeks. the exercise program are shown in [Table 2].

Table 2: 0-5weeks and 6-10weeks exercise program

Intensity	Stage	Time	Intensity	Stage	Time
	Warm-up (arm, leg, shoulder)	10min		Warm-up (arm, leg, shoulder)	10min
0-5weeks/days 51-60%HRmax	March Basic step Side up, Side kick Back up, Back turn March box turn V step Side v step	30min	6-10weeks/days 61-70%HRmax	Turn basic step Over the step Triangle Back turn Side basic step Side basic knee up Side basic kick	30min
	Cool-down (arm, leg, shoulder)	5min		Cool-down (arm, leg, shoulder)	5min

Statistical analysis: All data measured in this study were averaged and standard deviations were calculated for all variables using the SPSS win12.0 statistical program. The difference test before and after intervention was compared by T-test. Differences between groups were analyzed using repeated measures analysis. In the present study, the least significant difference test(LSD) was use for the post-test of the estimated mean, and the significance level was $p < .05$.

RESULTS AND DISCUSSION

The purpose of this study was to investigate the effects of long term stepping exercise program on body composition(fat free mass, body weight, % body fat), serum lipids(TC, HDL-C, TG, LDL-C). Results of analysis according to group(stepping exercise group, control group)and time(0week exercise, 5week exercise, 10week exercise) as follows.

Changes in body composition: The body is composed of water, protein, minerals and fat. Body composition is differentiated into fat composed of body fat, moisture, muscle, bone and residual chemicals^[14]. In the previous study, the body composition of obesity women showed a significant difference in the BMI values after 12 weeks of exercise^[15] the change of body composition are shown in [Table 3].

Table 3: The change of Body Composition

Item \ Time	Group	0week ^a	5week ^b	10week ^c	F
Fat free mass	EG	40.91 ± 1.84	41.67 ± 2.03	45.09 ± 1.66	203.58**
	CG	42.06 ± 3.24	41.63 ± 3.39	41.33 ± 3.92	2.81
	t	.87	.20	2.49	
% fat	EG	36.58 ± 1.72	34.26 ± 1.23	27.46 ± 2.47	98.93**
	CG	36.38 ± 3.53	36.32 ± 3.41	36.96 ± 3.41	1.86
	t	.14	1.61	5.80	
Body weight	EG	64.60 ± 4.56	63.35 ± 4.23	57.64 ± 3.55	40.70**
	CG	63.71 ± 8.48	64.51 ± 7.53	64.15 ± 8.46	2.51
	t	.26	.37	2.31*	

Mean ± SD, $p < .05$ *, $p < .01$ **

In the present study, body weight decreased 10.77% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. These results were consistent with the results of a 12-week combined exercise after weight loss^[16] and a decrease in body weight after 12 weeks of Pilates exercise^[17]. However, there was no change in body weight after participating in elementary school 12-week combined exercise program^[18]. The difference between these previous studies and the results is thought to be the difference in the dietary intake and exercise intensity of the group

Fat free mass increased 10.24% in the stepping group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment period. Post-test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. These results suggest that increased fat free mass after aerobic exercises^[19] 12 and long-term aerobic exercise and muscular resistance training in adolescents increased % fat mass^[20].

% Body fat decreased by 24.43% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. These results are consistent with the findings^[21] that the body fat percentage decreased after endurance exercise. Positive changes in body weight, fat mass, and body fat percentage were consistent with studies of persistent resistance and combined exercise, such as decreased body fat percentage and increased fat mass in obese people^{[22][23]}.

The positive changes in body composition are the decrease in body weight due to the increase in activity, the change in body fat and the decrease in body weight due to the improvement of basal metabolism and fat dissolving ability during stabilization^[21].

Changes in blood lipid: Blood lipids increase the incidence of hypertension, arteriosclerosis, coronary artery disease and heart disease. The change of blood lipids are shown in [Table 4].

Table 4: The change of Blood Lipids

Item \ Time	Group	0 week ^a	5 week ^b	10 week ^c	F
TC	EG	153.50 ± 13.86	148.63 ± 14.20	138.38 ± 15.72	72.02**
	CG	157.13 ± 15	158.38 ± 13.64	157.75 ± 12.64	.38
	t	.50	.18	0.01**	
HDL-C	EG	46.13 ± 4.19	49 ± 5.31	52.25 ± 4.2	34.18**
	CG	46.75 ± 2.37	48.13 ± 2.47	47.75 ± 2.49	2.10
	t	.32	.42	2.60*	
LDL-C	EG	91.1 ± 5.19	85.2 ± 7.67	73.95 ± 11.7	19.03**
	CG	92.62 ± 8.36	91.57 ± 8.88	92.52 ± 8.89	.29
	t	.43	1.53	3.57**	
TG	EG	110.13 ± 4.73	108.25 ± 4.86	90.50 ± 3.29	90.52**
	CG	108.63 ± 7.24	109.13 ± 7.49	105.88 ± 6.51	2.05
	t	.49	.27	5.95**	

As a result, TC decreased 9.85% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post - test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. The results of the study showing

positive changes in blood lipids in all types of exercise patterns^[24] support the results of this study. These results can be seen as a result of promoting the regulation of metabolism, such as increased lipid lipoproteinase, activation of oxidative enzymes in muscle mitochondria, and increased myoglobin concentration^[25].

HDL-C increased by 13.26% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. The results of a significant change in HDL-C in elementary school children after 12 weeks of exercise support the findings of this study^[25].

The TG was decreased by 17.82% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post test results showed differences between 0 and 5 weeks, 5 and 10 weeks. The control group did not change. The results of previous studies that showed a significant change in TG after long term exercise support this study^[21].

LDL-C decreased by 18.82% in the stepping exercise group after 10 weeks of exercise and showed a significant difference ($P < .01$) in the group treatment time. Post test results showed a difference between 0 weeks, 5 weeks and 10 weeks. The control group did not change. Previous studies in which the aerobic exercise of middle-aged women led to a significant change in LDL-C support this study^[10]. These results suggest that exercise may increase basal metabolism, fat-dissolving ability, and muscle mass, thereby decreasing LDL-C.

CONCLUSION

The results of the step box exercise conducted by obese middle school students showed that body composition and blood lipid were both positive. The results of this study showed that the step box exercise, which moves up and down the box with a height of 20.3cm, uses the glycogen and the blood lipid as the kinetic energy while using the femoral muscle, gastrocnemius muscle, and gluteus muscle as the major muscles in the body. It can be seen that blood lipids have changed positively. Therefore, step box exercise to students while they listen to their favorite music was found to be effective exercise methods for reducing obesity and promoting health.

Academic Resilience, Academic Stress, Self-leadership of Korea Nursing Students

Gye-Hyun Jung¹, Mi-Kyung Kang²

¹Department of Nursing, Deajeon University, 62 Daehak-ro, Dong-gu, Daejeon; ²Department of Nursing, Chungwoon University, Daehakgil, Hongseong-eup Hongseong-gun, Chungnam, Republic of Korea

ABSTRACT

Background/Objectives: The purposes of this study were to identify the degree of self-leadership, academic stress and academic resilience of Korean nursing students and apprehend influential factors to academic resilience.

Method/Statistical analysis: Data collection was conducted from December 28, 2017 to January 20, 2018, through a self-report questionnaire to 243 nursing students of Korea. Data were analyzed by frequency, percentage, mean and standard deviation, t-test, ANOVA, Pearson's correlation and multiple regression using IBM SPSS/WIN 22.0.

Findings: This study result confirmed that self-leadership showed a statistically significant positive correlation with academic resilience and academic stress showed a negative correlation with academic resilience among nursing students of Korea. The significant predictors of academic resilience for nursing students of Korea were self-leadership, perceived health status, academic stress. The explanatory power of these variables was 43.9%.

Improvements/Applications: The findings of this study suggest that the approach to the nursing curriculum reflection and program development so as to improve academic resilience of Korea nursing students. And when developing a program to improve academic resilience, the subjective health status of nursing students should also be considered.

Keywords: nursing, student, academic resilience, academic stress, self-leadership

INTRODUCTION

Korean nursing students experience emotional independence from their parents at the time of admission to the university, and various interaction and stress from physical, mental, and social relationship with their peers¹. Also, nursing education in Korea aims to cultivate practical and professional nurses who can integrate and apply knowledge related to health and apprehension about man based on scientific knowledge², but nursing students are under a lot of academic stress³.

Academic stress refers to inconvenient mental status such as mental, psychological burden, nervousness, anxiousness, concern, fear, depression and nervousness from studying and grade⁴. Korean nursing students experience academic stress due to tight schedule, intensive theoretic education, various and unfamiliar clinical practice environment and even due to financial concern⁵. Academic stress affects negatively to the psychosocial life of nursing student², could lead to termination of studying⁶, and even causes a vicious cycle of disabling acquirement of professional ability after graduation⁷. Thus, there is a need to develop teaching-learning strategy that could relieve academic stress of nursing students, and in particular, Korean nursing students need to develop their capabilities to overcome academic stress.

Self-leadership is one of the most important capabilities to handle academic stress⁸. Self-leadership, the process of influencing oneself, highlights

Chungwoon University, Korea

Email: bladeghost@hanmail.net

fundamental autonomy of man that influence oneself to give motivation to achieve a goal after setting one's own goal⁹. Those with high level of self-leadership could create more innovative and creative performance in tasks or problem solving process¹⁰. Thus, self-leadership is an essential element for Korean nursing student to adjust to desirable college life, and prepare professional capabilities as a nurse after graduation.

Meanwhile, academic resilience refers to a feature that generates successful result by overcoming excessive academic stress condition such as failure, low accomplishment and pressure in school and positively adjusting to the situation¹¹. According to previous researches about academic resilience, it is an important element that reduces academic stress of nursing students, and it was confirmed that higher academic resilience leads to positive adjustment to academic stress, higher academic performance and higher accomplishment in interpersonal relationship and occupation¹². Also, higher academic resilience improves problem solving and communicative ability², which enables positive adjustment to college life¹³. Thus, academic resilience is an important variable for Korean nursing students to positively adjust to situations involving massive amount of learning and unfamiliar practices to deal with academic stress.

However, researches that studied the relationship between self-leadership which enables students to handle academic stress in various situations and academic resilience which enables positive adjustment to situation are very insufficient. Thus, this study aims to apprehend academic stress, self-leadership and academic resilience of Korean nursing students, verify the influence of academic stress and self-leadership to academic resilience to provide basic data to development of education program for improvement of academic resilience of nursing students.

MATERIALS AND METHOD

Study design: This study is a descriptive research study to confirm the degree of self-leadership, academic stress and academic resilience of Korean nursing students and apprehend influential factors to academic resilience.

Study subject: The study conducted convenient sampling targeting nursing students from 3 universities located in C city, and D metropolitan city of Korea. To

confirm the adequacy of sample size of subjects, the study used G*Power 3.1.4 program. Based on significance level .05, effect size .15, and test power .95 for multiple regression analysis, the minimum number of sample was 172. The study applied 243 subjects for final analysis.

Study tool

Academic stress: Academic stress was measured using SAS (Scale of Academic Stress) developed by Park and Park¹⁴. This tool is composed of 45 questions with Likert's 6-point scale from 'strongly disagree (1 point)' to 'strongly agree (6 point)', higher point referring to heavier stress. The Cronbach's α , the credibility of tool was .96 in Park and Park's study¹⁴ and it was .96 in this study

Self-leadership: As for the self-leadership, the study used a survey which was revised and interpreted by Shin, Kim and Han¹⁵ considering conditions in Korea based on RSLQ (Revised Self-Leadership Questionnaire) developed by Neck and Houghton¹⁶. This tool is composed of 35 questions with Likert's 5-point scale from 'strongly disagree (1 point)' to 'strongly agree (5 point)', higher point referring to higher self-leadership. The Cronbach's α , the credibility of tool was .81 in Yang and Moon's study¹⁷ and it was .86 in this study.

Academic resilience: Academic resilience was measured by tool developed by Park and Kim¹⁸. This tool is composed of 29 questions with Likert's 5-point scale from 'strongly disagree (1 point)' to 'strongly agree (5 point)', higher point referring to higher academic resilience. The Cronbach's α , the credibility of tool was .84 in Nho's study¹⁹ and it was .94 in this study.

Data collection method and procedure: Data was collected from January 15 to February 28, 2018, and it took about 15~20 minutes to answer the questionnaire. Before the research, the researchers visited the nursing departments of four universities and explained to the director of the nursing department about the purpose of the study and the progress of the study. After that, the researchers explained to the nursing students the purpose and progress of the study and collected the data to nursing students who agreed. 261 Korean nursing students responded to questionnaire and total 243 copies excluding 18 copies with insincere or wrong answers were used in analysis.

Data analysis: The collected data was analyzed through IBM SPSS/WIN 22.0 program. General characteristics and

descriptive statistics of variables of Korean nursing students were analyzed in frequency, percentage, average and SD. The difference of academic resilience in accordance with general characteristics of Korean nursing students was analyzed using t-test or one ANOVA, sheffit's test. Correlation among self-leadership, academic stress, and academic resilience of Korean nursing student was analyzed using Pearson's correlation coefficients. Analysis on influential factors to academic resilience of Korean nursing student was conducted by using Stepwise Multiple regression.

Ethical consideration of the study: The study subjects were explained about the purpose of study, and those who agreed to participation self-report questionnaire. The subjects were able to start the questionnaire after signing the study agreement. In addition, the study consent formulated that the data collection is anonymous and that the collected data will not be used for research purposes in order to protect the personal information of the subject. The subjects understood that they can terminate the participation at any time and there is no disadvantage in dropping out of the study. Also, they received an explanation about confidentiality of private information.

RESULTS AND DISCUSSION

Results

General characteristics of subjects: The subjects of this study were 243 students, 74.1% of subjects were women and 43.2% were seniors. 56.8% of subjects received 200~30 thousand won per month as petty cash and 46.9% lived in dormitory. 72.8% of subjects did not attend club activity, and as for the subjective health condition, 50.2% were normal as seen in Table 1.

As for the difference in academic resilience of the subjects, gender, grade, GPA (grade point average), satisfaction on major, subjective health condition had significant influence. Post analysis results, male students had higher academic resilience than female students ($t=2.92, p<.005$). Also, academic resilience of senior was higher than freshman and sophomore ($F=4.96, p<.005$). Students with GPA between 3.5~4.0 had higher academic resilience than those with GPA lower than 3.0 ($t=3.46, p<.05$), and those with higher satisfaction on major had higher academic resilience ($t=22.22, p<.000$). The higher the subjective health condition, the higher the academic resilience ($t=14.40, p<.000$) as seen in Table 1.

Table 1: Difference in academic resilience by general characteristics (N = 243)

Characteristics	Categories	N(%)	Academic Resilience		Scheffé
			M ± SD	t/F(p)

Level of self-leadership, academic stress, and academic resilience of subjects: Self-leadership of subjects was average 3.41 out of 5. Among its sub-factors, self-clue (3.62) was the highest, and the lowest was self-conversation (3.20). Academic stress of subjects was 2.93 out of 6, and among its sub-factors the highest was GPA (3.16) followed by studying (2.87) and lecture (2.74). Academic resilience of subjects was 3.69 out of 5, and among its sub-factors, employment possibility (3.80) was the highest and the lowest was control studying (3.50) as seen in Table 2.

Correlation among self-leadership, academic stress, academic resilience of subject: Self-leadership of subjects had significantly positive correlation with academic resilience($r=.53, p<.000$), while academic stress had statistically significant negative correlation with academic resilience($r=-.38, p<.001$) as seen in Table 3.

Table 2: Level of self-leadership, academic stress, and academic resilience of subjects (N = 243)

Variables	M ± SD	Range

Influential factors to academic resilience of subjects:

To apprehend influential factors to academic resilience of subjects, the study conducted multiple regression analysis by setting academic resilience as dependent variable, and gender, grade, GPA, satisfaction on major, subjective health condition that showed significant difference among general characteristics in step 1, and self-leadership, academic stress that had significance correlation in step 2 as independent variables. The range of tolerance to all variables was 0.73~0.92, and the range of VIF (Variance Inflation Factor) was 1.08~1.36 which maintained

multicollinearity. The Durban-Watson statistic was 2.02 which confirmed normal autocorrelation as it is similar to 2. As the result of regression analysis, the influential factor to academic resilience of subjects ($F=48.75, p<.001$) were self-leadership ($\beta=.47, p<.001$), subjective health condition ($\beta=-.21, p<.001$) and academic stress($\beta=-.20, p<.001$)and such factors explained 43.9% of academic resilience of Korean nursing students as seen in Table 4.

DISCUSSION

This study aimed to find out academic stress, self-leadership and academic resilience of Korean nursing students, verify the influence of academic stress and self-leadership to academic resilience to provide basic data to development of education program for improvement of academic resilience of nursing students. The academic resilience of study subjects were 3.69 out of 5 which is similar to 3.67 from Bae and Park’s study², but higher than Shin’s study¹² 3.39. And as for the academic resilience in accordance with general characteristics of study subjects, there were difference in accordance with gender, grade, GPA, satisfaction on major and subjective health condition. This indicates the higher grade, higher GPA, and higher satisfaction on major is related to higher academic resilience which is similar to the result of Shin’s study¹². It seems academic resilience of nursing student differs by region, campus and department’s culture and place of practical training. As Bae and Park² suggested, to improve academic resilience, the students’ capability to overcome difficult and hard academic process, there is a need for not only the inner and outer resource of individual student, but also various learning strategy which will improve nursing students who study together under same objective. In addition, the instructor should be able to have positive thinking and achievement of nursing through feed-back between teacher and learner so as to solve diverse academic stresses of nursing students in developing learning programs to improve academic resilience something to do.

It was confirmed that when the self-leadership is high and academic stress is low, the subject’s academic resilience was high. When comparing academic resilience as the subordinate concept of resilience, it supported Lee’s study¹⁴ result that higher self-leadership leads to higher resilience. This indicates reinforcement of self-leadership capability for positive and constructive thinking can effectively handle stress, difficult situation or academic maladjustment, and that there is a need to consider a student instruction strategy that could improve functional handling ability with clear sense of goal toward career and academic motivation of nursing student through academic resilience.

Influential factors to academic resilience of nursing students were self-leadership, subjective health condition and academic stress ($F=48.75, p<.001$), and explanation power of these variables were 43.9%. This seems to improve capability²⁰ to effectively handle frustration and stress in academic scene through self-leadership¹⁴ to autonomously conduct task in efficient way. Also, when nursing students feel healthy physically, socially, and mentally, they will be able to carry out academic tasks with positive thoughts in new and difficult situations. Therefore, it is necessary to develop educational curriculum so that Korean nursing students can find various ways to solve academic stress efficiently. And, there is a need to develop a curriculum program linked with self-leadership to improve academic resilience of Korean nursing students.

This study result confirmed that self-leadership is the most influential antecedent predicting academic resilience of nursing students. Thus, it confirmed that changing students to discover behaviors to motivate themselves have positive mind and do construct thinking affects ability to effectively handle stress and crisis in academic scene. Also, the study is meaningful as it suggested a specific student instruction strategy to improve academic resilience.

Table 4: Factor affecting academic resilience of nursing students (N = 243)

Variables	Model I				Model II			
	B	SE	β	p	B	SE	β	p
(Constant)								
health	-5.02	1.39	-0.22	<.001	-4.78	1.20	-0.21	<.001
score	-2.66	1.11	-0.14	0.017	-1.68	0.96	-0.09	0.080
grade	-4.65	1.80	-0.15	0.010	-2.10	1.54	-0.72	0.156

Academic Stress					-0.08	0.02	-0.20	<.001
Adjustic. R ²	0.214				0.439			
F(p)	5.73(<0.05)				48.75(<.001)			

* Dummy variable: grade (4 = 0, other-1)

CONCLUSION

In conclusion, the academic resilience of Korean nursing students were higher when self-leadership was high and academic stress was low. Also, it was confirmed that the influential factors to academic resilience of nursing students were self-leadership, subjective health condition and academic stress, and the explanation power of the variables were 43.9%.

There is a need for aggressive student instruction to improve academic resilience and reduce academic stress of Korean nursing students, and developing and applying curriculum program considering self-leadership would be an effective strategy for academic resilience. In addition, since nursing students are able to solve their academic stress effectively and efficiently in studying nursing when they perceive themselves as healthy, it is important to develop a program to improve academic resilience in order to improve the physical, social and psychological health status of nursing students It should be considered.

This study targeted nursing students from 3 universities in C city, and D metropolitan city of Korea which makes it hard to generalize the result. Thus, this study hereby suggests a follow-up study by expanding number of samples of subjects from each region. Also, this study suggests a multilateral research regarding other influential factors to academic resilience based on the result of this study.

ABSTRACT

Background/Objectives: This study's purpose is twofold: to investigate the influence of smartphone use on the mechanical properties of upper trapezius muscle (UTM), forward head posture (FHP) and to examine the correlation between time spent using a smartphone, neck pain, and FHP.

Method/Statistical analysis: Thirty adults who average more than one hour of smartphone use per day participated in this study. We measured all participants' degree of the mechanical properties of UT and the craniovertebral angle (CVA) in normal conditions and during smartphone use. The order of experiments for both conditions was counterbalanced. We used Myoton to measure the mechanical properties (tone, elasticity, and stiffness) of UT, and we analyzed the CVA using a digital camera and ImageJ. Paired t test and Pearson correlation analysis were used for the statistical analysis.

Findings: The smartphone use condition was significantly lower in CVA than normal condition ($p < .05$). The smartphone use condition was significantly higher in both tone and stiffness for UT than when in normal condition, and the elasticity was lower ($p < .05$). The average smartphone use time per day was positively correlated with neck pain ($p < .05$), and neck pain was negatively correlated with CVA during smartphone use ($p < .05$). This study's findings suggest that smartphone use might increase the tone of UT and FHP.

Improvements/Applications: This study's findings suggest that smartphone use might increase the tone of UT and FHP.

Keywords: Smartphone, Mechanical property, Trapezius muscle, Forward head posture, Craniovertebral angle

INTRODUCTION

The smartphone has become one of the most important necessities for modern people in the information technology (IT) era; the number of smartphones subscribers in Korea exceeded 43 million in 2016 [1]. Although smartphones provide us with comfortable and efficient lives, they are also closely related to occurrences of conditions such as headaches,

neck pain, dry eye syndrome, anxiety, and smartphone addiction [2-4]. As smartphone use time increases, the induction of psychiatric and biomechanical problems also increases. In particular, it can induce forward head posture (FHP) among users, which is closely related to neck and disk pain [2-5].

Continuous sitting postures increase fatigue in muscles around the spine and aggravate lordosis and kyphosis in the waist and back; this is closely related to the aforementioned FHP [6]. Working in front of a computer for a long time or using a smartphone without moving for a long time increases tension in the neck and shoulder muscles [7]. This continued tension accelerates changes in the cells of skeletal muscles, which then

Corresponding Author:

Jin-Hwa Jung

Department of Occupational Therapy, Semyung University

E-mail: otsalt@nate.com

inhibit the correct support of the cervical spine and induce a load on the ligament that surrounds the corresponding joints [7]. This load excessively elongates the ligament and the ligament around the neck senses the pain very sensitively, thereby perceiving the nociceptive pain strongly [8].

Previous studies have reported that headaches that originate in the musculoskeletal system and neck pain are related, as are neck pain and activity of the upper trapezius muscle (UTM). Oksanen et al. [9] compared muscle activation of UTM during neck flexion among those who had tension headaches and migraines using electromyography (EMG). Their study reported that the tension headache group was related to changes in activities of upper trapezius. Chang and Lee [10] compared the muscle activity in the UTM and neck extensor muscles according to how the smartphone is held and body posture. Thus, study result of Chang and Lee [10] revealed significant differences in the activation of the UTM according to body posture.

Recent studies have examined the importance of the UTM. That is, stress and body fatigue are closely related to the UTM [11], which is controlled by the 3rd cervical vertebrae nerve root and innervated by the accessory nerve, which is the eleventh cranial nerve. Although this nerve is a motor nerve, it passes through the jugular foramen of the posterior cranial fossa alongside the vagus nerve that is responsible for the autonomic nervous system [12]. Two nerves are met in the inferior ganglion of the vagus nerve that passes through the jugular foramen of the posterior cranial fossa. Even though the accessory nerve is a pure motor nerve, it communicates with the vagus nerve; thus, the accessory nerve is closely related to the autonomic nerve's control. The trapezius and sternocleidomastoid muscles, which are innervated by the accessory nerve, experience pain together with frequent muscle tone increases under psychological stress [11-13].

Muscle tone is defined as resistance to passive stretch where the muscle's reflective drive or other effects in relation to muscles' mechanical elastic characteristics are reflected [14]. This muscle tone is affected by changes in the body. Previous research has introduced Myoton as a method of inspecting muscles' mechanical characteristics. The assessment of muscle characteristics using Myoton is less expensive than using surface EMG and simpler, thereby saving measurement time [15]. Myoton measurements showed a statistically significant association with the muscle activities of surface EMG [15, 16].

Although a smartphone is an indispensable necessity, it should be used properly so that modern people manage their healthcare [1-5, 17-19]. Previous studies have suggested the negative effects of excessive smartphones use [20, 21]. However, studies have not been conducted the influences of smartphone use on the mechanical characteristics of the UTM. In addition, correlations among smartphone use period, neck pain, and FHP need verification, which will be foundational data for future studies.

Thus, presents study aims to determine the influences of smartphone usage on the mechanical characteristics of the UTM and FHP and verify the relationship among the smartphone use period, neck pain, and FHP.

MATERIALS AND METHOD

Subjects: Present study involved experiments with 30 adults who used smartphones for more than an hour each day. The selection criteria for participants were as follows: (1) no surgical history in the neck or waist, (2) no history of neurological disease, and (3) no prior surgical procedures. The participant exclusion criteria were (1) less than one hour of smartphone use as self-reported and (2) no severe symptoms whose visual analog scale in neck pain was greater than seven points. The answers to the questions about the smartphone use time were obtained via oral interviews and participants were fully informed of the experiment and gave voluntary consent prior to the experiment. Table 1 presents the subjects' general characteristics. This study was approved by the Semyung University Institutional Review Board.

Table 1: General characteristics of the participants
Participants (n = 30)

Sex, n (%)	Male	15(50)
	Female	15(50)
Age (year) ^a	28.00 ± 2.60	
Height ^a	169.33 ± 7.84	
Weight ^a	61.77 ± 9.33	
Body mass index ^a	21.45 ± 2.15	
neck pain (VAS) ^a	3.17 ± 2.07	
Average time of smartphone use per day (hours) ^a	3.30 ± 2.22	
Footnotes. ^a mean±SD, VAS =Visual Analog Scale.		

Measurements

Myoton: A Myoton device (Tallinn, Estonia) was used to measure mechanical characteristics such as the muscle tone, muscle elasticity, muscle stiffness of participants' UTM. The measurements on the UTM were conducted in the same manner as that used in previous studies. The measurements on the UTM using the Myoton were conducted as follows: Participants were seated correctly and the measuring point of the UTM was marked by a pen at the horizontal midline connected from the acromion to the 7th cervical vertebra spinous process. Then, the probe was positioned to make the ground and muscle perpendicular to each other, followed by pressing the probe properly to enable proper measurement. The mechanical characteristics using Myoton were mostly expressed by muscle tone, muscle elasticity, muscle stiffness. Muscle tone is a quantified mechanical tone in muscles and its unit is Hz. Muscle elasticity refers to the muscle elastic property, and its unit is expressed as a log decrement. The stiffness refers to the level of hardness in muscle and its unit is N/m. The Myoton device's reliability is more than .90, which is very high [22].

Craniovertebral angle: The craniovertebral angle (CVA) was analyzed when the participants were seated to measure the FHP [6]; digital cameras and tripods were used in the analysis, the distance between the participant and camera was set to 0.8 m, and the right side of the participant was shot. The CVA was measured after attaching a marker to the tragus of the ear and 7th cervical vertebra spinous process and measuring the angle between the line parallel to the ground at the 7th cervical vertebra spinous process and the line that connects the tragus of the ear and 7th cervical vertebra spinous process. The analysis employed ImageJ (US National Institutes of Health, USA), and the CVA was measured twice repeatedly so that a mean value could be recorded. The CVA was analyzed when the participants were seated to measure the FHP [6]. Digital cameras and tripods were used in the analysis; the distance between the participants and the camera was set to 0.8 m and the right side of the participant was shot. The CVA was measured after attaching a marker to the tragus of the ear and spinous process of the seventh cervical vertebra and measuring the angle between the line parallel to the ground at the 7th cervical vertebra spinous process and the line that connects the tragus of the ear and 7th cervical vertebra spinous process. The analysis employed ImageJ, and CVA was measured twice repeatedly to record a mean value; this value was used in the statistics.

Procedures: The environment was the same for all participants, and subjects were seated in height-adjustable chairs to give them their most comfortable position. The CVA and mechanical characteristics of the UTM were measured while all participants took two states: seated comfortably and using smartphones. Counterbalancing was used to exclude the order effect of two states in the measurement. In addition, a rest was given between the two states to prevent fatigue. In the comfortable state, participants watched a television in front of them for three minutes. In the smartphone-using state, participants spent three minutes typing the Korean national anthem into the smartphone's message window. One evaluator took a photo to measure the CVA at each state, and measured the mechanical characteristics of the UTM in the right side and left sides. The evaluator was an occupational therapist with a six-year clinical career. The other evaluator who also conducted the analysis was also an occupational therapist; the evaluators had practiced the angle measurement sufficiently prior to the experiment.

Statistical analysis: The collected data were analyzed using Statistical Package for the Social Sciences 22 (SPSS 22). The participants' general characteristics were analyzed using descriptive statistics and the mechanical characteristics of the UTM were compared in a comfortable state and smartphone-using state, using a paired sample t test. Pearson correlation analysis was employed to analyze the correlation among smartphone-use period, neck pain, and FHP. Statistical significance was set at .05.

RESULTS AND DISCUSSION

The CVA was significantly lower in the smartphone-use state than in the comfortable state ($p < .05$) [Table 2]. The muscle tone and muscle stiffness in the UTM on the right and left sides were significantly higher in the smartphone-use state than the comfortable state, whereas the elasticity was significantly lower ($p < .05$) [Table 3]. The correlation analysis result among smartphone usage, pain, and CVAs during comfortable and smartphone-use states revealed that the smartphone-use time correlated significantly positively with neck pain ($p < .05$), but no correlation was found with CVA. Neck pain had a significant negative correlation with CVA during smartphone use ($p < .05$), but no correlation was found with CVA during the comfortable state ($p > .05$). The CVA during the comfortable state had a significant positive correlation with the CVA during smartphone use ($p < .05$) [Table 4].

Table 2: Comparison of forward head posture in two conditions

	Normal condition	Smartphone use condition	t	p
	Mean ± SD	Mean ± SD

Our study aimed to determine the effect of smartphone use on the mechanical characteristics in the UTM and FHP, and identify the correlation among smartphone-use time, neck pain, and FHP. The analyses of the study results are as follows:

The first study results showed that CVA was significantly lower the smartphone-use state than in the comfortable state. Kim et al. [20] analyzed the change in FHP according to smartphone use with 18 male and female adults; their study results showed that FHP worsened over time. This study verified that FHP was increased more significantly in the smartphone-use state than in the comfortable state even though the difference was not due to any time lapse.

In the second study results, the muscle tone and stiffness in the UTM on the right side and left sides were significantly higher in the smartphone-use state than the comfortable state, whereas the elasticity was

significantly lower. This findings was due to the increase in muscle tone and reduced elasticity in the UTM due to smartphone use. Interestingly, changes in the left trapezius muscle were discovered even though the task was conducted with the right hand; this was due to the unconscious compensation action of the human body to maintain the correct alignment for both sides of the body.

The increase in muscle tone in the UTM is one of the most mobilized compensable muscle movements at the time of functional disorder in the neck and shoulders and movements occur during incorrect posture [23]. In particular, office workers who have to work in a sitting posture for long periods experience increased muscle activity in the UTM, resulting in reduced muscle activities of lower trapezius muscle and serratus anterior muscle. The functional degradation in the lower trapezius and serratus anterior muscle is related to weakening and shoulder pain and increased imbalance of the shoulder joints; FHP increases the neck pain occurrence rate [23, 24].

In the third study results that included a correlation analysis, daily mean smartphone use time was positively correlated with neck pain significantly and neck pain was negatively correlated with CVA significantly during the smartphone-use state. Kim and Kim ^[21] reported that the mechanical characteristics of the UTM and smartphone addition scores of healthy male adults in their 20s correlated significantly. Hyperactivity in the UTM, which was a connecting portion between the neck and shoulder, was correlated with the stress index and pain ^[4]. In this regard, this study exhibited a significant correlation between smartphone use time and neck pain; the correlation between CVA and neck pain during the smartphone-use state implies that pain may be induced further by bad smartphone use habits. In addition, the CVA had a high correlation with the comfort and smartphone-use states, which implied that people with bad posture in normal times also had bad posture during smartphone use.

There was no significant correlation between smartphone use time and CVA; which means that the cause of FHP was not solely related to normal smartphone use time. The causes of the FHP can be varied ^[6]; for example, they can be constant work at a sitting position, computer games, excessive studying, fatigue, or aging. Since various causes are combined, no significant correlation was exhibited in particular ^[7]. The neck pain in this study had no significant correlation with the CVA in the comfortable state. Although neck pain was correlated with CVA in the smartphone-use state, it did not in the comfortable state; the reason for this was varied and included psychological problems ^[11]. In fact, some studies reported that FHP and neck pain had a significant correlation, but other studies reported no correlation. Thus, the authors of this study recommend the need for further research based on the correlation relationship of this study, and a few participants should not be overlooked.

The limitations of this study are as follows: first, the mean age of subjects in this study was 28 years, which was relatively young. Thus, the results in this study cannot be generalized for the entire population. Second, this study only verified the short-term effect, as the smartphone use time was set to three minutes in the experiment. Thus, verifying the change over time in a future study is necessary. Third, the number of samples was rather small for the correlation analysis conducted in

this study. Finally, only subjects with neck pain classed as mild-to-moderate pain were selected in this study; thus, differences in patients with severe pain cannot be discussed.

CONCLUSION

This study aims to determine the effect of smartphone use on the mechanical characteristics of the UTM and the FHP and verify the correlation among the smartphone use period, neck pain, and the FHP. The study results exhibited that the CVA was significantly lower in the smartphone-use state than in the comfortable state ($p < .05$), and muscle tone and stiffness in the UTM on the right and left sides were significantly higher in the smartphone-use state than in the comfortable state, whereas elasticity was significantly lower ($p < .05$). The daily mean smartphone use time was significantly positively correlated with neck pain ($p < .05$) and neck pain was significantly negatively correlated with CVA during the smartphone-use state ($p < .05$). Our study results indicate that smartphone use will increase muscle tone in the UTM and FHP. A highly qualitative level of long-term research is needed in future studies.

ABSTRACT

Background/Objectives: This study is a descriptive and investigative study that was conducted to identify the association and correlation among the service quality, organizational characteristics and job satisfaction of caregivers.

Method/Statistical analysis: Subjects of this study were 129 caregivers working at long term care insurance facilities located in city S. SPSS 20.0 program was used for analysis.

Findings: The service quality of caregivers and a significant positive correlation with job satisfaction ($F=.432, P<.001$) and organizational characteristics ($F=.248, P=.007$).

Improvements/Applications: It is hoped that the findings of this research will help improve the service quality of caregivers to make the long term care insurance system more stable.

Keywords: Caregivers, Long term care insurance system, Service quality, Organizational characteristics, Job satisfaction

INTRODUCTION

With progress in medicine and science, life expectancy has grown, leading to an increase in the elderly population and an extension of one's later years ^[1]. Korea, too, has been rapidly entering an aging society. By 2018, Korea becomes an aging society where the share of those aged 65 or older accounts for 14.3% of the total population. By 2026, the share will increase to 20.8%, to make Korean society a super-aged society ^[2,3]. In Korea, caregiving for the elderly was traditionally seen as entirely the responsibility of direct family members. But with the rapid aging of the society, more women entering the work force and changes in the family structure, the need for society to share the burden has been raised. This led to the launch of long term care insurance system. Caregivers that carry out

the tasks within the system are increasingly taking on an important role ^[4].

With the introduction of the long term care insurance system, the elderly can ease the burden imposed on their children while receiving more systematic and professional services that allow for higher quality of life. Moreover, children of aged parents can be relieved of the mental, physical and financial burden of having to take care of their parents to focus on their social and economic activities ^[5]. From these aspects, various attempts and studies to improve the quality of services provided by caregivers of the elderly are needed.

With the launch of the long term care insurance system, caregivers are providing services on the front line. Caregivers provide help with household chores or bodily care either at the elderly people's own home or long term care facilities ^[6]. Therefore, care givers are the direct service providers who are closely associated with the quality of elderly welfare services ^[7]. At a time when approximately a decade has passed since the job category of 'caregivers' was born, there are over 310,000 caregivers currently active on the front line, with 1.33 million licensed people in total ^[6]. They receive a low

salary, work long hours and suffer from job insecurity. Many have pointed out that these factors lead to low quality services provided by them. [8]. The service quality of caregivers will likely be associated with their job satisfaction and organizational characteristics of their job as they carry out such diverse tasks. Improvements need to be made to instill pride in caregivers about the work they carry out.

As such, this study analyzes the association among the service quality, organizational characteristics and job satisfaction of caregivers to provide basic data that can be used for the development of a program that can help improve the service quality of caregivers.

MATERIALS AND METHOD

Design of the study: This study is a descriptive and investigative study conducted to identify the association and correlation among the service quality, organizational characteristics and job satisfaction of caregivers.

Study subjects: Study subjects were caregivers working at long term caregiving facilities located in city S. To select subjects, convenience sampling was used to select 134 caregivers working at long term care facilities. These participants understood the objectives of the study and gave their consent to the questionnaire. Excluding 5 copies of the questionnaire that were not retrieved or that had insufficient responses, the data from 129 subjects were used for final analysis.

RESEARCH TOOLS

Service quality: Service quality refers to the score measured using the SERVQUAL scale of Parasuraman, Zeithmal, & Berry [9]. Using a total of 16 questions divided into 4 sub-categories, the tool consists of 2 questions on reliability, 6 questions on responsiveness and guarantee, 4 questions on empathy and 4 questions on typicity. Measured on a 5 point Likert scale, higher scores indicate a higher quality of services as perceived by the caregiver herself. Cronbach's $\alpha = .876$ in this study.

Job satisfaction: Job satisfaction was measured using the Job Descriptive Index (JDI) scale of Smith, Kendall, & Hulin [10]. It consists of a total of 29 questions in 5 categories, covering job satisfaction (6 questions), work environment (4 questions), job security of the caregiver (6 questions), interpersonal relations with colleagues, supervisors and the elderly (5 questions), and compensation and job changes (8 questions). Measured

on 5 point Likert scale, a higher score indicates higher job satisfaction. Cronbach's $\alpha = .754$ in this study.

Organizational characteristics: Organizational characteristics were measured using the tool that was revised from the original tool developed by Dieterly and Schneider [11]. Consisting of a total of 14 questions, the sub-categories cover autonomy, operational structure of the organization, compensation structure or level, and consideration of the supervisor. Measured on a 5 point Likert scale, a higher score indicates a higher degree of a given organizational characteristic. In this study, Cronbach's $\alpha = .845$.

DATA COLLECTION AND PROCEDURES

Data for the study were conducted using a self-reported structured questionnaire on caregivers working at long term care facilities in city S, from May 2 to May 28, 2017. To abide by ethical standards, the objectives of the study, an explanation was given on the time it will take to fill out the questionnaire, and details regarding privacy protection of study participants before asking for their voluntary consent. A consent form and signature of caregivers wishing to take part in the study were collected. Participants were told that they are free to withdraw from the study at any point in time. They were also informed that the collected data would be used for no other purpose than this study, and the anonymity of the participants will be upheld. It took approximately 10-15 minutes to complete the questionnaire. Participants were given an explanation that the collected data would not be used for any other purpose than this study.

DATA ANALYSIS

The collected data were analyzed using SPSS 20.0. The general characteristics of the participants were analyzed in real numbers and percentages. The service quality, organizational characteristics and job satisfaction of participants were analyzed using the mean and standard deviation. The correlation among the service quality, organizational characteristics and job satisfaction of participants were analyzed using Pearson's correlation coefficients.

RESULTS AND DISCUSSION

General characteristics of study subjects: The general characteristics of study subjects are as seen in Table 1. In terms of gender, there were 117 females (100%). There were 30 people (25.6%) aged 50-59 and 62 people (53%)

aged 40-49. In terms of marital status, there were 105 people (89.7%) who were married and 7 people (6.0%) who were single. In terms of educational background, there were 59 people whose final education was high school (50.4%) and 58 people whose final education was university (49.6%). In terms of religion, 77 people identified themselves as Christian (65.8%) which was the highest share. The most common response given for work experience as a caregiver was 2-3 years, with 53 subjects (45.3%) giving this response. The highest number of people at 97 people (82.9%) took the license test to acquire a license for their profession, and 51 people (43.6%) answered that their health status was average, which was the most common response given.

Table 1: General Characteristics

(N = 117)

Characteristics	Categories	n (%)
Gender	Female	117(100)
	Male	0(0)
Age(years)	40-49	62(53)
	50-59	30(25.6)
	Over 60	25(21.4)
Marital Status	Single	105(89.7)
	Married	7(6.0)
	Divorce or Bereavement	5(4.3)
Final Education	High school graduate	59(50.4)
	College graduate	58(49.6)
Religion	Christian	77(65.8)
	Catholicism	18(15.4)
	Buddhism	6(5.1)
	Other	1(0.9)
	None	15(12.8)
Caregiver Caregivers (years)	1-2	37(31.6)
	2-3	53(45.3)
	3-5	23(19.7)
	Over 5	4(3.4)
Types of Certification	No examination/ By education	20(17.1)
	As a qualification	97(82.9)
Health Status	Very healthy	6(5.1)
	Healthy	34(29.1)
	Usually	51(43.6)
	Bad	26(22.2)

Range of variables for the subjects: The range for service quality was 2.98 ± 0.19 points, while it was 3.31 ± 0.47 points for reliability, 2.82 ± 0.35 points for responsiveness and guarantee, 2.96 ± 0.33 points for empathy and 3.06 ± 0.36 points for typicity. Job satisfaction scored 3.31 ± 0.26 points, while organizational characteristics scored 2.84 ± 0.13 points. The range of all variables concerning the subjects seen in Table 2.

Table 2: Degree of the Variable of the Subject

(N = 117)

Variables	M ± SD	Min.	Max.
Service Quality	2.98 ± 0.19	2.63	3.44
Reliability	3.31 ± 0.47	1.50	4.50
Responsiveness and Guarantee	2.82 ± 0.35	2.33	3.67
Empathy	2.96 ± 0.33	2.50	4.00
Typicity	3.06 ± 0.36	2.25	3.75
Job Satisfaction	3.31 ± 0.26	2.59	4.03
Organizational Characteristics	2.84 ± 0.13	2.60	3.27

The correlation between variables concerning study subjects: The service quality of caregivers was found to have a significant positive correlation with job satisfaction ($F = .432, p < .001$) and with organizational characteristics ($F = .248, p = .007$). In addition, job satisfaction was found to have a significant positive correlation with organizational characteristics ($F = .323, p = .003$) [Table 3].

Table 3: Relationships among the Study Variable

(N = 117)

Variables	Service Quality	Job Satisfaction	Organizational Characteristics
	r(p)	r(p)	r(p)
Service Quality	1	.432 (<.001)	.248 (.007)
Job Satisfaction		1	.323 (.003)
Organizational Characteristics			1

DISCUSSION

This study was conducted to identify the association and correlation among the service quality, organizational characteristics and job satisfaction of caregivers, thereby providing basic data for the development of a program that can improve the service quality of caregivers in preparation of a super-aged society.

First, in this study, service quality had a high correlation with work satisfaction. Despite sufficient fostering of personnel in the field, the low job satisfaction, burnout and stress of caregivers continue. In the study by [7], too, the service quality of caregivers and their job satisfaction had a significant correlation, which is in line with the findings of this study. Among the job satisfaction factors, satisfaction with the work itself had the greatest impact, followed by job security. This indicates that by improving the satisfaction level with the work itself and job security, we can expect the service quality of caregivers at long term care facilities to improve, as well.

Second, in this study, organizational characteristics were found to have a high correlation with service quality and with job satisfaction. In this study, organizational characteristics consist of autonomy, operational structure of the organization, compensation structure and consideration of the supervisor. According to the study by [12], the difficulties at work for caregivers include insufficient salary, heavy work load, physical stress due to work, conflict and stress caused by co-workers, unsatisfactory handling of accidents at work, stress caused by the guardians and ineffective re-training.

A review of preceding studies on the job satisfaction of caregivers shows that in the study by [13], those with a better health status, those who work in caregiving to feel a sense of emotional reward, and those who interact with the elderly whose attitudes are positive had a higher job satisfaction. In the study by [14], overall job satisfaction had the highest correlation with the relationship with colleagues, followed by supervision, work tasks, facilities, general job satisfaction and salary. Moreover, in the study by [15], job satisfaction was higher when employment form was more stable, salary was higher, self-esteem was higher, commitment to the organization was higher, and burnout was lower. Therefore, various programs and training must be attempted to encourage caregivers to autonomously work and feel a sense of

reward and joy, as well as to improve the operation of the organization and the compensation structure. In addition, increased communication with the supervisor at long term care facilities will also help in improving the work environment.

Third, in this study, the sub-factors of service quality were reliability, responsiveness, guarantee, empathy and typicality. Caregivers undergo re-training on a continuous basis to further develop knowledge and capabilities required on the job. Through such specialized training, their qualifications and interpersonal relations improve while work stress decreases, leading to higher job satisfaction and subsequently improved service quality [12]. According to the study by [8], job training at long term care facilities is provided in the same manner, raising the need for a differentiated training according to the type of care facility and job experience of the caregiver. To improve the service quality of caregivers, job training that reflects to support physical activity and provides education to improve the mental and physical functioning of the elderly at the long term care facilities must be provided. At the same time, the content of the training must be associated with the accumulation of work experience so that expertise and capabilities can be built, job satisfaction increased, and better quality care given at the facilities. In addition, according to the findings of a qualitative study on the experience of caregivers engaging in the care of those with dementia, caregivers wish to receive various programs that they can apply to the elderly.

They also discussed their difficulty in dealing with the lack of time to provide quality services, and their wish to receive better understanding from the elderly as well as their guardians, based on education provided to the elderly and their guardians [16]. Therefore, education that takes into account the number of years of experience of the caregiver is needed.

CONCLUSION

Based on the findings of this study that there improved service quality is correlated with job satisfaction and with organizational characteristics, the following can be suggested. First, this study was conducted in a limited area and therefore the findings cannot be generalized to apply to all caregivers. For a more generalized conclusion, expanding the study to include various areas is suggested. Second, a qualitative

study is suggested for a more in-depth understanding of organizational characteristics of caregivers, or the factors that undermine service quality or job satisfaction of caregivers. Lastly, a program to improve the service quality of caregivers based on the findings of this study is suggested.

ABSTRACT

Background/Objectives: This study was conducted to apply TBL to classes of university students majoring in nursing studies to improve self-directed learning capability, increase learning transfers and learning ability and improve satisfaction with classes by having the students engage in critical thinking and experience an environment similar to clinical settings.

Method/Statistical analysis: This study is a quasi-experimental before and after research using a non-equivalent control group to verify the effects of TBL on the nursing students' self-directed learning capability, learning transfer and satisfaction with classes.

Findings: The study found that while there was a statistically significant difference in self-directed learning capability and learning satisfaction in TBL classes for nursing students, there was no statistically significant difference in learning transfer.

Improvements/Applications: A strategy involving new instruction and learning methods to improve self-directed learning and learning satisfaction in TBL classes for nursing students is needed.

Keywords: *Team-based learning, Self-directed learning capability, learning transfer, learning satisfaction, student perceptions*

INTRODUCTION

According to General Professional Education of the Physician Report of 1985 by the American Association of Medical Colleges, there needs to be a shift for medical education from one that focuses on the delivery of knowledge to one that is outcome-based. This report thus presents the standards for educational goals by setting the minimum level of achievements that must be met by students after graduation^[1]. Such outcome-based goals required a change in instruction methods, which

led to the adoption of team-based learning (TBL), and a move away from traditional lectures^[2].

The goal of TBL is not knowledge transmission but knowledge application^[3]. Therefore, the instructor must take on the role of developing the curricula and running the class to promote learning, which goes beyond the simply delivery of knowledge. Meanwhile, learners need to go beyond simply memorizing and understanding knowledge to proactively explore, collect and comprehensively analyze information to become an agent of learning who can solve problems^[2]. In addition, TBL sets itself apart from traditional lectures and classes in that it addresses the problem-solving process that may occur in actual clinical settings, based on team activities^[4].

Most preceding studies on TBL were conducted on medical students, their academic achievements or capabilities^[5,6], clinical extrapolation capabilities^[7]

and development of emotional intelligence [8]. Nursing students, too, need to be familiar with the clinical environment and be equipped with clinical extrapolation capabilities just as medical students do. It is important to have the capabilities to apply knowledge to various uses, rather than simply understanding said knowledge. However, TBL in universities of nursing is only carried out for a handful of subjects. Facilities or the development of related curricula are also lacking, as is related studies.

As such, this study was conducted to verify the effects of TBL programs for nursing students on their self-directed learning capabilities, learning transfer and satisfaction with the class.

MATERIALS AND METHOD

Design: This study is a quasi-experimental before and after research using a non-equivalent control group to verify the effects of TBL on the nursing students' self-directed learning capability, learning transfer and satisfaction with classes.

Participants: The subjects of this study were fourth year students majoring in nursing studies at two 4 year universities located in city S. Convenience sampling was done from a total of 82 students enrolled in their fourth year and who were taking the nursing management course. Those who understood the objective of the study and consented to take part in the study but who had no prior experience with TBL were selected. In terms of experimental intervention, to prevent the expansion of intervention, the university in which the subjects of the experiment group and of the control group was made sure to be different. An explanation of the study was given to each university, after which a consent was acquired before conducting the research.

First, students enrolled in universities that were similar to the universities of those in the experiment group were selected, in particular, in terms of the curriculum, number of students, size of the university, educational environment and experience of the instructor of nursing management courses. Of students who were enrolled in the nursing management course, 42 and 40 students respectively, were selected as the experiment group and the control group. A total of 82 subjects were used for the final analysis. The number of sample subjects was calculated as 80 when G*POWER3.1 was used, and the significance level of $\alpha=.05$, an effect size of .65, and a

power of .80 were set for the independent sample t-test. Given the attrition rate, it was decided that a total of 82 subjects each for the experiment group and the control group would be selected.

STUDY TOOLS

Self-directed learning capability: Self-directed learning capability refers to the score measured using the tool developed by Bae & Lee [9]. This tool consists of a total of 21 questions that can be broken down to three categories of cognition, definition and behavior. A higher score indicates a higher degree of self-directed learning capability. In this study, Cronbach's $\alpha=.903$.

Learning transference: Learning transference was measured using 6 questions on a 7 point Likert scale. These questions were used in the study by Choi et al. [10] that focused on the third level out of the four level evaluation model of Kirkpatrick [11], which was the behavior level. A higher score indicates a higher degree of learning transference. At the time the tool was developed, Cronbach $\alpha=.90$, and in this study, Cronbach $\alpha=.895$.

Learning Satisfaction: Learning Satisfaction refers to the score measured using the tool developed by Kim [12]. This tool consists of 10 questions in total, measured on a 6 point Likert scale. A higher score indicates a higher degree of satisfaction with the class. At the time of the tool's development, Cronbach $\alpha=.58$ while in this study, Cronbach $\alpha=.935$.

Data collection process and ethical considerations: To uphold the rights of the study subjects, before data were collected they were informed of the objective and methodology of the study, the gains and losses that may occur from participating in the study, guarantee of privacy, voluntary participation and the freedom to withdraw from the study without concerns for being placed at a disadvantage. Signatures were acquired on a consent form from students who gave their consent to participation in the study. Those in the control group were given at the beginning of the intervention lecture materials that had the same content as in the weekly lectures received by the experiment group. The control group was also given materials on TBL, after the post-test was completed. To minimize the Hawthorne effect, or any other effect caused by the situation or the person conducting the experiment, a double blind device was

applied so that neither the data collator nor the subject would know which group they were a part of.

TBL program procedures: TBL methods were applied to the course on the theory of nursing management, from April 3 to May 12, 2017, for 1 hours per week and for a total of 6 hours in accordance with the established learning goals. After the TBL program was applied, self-directed learning capabilities, leaning transference, self-respect and learning satisfaction were reviewed. Factors affecting the students’ satisfaction with the class would be identified in this manner. The TBL class will be consisted of a total of 3 stages as shown in table 1. The first stage is the pre-class: reading preparation stage. In this stage, notices are given so that students

are encouraged to carry out self-directed learning in accordance with the set learning goals.

The second stage is the readiness assurance stage, where the problem-solving content of the class was verified through an Individual Readiness Assessment Test (IRAT) and Team Readiness Assessment Test (TRAT). The third stage is the stage where course concepts are applied. To confirm problem-solving skills with a focus on cases, students were encouraged to apply the concepts learned through a discussion and collaborative process. Students check the problems on their own and engage in feedback within the team. Immediate feedback from the instructor is offered to the students, and in the wrap-up stage of the class a mini-lecture was offered to do a final review of what was learned.

DATA ANALYSIS

Data collected for the study were analyzed using the SPSS (Statistical Package for the Social Science) WIN 20.0 as follows, to review the effects of TBL. The general characteristics of study subjects were analyzed using frequency, percentage, mean and standard deviation.

1. The homogeneity test for the general characteristics of study subjects was carried out using the X2-test

and Fisher exact test. The homogeneity test for this study variables was done using ANOVA.

2. To review whether self-directed learning capabilities, learning transference and learning satisfaction had a normal distribution, the Kolmogorov-Smirnov test was applied, confirming a normal distribution.
3. An independent t-test was carried out to review the effects on self-directed learning capabilities,

learning transference and learning satisfaction in the control group and the experiment group.

- The reliability of the tools used in the study was verified with Cronbach’s Alpha Coefficient.

RESULTS AND DISCUSSION

Verification of homogeneity for the general characteristics of study subjects and dependent variables:

The general characteristics of the control group and the experiment group are as seen in <Table 2>. In terms of residence, in both groups own home showed the highest frequency, with 33 people (82.5%) for the control group and 33 people (78.6%) for the experiment group. In terms of the type of high school graduated, both groups had a high frequency for liberal arts high schools, with 33 people (82.5%) for the control group and 37 people (88.1%) for the experiment group. Those between the ages of 19 and 25 accounted for the largest share in both groups, with 32 people (80.0%) in the control group and 33 people (78.6%) in the experiment group. In terms of the satisfaction with university life, ‘average’ was the most frequently given response, with 26 people (65.0%) in the control group and 26 people

(61.9%) in the experiment group. Those without a religion accounted for the largest share in both groups, with 19 people (47.5%) for the control group and 25 people (59.5%) for the experiment group. In terms of satisfaction with nursing studies as a major, 22 people in the control group (55.0%) gave ‘satisfactory’ as the most frequent response, while 23 people (54.8%) in the experiment group gave ‘average’ as the most frequent response. Asked how helpful they thought a unilateral lecture by the professor is, in both the experiment group and the control group, 26 people each (65.0%) answered that they don’t know and 20 people each (47.6%) answered that they hadn’t thought too much of it. When asked whether they like the discussions with classmates and presentations, 19 people (47.5%) and 27 people (64.3%) in the control group and the experiment group, respectively, answered that they did not like it very much. There was a high frequency in both groups of those who answered that studying with an autonomously set learning assignment would be somewhat helpful, with 26 people (65.0%) in the control group and 26 people (61.9%) in the experiment group. There was no significant difference between the two groups in terms of general characteristics.

Homogeneity test for the dependent variables of the control group and the experiment group: A verification of homogeneity in the dependent variables of the control group and the experiment group showed that there was homogeneity <Table 3>. The control group and the experiment group did not show statistically significant difference in self-directed learning ($t=-.633, p=.531$), learning transference ($t=.136, p=.893$) or satisfaction with the class ($t=-1.443, p=.150$) before the TBL-based program was conducted. Therefore, there was no significant difference in the self-directed learning, learning transference or satisfaction with the class between the two groups before TBL-based program was conducted, and as such, the homogeneity of the control group and the experiment group was confirmed.

Table 2: Homogeneity Test of Self-directed learning, Learning transference and Learning Satisfaction between Experimental and Control Group

Cont.=Control group.; Exp.=Experimental group

The effect of TBL programs on self-directed learning, learning transference or Learning Satisfaction: Table 3 shows the results of analyzing the effects that TBL programs have on self-directed learning, learning transference or satisfaction with the class. Self-directed learning of the control group scored 77.28 ± 8.64 points, while the experiment group that underwent TBL programs scored 80.98 ± 7.09 , with a statistically

significant difference ($t=2.71, p= .008$). Learning transference of the control group scored 34.98 ± 4.14 points, while that of the experiment group scored 39.64 ± 15.79 points, with no statistically significant difference ($t=1.65, p= .109$). Satisfaction with the class for the control group scored 47.18 ± 5.33 points, while for the experiment group it was 54.26 ± 15.53 points, with statistically significant difference ($t=3.23, p= .002$).

DISCUSSION

TBL is recognized as an instruction method that shifts medical education that was originally instructor-oriented, into one that is more student-oriented with a focus on settings similar to actual clinical settings. As such, this study was conducted as a quasi-experimental before and after research using a non-equivalent control group to verify effects that TBL has on the self-directed learning capabilities of nursing students, their learning transference, self-respect and satisfaction with the class.

The analysis shows that while there was statistically significant difference in self-directed learning and learning satisfaction in TBL classes for nursing students, there was no statistically significant difference in learning transference. Learning transference refers to the application of acquired knowledge, technique and attitude through learning to the scene of practice^[13], and refers to changes through education not only to cognitive elements but also execution. However, in this study, the degree of changes to learning transference after TBL was surveyed and analyzed using a self-reported questionnaire. As such, for a more accurate verification of the findings, measurement of the changes in execution is recommended. In addition, for effective TBL classes, an appropriate educational environment including a computer based test system and round table, are needed^[14]. The application of tools that can promote interaction, such as the use of an audience response system, would also be effective^[15]. Therefore, an environment that can maximize the efficiency of TBL classes would have to be established.

According to preceding studies, TBL has many advantages. Okubo et al.^[7] confirmed through a

problem-solving ability test (P-SAT) before and after a TBL program that the students' clinical extrapolation skills had improved. Borges et al.^[8] confirmed through a Workgroup Emotional Intelligence Profile-Short Version (WEIP-S) that TBL programs also have a positive effect on the development of emotional intelligence in students.

Vasan et al.^[5] compared the scores for the National Board of Medical Examiners before and after medical students undertook TBL programs and found that compared to the traditional instruction methods, TBL had a greater effect on improving academic achievement in students. Moreover, Parmelee & Hudes^[6] noted that TBL improves medical professionalism and feedback capabilities, and offers training to foster students into life-long learners.

TBL is an education method that allows for interaction between the instructor and the student to realize a more student-oriented, integrated education^[16]. This researcher hopes that through active studies on the various media and experiences that can be applied to nursing education, the quality of nursing education can be improved. This study sought to verify the effect that TBL has on self-directed learning capabilities, learning transference, self-respect and satisfaction with the class using university students of nursing as study subjects. While there was statistically significant difference in self-directed learning capabilities and satisfaction with the class, there was no statistically significant difference in learning transference.

CONCLUSION

Based on the findings of this study, follow-up research is suggested as follows. First, while this study

sought to verify the effect that TBL has on self-directed learning capabilities, learning transference, self-respect and satisfaction with the class using university students of nursing as study subjects, a follow-up study should be conducted to identify the various effects that TBL may have. Second, as this study used only nursing students from one university of nursing, research should be continued using a wide range of subjects to verify the effects of TBL. Third, it is suggested that various curricula using TBL be developed, based on the findings of this study.

The Relationship between Oral Health Awareness and Successful Aging in Middle-Aged Women

Eun-Sil Choi¹, Young-Soo Lee²

¹Research Scholar, Department of Public Health Sciences, Graduate School, Korea University, Seoul, Korea; ²Associate Professor, Department of Dental Hygiene, College of Health Sciences, Sunmoon University, Asan, Korea

ABSTRACT

Objective: This study aims to assess the relationship between oral health awareness and successful aging in middle-aged women.

Method: The subjects of this study were 198 middle-aged women aged 40-60 years. The dependent variable was recognition of successful aging. The independent variable was oral health awareness. To confirm the effect of oral health awareness on the recognition of successful aging, oral health awareness and the recognition of successful aging were dichotomized using the median value and a logistic regression analysis was carried out.

Findings: After adjusting for confounding variables, the recognition of successful aging was 3.74 times higher in subjects with good oral health awareness than in subjects with poor oral health awareness (OR=3.74, CI: 1.99–7.03)

Improvements: This study will provide evidence to support the idea that improving oral health awareness is important for successful aging.

Keyword: *aging, middle-age, oral health awareness, successful aging, women*

INTRODUCTION

The United States Census Bureau reports that the size of aging population (over 65 years) will double by 2050. ¹ “Successful aging” is a worldwide topic of interest. ²⁻⁴ Although the prognostic factors of successful aging may differ due to cultural heterogeneity, ⁵ subjective health awareness, health condition, and age are reported to be associated with successful aging in general. ⁶⁻⁸

Increasing age results in greater exposure to chronic diseases and more frequent experiences of deteriorating oral health, due to periodontitis and tooth extraction. Oral health in the elderly population is functionally crucial

for proper nutritional (food) intake. Previous studies that assessed the association between successful aging and oral health have demonstrated that elderly people with more natural teeth have better recognition of successful aging. ^{9,10} The symposium led by the Oral Research group in the year 2000, on the topic of “successful aging with oral health maintenance,” demonstrated that oral health maintenance is a crucial factor in successful aging. ^{9, 11,12}

The middle-aged population will begin to exhibit greater interest in health and elderly life in the near future. More specifically, middle-aged women undergo menopause and begin to exhibit increased levels of anxiety and depression. ¹³ Although previous studies have found an association between middle-aged women and preparation for old age in general, ^{14,15} few studies have investigated the relationship between oral health in middle-aged women and recognition of successful aging. Since oral health and aging are closely related, the awareness of middle-aged women of the association between oral health and successful aging should be evaluated.

The present study aims to assess the relationship between oral health awareness and successful aging in middle-aged women.

MATERIALS AND METHOD

Subjects and data collection: In this study, a survey questionnaire was completed by 250 middle-aged (40–60 years old) women residing in different regions of the city of Seoul, between June 30, 2014 and September 30, 2014. After excluding inappropriate and incomplete surveys, the responses of 198 subjects were included in the analysis.

Study materials: The dependent variable was recognition of successful aging. A modified version of the measurement tool used to assess the recognition of successful aging—previously developed by In and Kim¹⁶—was used in this study. The survey included 23 questions rated using a 5-point Likert scale, designed to assess individual growth (11 questions), health and economy (7 questions), and the pursuit of meaning in life (5 questions).

The independent variable was oral health awareness, assessed using a modified version of the measurement tool developed by Kim.¹⁷ With a total of 17 questions rated using a 5-point Likert scale, information was collected on the participants' general characteristics, including age (40–60 years), level of education (\leq high school or \geq college), average monthly household income (\leq 300, 301–400, or \geq 401, in ten thousand won), children in the house (yes or no), financial status satisfaction (poor or good), subjective health condition (poor or good), and menstruation (yes or no).

Methods of Analysis: A frequency analysis was carried out to assess the distribution of general characteristics. In addition, the skewness and kurtosis of the key variables—including oral health awareness and recognition of successful aging—were validated. As Kolmogorov-Smirnov and Shapiro-Wilk test results showed a lack of normality, nonparametric analyses were carried out. Differences in the recognition of successful aging based on general characteristics were assessed using the Mann-Whitney test or Kruskal-Wallis test, with a post-hoc multiple comparison conducted if necessary. To confirm the effect of oral health awareness on the recognition of successful aging, oral health awareness and the recognition of successful aging were

dichotomized using the median value and a logistic regression analysis was carried out. Statistical analyses of the collected data were performed using SPSS 22.0 version (IBM Co., Armonk, NY, USA), with statistical significance at $P < 0.05$.

RESULTS

General characteristics of the study subjects and the distribution of key variables: Looking at the general characteristics of the subjects, all of the subjects were 40–60 years old, with 40.4% in the 45–50 group and 31.3% in the 51–55 group. 66.7% of the subjects had \leq high school level of education. In terms of average monthly income, 33.8% of the subjects had \leq 300 while 37.4% had \geq 401 ten thousand won. The remaining 28.8% had an average monthly income of 301–400 ten thousand won. 97% of the subjects had children in the household and 79.3% described their financial status satisfaction as “good.” 85.4% were satisfied with their subjective health condition and 28.8% had experienced menopause (Table 1).

The final scores for the 17 questions about oral health awareness were distributed between 36 and 85, with 71.5 being the median value. The final scores for the 23 questions on recognizing successful aging were distributed between 60 and 115, with 97 being the median value (Table 2).

Differences in the recognition of successful aging: Looking at differences in the recognition of successful aging based on general characteristics, there is clearly a significant difference in the recognition of successful aging associated with average monthly household income ($p < 0.05$). A post-hoc analysis showed no difference between the \leq 300 group and the \geq 401 group, a difference between the 301–400 and \leq 300 groups, and a significant difference between the \geq 401 and \leq 300 groups ($p < 0.05$). When differences in the recognition of successful aging were assessed in relation to oral health awareness, the score for recognizing successful aging was significantly higher in subjects who had higher scores for oral health awareness ($p < 0.001$) (Table 3).

The relationship between oral health awareness and the recognition of successful aging: After adjusting for confounding variables, the recognition of successful aging was 3.74 times higher in subjects with good oral health awareness than in subjects with poor oral health awareness (OR=3.74, CI: 1.99–7.03) (Table 4).

Table 1: General characteristics of the study subjects (N = 198)

Variable	Category	N	%
Age	40–45	27	13.6
	46–50	80	40.4

DISCUSSION

In this study, we have successfully confirmed the relationship between oral health awareness and the recognition of successful aging in middle-aged women. These results can be used to help middle-aged women prepare for successful aging.

The findings of this study reveal a positive relationship between oral health awareness and the recognition of successful aging in middle-aged women. As no previous study has validated this relationship, a direct comparison could not be made. However, for the elderly population, previous studies have reported that good oral health—either via natural teeth or restorations—is highly associated with successful aging.^{9, 11, 12} The findings of this study confirm the relationship between oral health awareness and the recognition of successful aging, supporting previous studies on elderly subjects. Previous studies by Rowe and Kahn¹⁸ and Tate RB et al¹⁹ have suggested that subjective health condition and satisfactory financial status affect the recognition of successful aging in elderly. Although we observed a similar trend, our findings did not show statistical significance. Since only 28% of the study subjects had undergone menopause, our outcomes may not have resembled those of previous studies assessing elderly female subjects. Kweon and Jeon²⁰ have previously

reported differences in health conditions and successful aging between middle-aged and elderly women, supporting the findings of our study. As very few studies have assessed the relationship between oral health and successful aging in middle-aged women, this study provides fundamental data regarding this relationship. In the future, active studies should be carried out on the middle-aged population preparing for successful aging.

Despite our interesting findings, this study has a few limitations. First, the convenience sampling of selected middle-aged women used in this study cannot represent the entire population of middle-aged women. Second, out of multiple aspects of successful aging, only a few aspects have been measured. Future studies should develop a measurement tool for successful aging that is specifically tailored for the Korean population. Third, multiple variables among the factors of successful aging were not corrected. Nevertheless, we have confirmed the relationship between oral health awareness and the recognition of successful aging in middle-aged women, who will soon reach the elderly period of their lives. With insufficient individual-level interest or municipal/national-level guidelines or policies to support successful aging among middle-aged women, the findings of this study will provide evidence to support the idea that improving oral health awareness is important for successful aging.

CONCLUSION

In this study, we confirmed the positive relationship between oral health awareness and the recognition of successful aging in middle-aged women, with following details:

1. A higher level of average monthly income and better oral health awareness resulted in significantly higher levels of success in aging.
2. After adjusting for confounding variables, better oral health awareness was significantly and positively associated with better recognition of successful aging.

Ethical Clearance: Not required

Source of Funding: Self

Conflict of Interest: Oral health awareness and successful aging in middle-aged women

Effects of Muscle Facilitation on Motor Activity and Tactile Perception

Sung-Hwa Hong¹, Yun-Tae Kim¹, Dong Yeop Lee¹, Jae Ho Yu¹, Jin Seop Kim¹, JiHeon Hong¹

¹Dept. Physical Therapy, Sun Moon Univeresity, Asan-si, Chungnam, Republic of Korea

ABSTRACT

Background/Objectives: The purpose of this study was to investigate changes in muscle activity and tactile perception ability through muscle facilitation

Method/Statistical analysis: The subjects of this study was consisted of 51 adults (26 males, 25 females) and randomly assigned to 26 experimental and 25 control groups. In both groups, a moving two-point discrimination test was performed on middle trapezius, upper trapezius, sternocleidomastoid, and posterior deltoid. In the experimental group, muscle facilitation was performed for activation of the back muscle. In addition, EMG was used for the two groups to compare before and after muscle activation to the middle trapezius, upper trapezius, and posterior deltoid. after those muscles were re-tested to two-point discrimination.

Findings: In this study, it was found that the muscle facilitation promoted the increase of muscle activity and the sensitivity of two-point discrimination due to simultaneous activation of the motor cortex and sensory cortex ($p < .001^*$). It was also found that activation through muscle stimulation affects the same spinal level as well due to the change in the tactile perception ability of the sternocleidomastoid along the same nerve branch of the middle trapezius. ($p < .0041^*$).

Improvements/Applications: This can interpret that muscle facilitation leads to changes in muscle activation and changes in tactile perception ability. Therefore, the results of this are expected to be the basis for future improvement of motor function and sensory function in patients with brain injuries or those with low function.

Keywords: *Muscle facilitation, Motor activity, Tactile perception, Two-point discrimination, Proprioceptive neuromuscular facilitation, Neuroplasticity*

INTRODUCTION

The nerve was divided into sensory nerves and motor nerves. Sensory nerves transmit the senses received in each receptor to the central nervous system through the nerves, and the motor nerves transmit the signals generated in the central nervous system to the muscles to show the response^{[[Ayatollahi, 2017 #25]1,2]}. Sensory and motor are essential signals and abilities in humans. The type of senses is divided into special senses and general senses. Special senses are senses like vision, smell, and hearing, and general senses are divided into temperature sensory perception, proprioceptive sensation, and tactile sensation. Among, the tactile sensation is given to the spinal cord through the nerve roots and, depending on the type, it is transmitted to the spinal cord or brain. In

addition, the motor systems are commanded by the brain to activate the muscles by signaling each muscle through the nerve roots^[3].

The method of tactile inspection includes static touch sensing, brush movement direction distinction, and benefit identification^[3]. Among them, the two-point discrimination method refers to the distance between two points, which is felt as points on different parts when stimulating the epidermis by stimulating the epidermis^[4]. This test has been proven to be effective in several studies, and it has been shown that the reliability of the test is high^[5]. Sensations are also generally influenced by other factors. These factors are include age, weight, skin temperature, fatigue, and sex^[6-10]. Methods for activating the neuromuscular are based on neuro developmental

therapy (NDT) and proprioceptive neuromuscular techniques(PNF) using spiral and oblique motion patterns using traditional functional and promotional strategies, and Brunnstrom methods using synergistic movement. These techniques selectively apply force to induce the voluntary contraction of the subject in the correct direction to relax the shortened muscles, to activate the restricted joints, and to activate the muscles to cause reinforcement or inhibition^[11]. It is also effective to stimulate the intrinsic receptors in muscles and tendons to improve function, increase muscle activity, balance and flexibility, and to maximize the response of exercise units by increasing muscle strength, flexibility and responsiveness to muscle nerve stimulation^[12]. When a sensory stimulus is given, the signal is transmitted to the brain through the corresponding path through the spinal cord. Pain and temperature sensation reach the postcentral gyrus through the spinal cord and through the lateral spinothalamic tract^[13,14]. The contact identification ability, proprioceptive sensation, and sense of vibration come to the postcentral gyrus through the spinal cord and through the medial lemniscus pathway. These sensations lead to activation of the sensory cortex^[15,16].

Jang et al. analyzed the activity of the sensory cortex and motor cortex when stimulation through the lateral spinothalamic tract and stimulation through the medial lemniscus pathway were given. Simultaneous activation of the motor cortex and the sensory cortex was observed when the stimulus was given through the lateral spinothalamic tract, but when the stimulus was given through the medial lemniscus pathway, the simultaneous activity of the motor cortex and sensory cortex was high. This implies that activation of the motor cortex occurs when stimulation of the tactile or proprioceptive sensation is given, which explains the mechanism of tactile and motor interaction^[17]. In addition, Janda used the term sensory kinematics as the sensory system responsible for the human body and the kinetic system responsible for the movement interact with each other in controlling the movement^[18]. It suggest that sensory and motor have a close relationship with each other and can also affect each other. Thus, although there have been many researches on how the sensory stimulation affects the kinetic system, the research on how the stimulation through the exercise affects the senses has not been studied yet. Ko et al. showed improvement in motor function and sensory function in stroke patients, but motor function was improved, but sensory

function(Two-point discrimination) was not changed^[19]. Han et al. investigated the correlation of Cutaneous nerve following muscle fatigue. In this case, the sensitivity of the sensory nerve was lowered when muscle fatigue was present^[10].

According to the above studies, improving the motor function in patients is interpreted as insignificant change of sensation. However, changes in the activity of the affected sensory nerve due to direct muscle contraction are not known. Thus, there is a lack of studies on the effect of exercise on tactile sensation to date, and it is a fact that there is no fact that has been revealed clearly. Therefore, activation of epidermal sensory by activation of motor and sensory nerves will prove a correlation between motor sense and tactile sense. Therefore, in this study, we will investigate changes in kinesthetic and tactile sensations through muscle stimulation.

MATERIALS AND METHOD

Participants: The subjects of this study were 26 healthy (male 13, female 13) and 25 control (male 13, female 12) adult male and female 51 (male 26, female 25) students in S 20 university in Asan city. The study was carried out in randomize control. Subjects were instructed about the purpose and method of the study before the experiment and consisted of those who agreed to participate in the study and measured in the dominant hand direction. (Neck, back, waist), shoulder and upper limb skeletal system, person without neurological disease, trunk (neck, back, waist), shoulder and upper extremity Those who did not appeal to pain, 20 healthy subjects were selected. This study was approved by Institutional Review Board (IRB) agency bioethics. The overall research process is shown in [Figure 1].

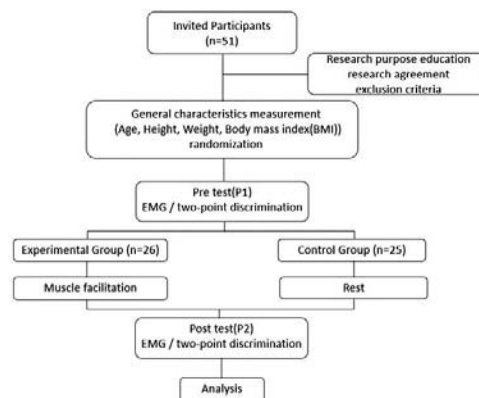

Figure 1: Flow diagram of the process through the phases of the study

Materials

Surface electromyography (sEMG): sEMG (Zero WIRE EMG, EMG OQUS100, Italy, 2009) was used to examine the muscle activity of the back muscle (upper and middle Trapezius muscle) and deltoid posterior muscle. The sEMG analog signals collected from the three channels were converted to digital signals by the MP150 system, and analyzed by computer using sEMG software myoresearch 1.06.44 software.

Two-point discrimination: Precision machined industrial digital vernier calipers were used in this test to see the benefit of the back muscle (upper and middle Trapezius muscle), Sternocleidomastoid muscle(SCM) and deltoid posterior muscle. The electronic calipers can measure up to 0.01mm. In this study, the analysis and data processing were performed up to 0.01mm. (Browne & Sharpe Tesa Eagle Electronic Caliper, Tesa, Renens, Switzerland) [Figure 2].

Figure 2: Digital Vernier Calipers

Muscle facilitation method: The subjects were allowed to keep their forehead in contact with the floor in a prone position. In order to facilitate the movement of the middle trapezius muscle for correct movement, the trainer was instructed to pull the scapular bone retraction, and the shoulder was external rotation for horizontal abduction activation of the middle trapezius muscle and rhomboid muscle^[20]. When the subject reached the end of the horizontal abduction, the examinee is promoted muscle facilitation by promoting the hand to the shoulder scapular and upper arm bones and then giving resistance. Muscle facilitation was performed 7 times for 7 seconds [Figure 3].

Figure 3: Muscle facilitation method

Test Procedure

Two-point discrimination Measurements: The upper trapezius muscle, middle trapezius muscle, posterior deltoid muscle, and Sternocleidomastoid muscle(SCM) were used to measure the two-point discrimination ability. Because exercise intervention focuses on the middle trapezius muscle, basically the tactile test was performed on the skin just above the middle trapezius muscle. The location of the upper trapezius muscle, located in the skin segment (C4) along the middle nerve branch (C2,3,4) of the middle trapezius muscle and used as the joint muscle, was examined and the location of the Sternocleidomastoid muscle(SCM) following the C4 branch of the middle trapezius muscle Respectively. In addition, posterior deltoid muscle position, which is used as a joint muscle, was also examined [Figure 4]. When the two-point discrimination ability examine, dynamic testing was performed^[21]. The skin was scratched about 5 cm over 10 seconds for 2 seconds, and the measurement was made 3 times in total. After each measurement, each patient was allowed to rest for 30 seconds. In the measurement, the distance was recorded by measurement the distance from the wide range to the range of 2 points. The ability to distinguish the muscles before inducing muscle activity through exercise intervention was measured, and the ability to distinguish the benefits was measured after exercise. The mean of the values was measured three times before and after exercise. In recording, when the subject felt one point, he answered ‘one’ and when he felt two points he answered ‘two’.

Figure 4: Two-point discrimination Location A: middle Trapezius muscle, B: upper Trapezius muscle, C: Sternocleidomastoid muscle, D: posterior Deltoid muscle

Surface electromyography (sEMG) Measurements:

In order to compare muscle activity and post-exercise activity before exercise intervention to induce muscle activity and proprioceptive sensory stimulation, measurements were performed once or twice before and after the same as the two-point discrimination ability^[22]. (upper trapezius muscle: middle point of the lateral border in the sagittal plane of the acromioclavicular joint and sternocleidomastoid muscle, middle trapezius muscle: mid-point between the medial border of the scapular and the fifth thoracic bone, posterior deltoid muscle: upper and rear of the humerus). [Figure 5]

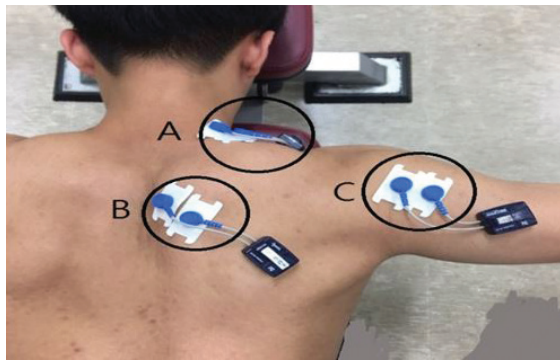

Figure 5: sEMG Location A : middle Trapezius muscle, B : upper Trapezius muscle, C : posterior Deltoid muscle

Muscle activity was measured by raising the horizontal adduction to 100 ° while keeping the internal rotation in the prone position with shoulder joint flexion 90°. After horizontal abduction from the starting posture to 100°, it was intervened at a speed of 5 seconds. The velocity was adjusted to 5 seconds until it returned to the starting position [Figure 6]. The sampling rate was set to 1000 Hz, the root mean square (RMS) value was measured, and the band pass filter was set to 20 to 500 Hz^[23].

Figure 6: Horizontal abduction posture A: Horizontal abduction start posture B: Horizontal abduction end posture

Statistical analysis: All measurements for this study were calculated using SPSS / PC ver.22.0 for windows programs (SPSS INC, Chicago, IL). The descriptive statistics were used to calculate the characteristics of the subjects and the mean and standard deviation of each variable. The Shapiro-Wilk method was used for the normality test and the normality test was satisfied. The paired t-test was used to compare before and after EMG for muscle stimulation, and statistical significance was set at P<0.05.

**RESULTS AND DISCUSSION
RESULTS**

In the general characteristics of the study subjects, the mean age of the experimental group was 22.19 years, the mean height was 167.56cm, the mean body weight was 61.9kg, and the mean body mass index was 21.87. The mean age of the control group was 21.88 years, the mean height was 167.72cm, the mean body weight was 64.48kg, and the mean body mass index was 22.70 [Table 1].

Table 1: Physical characteristics of subjects (n = 51)

Variable	Experimental Group (n = 26)	Control Group (n = 25)
Age(year)	22.19 ± 2.31	21.88 ± 1.71
Height(cm)	167.56 ± 9.06	167.72 ± 8.82
Weight(kg)	61.9 ± 13.19	64.48 ± 14.00
Body mass index BMI(m ² /kg)	21.87 ± 3.30	22.70 ± 3.08
^a mean ± standard deviation		

As shown in [Table 2], when comparing the advantage recognition ability according to the muscle promotion, there was a significant difference in the difference recognition ability between before and after exercise intervention in the experimental group. When comparing the two-point discrimination ability according to the promotion of muscle in middle trapezius muscle, the discrimination ability of the experimental group was 42.27 ± 12.29 before exercise intervention, and 33.29 ± 14.61 after exercise intervention. 001, and the difference of the two-point discrimination ability before and after exercise in the control group was not significantly different (p <.115). In the upper trapezius muscle, the ability to discriminate the two points according to muscle acceleration was 29.59±12.06 and

15.56±5.82, respectively, in the experimental group. There was no significant difference in the difference of the two-point discrimination ability before and after the exercise intervention in the control group, $p < .272$. In posterior deltoid muscle, the ability to discriminate the two points according to the muscle stimulation was 32.18±13.63 in the experimental group and 14.50±5.14 in the exercise group, and the difference in the two-point discrimination ability was $p < .001$. The difference of the two-point discrimination ability before and after the exercise intervention in the control group was

$p < .172$, but there was no significant difference. In the Sternocleidomastoid muscle (SCM), when comparing the two-point discrimination ability according to the muscle promotion, the discrimination ability of the experimental group was found to be 24.01 ± 10.26 before the exercise intervention, 20.33 ± 13.36 after the exercise intervention, and the difference of the two-point discrimination ability was significant. And the difference of the two-point discrimination ability before and after exercise in the control group was not significantly different ($p < .638$).

Table 2: Two-point discrimination ability due to muscle facilitation

		pre	post	t	p
middel trapezius	Experimental	42.27 ± 12.29	33.29 ± 14.61	5.01	0.001***

As shown in [Table 3], the differences in the two-point discrimination ability before and after EMG compared to before and after EMG according to muscle facilitation showed significant differences in middle trapezius muscle and upper trapezius muscle. In the middle trapezius muscle, EMG before and after exercise intervention was 25.67±11.53 and 31.10±15.70, respectively. EMG differences were significantly different between the groups ($p < .004$). The EMG difference before and after exercise in the control group was not significantly different ($p < .796$). In the upper trapezius muscle, EMG before and after exercise intervention was 16.10 ± 11.78 and 22.00 ± 16.09 after exercise intervention, respectively, and EMG difference was significant in $p < .003$. And the EMG difference before and after exercise in the control group was not significantly different ($p < .173$). There was no significant difference in the EMG difference between the posterior deltoid muscle and the muscle facilitation before and after exercise in the experimental group and $p < .423$ in the experimental group and the difference of EMG before and after exercise intervention in the control group was significant.

DISCUSSION

In this study, we investigated the changes of tactile perception and muscle activity according to muscle facilitation. The experimental results showed that the two-point discrimination ability of the experimental group showed a significant difference in middle trapezius muscle, upper trapezius muscle, posterior deltoid muscle, and Sternocleidomastoid muscle (SCM) when comparing the two-point discrimination ability before and after exercise intervention. However, there was no significant difference in the control group. EMG of experimental group showed significant difference in middle trapezius muscle, upper trapezius muscle, and posterior deltoid muscle. However, there was no significant difference in the control group.

Jang et al. investigated the effects of the lateral spinothalamic tract, which transmits sensations of temperature and pain, and the medial lemniscus pathway, which transmits tactility, proprioceptive sensation, and sense of vibration, in 24 healthy adults. The brain activity was analyzed. The activity of sensory cortex and motor cortex were analyzed when brain activity was analyzed. The activation of the sensory cortex was high when stimulated, while the stimulation of the medial lemniscus pathway resulted in simultaneous activation of the motor cortex. This proves that activation of the motor cortex occurs through the input of a proprioceptive sense^[17]. In this study, the sensory cortex and motor cortex were simultaneously activated by exercise intervention. This means that by stimulating the muscles, not only the stimulation of the movement but also the input of the stimuli of the proprioceptive sensation act simultaneously. Kandel reported that when performing exercise tasks, sensory feedback is formed through repetitive exercises and that latent nerve synapses are unmasked, which increases the distribution of cortical neurons in the movement. Since then, the synaptic efficiency of the sensory and corticospinal associations has been increased and the pruning and branching of the dendrites have been increased, resulting in a continuous cortical and subcortical representation of the mastered motor skills. In this study, it was thought that muscle activation resulted in simultaneous activation of the motor cortex and sensory cortex, resulting in greater muscle activity^[24].

Meesesn et al. reported that the motor map representation of the forearm and hand was expanded

when TENS was applied to the abductor pollicis brevis muscle for 3 weeks^[25]. According to meta-analysis, Bolton et al. reported that electrical stimulation is effective in both acute, subacute, and chronic stroke patients, in association with the two exercise principles of repetition and sensory motor integration. And that sensory stimulation is important^[26]. In addition, Thomsom and Stein can stimulate the neuroplasticity of the central nervous system by stimulating the corticospinal tract by sensory input by functional electrical stimulation (FES), and changes in body movements through muscle fiber stimulation can be induced by central nervous system^[27]. These results suggest that electrical stimulation can lead to activation of neuromuscular muscles and this study can also be interpreted as meaningful changes in sensory stimulation and motor sense during muscle facilitation. Ko et al. studied the enhancement of motor function and sensory function when upper extremity rehabilitation exercise program was applied in patients with chronic stroke. As a result, exercise functions such as exercise capacity of the Activities of Daily Living (ADL) were improved, but only some results were obtained in the two-point discrimination ability test and the stroke upper limb function test^[19]. In this case, if the direct stimulation of the stimulation of the muscle was mediated, the study showed that the difference in the sensory function was increased by suppressing the non-affected side of the brain.

The impairment of sensory function due to damage of the brain can attribute to the problems in the damage itself, but it is also caused by the lack of various experiences^[28]. Two-point discrimination is closely related to peripheral and central factors. This means that the receptor areas of the skin receptor can affect the two-point identification process, and the inhibition mechanisms of the central nervous system, including spinal cord, subcutaneous structure and cerebral cortex^[29]. Hebb demonstrated that the new environment creates a change in neural connections^[30]. Although the central nervous system of humans is limited, it has been shown that the structure and function are changed through various stimuli with the ability to regenerate the nerves^[31]. Neuroplasticity of the brain is the result of such a continuous experience that modifies and reorganizes the nerve pathways of the central nervous system^[32, 33]. This suggests that the sensory ability is improved due to the input of sensory stimuli.

Knott and Voss defined irradiation as a reinforcement of the strong side stimulus to the weaker side when the resistance was adapted for therapeutic purposes^[34]. Many studies have adopted cross-training in clinical practice based on this theory, and the application of such indirect treatment has been described as cross-training in clinical practice^[35]. Carroll et al. explained that the mechanism of the irradiation effect is unclear, but it may be the cortex, subcortical, spinal cord, muscular response, or neurogenic response of the brain^[36]. The results of this study also suggest that the middle trapezius muscle intervention has affected the spinal cord irradiation effect as well as the Sternocleidomastoid muscle(SCM) following the same nerve branch. Bretischwerd et al. was reported that when muscle facilitation was applied to the hamstring muscle, the pain of the trapezius muscle and the masseter muscle was reduced and the active mouth opening was increased^[37]. In addition, Espejo et al. reported that when the hamstring muscle proprioceptive neuromuscular stimulation method was applied, the active mouth opening increased by 0.34 cm and the indirect treatment was achieved^[38]. Pollard reported that when the proprioceptive neuromuscular facilitation was applied to the suboccipital muscle, the activated information reached the lower limb through the cerebral cortex - superior colliculus - vestibular nucleus - reticular formation - cerebellar cortex - vestibulospinal tract - reticulospinal tract - corticospinal tract^[39]. The middle trapezius muscle follows c2, c3, and c4 neuronal branch, and Sternocleidomastoid muscle(SCM) follows c2 and c3 neuronal branch. In this study, the tactile perception ability of the Sternocleidomastoid muscle(SCM) following the same nerve branch as middle trapezius muscle changes due to activation through muscle facilitation. And it also affected the level of the spinal cord. Therefore, the results of this study will be the basis for studying the treatment for improvement of motor function and sensory function in future brain injured patients and those with low function.

In this study, the results of long-term training were unknown because the mediation of the muscle facilitation was not continuous. In addition, since the units of the two-point discrimination ability and the units of the EMG are different from each other, it is not possible to accurately analyze how each of the enhanced differences affect each other. Therefore, if we compare these limitations with long-term research intervention, it will be useful for future research.

CONCLUSION

In this research, it was found that muscle facilitation improved muscle activity and sensitivity of Tactile perception ability. This is due to the simultaneous activation of the motor cortex and sensory cortex in the brain due to muscle facilitation. The significant change in the two-point discrimination ability can be attributed to the enhanced sensitivity of the tactile perception ability on the skin. It was also found that after the muscle facilitation, the Tactile perception ability of the Sternocleidomastoid muscle(SCM) following the same nerve branch as the middle trapezius muscle also changed, affecting the same nerve branch.

An Empirical Study on the Comprehensive Information System for Reducing Physical Symptoms in Colon Cancer Patients

Seong-Ran Lee

Department of Medical Information, Kongju National University, Kongjudaehak-ro, Gongju-si, Chungnam, South Korea

ABSTRACT

Background/Objectives: This research is to verify an empirical study on the comprehensive data system for reducing physical symptoms among population with cancer disease in the colon.

Method/Statistical analysis: A survey has been carried out from January 8th to March 12th, 2018 through face-to-face survey and preparation survey. A total of 132 participants went to proctological surgery at the university hospital in the region of C. The present circumstances of participants were conducted on the chi-square test. The t-test analyzed the difference between improvement and deterioration of physical symptoms.

Findings: The derived content is divided into five categories. 1) For blood types, 33.3 percent of the experimental group was more than 27.3 percent of the control group 2) Constipation was found to be higher at the average of 32.85 ± 1.23 before mediation than the average of 20.57 ± 1.69 after mediation ($t = .362$, $p = .000$). 3) The respondents who had eaten mushroom after application were significantly higher after mediation of the information system than before mediation of the system ($t = -1.75$, $p = .000$). 4) The average number of listening to music was significantly higher the average of 56.72 ± 3.65 after mediation of the system than the average of 25.18 ± 3.37 before mediation of evaluation system ($t = -3.26$, $p = .000$). 5) The recuperative power rate of physical movement revealed an increase in the experimental group over time since the 30 days after mediation. However, as time passed, physical movement was not more recovery in the experimental group than the control group.

Improvements/Applications: Music had proved effective in reducing the physical symptoms of patients. When they listen to music, sound comes to their thalamus stimulate cerebral cortex, which causes emotional reactions.

INTRODUCTION

Colon cancer is ranked high in our country after stomach cancer as seen in Figure 1. Colon malignancy is a digestive cancer that affects men and women and the cause of death among cancers [Figure 2]. Colon malignancy is caused by cancer in the colon [Figure 3]. Cancer is a non-generative growth cell that can invade other organs or tissues of the body. Depending on the location of the disease, it is called colon. It can be accompanied by poor appetite and weight loss [Figure 4]. Colon cancer occurs after middle age. There are no symptoms in the early stages of rectal cancer, but as cancer grows, the stool get blood and the stool wanes [Table 1]. People think colon cancer as a disease of old age. In fact, the average age of diagnosis for cancer

patients in the Canada is 68. But Canada and Korea in the last decade, there has been a steady increase in the incidence of cellularity in the layer. For 100,000 people, there are 5.08 men in the East and 4.37 women. There are more men than women by gender in rectal cancer^[1,2].

Early colon cancer is mainly performed by endoscopic mucous membrane or muscular layer. Complications in the procedure itself can cause bleeding, perforation, pain, and infection^[3,4]. The diagnosis of cancer is endoscopic, but in some cases it is not controlled and requires surgery. Colon cancer is only possible to find cancer cells through biopsy. Operation performance is extremely good in the early stages of an operation confined to the work wall. If surgery is not possible, make an artificial anus to defecate and tighten it with radiation. The confirmation

of colon cancer is possible only after the discovery of cancer cells through biopsy. The number of men with colon cancer is 152,617, or 20.8 percent. The number of women with colon cancer is 90,152. In the case of rectal cancer, it shows a high survival rate of 95.4 % if detected early. Colon cancer has a 82.5 % survival rate when it invades the organs, adjacent tissues or lymph nodes outside the colon^[5,6]. If the cancer is transferred to another part of the organ, the survival rate becomes very low at 17.5 %.The primary treatment for rectal cancer is surgery, which must absorb the moisture of the food. If patient does not breathe and spit out phlegm due to pain in the wound immediately after surgery, it is likely to cause complications of pneumonia. Rectal cancer has been uncomfortable in everyday life after surgery. Colon cancer patients have a weakened immune system. They need to strengthen his recovery because he or she is less energetic in everyday life. To this end, it is necessary to apply state-of-the-art system to strengthen resilience^[7,8]. So far, the preceding study focused only on treating colon cancer, but there was no mediation of the system for the resilience of colon cancer. Therefore, this research is to verify an empirical study on the comprehensive data system for reducing physical symptoms among population with cancer disease in the colon. This will reduce the incidence and mortality of cancer.

DATA RESEARCH AND EXTRACTION

Data Research: Survey has been carried out from January 8th to March 12th, 2018 through face-to-face and preparation survey. A total of 132 patients who went to proctological surgery at the university hospital in the region of C. The resilience of the experimental group measured the effectiveness of evaluation system for 45 days

Program for the resilience of experimental group:

This program is classified into various aspects for the resilience of the experimental group. 1) According to the plan, this program applies a systematic information system to patients. 2) This program plans to achieve a successful performance. 3) This program analyzes the data obtained from patients. 4) This program is to examine the patient’s satisfaction with the mediation system. 5) This system measured whether it works or not. 6) The results derived from this program are applied to the medical field.

Extracting survey data: The present circumstances of participants were conducted on the chi-square test. The t-test analyzed the difference between improvement and deterioration of physical symptoms.

Table 1 : Causes, symptoms, diagnosis and complication of the experimental group

Causes and diagnosis	Symptoms and complication
<p>Causes</p> <ul style="list-style-type: none"> ● It can be largely divided into environmental and genetic factors ● High calorie intake, animal fat intake, lack of fiber intake obesity and the occurrence of colon cancer. ● The rate of colon cancer varies depending on regional characteristics. 	<p>Symptoms</p> <ul style="list-style-type: none"> ● Even if there are no symptoms, inconspicuous intestinal bleeding can cause anemia ● In case of cancer, there are changes in bowel movements such as stomach pain, diarrhea or constipation. ● Symptoms of blood bleeding from the anus can occur.
<p>Diagnosis</p> <ul style="list-style-type: none"> ● It is only possible to confirm colon cancer through biopsy to find cancer cells- The diagnosis of colon cancer is, for example, rectal digital examination, colonoscopy 	<p>Complication after surgery</p> <ul style="list-style-type: none"> ● If one does not breathe and spit out phlegm due to pain in the wound immediately after surgery

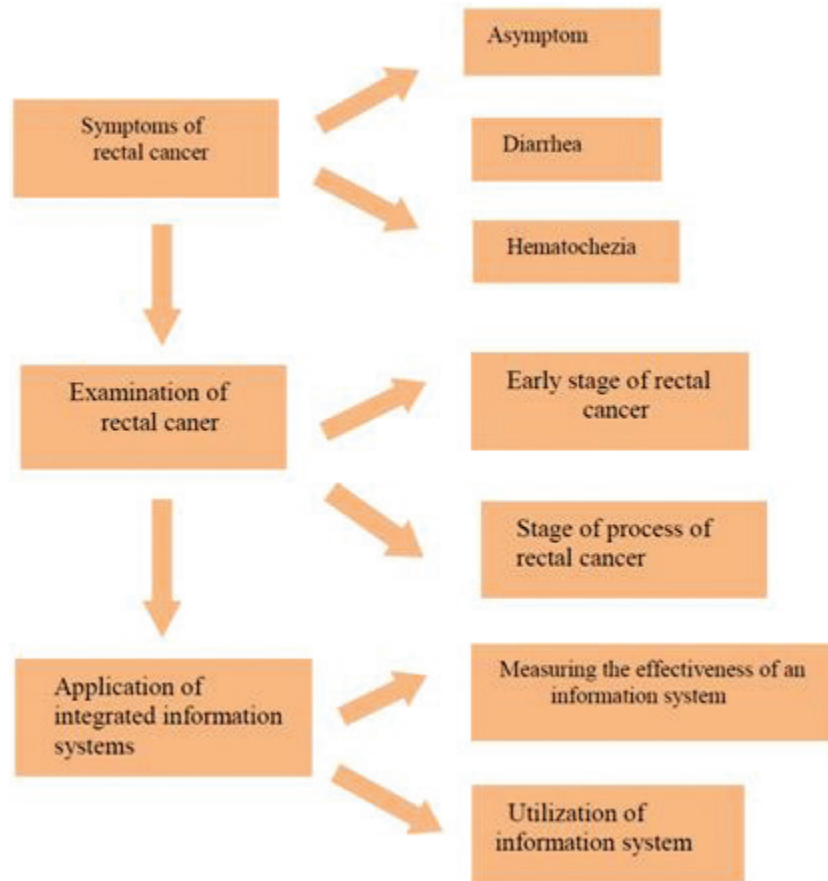

Figure 3: Data step procedures for the program

Data step procedures for the program: This reveals the data step procedures for the program in Fig. 3. 1) It reveals hematochezia, asymptoms, diarrhea, 2) An examination is carried out after the symptoms. 3) This system will measure the effectiveness of the information system. 4) The effectiveness of the information system will be used in other areas.

RESULTS AND DISCUSSION

Present circumstances of participants: The present circumstances of the participants indicate in Table 2. In men, 53.0 % of the target population was significantly more than 40.9 % of the comparative respondents ($X^2=3.76$, $p<.05$). For blood types, 33.3 percent of the target population was higher than 27.3 percent of the comparative population. In the married state, 71.2 % of the comparative population was significantly higher than 68.2% of the target population($X^2=5.72$, $p<.05$).

Observation of physical symptoms: The observation of physical symptoms indicates in Table 3. Constipation was found to be higher at the average of 32.85±1.23 before mediation than the average of 20.57±1.69 after mediation (t=.362, p=.000). The experimental group who had been intake vegetable was significantly higher than after mediation of the system than before mediation of it (t=-8.19, p=.000).

Table 3: Observation of physical symptoms

Items	Before	After	t	P
	Mean ± S.D.	Mean ± S.D.		
Anorexia	27.94 ± 0.62	23.82 ± 2.62	2.84	.152
Iron deficiency anemia	24.19 ± 1.51	20.44 ± 4.93	1.92	.076
BW control	29.64 ± 3.84	23.13 ± 0.89	6.31	.049
Constipation	32.85 ± 1.23	20.57 ± 1.69	3.16	.000
Melena	30.41 ± 0.57	18.40 ± 0.77	0.74	.000
Physical pain	27.39 ± 1.82	23.74 ± 3.52	5.26	.362
Diarrhea	23.77 ± 1.93	18.69 ± 0.73	2.81	.002
Carnivorous	18.51 ± 1.34	10.61 ± 1.49	5.14	.000
Daily smoking	12.96 ± 0.77	8.22 ± 2.95	0.73	.054
Daily vegetable	16.53 ± 3.52	24.82 ± 3.47	-8.19	.000
Daily exercise	12.23 ± 1.68	20.56 ± 1.92	-3.47	.001
Alcohol	20.28 ± 3.25	12.57 ± 0.58	1.28	.000

Practice for recovery of disease: The practice for recovery of disease indicates in Table 4. The respondents who had eaten mushroom after application were significantly higher after application of the information system than before application of information system($t=-1.75$, $p=.000$). The respondents who had eaten mushroom showed statistically significantly positive changes of recuperative power in physical activities. It had been decreased the progression rate of colon cancer. The findings were similar with the previous studies on breast cancer^[9-14]. These finding should focus on special areas to improve the resilience of the cancer population. Based on the finding, it is anticipated that this paper may be used as important data for enhancing body's condition in cancer population.

The average number of listening to music was significantly higher the average of 56.72 ± 3.65 after mediation of the system than the average of 25.18 ± 3.37 before mediation of evaluation system($t=-3.26$, $p=.000$). The average number of listening to music was significantly higher the average after mediation of the system than the average before mediation of the system. This result is similar to that in the preceding study that music reduced stomach cancer. Listening to music is effective for cancer population. When patients listen to meditation music, sound comes to their thalamus and limbic system stimulate cerebral cortex, which causes emotional reactions. Therefore, music stimulation works for the patients.

Table 4: Practice for recovery of disease

Items	Pre	Post	t	P
	M. ± S.D	M. ± S.D		
Eating mushroom	32.72 ± 1.58	62.45 ± 1.94	-1.75	.000
Listening to music	25.18 ± 3.37	56.72 ± 3.65	-3.26	.000
mind and body rest	37.75 ± 0.82	41.39 ± 0.71	-5.18	.186
Yoga	18.63 ± 1.65	23.15 ± 1.62	-1.63	.394
Fruit intake	42.04 ± 1.27	65.86 ± 1.59	4.71	.000
Calcium intake	37.29 ± 3.64	52.72 ± 2.69	-1.52	.000
Moderate exercise	29.54 ± 0.75	59.18 ± 0.42	-3.78	.000
Screening	37.62 ± 1.84	63.42 ± 1.97	-6.94	.000
Carnivorous	59.49 ± 0.35	47.95 ± 0.38	1.65	.025
Daily smoking	31.28 ± 0.52	15.42 ± 1.46	0.82	.000
Daily vegetable	47.16 ± 1.84	64.92 ± 1.59	-3.61	.000
Daily exercise	29.84 ± 0.59	58.39 ± 0.75	-1.84	.000
Alcohol	46.19 ± 3.63	32.18 ± 2.73	1.28	.046

Recuperative powers of body movement: The changes in the recuperative powers of physical movement indicate in Figure 4. The recuperative power rate of physical movement revealed an increase in the experimental group over time since the 30 days after mediation. However, physical movement was not more recovery than the control group.

Figure 4: Recuperative powers of physical movement

CONCLUSION

The derived contents are divided into three categories.1) Constipation was found to be higher at the average of 32.85 ± 1.23 before mediation than the average of 20.57 ± 1.69 after mediation ($t=.362$, $p=.000$).2) The average number of listening to music was significantly higher the average of 56.72 ± 3.65 after mediation of the system than the average of 25.18 ± 3.37 before mediation ($t=-3.26$, $p=.000$). 3) The recuperative power rate of physical movement revealed an increase in the experimental group over time since the 30 days. However, as time passed, physical movement was not more recovery in the experimental group than control group.

Therefore, music had proved effective in reducing the physical symptoms of patients. When they listen to music, sound comes to their thalamus stimulate cerebral cortex, which causes emotional reactions.

A Case Study of Word finding Intervention for the Elderly with Alzheimer's Dementia at Home

Soo-Jin Kim

Associate Professor, Department of Special Education, Baekseok University, # 76 Moonam-ro, Dongnam-gu, Cheonan-si, Chungcheongnam-do, 3106,5 Republic of Korea

ABSTRACT

Background/Objectives: Once dementia develops, the cognitive problems associated with memory gradually worsen. The purpose of this study was to provide word finding intervention and to investigate changes in the performance of the subject during the intervention.

Method/Statistical analysis: The subject was an 85 - year - old woman suffering from Alzheimer's dementia, which was progressing from mild to moderate stages. The word finding intervention was composed of 30 sessions. The number of words remembered by the subject was calculated and scored by counting the number of syllables and the number of words per part of speech. Also, changes in other related performances throughout the intervention were observed.

Findings: As the number of words increased throughout the intervention sessions, though there were few dips in the number, it remained relatively high as time progressed than what it was at the beginning of the training. Eventually, the increase in numbers showed a tendency to slow down slightly. The rate of improvement at the beginning of the intervention was faster than the rate at the end of the intervention. Most of the words remembered were mainly composed of two syllable nouns. The errors in the two-digit multiplication and addition persisted throughout the entire intervention. And the letters were not written uniformly throughout the entire intervention.

Improvements/Applications: The results of this study can be used as basic data to provide cognitive intervention in the elderly with Alzheimer's dementia.

Keywords: *Alzheimer, Dementia, Elderly, word finding, Intervention*

INTRODUCTION

In Korea, the number of elderly people with dementia is increasing due to the rapid increase in the elderly population. ¹The number of nursing homes is also increasing due to the increase in number of elderly people with dementia. Meanwhile, the number of families and home care for the elderly with mild and moderate dementia is increasing. The reason for this is that the government is putting the burden of the shortage of facilities and caretakers, to take care of the increasing number of elderly people with dementia, on the family members who are not professionals dealing with this illness prior to addressing the effects of home care. According to National Health Insurance Service, of the 720,000 patients with dementia in Korea, the families are taking care of 520,000 patients. The three main reasons for those who care for patients with dementia at home are as follows: First, they want to

protect their family members at home. Second, they want to be close to the patient. ²And finally, they want to fulfill their duties as a spouse.

Dementia is a chronic progressive disease that is difficult to cure once the onset of dementia occurs. ³The related symptoms of the disease gradually progress as their independence, along with their daily life functions, gradually get lost. As dementia progresses in time, the patient's dependence on others gradually increase. Therefore, families become socially and economically distressed and disadvantaged. In addition to providing medication to treat dementia, the families for the elderly also need to provide rehabilitation treatments that can slow down the symptoms of dementia, in hopes of extending their time at home, and improving the quality of life for the family members. When medication was combined with intervention, it was more effective than

medication alone. ⁴And the success of their cognitive rehabilitation is directly related to the close involvement of their family members to the patient and their involvement in their daily life. ⁵Furthermore, in the case of early dementia, the higher degree of perception of the patient's disability and difficulty, the better cognitive rehabilitation results.

The dysfunction of cognition is the main symptom of dementia⁶ and the patient with this disease will gradually lose their independence of daily life functions. Cognitive disorders cause Alzheimer's disease. While dementia progresses, language deficits are overshadowed by cognitive dysfunction and are not evidently visible. ⁷The cognitive problems that cause such dementia are related to memory. ^{6,8,9} The close link between dementia and language and speech is the cause of the most common symptom of decrease in word memory. ^{9,10}The inability to remember words makes word finding difficult for patients with Alzheimer's dementia. The difficulty of word finding mainly comes from the dwindling of object naming. ¹¹For example, the patient can use an object but cannot remember the names of the object.

The management of dementia depends on the types of dementia. ¹²But the management of Alzheimer's dementia focuses on slowing down the progression of symptoms associated with behavioral problems facing daily life and to help in preserving residual functions. ¹³Rehabilitation to awaken the cognitive function is needed in addition to the medication in slowing down these progressing symptoms caused by dementia. In order to prevent deterioration of the cognitive functions that can be damaged by dementia and to maintain and to improve the cognitive functions, customized rehabilitation methods should be tailored to address the characteristics of each individual case and the symptoms. Therefore, it is necessary to examine whether cognitive rehabilitation reveals changes in cognitive functions and performances in the patient with Alzheimer's disease in order to maintain them and to delay the dysfunctions brought on by dementia. The purpose of this study was to provide word finding intervention for patients with Alzheimer's dementia in order to investigate the changes in cognitive functions and performances during the intervention. Based on the results of this study, using word memory, the findings will assist in predicting the progression of symptoms brought on by dementia, and further provide customized intervention for the patients of this disease.

MATERIALS AND METHOD

In order to provide word finding intervention and to investigate the performances of the subject, this study used the following research methods.

Procedures: In the cognitive intervention, 26 sessions were conducted in the morning once a week for 6 months (from April to September). Then 4 sessions of maintenance period (from October 28 to November 19) were added after 3-weeks of rest. The subject received in total 30 sessions during the cognitive intervention. The main task of the cognitive intervention was word finding. The subject performed these tasks in her home with the researcher during each of these sessions. In this word finding study method, the subject was more familiar with the Bible than the newspaper because she had been copying the Bible regularly. In her regular Bible reading, she chose her most favorite phrases from the Psalms. Then she was asked to write the words from memory, using words from her word memory bank, in the exact order of the letters that make up the phrase. In each 15 minutes sessions, the subject received a total score by calculating the number of words remembered and the number of syllables she wrote. During 26 sessions of intervention and 4 maintenance sessions, the researcher counted the number of words, and the number of syllables, and the number of words in the part of speech remembered by the subject, and also observed the changes in other related performances throughout the intervention.

Subject: The subject was an 85 - year - old woman suffering from Alzheimer's disease, which was progressing from mild to moderate. At the age of 74 she visited the neuropsychiatric office concerned about her unexplained crying when she was alone and feeling lost and wandering around the new house she had moved into. She was diagnosed with geriatric depression and received medication for 2 years. Then after discontinuing the medication for about 6 years, she would often lose things like her cell phone, her hat, and other things in and out of her home. Then it progressed to losing her way to and from the local market which she often went to. Eventually she visited the neuropsychiatric department once again and was diagnosed with Alzheimer's dementia. The subject was given the K-MMSE scores¹⁴ of 21 points at the time of her diagnosis. Her scores were 19 points at the start of this study. She had also been taking medications for diabetes, high blood pressure, and for dementia as well for 5 years. The most serious symptom for her was the loss of short-term memory since the onset of dementia. While

taking her medication, she showed signs of cognitive dysfunctions and minor communication difficulties due to her short - term memory loss. The problem in her communication was that she was using wrong choices of words to express herself. For example, when it was pointed out to her that she had used a wrong word, she would acknowledge that she had made an error. But this pattern continued.

Materials: At the national level, the Jung-ang Center for Dementia developed cognitive training methods related to the memory, locomotion, and language ability of the elderly with dementia, and bundled the methods into two books. They distributed them in a two volume work entitled, ‘9988 ¹⁵A Smart Newspaper Reading: Doo-geun Doo-geun Brain Movement’. The method that ‘Doo-geun Doo-geun Brain Movement’ suggests is a rehabilitation training that utilizes newspaper reading which can be easily done by the patient in daily life. In this study, Open Word Warehouse(No. 17) was used in ‘Doo-geun Doo-geun Brain Movement II’. The training procedure for Open Word Warehouse is to select one or two sentences from the newspaper, remember as many words as possible starting with the letters that make up the sentence, and to write the words from memory for 15 minutes.

Data analysis: In this study, the researcher calculated the total number of words that the subject remembered in each of the 15 minutes sessions. The subject’s performances were then tabulated, and a total score for the words remembered was assigned [Appendix 1], as the scores reflect the number of syllables in the words remembered. The word scores were assigned 1 point per 2 syllable words, 3 points per 3 syllable words, 5 points per 4 syllable words, and 10 points per 5 syllable words.

RESULTS AND DISCUSSION

Word finding intervention was applied to all 30 sessions and the results obtained were summarized and discussed according to the number of words and other performances tabulated in the procedure.

Word finding performance: Word finding performance was applied to calculate the number of words per session and also to calculate the distribution of syllables and parts of speech in the total number of words.

The number of words per session: During the 26 sessions of the intervention, the number of words per session ranged from 28 to 66. The number of words counted in the first session was the lowest, at 28. But then from the second to the 10th session, it showed a rising curve[Picture 1]. From

there the number of words per session fluctuated slightly, but then during the 16th session, the number peaked to 66 words. However, in the 17th session, the number of words dropped down to 45. But then it increased back up to 61 at the 18th session and then decreased to 45 at the 24th session in the 5th month.

The dips in the number of words were observed in the 17th and the 24th sessions. The reason for the decrease in the number of words recorded in the 17th session was due to the fact that the subject was ill. But the condition of the subject was not a factor for the drop in the number during the 24th session. But the following session, the number of words increased to 52 again. The low score in the 17th session can be attributed to her being sick but the result of the other low number of words remains an anomaly. After a rapid decline at the 17th and 24th sessions of the intervention, the degree of recovery was similar overall. Even though the number of words showed couple of dips until the 24th session, yet it increased back up to 58 and remained there until the 26th session.

After the 3-week rest, the number of words decreased to 47 for the 1st session of the maintenance period. But the average number of words was kept at 54 during the 2nd to the 4th maintenance sessions. As a whole, despite the slight fluctuation, the number of words continued to increase and remained constant at over 50 words.

¹The word finding performance varied according to the condition of the subject, yet these results suggest that this kind of training can improve and or maintain word memory. The cognitive enhancement program improved scores before and after the intervention. ¹³The cognitive interventions were important and effective in the early stages of dementia. Further research is needed on how these improvements in word memory exercises affect the expressive language ability in patients with Alzheimer’s dementia.

Figure 1: The number of words per session

The classification of words: Of the number of words according to the number of syllables in the entire

intervention, 2 syllable words were the most common accounting for 48.8%, 3 syllable words 39.8%, 4 syllable words 10.6%, and 5 syllable words 0.6%, respectively [Table 1]. One syllable word was not included in the number of words as well as the total scores because the subject needed to find the word that started with that particular syllable in the letter warehouse and then had to write it in the word warehouse.

As for the number of words per part of speech, nouns accounted for 82.8%, verbs 12.8%, adjectives 2.4%, adverbs 2.3% and others 0.1% [Table 1]. The most frequently recalled words were two syllable nouns. This seems to be due to the fact that most frequently used target words in daily life are composed of two syllables.

Table 1: Distribution of the classification of words

Word	Classification	Total number	Percentage (%) [*]
Syllables	2 syllables	763	48.8
	3 syllables	623	39.8
	4 syllables	166	10.6
	5 syllables	10	0.6
Parts of speech	noun	1283	82.1
	verb	201	12.8
	adjective	39	2.4
	adverb	36	2.3
	others	3	0.1

^{*}Rounded to the second decimal place.

¹⁶The increase in the positive response rate of nouns as shown by the results of this study, is similar in comparison to that of the results of the previous study. ⁶The main symptom of Alzheimer’s dementia is dysfunction of cognition. ^{6,7,13}And the cognitive impairment that causes dementia is associated with memory. ^{8,9}And the most common symptom associated with cognitive impairment concerning speech and language is the naming disorder. ^{16,17}The research revealed that the patient’s ability to name things was maintained by the intervention. ¹⁴It should be noted that there was a difference in naming ability according to the severity of the Alzheimer’s dementia.

On the other hand, the patient’s attempt at articulating their thoughts remained normal despite the reduction in their word memory. ^{6,18}This was also consistent with the results of the previous studies. ^{9,19}The speech analysis of

the patients with Alzheimer’s dementia showed that the syntactic and morphological aspects of their speech were preserved though the semantic aspect was impaired.

Other performance: In other performances, the subject’s calculation ability and their writing ability were observed and the following problems were identified during the entire intervention.

Calculation: The subject was able to perform one-digit multiplication. However, she often made errors in performing two-digit calculations. Even when the session was repeated, she still had difficulties in performing this task. Therefore, it was necessary to establish and maintain cognitive training programs to help manage her ability to perform double-digit multiplication.

In performing the calculations during the intervention process, she had difficulties tabulating the scores from her word memory exercise. She struggled in doubling and adding two-digit numbers when calculating the total score [Appendix 1]. When she was uncertain about the results, she was able to recalculate and get the correct score after repeating the task 2-3 times. She, on the other hand, was slow in remembering the multiplication times table, but eventually she was able to recall them accurately. Throughout the intervention, the subject continued to display difficulties in performing calculations. But the duration of the intervention was too short to properly observe why she showed difficulties performing this task. Another factor may have been that she had to perform this task after having performed the grueling task of word memorization. Being tired and stressed, this may have influenced her ability to concentrate in performing the calculations.

Writing: A peculiar thing was observed concerning the nonuniformed penmanship of the subject throughout the intervention sessions. In the beginning of the intervention, when the subject wrote words in the word warehouse [Appendix 1], she wrote them inside the lines and columns provided. However, from the 9th session, she started to go outside the provided lines or cram the words into one given space. In the 14th session, she filled the space with multiple lines with words. Eventually, she was often asked by the researcher to write bigger using larger letters. She initially made the adjustments then reverted back to writing small again. The shapes of her letters were also slightly tilted to the right and the letters became more distorted as the intervention sessions went on. Future research must be done in order to investigate the reasons for these shifts in penmanship.

²⁰The elderlies living at home were more likely to perform their daily activities more so than those living in nursing homes. This seems to be due to the fact that the elderlies living at home can receive ongoing care while they were doing daily activities with their family members. ²¹In addition, active management of Alzheimer’s dementia can improve the quality of life for the patients and for their families. For this reason, more research needs to continue supporting the findings of the previous studies^{13,20}, investigating the factors affecting the cognitive functions of the elderlies with dementia.

CONCLUSION

The results of providing word finding intervention to a subject with Alzheimer’s dementia and the observed changes in her performance during the intervention are summarized below.

First, the number of words during the intervention period increased up until the 16th session and then decreased slightly. The number of words fluctuated, going up and down, throughout the sessions.

Second, most of the words remembered by the subject were mainly composed of two syllable nouns.

The words were measured according to the number of syllables, ordering from 2 syllables, 3 syllables, 4 syllables, and 5 syllables. Meanwhile, the words in parts of speech were in the order of nouns, verbs, adjectives, and adverbs.

Third, in calculating the total scores, the subject showed errors in the two-digit multiplication and addition and these errors persisted during the entire intervention.

Forth, the letters and numbers were not written uniformly filling in the word warehouse and the calculation results. This also persisted throughout the intervention sessions. And the shape of her letters was also slightly tilted to the right.

In conclusion, it is necessary to provide professional rehabilitation methods, information, and materials to the family members of the elderlies suffering with dementia, in order to educate them so that they can apply them effectively in real life. Therefore, future studies require long-term interventions and observations to understand the implications of applying them on patients suffering from dementia. And there is a need for continuous follow-up research to provide customized diagnostic intervention to address properly the patient’s problematic situation.

[Appendix 1] Exercise sheet

Date of training	Year Month Date Day of the week
Letter warehouse	
Word warehouse	
	2 syllable word score(number ____ x 1 point) + 3 syllable word score(number ____ x 3 points) + 4 syllable word score(number ____ x 5 points) + 5 syllable word score(number ____ x 10 points) = Total score

The Structural Relationships among Professor's Servant Leadership, Faculty Trust, Learning Flow, and Adjustment to College Life

Boo-Gil Seok¹, Hyun-Suk Park², Yong-Gun Lee³, Hyung-Chul Joo⁴

¹Assistant Professor, Dept. of Beauty Health, ²Assistant Professor, Division of Liberal Arts, Halla University, 28 Halladae-gil, Wonju, Korea; ³Research Scholar, Dept. of Sport Industry Studies, Yonsei University, 50 Yonsei-ro Seoul, Korea; ⁴Research Professor, Dept. of Physical Education, Chungang University, 84 Heukseok-ro Seoul, Korea

ABSTRACT

Background/Objectives: Reducing the drop-out rates may be one of the major concerns in many schools including both secondary and tertiary levels. This study examines how professors' servant leadership affects students.

Method/Statistical analysis: A questionnaire survey was conducted amongst 4-year college students in Korea. The survey consists of 5 parts asking demographic information, servant leadership, faculty trust, learning flow, and adjustment to college life. To secure reliability and validity, confirmatory factor analysis was used. Frequency analysis, correlation analysis, path analysis, and mediating effect analysis were also carried out. The data were analyzed with PASW 18.0 and AMOS 18.0.

Findings: Professors' servant leadership influences students' trust in professors positively. Also, both professors' servant leadership and faculty trust positively affect students' learning flow. Students' learning flow seems positively related to students' adjustment to college life. The results indicate that professors' servant leadership, students' trust in professors, learning flow, and adjustment to college life influence one another. Therefore, it is fundamental to better understand the structural relationships among them to reduce the drop-out rates. Students' learning flow is one of the important antecedents required to help students adjust to college life. Professors' servant leadership plays important role to help students enhance their learning flow. Consequently, a variety of opportunities to train and enhance their servant leadership should be given to professors so that they can help their students find college life enjoyable and meaningful.

Improvements/Applications: Professors' servant leadership leads to enhancing faculty trust and learning flow, and ultimately helps students adjust to college life. Professors' servant leadership plays an important role in assisting their students.

Keywords: *Servant leadership, Faculty Trust, Learning flow, Adjustment to college life, Professors*

INTRODUCTION

School age population has sharply fallen recently in Korea. As a result, it is expected that most colleges will not be able to recruit enough students. It has been forecast that school age population will drop to 380,000 in 2030, which plummets by 55 percent compared to 2012 ^[1]. Low enrollment rates will cause college to be confronted with financial difficulties. Consequently, most colleges in Korea strive to attract high school graduates and prevent current students from dropping out school.

To boost the enrollment rates, first and foremost, it is highly required for students to be satisfied with college life in many directions. Many colleges provide their students with various events such as festivals, athletic meeting, and/or field trips so that their students can find the excitement in school and, in turn, become satisfied with college life. However, those events cannot be fundamental alternatives. A number of previous studies have suggested learning flow as one of the antecedents to help students adjust to college life [2][3]. Learning flow is attaining a spiritual state of perfect selflessness that students usually experience when they concentrate on solving tasks given to them during educational activities [4]. When students frequently experience learning flow, their satisfaction level increases and they tend to adjust themselves to college life more smoothly. Learning flow usually improves through trust. When students trust their professors, their learning flow also improves [5][6]. In addition, as trust facilitates interactions between two parties, mutual trust between students and their professors should be established above all else because mutual trust enables them to have productive communication. Mutual trust between students and professors positively influences students' motivation and learning flow [6]. Trust is defined as belief and faithfulness and trust in a leader is highly related to leadership that a leader show [7]. Servant leaders' ethics and modality have an effect on trust between superiors and subordinates [8]. Professors' servant leadership has a positive effect on faculty trust and students' learning motivation [9] and learning motivation stimulates learning flow. In sum, professors' servant leadership generally leads to students' trust in professors, namely faculty trust, as well as their learning flow.

Thus, this study aims to closely investigate the structural relationships among servant leadership, faculty trust, learning flow, and adjustment to college life. The research hypotheses are as follows;

Hypothesis 1. Professors' servant leadership has a positive effect on faculty trust.

Hypothesis 2. Professors' servant leadership has a positive effect on learning flow.

Hypothesis 3. Students' trust in their professors has a positive effect on learning flow.

Hypothesis 4. Learning flow has a positive effect on students' adjustment to college life.

Hypothesis 5. Faculty trust plays a mediating role between servant leadership and learning flow.

MATERIALS AND METHOD

To fulfill the purposes of this study, a questionnaire survey was conducted. To find out the structural relationships among professors' servant leadership, students' trust in their professors, learning flow, and students' adjustment to college life, the study samples were selected by convenience sampling method. The survey was conducted for about two weeks (between November 27 and December 8, 2017). A total of 163 questionnaires were distributed and collected. To include students from various majors, the questionnaires were distributed during liberal arts classes which students are required to take regardless of their majors. After explaining the purposes and the procedures of the research, the participants were asked to answer the questionnaire.

Instrument: The questionnaire consists of the five parts regarding demographic information, servant leadership, faculty trust, learning flow, and adjustment to college life. Except for the demographic information, each item is rated on a 5-point Likert scale. First, the questionnaire items on professors' servant leadership include 11 items from the previous studies [10][11][12][13]. Second, for faculty trust, the 27 items modified from the previous studies are included [14][15][16]. Third, a total of five items are related to learning flow [17][18][19][20]. Last, the 25 items are included to measure the adjustment to college life [21][22].

Data Analysis: A total of 146 questionnaires were used for final data analysis after removing the 17 questionnaires with insufficient information. The data were analyzed with PASW 18.0 and AMOS 18.0. To secure reliability and validity, confirmatory factor analysis and Cronbach's α was used. With the data whose reliability and validity were secured, the path analysis was utilized with structural equation model to prove the research hypotheses and examine the structural relationships among professors' servant leadership, students' trust in their professor, learning flow, and adjustment to college life. The mediation effects were examined by using Baron & Kenny's procedures [23]. The statistical significance was examined by Bootstrapping. The results of confirmatory factor analysis and the reliability are presented in Table 1 and Table 2.

RESULTS AND DISCUSSION

The results of confirmatory factor analysis are presented in Table 1.

Table 1: The results of confirmatory factor analysis

Standards	χ^2	df	CFI	TLI	RMSEA
Indexes	450.471	269	.910	.901	.068

The results of reliability are presented in Table 2.

Table 2: The results of reliability

Factor		Cronbach's α
Servant leadership	Servant leadership	.940
Faculty trust	Sense of closeness	.914
	Expertise	.910
	Leadership	.901
	Instructional ability	.810
Learning flow	Learning flow	.752
Adjustment to college life	Academic adjustment	.804
	Social adjustment	.695
	Emotional adjustment	.949
	Physical adjustment	.752
	Attachment to college	.839

As shown in Table 3, the study model suggested in this study is suitable for examining the structural relationships between the variables.

Table 3: The results of comparison of fit of the research model

Standards	χ^2	df	CFI	TLI	RMSEA
Research model indexes	451.199	271	.912	.902	.068

The research model with overall results of confirming the hypotheses are presented in Figure 1. Also, the detailed results of path analysis to test the hypotheses are presented in Table 4 and Table 5.

Figure 1: Research model and the results of the hypothesis test

As shown in Table 4, the results of path analysis confirm Hypothesis 1, 2, 3, and 4. That is, professors' servant leadership has a positive effect on students' trust in their professors and students' learning flow. Both professor's servant leadership and students' trust in their professors influence students' learning flow positively. Experiencing learning flow helps students adjust to college life smoothly.

Table 4: The results of path analysis

Hypothesis	Path	β	S.E.	t	p
1	Servant leadership → Faculty trust	.738	.743	8.821	***
2	Servant leadership → Learning flow	.330	.456	3.434	***
3	Faculty trust → Learning flow	.298	.410	3.184	**
4	Learning flow → Adjustment to college life	.317	.282	2.577	*

* $p < .05$, ** $p < .01$, *** $p < .001$

Namely, servant leadership and faculty trust, servant leadership and learning flow, faculty trust and learning flow, and learning flow and adjustment to college life influence one another positively.

Table 5: The results of mediating effect

Path	Direct effect	Indirect effect	Total effect
Servant leadership → Faculty trust	.743		.743
Faculty trust → Learning flow	.410		.410
Servant leadership → Learning flow	.456	.304	.760

Direct effect 60.0%, Indirect effect 40.0%

As shown in Table 5, the results of Bootstrapping indicate that the indirect effect is significant as confidence intervals fall between .62 and .661 on the significance level of .05. Namely, the null hypothesis is rejected, which means the indirect effect is significant. Therefore, faculty trust plays a mediating role between servant leadership and learning flow.

CONCLUSION

This study aims to examine the structural relationships among servant leadership of professor, students trust in professor, learning flow, and adjustment to college life. To this end, a questionnaire survey was conducted and the results indicate that they have the structural relationships and influence one another. The five hypotheses were tested; Hypothesis 1. Professors' servant leadership has a positive effect on faculty trust, Hypothesis 2. Professors' servant leadership has a positive effect on learning flow, Hypothesis 3. Students' trust in their professors has a positive effect on learning flow, Hypothesis 4. Learning flow has a positive effect on students' adjustment to college life, Hypothesis 5. Faculty trust plays a mediating role between servant leadership and learning flow. All the hypotheses were confirmed.

First, professors' servant leadership enhances faculty trust, which means that professors who listen to, support, and empathize with their students gain more trust by their students. Therefore, the paradigm in educational settings should be changed, namely, professor-oriented into students-oriented.

Second, professors' servant leadership increases students' learning flow. Therefore, professors should try to give more opportunities for their students to experience learning flow. Professors also try to promote their students' autonomy so that students take responsibility for their own learning. Student autonomy eventually leads to enhancing students' learning flow.

Third, the more students trust their professors, the more students' learning flow level increases. Professors should find the ways to make their students trust them. Usually, students' trust in their professors grows a lot when they feel that their professors support them in all sincerity and have sound content knowledge of their discipline. Thus, it is important to make students realize that their professors care about them and are fully qualified for the disciplines they teach.

Fourth, when students experience learning flow, they are more likely to adjust to college life easily. This means learning flow actually helps prevent students from dropping out school. Therefore, professors and schools should establish the environment where students easily experience learning flow.

Fifth, faculty trust plays a mediating role between servant leadership and learning flow, indicating professors' servant leadership positively influences students' learning flow both directly and indirectly.

In sum, professors' servant leadership, students' trust in their professors (faculty trust), learning flow, and students' adjustment to college life affects one another. Among those variables, professors' servant leadership plays a primary role. Therefore, a variety of programs and opportunities should be offered to professors so that they can foster their servant leadership.

Development of Creativity Program using Disney Animation of Young Children

Rae-Eun Kim¹, Sang-Mee Koo²

¹Assistant Professor, Dept. of Gifted Child Care and Education, ²Assistant Professor, Dept. of Nursing, UI University, Korea

ABSTRACT

In order to develop a 5-year-old creativity program for young children that is applicable to the field of early childhood education, this study selected appropriate animation for a lifestyle theme and then selected various animation types such as drama, game, art, cooking, and science. In order to accomplish the purpose of the study, the following research problems were set up. We developed the creativity program model using Disney animation and to develop developed program teaching model and to select appropriate animation for 11 life subjects applicable to 5 year old young children and then to develop 3-4 creativity program activities. We developed the project plan for 44 program activities. In other words, we developed a program instructional model and developed a total of 40 activities for each 3 to 4 life topics.

10 creativity and early childhood education experts were tested. The teaching and learning activities of each session were composed of ‘ introduction - development - finishing and development ‘. At the introduction stage, we introduced Disney animated fairy tales and made them listen to fairy tales. In the development stage, we explored Disney animated fairy tale situations and explored ways to solve various problem situations. In summary and development phase, we expanded to various activities. Consequently, it is meaningful that this program activity is developed so that it can be applied and utilized in the curriculum at the stage of early childhood education. Nevertheless, rather than applying the activities presented in this program, it should be flexibly implemented in consideration of the situation of each classroom and the interest of young children in connection with the advance activities or extension activities in the field of early childhood education.

Keywords: young children, creativity, program development, creativity program, Disney animation

INTRODUCTION

In today’s rapidly changing world of times and societies, education is continuously demanding a new educational paradigm. We emphasized the importance of creativity development and education, addressing whether the society gives a fair opportunity for the potential creativity to be exercised by the members of the society, whether the society is dead or not.

Creativity is developed through the interaction of the individual’s cognitive abilities, creative abilities,

creative attributes, and creative personality with the environment and tasks¹. Creativity is the ability to make available stored information new, and new things have more meaning than imitation for infants, and their imagination and fantasy become important assets².

Effective teaching and learning for children’s creativity development can be achieved when they form a desirable learning environment based on teacher’s theory and practical knowledge and interact with infants. Therefore, in order to educate young children effectively, it is necessary to utilize proper teaching medium and teaching and learning methods in the advanced information age. Among the various teaching media, animation is a mass media with excellent information transfer effect in the information age. It is a mass media that goes beyond the scope of entertainment according to the development of video media since the 20th century

Corresponding Author:

Sang-Mee Koo
Professor, Department of Nursing,
UI University, Korea
Email: ksm@u1.ac.kr

and goes across various fields such as politics, economy, philosophy, it is firmly established as a genre. In other words, animation is a piece of comprehensive art with both visual and print media characteristics, and it can be an effective teaching medium for children's creativity development as it has educational function as a medium of knowledge and information as well as entertainment function. In particular, there is often a conflict situation in the animation contents, so creativity develops in the process of self-exploration of problem-solving methods in the conflict situation³.

Animation fairy tale is a fairy tale that composes a picture fairy tale together with not only texts and voices but also pictures as animations according to animation production techniques. ⁴suggested the possibility of educational use of animation, which can enhance the learning effect and provide much information to young children by making good use of such animation as a teaching medium. Especially, the most prominent feature of animation is 'Fantasy'. Fantasy, which is the source and the driving force of fairy tales, is not merely a talent to think about whatever happens, but it induces new thoughts and emotions in imaginary world it means power to do.

The educational value of animation can be enjoyed or read by young children who cannot read or write, and you can see facts and situations that cannot be seen through animation. Since animation is expressed through paintings, infant dreams and imaginations can be unfolded because there is no limit to the development of the plot ⁵. In this way, the animation can be easily accessed with interest by the infant. By providing diverse contents over time, it will be able to expand the existing knowledge of the infant, and will be an effective teaching medium for promoting the creativity by promoting the thinking.

In 1982, UNESCO suggested that it is necessary to develop a curriculum that educates teachers about media knowledge and awareness for media education⁶. In order to utilize animations properly in the early childhood education field, it is necessary to show the animation and then expand the contents to link them to activities⁷. However, according to a study by ⁸, early childhood

teachers in Korea show animation to infants frequently, but rather than linking activities to expanding contents of animation, respectively.

The preceding studies on animation related creativity program are few, and it is effective to improve creativity of infant using the animation of imagination animation. The activity of listening to music through animation was effective in promoting the creativity of young children ⁹. In addition, the creativity program using manga and animation was effective in the creativity of the young children and the creative problem solving ability¹⁰, and the camber technique using the animation video appreciation was effective in promoting the creativity of young children. Nonetheless, these previous studies consisted of one type of activities such as superficial - arithmetic thinking, listening to music, language, and story - telling.

Therefore, in order to develop a 5-year-old creativity program for young children that is applicable to the field of early childhood education, this study selected appropriate animation for a lifestyle theme and then selected various animation types such as drama, game, art, cooking, and science. In order to accomplish the purpose of the study, the following research problems were set up.

Research questions 1. What is the model of creativity program using animation of young children?

Research questions 2. What is the activity of creativity program using animation of young children?

METHOD

Process of Program Development: The purpose of this study is to develop an creativity program model using Disney animation and to develop developed program teaching model and to select appropriate animation for 11 life subjects applicable to 5 year old young children and then to develop 3-4 creativity program activities. The development process of the creativity program using Disney animation was completed through the following six steps as shown in Fig 1.

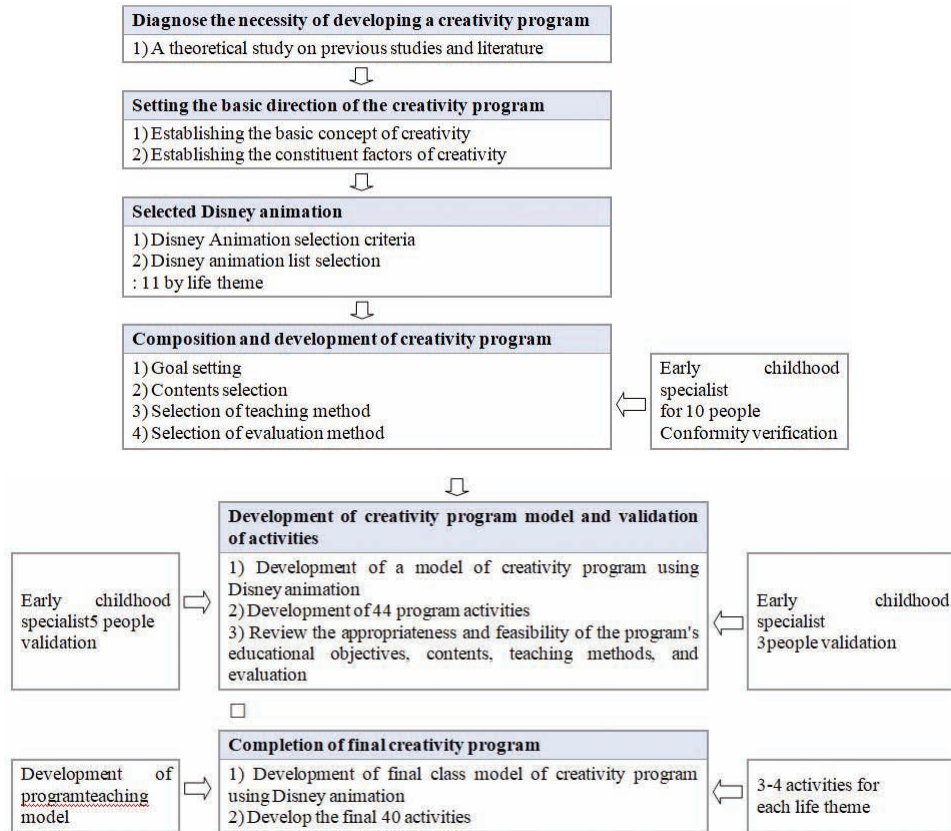

Figure 1: Development process of creative and humanity program using Disney animation

First, the necessity of development of creativity program was examined by examining previous researches and documents related to creativity of young children. Second, we examined the precedents and literature related to creativity and set the basic direction of creativity program developed in this study. In other words, the basic concept of creativity was established and the creativity factor was set. Third, we tried to utilize Disney animation as an effective medium for young children’s creativity development. We set evaluation criteria for selection of Disney animation, and selected 11 Disney animated fairy tale lists based on them. Fourth, after constructing and developing a creative program using Disney animation such as goal setting, content selection, teaching and learning method selection and evaluation method selection based on the 5th year nursing course, respectively. Fifth, we developed a model of creativity program based on Disney animation. Based on this, we developed the project plan for 44 program activities. Sixth, the creativity program using the final Disney animation was developed. In other words, we developed a program instructional model and developed a total of 40 activities for each 3 to 4 life topics.

Contents of Program Model: The model of this program was developed as shown in Fig. 2 using the assimilation education program.

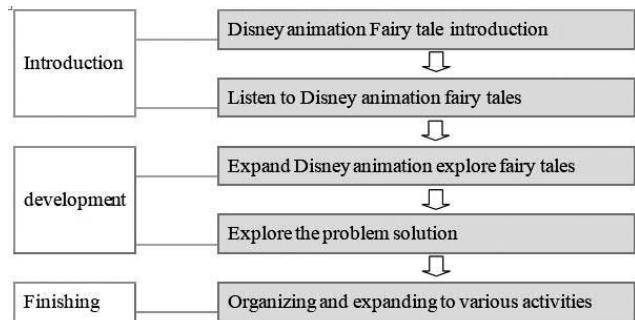

Figure 2: Creativity program teaching model using Disney animation

In this process, 10 creativity and early childhood education experts (professors and teachers) were tested. The teaching and learning activities of each session were composed of ‘introduction - development - finishing and development’. At the introduction stage, we introduced Disney animated fairy tales and made them listen to fairy tales. In the development stage, we explored Disney animated fairy tale situations and explored ways to solve various problem situations. In summary and development phase, we expanded to various activities.

Selected Disney Animation: We tried to use Disney animation to select the animation suitable for the

creativity program activity because most infant teachers are very fond of it. Disney Animation’s selection criteria are based on the creative education elements composed of cognitive elements, inclination elements, and synchronous elements presented by Moon Il-rin and Choi In-su, who set the standard, we used entertainment, education, and appropriateness as criteria. In other words, whether or not recreation affects children ‘, ‘ does it reflect the needs of young children’, ‘does it provide

the right information on the subject’, ‘does it help the young children’ ‘Is it appropriate for three infants?’ And ‘Is it appropriate for the content of the life topic?’.

The selection process of the animation list was firstly calculated 72 of the Disney animations released from the 1970s to the 2013, and based on the contents of the animation and the evaluation criteria set up in the past, through the content validity of three early childhood education experts, were selected for the animation.

RESULTS

Table 1 is the creativity program for young children using Disney animation.

Table 1: The creativity program for young children using Disney animation

Division	Life topic	Animation	Type	Activity name
1	Kindergarten and friends	Toy story	Share your story	Let me introduce you and your friends.
			Body expression	Become a navigation king.
			Role play	Become a Toy Story friend.
			Cooking	I make cookies.
2	Me and my family	Finding Nemo	Body expression	Become Nemo and play a pantomime situation.
			Art	Represent my family as a fish.
			Language	Write a letter in your own favor.
			Music	Open up a celebration for Nemo and Malin.
3	Hometown	Chicken little	Art	I decorate the neighborhood I want to live in.
			Share your story	Find a way to save our neighborhood.
			Role play	It’s bad to be bullied.
4	Animals and plants	Mouse rescue II	Share your story	Find out about rare animals.
			Body expression	Be a mouse rescue animal.
			Language	Make a mouse rescue animal.
5	Health and Safety	Cloudy with a chance of meatballs?	Cooking	I make a good fusion dish.
			Science	Make a blueprint for a food making machine.
			Role play	Become a weather caster to inform the weather of food.
			Music	I make a food advertisement song.
6	Living tools	Super bad	Art	Become a group and a group to create new futuristic tools.
			Science	Make your own invention book.
			Share your story	Learn about the energy of the future.
			Game	Organize the vector and the grove lab.
7	Transportation	Airplane	Game	What airplane am I?
			Active	I can get through.
			Art	I make a plane of the future.
8	Our country	Atlantis: Lost Empire	Language	I make Atlantis country book.
			Share your story	I want to be president.
			Cooking	I make dishes for the Atlantis people.

Conted...

9	Countries around the world	Car 2	Science	Money has disappeared.
			Math	Pair architecture and national flag with country.
			Stacking play	Build a new building.
			Art	Let's make a world travel map.
10	Environment and Life	Well E	Share your story	My earth hurts.
			Art 1	I make well E and Eve.
			Art 2	Let's express our recycled products in masterpieces.
11	Spring, Summer, Fall, Winter	Frozen	Share your story	See the background of the winter kingdom and learn about winter weather.
			Science	Set up your own winter kingdom.
			Body expression	I make musicals in the background of summer.

CONCLUSION

Consequently, first, Disney Animation, which is the teaching medium of this study, is an important medium that connects education and play in this creativity program, and it coincides with the integrated approach to creativity of this study. In other words, intrinsic motivation in an integrated approach is an important factor for creativity. Intrinsically synchronized and concentrated infants can immerse themselves in data and activities they experience, work-play dichotomy, and challenging tasks.

Second, this study used Disney animation as a teaching medium to develop creativity program models and activities that can promote infant creativity in the advanced information society. As a part of the convergent talent education, which has become an issue in the early childhood education field, it provided a teaching and learning method connecting Disney animation media and early childhood education.

Third, the program model developed in this study is applied and applied to the field of early childhood, so that when the early childhood teachers conduct activities of creativity class and various types and areas, they form a 'creative classroom culture' It will help. This study suggests ways to select and utilize diverse media such as animation from the activity - centered activities of early childhood creativity in early childhood education on the aspect of early childhood teachers. In the process, we can expect to cultivate a convergent human resource with three aspects of creativity, cognitive, propensity and motivation.

Fourth, a variety of creative thinking experiences such as exploring the fairy tale situation and exploring problem solving methods in the activity of the infant creativity enhancement program using animation are deepened into the daily life area beyond the creative idea in the virtual space of the young children, It will help you grow into a convergent talent.

Especially, the experience of various conflicts such as moral dilemma and problem situation in creativity promotion activities using animation makes it possible to immerse not only the emotions of the characters of the infants, but also the problem situations, and the infant himself shows up in the animation fairy tale I will have an opportunity to reflect on myself through surrogate experience, such as thinking about and solving what to do.

Fifth, this study linked the activities based on the creativity program model using animations to the theme of life, and selected the animation line that can be handled in the life topic. Therefore, it is meaningful that this program activity is developed so that it can be applied and utilized in the curriculum at the stage of early childhood education. Nevertheless, rather than applying the activities presented in this program, it should be flexibly implemented in consideration of the situation of each classroom and the interest of young children in connection with the advance activities or extension activities in the field of early childhood education.

Analysis of the Influencing Factors on Life Satisfaction in College Students: A Structural Equation Modeling Approach

Jung-Hyun Choi

Dept. of Nursing, Namseoul University, 91 Daehakro, Seonghwan-eup, Seobuk-gu, Chonan, South Korea

ABSTRACT

Background/Objectives: This study aimed to examine the structural relationships of positive caring, negative feeling, and self-esteem that affect life satisfaction of college students in Korea.

Method/Statistical analysis: This study used data of the seventh KCYSPS (Korean Children and Youth Panel Survey) of 2016. The participants were college 1st year students. The number of participants was 1881 students.

Findings: The participants in this study were 954 females (50.7%) and 927 males (49.3%). The mean age was 19.89 years old. Most participants were included in the middle class of socioeconomic status (63.0%). The participants who visited foreign countries were 322 persons (17.1%). The participants who experienced gambling were 29 persons (1.9%). This study showed positive caring, negative feeling, and self-esteem were prominent variables to predict life satisfaction of college students. Self-esteem was the most influential factor in life satisfaction of college students rather than positive caring and negative feeling. Also, the study showed the mediating effect of self-esteem in the relationship between positive caring and life satisfaction of college students. And it also showed that negative feeling indirectly influenced life satisfaction of college students via self-resilience.

Improvements/Applications: These findings imply that positive caring, negative feeling and self-esteem are important variables of life satisfaction and can be used as important intervention factors which increase life satisfaction among college students.

Keywords: *life satisfaction, self-esteem, positive caring, negative feeling, students, Korea*

INTRODUCTION

According to the Ministry of Education, the 18-year-old school population is expected to decline from 625,000 in 2015 to 500,000 in 2020 and to 440,000 in 2030. This is a decrease of 23.4% and 32.5%, respectively¹. This decline in the school-age population is causing problems such as a reduction of university enrollment quota, increasing dropout rate of college students, and university restructuring. The dropout rate of college students is high during the first year of

admission, and the decline in college life satisfaction and university adaptation is an important variable². Since college students are also members of a society, they should get along well with other people to survive in their environment³. Literature analysis revealed that positive caring, negative feeling, and life satisfaction has been separately investigated in other studies^{4,5}. In this study, the variables of positive caring, negative feeling, and satisfaction has been investigated, and their correlations with one another will be investigated in the structural equation model.

Life satisfaction is the way in which people show their emotions and feelings⁶. Life satisfaction is one of the themes focusing on the positive qualities of human nature psychologically³. Life satisfaction of college students can affect overall university life, employment, and even adulthood in general. Life satisfaction of college students is influenced by individual internal factors,

family environment factors, and social environment. Self-esteem is explained as an individual's thoughts and feelings that he or she is a valuable and important person⁷ There are not many studies on life satisfaction and self-esteem among early college students. Therefore, studies to research a variety of strategies are needed to improve the life satisfaction of college students at the beginning of adulthood. This study aims to test the developed model whether there is a casual relationship among positive caring, negative feeling, self-esteem, and life satisfaction (See Fig. 1).

Figure 1: Hypothesized path model

MATERIALS AND METHOD

Participants: Data were collected from the seventh KCYSPS (Korean Children and Youth Panel Survey) of 2016. The participants were college 1st year students. The number of participants was 1881 students.

Study Design: The purpose of the study was to test the hypothesized model connecting positive caring, negative caring, self-esteem with life satisfaction of college students.

Measurement

Life satisfaction: Life satisfaction scales used by Kim and Baek⁸ were used in this study. It was composed of 3 items asking about a degree of life satisfaction (e.g., “I enjoy living”, “I don’t have much worries”). Each item was evaluated with the 4 point Likert scale. A higher score meant a higher level of life satisfaction from students. Cronbach’s alpha coefficient was .79.

Self-esteem: Self-esteem scales made by Rosenberg⁷ were used in this study. It was composed of 10 items asking about a degree of self-esteem (e.g., “I have a lot of good points”, “I am very competent person”). Each item was evaluated with the 4 point Likert scale. The higher score meant a better level of self-esteem from students. Cronbach’s alpha coefficient was .71.

Affection: Affection scales used by Huh⁹ were used in this study. It was composed of 4 items asking about a degree of affection from their parents (e.g., “They respect my opinion.”, “They say they like me.”). Each item was evaluated with the 4 point Likert scale. The higher score meant the more affection from their parents. Cronbach’s alpha coefficient was .73.

Rational explanation: Rational explanation scales used by Huh⁹ were used in this study. It was composed of 3 items asking about a degree of rational explanation (e.g., “Parents explain why instead of forcing to follow their decisions unconditionally.”, “If I make an unreasonable request to my parent, they explain why they do not allow it.”). Each item was evaluated with the 4 point Likert scale. The higher score meant the better level of rational explanation from their parents. Cronbach’s alpha coefficient was .80.

Aggression: Aggression scales used by Cho and Lim¹⁰ were used in this study. It was composed of 6 items asking about a degree of aggression (e.g., “I sometimes find fault with little things.”, “I sometimes interfere with what others do.”). Each item was evaluated with the 4 point Likert scale. The higher score meant the more aggressive level. Cronbach’s alpha coefficient was .81.

Social withdrawal: Social withdrawal scales used by Kim and Kim¹¹ were used in this study. It was composed of 5 items asking about a degree of social withdrawal (e.g., “I feel awkward when there are many people around.”, “I am shy a lot.”). Each item was evaluated with the 4 point Likert scale. The higher score meant the more shy level. Cronbach’s alpha coefficient was .89.

Data Analysis: Data were analyzed using Statistical Package for the Social Sciences and the Analysis of Moment Structures statistical software programs¹².

RESULTS

Demographic characteristics: The participants in the study were 954 females (50.7%) and 927 males (49.3%). The average age was 19.89 years old. Most participants were included in the middle class of socioeconomic status (63.0%). The participants who visited foreign countries were 322 persons (17.1%)(Table 1).

Table 1: General characteristics (N = 1881)

Variable	Category	N (%), Mean ± SD
Gender	Male	927 (49.3%)
	Female	954 (50.7%)
Age	-	19.89±0.34
Economic status	Very wealthy	6 (0.3%)
	Wealthy	96 (5.1%)
	A little wealthy	248 (13.2%)
	Normal	1,185 (63.0%)
	A little poor	232 (12.3%)
	Poor	101 (5.4%)
	Very poor	13 (0.7%)
Drinking	Yes	1,504 (80.0%)
	No	377 (20.0%)
Smoking	Yes	380 (20.2%)
	No	1,501 (79.8%)

Descriptive statistics: Descriptive statistics for participants' life satisfaction, self-esteem, affection,

rational explanation are described as seen in Table 2. The level of life satisfaction and self-esteem was 2.84±.58, 2.94±.45 point each.

Table 2: Descriptive statistics for variables (N = 1881)

Variable	Mean ± SD
Life satisfaction	2.84 ± .58
Self-esteem	2.94 ± .45
Affection	3.11 ± .54
Rational explanation	2.82 ± .58
Aggression	1.80 ± .52
Social withdrawal	2.19 ± .71

Correlation between main variables: Correlations among main variables are described as seen in Table 3. Life satisfaction was significantly positively related to self-esteem ($r = .60, p<.001$), affection ($r = .37, p<.001$), rational explanation ($r = .29, p<.001$). But life satisfaction was significantly negatively related to aggression ($r = -.28, p<.001$) and social withdrawal ($r = .30, p<.001$).

Table 3: Correlation between main variables (N = 1881)

	Affection	Rational explanation	Aggression	Social withdrawal	Self-esteem	Life satisfaction
Affection	1					
Rational explanation	.60***	1				
Aggression	-.22***	-.18***	1			
Social withdrawal	-.12***	-.11***	.37***	1		
Self-esteem	.36***	.25***	-.37***	-.38***	1	
Life satisfaction	.37***	.29***	-.28***	-.30***	.60***	1

* $p<.05$, ** $p<.01$, *** $p<.001$

The model testing: The initial analysis of the hypothesized model revealed adequate fit to the data $\chi^2 = 40.31, df=6, p < .001, TLI = 0.97, CFI = 0.99, RMSEA = 0.06$ (Table 6, Figure1). All specified paths were significant (Table 4). A competing model which have a direct path of the negative feeling to life satisfaction within the model was explored to enhance the model fit. Based on theoretical reasoning and literature review suggesting a significant relationship between negative feeling and life satisfaction (Table 5), the competitive model (final model) has a direct path from the negative

feeling to life satisfaction within the hypothesized model (Table 5, Fig.2). The final model resulted in a substantially better fit to the data ($\chi^2 = 23.86, df = 5, p < .001, TLI = 0.98, CFI = 0.99, RMSEA = 0.04$) (Table 6, Figure 2). Comparing the hypothesized model with the final model ($\Delta\chi^2_{df=1} = 16.45$), the latter is better. Sobel's test suggested that self-esteem partially mediates the relation between positive caring and life satisfaction ($Z=7.13, p<.001$), and self-esteem partially mediates the relation between negative feeling and life satisfaction ($Z=-9.89, p<.001$).

Table 4: Regression weights of hypothesized model

	Estimate (unstandardized)	Estimate (standardized)	S. E	C. R
Positive caring --> Self-esteem	.24	.21***	.03	7.60
Negative feeling--> Self-esteem	-.58	-.55***	.05	-12.93
Positive caring --> Rational explanation	1.00	.67***	-	-
Positive caring --> Affection	1.22	.89***	.07	16.55
Negative feeling--> Social withdrawal	1.00	.60***	-	-
Negative feeling--> Aggression	.74	.61***	.05	14.70
Positive caring --> Life satisfaction	.33	.22***	.03	9.63
Self-esteem --> Life satisfaction	.66	.51***	.03	25.09
***P<.001, *P<.05

Figure 2: Final study model

DISCUSSION

This study aimed to examine the structural relationships of positive caring, negative feeling, and self-esteem that affect life satisfaction of college students. The structural model developed on the basis of the causal correlations between positive caring, negative feeling, self-esteem and life satisfaction was verified. Firstly, it is turned out positive caring significantly positive affect life satisfaction of college students. This result is partly similar to the previous study about stressing parent positive caring¹³. College students have various stresses such as academic work, job management and friends, but the positive caring they receive from their parent has a significantly positive effect on their life satisfaction, so the importance of raising their children at home is more emphasized. Secondly, negative feeling has an impact on negatively life satisfaction of college students. This result is also supported by the previous study⁴. Life satisfaction is one of the themes focusing on the positive qualities of human nature psychologically³. Individuals with negative feeling seems to blame themselves and others, have a negative self-esteem because of the negative message effects they receive from the environment^{3,14}. When negative feeling such as aggression or social withdrawal increase, it becomes difficult to get close to others or feel intimacy with others, then it reduces social relationships and communication, and the life satisfaction is decreasing as a result. Thirdly, self-esteem was the most influential factor in life satisfaction of college students rather than positive caring and negative feeling^{15,16}.

Fourthly, this study showed the mediating effect of self-esteem in the relationship among positive caring and life satisfaction of college students. Positive caring indirectly influence life satisfaction of college students via self-resilience. The higher the parental positive caring, the higher the self-esteem. And as a result, a level of life satisfaction increases. A person who has been cared with

love and affection at home recognizes himself as a valued person, and a person with such a high self-worth will grow up to be more satisfied with his or her life. Therefore, it is emphasized that affectionate care at home and in school is always important in modern society¹⁷.

Fifthly, this study showed the mediating effect of self-esteem in the relationship among negative feeling and life satisfaction of college students. Negative feeling indirectly influence life satisfaction of college students via self-resilience. As a result, the higher the negative feeling, the lower self-esteem and the lower the life satisfaction. Through the study of a relationship between negative feeling and life satisfaction of college students, it was confirmed that negative feeling was examined as a mediator of self-esteem in the path of negative feeling to life satisfaction. Through this, an important variable that affects life satisfaction of college students was found and that is significant in that it provides a theoretical basis for establishing an intervention strategy to enhance life satisfaction. This study showed that negative feeling has more influence on life satisfaction by mediation of self-esteem than the direct influence to life satisfaction. These results suggest that it is necessary to strengthen self-esteem for adolescents who give up their lives by negative feeling such as aggression or social withdrawal or whose life satisfaction is low. In order to improve the self-esteem of adolescents, academic and practical efforts should be made together.

These findings imply that positive caring, negative feeling and self-esteem are important variables of life satisfaction and can be used as critical intervention factors that increase life satisfaction among college students¹³. Education experts have begun to pay more attention to the evaluation and promotion of self-esteem and life satisfaction of college students⁵.

CONCLUSION

This study aimed to examine the structural relationships of positive caring, negative feeling, and self-esteem that affect life satisfaction of college students in Korea. This study showed positive caring, negative feeling, and self-esteem were prominent variables to predict life satisfaction of college students. Also this study showed the mediating effect of self-esteem in the relationship among positive caring and life satisfaction of college students. In addition, this study showed the mediating effect of self-esteem in the relationship among

negative feeling and life satisfaction of college students. Negative feeling indirectly influence life satisfaction of college students via self-resilience. These results may have insight into the an effect of self-esteem on life satisfaction among Korean college students

The Structural Relationship between Trust-Forming Factors, Leader Trust, University Trust, University Satisfaction, and Maintenance of Relationship in University Physical Education Courses

Kye-Sok Lee¹, Seung-Yong Kim²

¹Department of Physical Education, Soongsil University, Korea; ²Graduate School of Education, Donga University, Korea

ABSTRACT

Background/Objectives: The purpose of this study was to evaluate relationships between trust-forming factors, leader trust, university trust, university satisfaction, and maintenance of relationship in university physical education courses.

Method/Statistical analysis: Frequency analysis, exploratory factor analysis, reliability analysis, correlation analysis, and regression analysis were conducted to explain participants' characteristics and questionnaire using PASW (ver. 18.0).

Findings: The result of this study was as follows. First, trust-forming factors affecting leader trust were faithfulness and good will and trust-forming factors affecting university trust were faithfulness. Second, leader trust significantly affected university trust. Third, leader trust and university trust all significantly affected university satisfaction. Fourth, university satisfaction significantly affected maintenance of relationship.

Improvements/Applications: A university plays an important role in providing a good quality of service and may need efforts to improve the quality of education services. Also, it is determined that the roles and responsibilities of university faculty members as a leader are important.

Keywords: *Trust-Forming Factors, Leader Trust, University Trust, University Satisfaction, Maintenance of Relationship*

INTRODUCTION

The important purpose of university physical education courses is to improve cognitive, social, and affective abilities through physical activities, so students enable to lead the pleasant life ¹. Therefore, university physical education courses play an important role in encouraging student to promote participation in physical activities as well as experiences for improved quality of life through active participation.

University education needs social relationship between students when education services are provided. In other words, leaders in universities may have the responsibility for social relationship between students because they are education service providers to meet students the most frequently. So, leader trust is an important role to students that receive education service at university.

The studies in regard to leader trust have been continually documented since 1950 ^{2,3,4}. In particular, it is important to build mutual trust between students and leaders and students and universities for active and productive communication ⁵. Furthermore, university trust is important to students who receive education service at the university. Generally, trust in the area

Assistant Professor, Graduate School of Education

Donga University, Korea

Email: dragonkim@dau.ac.kr

of relation marketing is essential to build long-term relationship between a company and customer and is an important factor to promote business performance through customer loyalty as a service provider ⁶. However, service trust is classified into content and object multi-dimension ⁷. So, single and multidimensional perspectives to measure trust for education service at university should be considered together.

In counterpoint to the preceding studies provided, this study added a leader trust factor to consider multidimensional perspectives. Thus, the purpose of this study was to find relationship between trust-forming factors, leader trust, university trust, university satisfaction, and maintenance of relationship in university physical education courses. For this study, four hypotheses were provided and research design was suggested to reveal purposes (Figure 1).

Hypothesis 1: Leader trust of university physical education courses will significantly affect multidimensional trust.

Hypothesis 2: Leader trust of university physical education courses will significantly affect university trust.

Hypothesis 3: Multidimensional trust will significantly affect university satisfaction.

Hypothesis 4: University satisfaction will significantly affect maintenance of relationship at university.

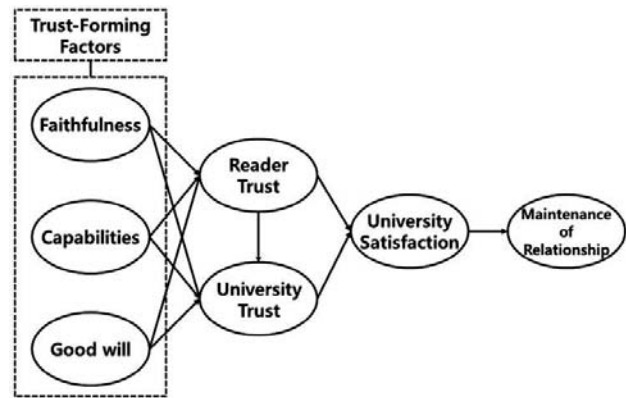

Figure 1: Research model

MATERIALS AND METHOD

Research Subject: Participants included 400 university students who participated in university physical education courses in 2016 and were selected by convenience sampling. The setting was three universities in Seoul, Gyeonggi-do, and Chungcheong-do in Korea. The self-report questionnaire was distributed to students and directly returned from them. The table 1 indicates participants’ demographic characteristics.

Table 1: Demographic characteristics of research subjects

Gender	Frequency	%	Grade	Frequency	%	Area	Frequency	%
Man	189	51.8	a freshman	96	26.3	Seoul	127	24.8
			a sophomore	87	23.8	Gyeonggi	120	32.9
female	176	48.2	a junior	85	23.3	Chungcheong	118	32.3
			a senior	97	26.6			

According to our result, there were 189 males and 176 females. Specifically, there were 96 freshmen, 87 sophomores, 85 junior, and 97 senior. Areas located at universities were Seoul (n=127), Gyeonggi-do (n=120), and Chungcheong-do (n=118).

Inquiry Tool: This study used Likert-type survey and detailed questions are as follows.

First, a questionnaire that inquires about faithfulness, capabilities, good will, leader trust, and university trust was created and based on the existing survey, developed by Sirdeshmukh, Singh, and Sabol ⁸. Second, four

questions for university satisfaction, developed by Oliver ⁹, was included. Third, four questions for maintenance of relationship, developed by Dick and Basu ¹⁰, was included.

Validity and Reliability of Inquiry Tool: Items with factor loadings of more than .5 were selected using varimax in exploration factor analysis (Table 2). This study found that Factor 1, 2, 3 contained items that reflected faithfulness, capabilities, and good will respectively. The accumulated percentage of explained variance was 83.97% (Table 2).

Table 2: Results of exploration factor analysis on Trust-Forming Factors

	Factor 1	Factor 2	Factor 3	h ²
Trust-Forming Factors 1	<u>.846</u>	.310	.255	.877
Trust-Forming Factors 2	<u>.853</u>	.300	.189	.853
Trust-Forming Factors 3	<u>.808</u>	.357	.253	.844
Trust-Forming Factors 4	<u>.781</u>	.318	.331	.821
Trust-Forming Factors 5	.387	<u>.691</u>	.287	.710
Trust-Forming Factors 6	.276	<u>.822</u>	.299	.842
Trust-Forming Factors 7	.320	<u>.822</u>	.298	.866
Trust-Forming Factors 8	.371	<u>.781</u>	.281	.827
Trust-Forming Factors 9	.378	.443	<u>.718</u>	.854
Trust-Forming Factors 10	.308	.382	<u>.814</u>	.903
Eigenvalue	3.410	3.197	1.790	
Variance (%)	34.100	31.969	17.902	
Accumulation (%)	34.100	66.069	83.971	

Cronbach’s alpha on all items was used as a measure of the reliability and ranged from .815 and .95 that had acceptable reliability ¹¹. The reliability analysis is shown in Table 3.

Table 3: Reliability analysis

		Cronbach's α
Trust-Forming Factors	Faithfulness	.938
	Capabilities	.919
	Good will	.859
Leader Trust		.950
University Trust		.917
University Satisfaction		.906
Maintenance of Relationship		.815

Data Processing: Frequency analysis, exploratory factor analysis, reliability analysis, correlation analysis and regression analysis were conducted using PASW (Ver. 18.0).

Correlation Analysis: The correlation analysis was performed to quantify the association between each variable and is presented in Table 4. It was hypothesized that there would be a positive correlation between each variable and our results corresponded with hypothesis. The discriminant validity is achieved when the value of 1 is not included within the 95% confidence interval ¹².

Table 4: Correlation analysis

Dependent	1	2	3	4	5	6	7
Faithfulness	1						
Capabilities	.731**	1					
Good will	.708**	.783**	1				
Leader Trust	.381**	.342**	.412**	1			
University Trust	.283**	.244**	.259**	.539**	1		
University Satisfaction	.290**	.264**	.316**	.633**	.734**	1	
Maintenance of Relationship	.264**	.259**	.287**	.543**	.754**	.665**	1

**p<.01

RESULTS

Relationship between Trust-Forming Factors and Leader Trust: The multiple regression analysis was conducted to find the association between trust-forming factors and leader trust. This study revealed that faithfulness

and good will were important antecedent factors to affect leader trust (Table 5). The power of trust-forming factors explaining a change of leader trust was found to be 18.6%, and in standardized regression coefficient, good will was found to be highest .305, followed by faithfulness (.191).

Table 5: Regression analysis

Dependent	Independent	Standardized Coefficients	t
		β	
Leader Trust	Faithfulness	.191	2.605*
	Capabilities	-.037	-.443
	Good will	.305	3.791***

*p<.05, ***p<.001

Relationship between Trust-Forming Factors and University Trust: The multiple regression analysis was conducted to find the association between trust-forming factors and university trust. This study revealed that faithfulness, capabilities, and good will were important antecedent factors to affect university trust (Table 6). The power of trust-forming factors explaining a change of university trust was found to be 8.7%, and in standardized regression coefficient, faithfulness was found to be highest .193, followed by good will (.107), and capabilities (.018).

Table 6: Regression analysis

Dependent	Independent	Standardized Coefficients	t
		β	
University Trust	Faithfulness	.193	2.484*
	Capabilities	.018	.209
	Good will	.107	1.258
R ² = .087, F= 11.460, p= .000,			

*p<.05

Relationship between Multidimensional Trust and University Satisfaction: The multiple regression analysis was conducted to find the association between multidimensional trust and university satisfaction. This study revealed that leader and university trust significantly affected university satisfaction (Table 7), so leader and university trust were important antecedent factors to affect university satisfaction. The power of multidimensional trust explaining a change of university satisfaction was found to be 61.9%, and in standardized regression coefficient, university trust was found to be .554, and leader trust (.335).

Table 7: Regression analysis

Dependent	Independent	Standardized Coefficients	t
		β	
University Satisfaction	Leader Trust	.335	8.683***
	University Trust	.554	14.375***
R ² = .619, F = 293.598, p = .000,			

***p<.001

Relationship between University Satisfaction and Maintenance of Relationship: The regression analysis was conducted to find the association between university satisfaction and maintenance of relationship. This study revealed that university satisfaction significantly affected maintenance of relationship (Table 8), so university satisfaction was an important antecedent factor to affect maintenance of relationship. The power of university satisfaction explaining a change of maintenance of relationship was found to be 44.2%, and the standardized regression coefficient was found to be .665.

Table 8: Regression analysis

Dependent	Independent	Standardized Coefficients	t

University Satisfaction	Maintenance of Relationship	.665	16.949***
R ² = .442, F = 287.253, p = .000,			

***p<.001

DISCUSSION

This study revealed that faithfulness and good will are considered as important antecedent factors in regard to leader trust, while leader trust is an important antecedent factor in regard to university trust. In addition, leader and university trust all are considered as important antecedent factors in regard to university satisfaction, while university satisfaction was an important antecedent factor in regard to maintenance of relationship.

In the research by Anderson and Sullivan ¹³, they pointed out that customer satisfaction is a very important

variable in maintaining the relations with a customer. They also argued that the higher a customer-perceived satisfaction, the more a customer's intention to maintain purchase continuously, whereas their intention to transfer to other services comes to decrease, if anything. Even in the research by Lee, Choi, and Han¹⁴, they set forth a view that satisfaction formed by the customers using a commercial sports center has a positive influence on retention of relations with the center.

The satisfaction with the class experience in cultural physical education in college is highly likely to get across to others positively through word of mouth by the class experience students. The influence of word-of-mouth spread is very big because word of mouth through satisfaction makes it relatively easy to deliver class information, and it is delivered to the objects in large numbers simultaneously with delivery¹⁵. It might be said that the positive transition through such reliability and satisfaction plays a great role in the retention of relations with a school. Therefore, to give a lot bigger reliability to class-participating college students, it might be necessary to arrange a plan that can increase college students' emotional characteristic and cognitive characteristic through the culture physical education class.

Based on our results, this study maintains that university faculty members as a leader play an important role in promoting physical education courses in universities and encouraging students to increase interest in physical education. Therefore, a university may need efforts to provide various physical education courses as well as high quality of education service.

CONCLUSION

The purpose of this study was to find relationships between trust-forming factors, leader trust, university trust, university satisfaction, and maintenance of relationship in university physical education courses.

To reveal the purpose of this study, university students in Seoul, Gyeonggi-do, and Chungcheong-do who participated in university physical education courses in 2016 were selected. Total 365 valid questionnaires for this study were analyzed using frequency analysis, exploratory factor analysis, reliability analysis, correlation analysis, and regression analysis via PASW (Ver. 18.0).

The result of this study was as follows. First, trust-forming factors affecting leader trust were faithfulness

and good will and trust-forming factors affecting university trust were faithfulness. Second, leader trust significantly affected university trust. Third, leader trust and university trust all significantly affected university satisfaction. Fourth, university satisfaction significantly affected maintenance of relationship.

Factors Influencing on Dry Eye Symptoms of University Students Using Smartphone

Jung-hyun Choi¹, Kyung-sook Kim¹, Hee-jeong Kim¹, Se-jin Joo¹, Hye-gyeong Cha¹

¹Department of Nursing, Namseoul University, Cheonan, South Korea

ABSTRACT

This study is a descriptive study to investigate relevance of dry eye symptoms and physical symptoms of university students using smartphones and to identify the factors affecting dry eye symptoms. We collected data from university students in C province of Korea on March 3-29, 2016. They responded questionnaires of general characteristics, physical symptoms, and eye dry symptoms. 315 questionnaires were collected and 310 questionnaires were analyzed except for the incomplete one. Data were analyzed using t-test, one-way ANOVA, Scheffe test, Descriptive analysis, Pearson's correlation coefficients, and multiple regression analysis. The participants' dry eye symptoms according to general characteristics showed statistically significant differences in gender ($t=-3.306$, $p=.001$), whether to wear contact lenses ($t=-3.386$, $p=.001$), smartphone use time ($F=5.133$, $p=.002$), and computer use time ($F=5.137$, $p=.002$). We were found that 68 (21.9%) were normal, 80 (25.8%) were mild, 58 (18.7%) were moderate and 104 (33.5%) were severe, and that 78.1% of 310 students had dry eye. And OSDI (Ocular Surface Disease Index) showed a significant correlation with turtle neck syndrome ($r=.343$, $p<.001$), wrist tunnel syndrome ($r=.252$, $p<.001$), and eye fatigue ($r=.681$, $p<.001$), and OSDI was significantly affected by eye fatigue ($\beta=.668$, $t=16.042$, $p<.001$), and computer use time ($\beta=.111$, $t=2.656$, $p=.008$), these variables explained 47.2% of OSDI among university students. It is necessary a program that will reduce the unnecessary computer use time and make the students interested in the importance of proper use of smartphone to reduce eye fatigue.

Keywords: Dry eye symptoms, OSDI, Turtle neck symptoms, Wrist tunnel symptoms, eye fatigue

INTRODUCTION

In 2007, Dry Eye Workshop defined Dry Eye as a multifactorial disease of the tears and ocular surface that results in symptoms of discomfort, visual disturbance, and tear film instability with potential damage to the ocular surface. It is accompanied by increased osmolarity of the tear film and inflammation of the ocular surface¹. According to the Health Insurance Review and Assessment Service statistics², the number of patients treated with dry eye symptoms has steadily increased from 1.4 million to 2.4 million for the last 10 years (2005~2015). Dry eye symptom is one of the most common ophthalmic diseases in clinical practice, and its

symptoms are reported to include a foreign body feeling like sand in the eye, stiffness, blurred object, easily tired eye, burning, heavy eyelid, irregular eye congestion, and sticky eye mucus, etc.³. In addition, although left untreated despite severe symptoms, it is reported that it causes corneal damage and severely impairs visual acuity⁴, and is associated with attention deficit hyperactivity disorder, sleep disorder, and depression⁵.

The causes of dry eye symptoms are indoor environmental pollution⁶, air pollution⁷, contact lens wear and myopia correction, long smartphone use, TV, computer and reading⁸, specific agents (antihistamines, antidepressants, antiarrhythmics, hormones, anti-Parkinson's drugs, etc.) or using artificial tears⁹.

With the increasing use of computers and mobile-phones and the Internet, as young adults have become more active in using documents, lectures, games, and Internet searches, previously, dry eye symptoms, which are common in older adults, are increasingly occurring in young adults¹⁰.

As a result of studying domestic and foreign previous researches, there were many studies on cases of occurrence of dry eye symptoms, but studies to analyze the influence factors to prevent dry eye symptoms were rare. In particular, the use of smartphones and computers, which have recently become widely available, can lead to various physical symptoms¹⁰⁻¹¹ as well as dry eye symptoms.

This study attempted to investigate the relationship between dry eye symptoms and physical symptoms, and factors affecting dry eye symptoms in young university students, and to use it as basic data to prevent the dry eye symptoms and physical symptoms of university students.

METHOD

Research Design: This study is a descriptive study to investigate relevance of dry eye symptoms and physical symptoms that are rapidly increasing in university students using smartphones and to identify the factors affecting dry eye symptoms.

Data Collection: The participants for this paper were university students in C Province of Korea, and the survey was conducted in 2016. 315 university students participated in the survey after informed consent. The required sample size was estimated by G*power 3.1.2 Program. The minimum required sample size was 138 with significance level (α) 0.05, power of test ($1-\beta$) 0.95, effect size (p) 0.3, and the number of predictors 5. In considering the dropout rate, out of a total of 315 questionnaires collected, and except for the 5 questionnaire that had missing values and were responded improperly, a total of 310 questionnaires were used for the data analysis of this study.

Measurements: The questionnaire consisted of research participants' general characteristics, risk factors, physical symptoms, and dry eye symptoms. The general characteristics included gender, age, grade, smoking, drinking, and caffeine intake, the risk factors included contact lens wear, sleep time, smartphone use time, computer use time, reading time, and the physical symptoms included turtle neck, carpal tunnel, and eye fatigue self-test. The turtle neck subjective symptom had a total of 14 items, ranging from 0 to 31 points, at a scale of 1 to 4 points. And 0 point is a healthy condition without problems, 1-5 points is attention, 6-9 points is

warning, and 10 or more points is the risk of turtle neck syndrome. The subjective symptoms of the carpal tunnel were total 5 items, with 1 point in yes and 0 point in no, and if the total score was 4 points or more, it was measured as the carpal tunnel syndrome risk group. Eye fatigue subjective symptoms were measured on a total of 10 items, ranging from 1 point to 3 points, with 10-15 points being normal, 16-20 points being warning, and 21-30 points being ophthalmic.

Dry eye symptoms were measured using the Ocular Surface Disease Index (OSDI) developed by¹². The OSDI scores were calculated as follows with the 4 point scale of 12 items related to the perceived symptoms of the subjects on the eyeball surface, from 0 point for 'not at all' to 4 points for 'always.'

OSDI score = (total score of items answered * 25 / number of items answered)

The OSDI score ranged from 0 to 100, with higher scores indicating severer dry eye symptoms. According to the OSDI score, 0-12 points were classified as normal, 13-22 as mild dry eye, 23-32 as moderate dry eye, and 33-100 as severe dry eye. Reliability was Cronbach's $\alpha=.92$ at the study of¹⁴, and reliability in this study was Cronbach's $\alpha=.89$.

Data Analysis: This study used SPSS Win 22.0 for statistical analysis of the data, and conducted descriptive statistics for the general characteristics, physical symptoms, OSDI. For difference analysis of variables, we used t-test, one-way ANOVA, and analyzed the relation between variables with Pearson correlation coefficients. We used a stepwise multiple regressions for finding affecting factors of dry eye syndrome.

Ethical Consideration: Prior to data collection, this study considered the ethical aspects by providing participants with the purpose and method of research, utilization of research results, survey data to be used only for the study purpose, anonymity and confidentiality of research participants, and a description of stopping during the creation of the questionnaire, and by receiving the consent from participants. It took 10 to 15 minutes to complete the survey questionnaire items, and after the questionnaire items were fulfilled, a predetermined gift was provided for participants.

Limitations: This study was constricted by convenience sampling, which limited generalization to a broad population.

RESULTS AND DISCUSSION

Dry Eye Syndrome according to general Characteristics: The Dry Eye Symptoms according to general characteristics of the participants are shown Table 1.

Table 1: OSDI ACCORDING TO GENERAL CHARACTERISTICS (N = 310)

Variables*	Categories	N (%) M ± SD	OSDI

*p<.01

Of the participants, 83 students (26.8%) were male and 227 students (73.2%) were female, and there was a significant difference between the two groups ($t=0.993$, $p=.001$). That is, the mean score of dry eye symptoms was higher in women than in men, which is consistent

with the results of previous studies^{10, 11}. This suggests that women prefer to use contact lenses rather than eyeglasses and that they are affected by frequent eye makeup and hormones. The average age of them was 20.82 years, 111 students (35.8%) were freshmen, 69

(22.3%) were sophomores, 72 (23.2%) were juniors, and 58 (18.7%) were seniors. There was no significant difference in dry eye symptoms between the ages and the grades, and there was no significant difference in smoking, drinking and caffeine use. However, there was a significant difference in wearing contact lenses. The average wearing time was 31.62 ± 18.45 in 125 patients (40.3%), and 185 patients (59.7%) in non-wearing contact lenses were found to be mean 24.29 ± 18.85 . This was consistent with the results of previous studies^{10, 14, 15} in which dry eye symptoms are more severe and more frequent when wearing contact lenses. This may be due to the increase in the number of people wearing color contact lenses for cosmetic purposes as well as the recent correction of eyesight, resulting in a higher rate of dry eye symptoms in the younger age group.

Sleep time and reading time did not differ among groups, but smartphone use time and computer use time differed by group. In other words, the dry eye symptom score in the group using more than 3 hours was higher than the group using less than 3 hours in the smartphone use time ($t=5.133, p=.002$), and the group using the computer for more than 3 hours had a higher dry eye symptom score than the group using less than 3 hours ($t=5.137, p=.002$). Excessive use of video devices such as computers and smartphones can cause visual display terminal (VDT) syndrome. That is, while using these, the number of flicker is reduced, and the evaporation of the tears occurs well, which can lead to symptoms such as conjunctival hyperemia, foreign body sensation, tearing, headache, dry eye, etc.¹⁶. In a study of 3549 white-collar office workers in Japan¹⁷, long-term use of VDT for more than 4 hours was reported to increase the risk of dry eye symptoms, but in this study, dry eye symptoms were significantly different in the group using computer and smartphone for more than 3 hours. Therefore, the education program for the prevention of VDT syndrome of university students should include recommendations to decrease the use of video equipment such as computer and smartphone to less than 3 hours.

The distribution of Ocular Surface Disease Index (OSDI) score: In a study¹⁰ to investigate the prevalence of dry eye for a total of 263 university students, it is reported that dry eye was seen in 133 students (50.5%) as shown in figure 1. However, in this study, it was found that 68 (21.9%) were normal, 80 (25.8%) were mild, 58 (18.7%) were moderate and 104 (33.5%) were severe, and that 78.1% of 310 students had dry eye,

which is higher than the previous studies. This is a result reflecting the tendency that the dry eye is increasing in the younger age group, though there is a difference between the subjects and the time of the investigation, and follow-up research is required.

Figure 1: The distribution of Ocular Surface Disease Index (OSDI) score

OSDI According to Physical symptoms of Participants: Table 2 shows the correlations between dry eye symptoms and physical symptoms appearing in the participants. That is, There were a positive correlation in OSDI and turtle neck symptoms ($r=.343, p<.001$), carpal tunnel syndrome ($r=.252, p<.001$), and eye fatigue ($r=.681, p<.001$). Visual Display Terminal (VDT) syndrome is a typical problem that can arise when the use of smartphone by university students increases due to popularization of smartphone. The most common symptoms of VDT syndrome are eye diseases and musculoskeletal disorders. In a study on university students' smartphone addiction and health problems¹⁸, university students who used smartphones for a long time reported that the eye fatigue was 31%, the wrist and finger pain was 15%, and neck and shoulder stiffness were 15%. When staring at the same screen such as smartphone for a long time, it reduces the blink of the eye, and due to bad posture, as well as dry eye symptoms, eye fatigue, turtle neck, and carpal tunnel symptoms can appear. Also, since university students are at the highest level of physical health during the life cycle, it would be easy to overlook the awareness or risk of their physical symptoms. Therefore, to reduce the dry eye symptoms of university students, it is necessary to incessantly remind them about the correct posture and usage of the smartphone. Dry eye symptoms were significantly correlated with eye fatigue, carpal tunnel symptoms, and turtle neck symptoms. Therefore, it is necessary to introduce education program to manage these physical symptoms as well as dry eye symptoms.

TABLE 2: CORRELATION AMONG MAIN VARIABLES (N = 310)

Description	OSDI	Turtle neck syndrome	Wrist tunnel syndrome	Eye fatigue
OSDI	1			
Turtle neck syndrome	.343*	1		
Wrist tunnel syndrome	.252*	.359*	1	
Eye fatigue	.681*	.422	.298*	1

* $p < .001$

Factors Influencing on Organ Donation Attitude of University Students: Table 3 shows the participants' dry eye symptoms was affected significantly by eye fatigue ($\beta = .668$, $t = 16.042$, $p < .001$), and computer use time ($\beta = .111$, $t = 2.656$, $p = .008$), and these variables explained 47.2% ($F = 139.210$, $p < .001$).

TABLE 3: FACTORS INFLUENCING (N = 310)

Variable	B	S.E.	β	t	p	Adj. R ²
Constant	-21.117	3.075		-6.867	<.001	
Eye Fatigue	2.876	.179	.668	16.042	<.001	.462
Computer use time	2.036	.767	.111	2.656	.008	.472

F = 139.210, $p < .001$

Prolonged use of the smartphone as well as the computer has been shown to be the most important factor affecting eye fatigue and affecting dry eye symptoms. Therefore, to prevent dry eye symptoms that may occur when using a smartphone, university students need to improve their posture and computer habits to reduce eye fatigue. In other words, it is necessary to keep the distance between the smartphone and the eyes at about 40cm and avoid using it continuously for more than 30 minutes to prevent eye fatigue. It is also necessary to reduce unnecessary computer use time and to have a break time frequently when using the computer.

CONCLUSION

This study was conducted to propose a method to prevent the dry eye symptoms of university students by

analyzing factors affecting rapidly increasing dry eye symptoms among college students using smartphones. The results of this study showed that dry eye symptoms were significantly higher for women, contact lens users, and those who used computer for more than 3 hours, and It was also found that they could be accompanied by dry eye symptoms as well as turtle neck symptoms, carpal tunnel symptoms, and eye fatigue. In addition, eye fatigue and computer use time were the most influential factors for dry eye symptoms. Therefore, to prevent the dry eye symptoms of university students using smartphones, it is necessary to have a program that will reduce the unnecessary computer use time and make the students interested in the importance of proper use of smartphone to reduce eye fatigue. There is a limit to generalization of this study because this study is a convenience sampling study on university students in one area of Korea. Therefore, it is necessary to elucidate the prevalence and influencing factors of dry eye symptoms which are rapidly increasing in young ages through repeated research in future. These studies will enable university students to be more interested in and active in managing their health care in using smartphones and computers, and this study can be used as a basic data for the development of preventive programs that minimize the negative effects of long time use of smartphones and computers.

Communication, Emotional Labor and Organizational Commitment among Nurses

, Sung-Yun Ahn²

¹Assistant Professor, Dept. of Nursing, Daejeon University, Korea; ²Assistant Professor, Dept. of Nursing, Pai Chai University, Korea

ABSTRACT

Nursing is professional care based on interactive relationships, and performed primarily through communication. This study investigated the nurse's communication type. The present study is a cross-sectional correlation study that aimed to investigate nurses' communication type and identify the differences in emotional labor and organizational commitment according to nurses' communication type. The subjects were 170 nurses working in university hospitals. Data were collected from August 1, 2016 to August 15, 2015. Data were analyzed using IBM SPSS program version 23.0. The communication competence of the participants was clustered using K-means cluster analysis. Two groups of group 1 (verbal and nonverbal communication positive) and group 2 (verbal and nonverbal communication negative) were finally determined. Comparison of emotional labor and organizational commitment according to communication type of nurse, Emotional labor was higher in group 2, but not statistically significant, and organizational commitment was significantly higher in group 1 ($p = .040$). There were significant relationships between verbal communication and nonverbal communication ($r = .58, p < .001$), and between nonverbal communication and emotional labor ($r = -.20, p = .041$) in group 1; whereas there was a significant relationship between verbal communication and nonverbal communication ($r = .31, p = .008$) in group 2. Therefore, emotional labor and organizational commitment programs based on nurse communication styles are needed.

Keywords: *Communication type, Emotional labor, Organizational commitment, Nurse, Group.*

INTRODUCTION

The Necessity for this Study: Nursing is professional care based on interactive relationships, and performed primarily through communication. In other words, communication is used when interacting with patients and providing direct nursing care. In addition, communication also plays an important role in drawing cooperation and mediating conflict when providing indirect nursing through cooperation with other medical professionals. In view of the fact that communication is the process by which people effectively deal with partners in the interaction process¹; communication becomes

an essential component of medical practice, beyond increasing patient satisfaction with medical service, when effective communication between employees in hospitals is achieved.

Meanwhile, nurses may be pressured to display only the emotions socially acceptable and required by hospitals in the process of interacting with communication partners such as patients, senior nurses, doctors, administrators etc. When there is a gap between the feelings experienced by employees and emotional display rules allowed by an organization, individual employees' efforts to control their emotional expressions in compliance with the rules is referred to as emotional labor². If nurses are forced to express their feelings in a stereotyped manner, they are likely to experience negative symptoms leading to depression and stress³. However, as the competition between medical institutions becomes intense, the demand for emotional labor is emphasized to improve customer satisfaction⁴.

Emotional dissonance caused by emotional labor decreases job satisfaction and increases depression among employees⁵. It also decreases organizational commitment and employee morale, which decreases employees' willingness to devote their efforts and loyalty to the organization⁶. Previous studies have revealed that emotional labor was negatively related to organizational commitment⁷⁻⁸. Therefore, organizational commitment⁶, in which an employee voluntarily strives to achieve organizational goals by internalizing organizational goals, is very important in order to improve organizational performance and productivity. Thus, it is necessary to explore ways to reduce the negative effects of emotional labor in nurses.

According to previous studies, communication competence was found to be negatively related to emotional labor⁹⁻¹⁰, and was found to be a useful resource to reduce emotional labor in nurses by establishing a relationship of mutual trust through communication competence¹¹. In another study, communication competence was found to be related to organizational commitment³, and communication satisfaction was found to be highly correlated with organizational commitment¹².

Communication competence is not merely language delivery, but is a combination of diverse abilities such as message output ability, message interpretation ability, and the ability to understand relationships. The expression of microscopic aspects of communication competence, including verbal and nonverbal skills, is also important¹³. Therefore, when nurses communicate with patients, it is important to use nonverbal expressions such as eye contact or gestures in addition to verbal expressions.

Studies regarding nurses' communication classified into verbal and nonverbal communication are scarce. The results of the present study, which intended to classify nurses' communication type into verbal and nonverbal communication and to investigate the characteristics of communication type, can be used as baseline data for the development of desirable communication-intervention programs, considering the characteristics of communication types in nurses. The present study intended to classify nurses' communication type using a cluster analysis, investigate the characteristics of communication type, and the relationship between emotional labor and organizational commitment.

Purpose of this Study: The present study aimed to investigate the differences in emotional labor and organizational commitment according to nurses' communication competence. The detailed objectives are as follows.

1. To identify the differences in communication competence between the two groups according to the general characteristics of nurses.
2. To classify nurses' communication type.
3. To investigate the differences in communication competence according to communication type.
4. To investigate the differences in emotional labor and organizational commitment according to communication type.
5. To investigate the relationship between communication competence, emotional labor, and organizational commitment according to nurses' communication type.

STUDY METHODS

Study Design: The present study is a cross-sectional correlation study that aimed to investigate nurses' communication type and identify the differences in emotional labor and organizational commitment according to nurses' communication type.

Instruments

Communication competence: Communication competence was measured using a communication competence measurement tool developed by Kim and Yu¹⁴, and modified by Kim¹⁵. It was developed to measure verbal and nonverbal communication in doctors. This tool consists of 13 items with 4 items on verbal communication and 9 items on nonverbal communication. Each item is scored on a 5-point Likert scale, and the total score ranges from 13 to 65 points. A high score indicates high communication competence. In a study by Kim¹⁵, the reliability of this tool showed Cronbach's alpha = .93, and in this study Cronbach's alpha = .90.

Emotional labor: Emotional labor was measured using a tool developed by Morris and Feldman¹⁶, and translated into Korean by Kim¹⁷. This tool consists of 9 items measured on a 5-point Likert scale with 3 items on the frequency of emotional display, 3 items on

attentiveness to required emotional-display rules, and 3 items on emotional dissonance. A high score indicates a high degree of emotional labor. Cronbach’s $\alpha=.81$ at the time of tool development, .86 in a study by Kim¹⁷, and .89 in the present study.

Organizational commitment: Organizational commitment was measured using a tool developed by Mowday and Poeter¹⁸ and a factor analysis was performed by Lee¹⁹. This tool consists of 15 items measured on a 5-point Likert scale. A high score indicates high organizational commitment. Cronbach’s $\alpha=.86$ in a study by Lee¹⁹, and Cronbach’s $\alpha=.91$ in the present study.

Participants and Data Collection: The present study was conducted with 170 nurses working at a university hospital. Data were collected from August 1, 2016 to August 15, 2015. Before data collection, the participants were explained the purpose, methods, expected outcomes, possible risks of the present study, contents of study participation, and were guaranteed anonymity. The participants were also informed that the collected data would be not used for any purpose other than the present study, and that they could stop participating in the present study at any time during the survey. The participants provided a written consent if they volunteered to participate in the present study.

Data Analysis: Collected data were analyzed using the statistical software program IBM SPSS version 23.0.

The demographic characteristics of the participants, and the mean values and standard deviation of

variables were analyzed using descriptive statistics. Differences in communication competence according to the demographic characteristics of the participants were analyzed using a t-test and an ANOVA, and post-hoc was tested using Scheffe’s test.

- The communication competence of the participants was clustered using K-means cluster analysis.
- Differences in communication competence according to communication type were analyzed using a t-test.
- Differences in emotional labor and organizational commitment were analyzed using a t-test.
- The relationship between communication competence, emotional labor, and organizational commitment according to communication type was analyzed using Pearson’s correlation coefficients.

RESULTS

Differences in Communication according to the General Characteristics of the Participants: There were significant differences in verbal communication according to age ($t = -3.05, p = .003$), gender ($t = -5.0, p < .001$), experience of working ($F = 4.23, p = .016$), and job satisfaction ($F = 6.54, p = .002$); while there were significant differences in nonverbal communication according to age ($t = -3.05, p = .003$), gender ($t = -4.33, p < .001$), experience of working ($F = 6.48, p = .002$), and job satisfaction ($F = 4.67, p = .011$) [Table 1].

Table I: General Characteristics of Subjects

Variables	Categories	N(%)	Verbal communication		Nonverbal communication	
			M(SD)	t or F(p)/Scheffe	M(SD)	t or F(p)/Scheffe
Age(year)	<30	110(64.7)	14.26(1.85)	-3.05(.003)	32.85(3.81)	-3.05(.003)
	30≤	60(35.3)	15.21(2.09)		34.73(3.84)	
Marriage	Married	34(20.0)	16.02(1.58)	-5.0(<.001)	36.0(3.67)	-4.33(<.001)
	Single	136(80.0)	14.24(1.92)		32.89(3.74)	
Education level	College	29(17.1)	14.72(1.88)	0.26(.771)	33.93(4.68)	0.84(.433)
	University	129(75.9)	14.54(1.98)		33.31(3.71)	
	Over master	12(7.1)	14.91(2.35)		34.66(4.14)	
Number of nurses/unit	<20	112(65.9)	14.63(1.99)	0.30(.758)	33.51(3.90)	0.01(.999)
	20≤	58(34.1)	14.53(1.98)		33.51(3.97)	
Experience of working(year)	<5 ^a	94(55.3)	14.45(1.79)	4.23(.016) a,b<c	33.48(3.40)	6.48(.002) a,b<c
	5-10 ^b	48(28.2)	14.31(2.32)		32.35(4.61)	
	11≤ ^c	28(16.5)	15.57(1.75)		35.60(3.51)	
Job satisfaction	Satisfied ^a	40(23.5)	15.55(2.27)	6.54(.002) a,b<c	35.05(4.25)	4.67(.011) a<c
	Moderate ^b	94(55.3)	14.37(1.82)		33.25(3.53)	
	Dissatisfied ^c	36(21.2)	14.13(1.75)		32.50(4.12)	

Classification of Nurses' Communication: In order to classify nurses' communication type, K-means cluster analysis, a non-hierarchical cluster analysis, was performed for verbal and nonverbal communication, which are the sub-areas of communication. The K-means cluster analysis has the advantage of calculating errors that occur at the end of each step of clustering, and continue clustering in the direction that does not cause further errors²¹.

When the authors of the present study tried to extract various results within the number of possible clusters, the results showed that 2 clusters were finally determined [Table 2].

Looking at the extracted factor loading values by communication type, group 1 consisted of 100 participants (58.8%) and was positive for verbal and nonverbal communication (+), whereas group 2 consisted of 70 participants (41.2%) and was negative for verbal and nonverbal communication (-). There were statistically significant differences in both verbal and nonverbal communication as the standardized variables according to each cluster ($p < .001$).

Table II: Factor Loading and Group Distribution

Factor loading	Group 1	Group 2	F(p)
Verbal communication	.64	-.91	246.75 (<.001)
Nonverbal communication	.62	-.88	207.80 (<.001)
N(%)	100(58.8)	70(41.2)	

Differences in Communication Type: The mean values for verbal communication and nonverbal communication were compared to determine whether there was a significant difference between the two groups classified through the cluster analysis. As a result, there were significant differences in both verbal and nonverbal communications ($p < .001$) between the groups, and group 1 showed higher verbal and nonverbal communication than group 2 [Table 3].

Table III: Mean of communication by the group

Factor loading	Group 1 M (SD)	Group 2 M (SD)	t (p)
Verbal communication	15.88 (1.23)	12.77 (1.32)	15.70 (<.001)
Nonverbal communication	35.95 (2.72)	30.04 (2.48)	14.41 (<.001)

Based on the above results, group 1 was classified as having good communication, while group 2 was classified as having poor communication.

Differences in Emotional Labor and Organizational Commitment according to Communication Type: A t-test was performed to compare the degree of emotional labor and organizational commitment by communication type. As a result, the degree of emotional labor was higher in group 2, but it was not statistically significant. The degree of organizational commitment was significantly higher in group 1 ($p = .040$) [Table 4].

Table IV: Comparisons of Variables by group of communication

Variables	Group 1 M (SD)	Group 2 M (SD)	t(p)
Emotional labor	32.72(6.09)	33.14(5.30)	-0.46(.640)
Organizational commitment	58.36(7.0)	56.37(4.66)	2.07(.040)

Relationship between Verbal and Nonverbal Communication, Emotional Labor, and Organizational Commitment: There were significant relationships between verbal communication and nonverbal communication ($r = .58, p < .001$), and between nonverbal communication and emotional labor ($r = -.20, p = .041$) in group 1; whereas there was a significant relationship between verbal communication and nonverbal communication ($r = .31, p = .008$) in group 2 [Table 5].

Table V: Correlation among the Variables

Group	Variables	Verbal communication r(p)	Nonverbal communication r(p)	Emotional labor r(p)
1	Verbal communication	1		
	Nonverbal communication	.58(<.001)	1	
	Emotional labor	-.16(.102)	-.20(.041)	1
	Organizational commitment	.06(.515)	.02(.839)	.11(.263)

Conted...

2	Verbal communication	1		
	Nonverbal communication	.31(.008)	1	
	Emotional labor	.14(.223)	.18(.118)	1
	Organizational commitment	.02(.833)	-.04(.710)	.01(.980)

DISCUSSION

The present study aimed to analyze nurses' communication type, investigate the differences in emotional labor and organizational commitment according to nurses' communication type, and the relationship between communication type, emotional labor, and organizational commitment.

Communication can be divided into verbal and nonverbal communication, and nonverbal communication or paralinguistics is as important as verbal communication²⁰. Paralinguistics plays an important role in interacting with others, and can affect the persuasive effect that influences the persuasive power, authority, credibility, and attraction of a persuader in a communication situation²¹. In other words, communication is a process in which verbal and nonverbal communication are combined and perceived, and when one of these two factors is insufficient, it is seen as ineffective communication. This is in accordance with the present study that revealed that group 1 showed positive (+) values for both verbal and nonverbal communication, whereas group 2 showed negative (-) values for both verbal and nonverbal communication. However, future studies on verbal and nonverbal communication are needed to investigate the differences in the values.

The results of the present study found that organizational commitment differed according to nurses' communication competence. These results are similar to the results of a study by Lee and Kim²² that showed a significant relationship between communication competence and organizational commitment. It is thought that good communication within an organization increased employees' feelings of being respected and provides a sense of belongingness to the organization when their opinions were accepted, and this might positively influence their organizational commitment. As communication competence increases, employees have less friction with other employees and have a more satisfying relationship with others²³. Therefore,

it is necessary to increase organizational commitment by improving verbal and nonverbal communication competence in nurses.

The results of the present study showed a negative relationship between nonverbal communication and emotional labor. This finding is consistent with the results of a study by Park et al.¹⁰ that showed a negative relationship between communication competence and emotional labor. However, this study is in conflict with the results of another study by Park and Jung²⁴ that showed a positive relationship between communication competence and emotional labor. Nurses' nature of work is such that they should continuously interact with patients and maintain their relationship with patients while restraining their emotions. Considering that emotional labor is defined as the management of feelings to display externally observable facial expressions or gestures², emotional labor that cannot be expressed verbally might be expressed nonverbally without one's awareness. Communication competence is a significant factor influencing nursing performance and resilience that is negatively related to emotional labor²⁴. Therefore, emotional labor decreases if communication competence increases.

The results of the present study showed a significant relationship between verbal and nonverbal communication, and showed a difference in and a significant relationship between emotional labor and organizational commitment according to communication type. Therefore, communication type should be considered when developing and applying intervention programs designed to reduce emotional labor and increase organizational commitment in nurses. In addition, support programs should be provided to improve communication competence in nurses.

CONCLUSION

Nursing is based on interpersonal relationships, in which communication skills are most frequently used. Verbal and nonverbal communication is an influential factor for communication among nurses themselves, and is an important tool for evaluating the quality and satisfaction of nursing care for patients.

The results of the present study found that verbal and nonverbal communication competence in nurses differed according to age, marital status, experience of working, and job satisfaction. These results suggest that the personal characteristics of nurses influence their communication competence. These results should be applied to developing communication-intervention programs for nurses, and customized communication-interventions should be provided, accordingly.

In addition, the results of the present study showed no differences in emotional labor according to the nurses' communication type, but showed a difference in organizational commitment. This suggests that nurses' communication does not have a great influence on emotional labor, but it is an influential factor in organizational commitment. Further studies should be conducted, and efforts to improve nurses' communication competence are needed to reduce the high turnover rate among nurses and to ensure that they are well absorbed into organizations.

The results of the present study will be helpful in improving the quality and efficiency of nursing care in clinical nursing.

Application of Problem Based Learning (PBL) for Nursing Students' Practicum in Handoff Communication

Eun-Kyung Lee¹, Sun Young Park²

¹College of Nursing, Catholic University of Daegu, Daegu, Republic of Korea; ²Department of Nursing, Division of Health Science, Baekseok University, Cheonan, Republic of Korea

ABSTRACT

This study's purpose is to verify its effectiveness upon developing and carrying out the field practicum in problem based learning (PBL) applied handoff communication. The study formed discussion learning groups consisting of senior nursing students in B university, and was developed and operated for the practical training class for hand off communication utilizing the suggested scenario. The evaluation for the overall PBL class was an average point of 4.46 ± 0.43 , the evaluation for students' self-capacity was an average point of 4.62 ± 0.49 , the evaluation for small group activities for PBL was an average point of 4.69 ± 0.50 , and the evaluation for an instructor's role in PBL class was an average of 4.77 ± 0.29 . Through the study, upon graduation, senior nursing students transitioning into new nurses ahead of actual duty, are considered more benefited from carrying out practical training in handoff communication in the aspect of adaptation of nursing duty and its handoff communication.

Keywords: *Problem based learning, nursing, handoff, communication*

INTRODUCTION

It has been reported that handoff communication in practice among nurses is a task of great difficulty and importance^{1,2}. Mutual handoff communication enables nurses not only to share information about nursing courses and acquire important guidance in nursing the sick, but it also shares personal information, including doctors' medical treatments, treatment protocols, patients' physical mental nursing contents, patients' economic conditions, family and social relationships, and awareness of health problems^{3,4,5}.

Recently, rapid changes in health care have led to set a high value on the acquisition of knowledge about diverse and complex diseases and patient safety and rights, which in turn restricts nursing students' nursing care activities in clinical practice, and thus in particular

it has become difficult for them to experience practicum in handoff communication.

Meanwhile, PBL has recently been applied to nursing courses. PBL is a small group discussion learning which, by presenting practical questions, leads learners to explore and understand logically approaching procedures, problem solving information and basic clinical knowledge in dealing with problems for themselves with interest and motivation^{6,7,8}. Students, through nursing courses with PBL application, are not only able to systemize necessary knowledge, skills and attitude in dealing with nursing problems, but are also able to build critical thinking ability, problem solving skills and communication skills.

The study concludes to provide nursing students and new nurses with the baseline data for the organization of the training program of the standardized nursing practicum in handoff communication by developing and implementing the nursing practicum program in handoff communication and verifying its effectiveness. The subjects of the program are senior nursing students, PBL is applied to it, and the program follows the given patients' scenario^{9,10}.

MATERIALS AND METHOD

Subject of study: The study subjects were recruited through verbal explanation; study contents were explained to them through the explanatory note. Those who agreed to participate in the study consisted of 100 senior nursing students in B university who completed adult nursing classes including those dealing with emergency, dyspepsia, circulatory, respiratory, and neurologic patient nursing focuses.

The sample size was analyzed by using G power program 3.1.9. 82 subjects were required to maintain 0.05 of the significant level in the independent t-test, 0.30 of the effect size, and 0.80 in the test power. A total of 100 study subjects were selected, with 20% considered for the elimination rate.

Research Tool: The study's purpose is to develop the practicum module in PBL applied handoff communication and evaluate its effectiveness. After running a total of eight hours (four hours a week for two weeks) of nursing practicum in PBL applied handoff communication, a five-point scale questionnaire was used to verify its effectiveness. The questionnaire consisted of 27 questions, nine questions to evaluate the PBL module, four questions to evaluate students' self-capacity, five questions to evaluate small group activities, and nine questions to evaluate an instructor's role.

Data Collection and Statistical Analysis: Data collection was done through the self-administered questionnaire

which the subjects filled out in person. The researcher explained the research goal and contents, and how to fill out the questionnaire, and the subjects signed on the written agreement for the study. The analysis of operation effect was carried by using mean and standard deviation.

RESULTS AND DISCUSSION

Most authors will be able to prepare images in one of the allowed formats listed above. This section provides optional, additional information on preparing PS, EPS, and TIFF files. No matter how you convert your images, it is a good idea to print the files to make sure nothing was lost in the process.

Development and Operation of the Practicum Module in Handoff Communication with PBL Application

Setting of learning objectives: Learning objectives included developing the scenario of nursing care situations of the subjects for circulatory system, respiratory system, and digestive system by collecting information in the field of clinical practice, and effectively solving the health problems of the nursing subjects by adjusting the duties of the health care team under the condition of the suggested scenario and by carrying out handoff communication through the cooperation of professional teams.

Operation of practicum module: Practicum module in PBL applied handoff communication was managed as seen in Table 1.

Table I: OPERATION PLAN FOR PRACTICUM MODULE

Week	Content of Learning Activity	Form of class
Week 1 (2 hours)	<ul style="list-style-type: none"> ● Orientation ● Selection of a role such as a group leader and a secretary, ● Set of ground rules ● Confirmation of suggested scenario 	OT, group activity
Week 2 (2 hours)	<ul style="list-style-type: none"> ● Discussion and confirmation of additional data in accordance with problem-solving approach ● Discussion on assignment of self-study ● Emergency nursing simulation practice 	Group activity, discussion, simulation practice
Week 3 (2 hours)	<ul style="list-style-type: none"> ● Presentation of assignment of self-study ● Reanalysis and confirmation of problems ● Performance of emergency nursing and simulation in handoff communication 	Group activity, discussion, simulation practice
Week 4 (2 hours)	<ul style="list-style-type: none"> ● Presentation of group assignments and submission of report ● Evaluation 	Group presentation

Evaluation of Practicum Module in PBL Applied Handoff Communication: The evaluation of the operation of the practicum module in PBL applied handoff communication were implemented by dividing the evaluation of the overall PBL class, the evaluation of self-capacity, the evaluation of small group activities, and the evaluation of an instructor’s role. The evaluation of the operation of the practicum module in PBL applied handoff communication were implemented by dividing the evaluation of the overall PBL class, the evaluation of self-capacity, the evaluation of small group activities, and the evaluation of an instructor’s role. The evaluation for the overall PBL class was an average point of 4.46 ± 0.43 , the evaluation for students’ self-capacity was an average point of 4.62 ± 0.49 , the evaluation for small group activities for PBL was an average point of 4.69 ± 0.50 , and the evaluation for an instructor’s role in PBL class was an average of 4.77 ± 0.29 as seen in Table 2. The category with the lowest grade was the evaluation for the overall PBL class, and the category with the highest grade was the evaluation for an instructor’s role in PBL class.

Table II: EVALUATION OF FOR PRACTICUM MODULE

Number	Category	Mean ± SD
1	Evaluation for PBL class	4.46 ± 0.43
2	Evaluation for students’ self-capacity	4.62 ± 0.49
3	Evaluation for small group activities	4.69 ± 0.50
4	Evaluation for an instructor’s role	4.77 ± 0.29

Evaluation for the overall PBL class: The evaluation for the overall PBL class was an average point of 4.46 ± 0.43 as seen in Table 3. The items with the highest grade were “PBL is an effective method of learning” and “PBL was more interesting than previous learning styles,” and the item with the lowest grade was “Acquired various information searching methods through PBL.”

Table III: EVALUATION OF PBL CLASS

Number	Item	Mean ± SD	Overall Mean
1	Clinical practice knowledge insufficient in PBL was complemented.	4.56 ± 0.52	4.46 ± 0.43
2	PBL is an effective method of learning.	4.71 ± 0.48	
3	PBL was more interesting than previous learning styles.	4.71 ± 0.58	
4	Led own learning under intellectual stimulus.	4.30 ± 0.72	
5	Printed materials and learning materials were helpful.	4.44 ± 0.67	
6	Acquired various information searching methods through PBL.	4.25 ± 0.83	
7	Learned how to discuss sequentially respecting colleagues’ opinions and howto reach a conclusion systematically.	4.59 ± 0.58	
8	Materials and space for discussion were sufficient.	4.35 ± 0.79	
9	Time for discussion was sufficient.	4.27 ± 0.82	

Evaluation for self-capacity: The evaluation for students’ self-capacity was an average point of 4.62 ± 0.49 as seen in Table 4. The item with the highest grade was “Participated in discussions passionately and positively,” and the items with the lowest grade were “Can lead own study with a positive attitude and an inquisitive mind” and “Can analyze nursing problems and nursing processes.”

Table IV: EVALUATION FOR SELF-CAPACITY

Number	Item	Mean ± SD	Overall Mean
1	Can lead own study with a positive attitude and an inquisitive mind.	4.55 ± 0.61	4.62 ± 0.49
2	Can express own opinion in front of others.	4.66 ± 0.54	
3	Can analyze nursing problems and nursing processes.	4.55 ± 0.58	
4	Participated in discussions passionately and positively.	4.70 ± 0.55	

Evaluation for small group activities: The evaluation for small group activities for PBL was an average point of 4.69 ± 0.50 as seen in Table 5. The item with the highest grade was “Observed the rules of small groups,” and the item with the lowest grade was “Made an effort to improve by monitoring the activities from time to time.”

Table V: EVALUATION FOR SMALL GROUP ACTIVITIES

Number	Item	Mean \pm SD	Overall Mean
1	Every group member participated in discussions.	4.67 ± 0.65	4.69 ± 0.50
2	Observed the rules of small groups.	4.81 ± 0.44	
3	Every group member participated in cooperative learning for problem-solving.	4.70 ± 0.65	
4	Every group member participated in discussions for problem-solving.	4.68 ± 0.64	
5	Made an effort to improve by monitoring the activities from time to time.	4.61 ± 0.70	

Evaluation for an instructor’s role: The evaluation for an instructor’s role in PBL class was an average of 4.77 ± 0.29 as seen in Table 6. The item with the highest grade was “The instructor explained and answered questions kindly,” and the item with lowest grade was “The instructor interfered with discussions.”

Table VI: EVALUATION FOR AN INSTRUCTOR’S ROLE

Number	Item	Mean \pm SD	Overall Mean
1	The instructor showed intimacy-smile, warm gestures, and so on.	4.86 ± 0.35	4.77 ± 0.29
2	The instructor explained and answered questions kindly.	4.90 ± 0.33	
3	The instructor provided the class with quick feedback.	4.88 ± 0.37	
4	The instructor provided the class with adequate information materials for self-learning.	4.75 ± 0.45	
5	The instructor interfered with discussions.*	4.41 ± 0.85	
6	The instructor encouraged the class by asking individual tasks or questions.	4.71 ± 0.51	
7	The feedback from the instructor was helpful to clarifying problems.	4.81 ± 0.42	
8	The instructor encouraged the class to summarize and organize themselves.	4.82 ± 0.41	
9	The instructor guided students’ discussions to go smoothly.	4.88 ± 0.32	

* Reverse conversion process

CONCLUSION

The study’s purpose is to verify its effectiveness upon developing and carrying out the field practicum in PBL applied handoff communication.

The study formed discussion learning groups consisting of senior nursing students in B university, and was developed and operated for the practical training class for handoff communication utilizing the suggested scenario of the subjects with disorders in the circulatory system, respiratory system, and digestive system.

The evaluation for the overall PBL class was an average point of 4.46 ± 0.43 , the evaluation for students’ self-capacity was an average point of 4.62 ± 0.49 , the evaluation for small group activities for PBL was an average point of 4.69 ± 0.50 , and the evaluation for an instructor’s role in PBL class was an average of 4.77 ± 0.29 .

Through the study, upon graduation, senior nursing students transitioning into new nurses ahead of actual duty are considered more benefited from carrying out practical training in handoff communication in the

aspect of adaptation of nursing duty and its handoff communication.

Health Perception and Wellness Behaviors of College Students Participating in Physical Education

Yeong-Gwon Jo¹, Chun-Ho Yang²

¹Dept. of Physical Education Gwangju University; ²Dept. of Marine Sports Hanseo University

ABSTRACT

Background/Objectives: The purpose of the study is to identify the effects of health perception of college students who participated in physical education.

Method/Statistical analysis: Toward this end, the survey was conducted targeting 293 four-year college students and the following results were obtained.

Findings: First, a statistically significant positive correlation was observed between sub-factors of health perception and behavioral wellness of students who participated in physical education.

Second, physical health perception had a positive effect on well-being in terms of product purchase, environment-friendly behaviors, dietary well-being and lifestyle measures, and exercise orientation.

Third, the sub-variable of physical and mental health perception showed statistically significant effects on hobby orientation.

Improvements/Applications: The university students who participated in optional sports classes manifested a positive effect not only on the purchase of wellness products and services, but also on their life styles, including exercise, meditation, wellness diets and leisure or hobby activities.

Keywords: *physical education, physical health perception, mental health perception, well-being oriented behaviors*

INTRODUCTION

Compared with other curricula, physical education encompasses a functional curriculum with physical activities as a tool, and cognitive, emotional and social activities as well as simple physical activities ¹. It maintains and promotes the individual student's health through voluntary participation in sports activities and enables students to cultivate their social and moral spirits, leading to a prosperous school life ².

Since the physical education in college is targeted at university students who will enter the society soon,

it is an important driving force for college students to participate in physical education activities continuously after graduation. Conclusively, physical education in college can be expected to provide ways to live a healthy and pleasant life even after graduation as well as to participate in various sports for satisfactory college life³.

Physical education in college should promote a desirable perception of health in everyday life as a qualitative concept to maintain and promote individual health. In other words, the students should pursue physical and mental health by participating in physical education. Among college students, health is an expression of self-realization. In addition, health is not related to any specific disease or problems and is a behavior aiming at promotion of individual well-being.

This health perception carries a personal dimension that dominates human health behaviors and may be regarded as self-assessment of individual physical and mental well-being ⁴. The optimal health condition pursued

Corresponding Author:

Chun-Ho Yang
Professor, Dept. of Marine Sports, Hanseo University,
Seosan, 31962, Korea
Email: healthyang@hanseo.ac.kr

by college students represents the basis of individual happiness and well-being and eventually, enhances their mental quality of life⁵. Health perception that dominates human behaviors, from the individual perspectives, is self-evaluation of individual physical and emotional well-being⁶. Health perception, which is one of the motivational factors affecting individual well-being-oriented behaviors, strongly predicts life satisfaction⁷.

Participation in physical education at college is a pursuit of well-being through physical and mental health as well as satisfying college life. Well-being is defined by happiness and stability and also seeking search for the value of physical and mental health⁸. With the expansion of well-being to include physical and mental harmony, activities targeting environment-friendly behaviors have expanded widely in recent years in relation to health throughout the society, and social perception about healthy life quality has spread rapidly⁹.

Wellness behaviors have evolved to an industry level in developing wellness products catering to consumer culture. Commercialization of behaviors involving wellness products and services has become a cultural phenomenon.

Consumption based on wellness behaviors is a decision based on economic efficiency. However, it may be regarded as representative of differentiated emotional and symbolic consumer culture where the thoughts or values of college students manifest through the consumption of time as well as consumption of goods and services¹⁰.

In other words, health perception affects both material and psychological aspects of our lives¹¹, and is also closely related to wellness behaviors. Emotions underlying wellness behaviors triggered by health perception and expectations related to wellness culture may be bigger than other factors¹². Recent trends suggest wellness as an emerging social issue related to improvement in college life satisfaction and quality of life. It differs progressively from the simple wellness life style and also affects the way of life of college students. Therefore, the purpose of this study is to identify the effects of health perception on wellness behaviors of college students participating in physical education.

STUDY METHOD

Study subjects: The study population included college students who attended liberal arts physical education

classes among the four-year college students in Gwangju metropolitan city in 2017. Based on a convenience sampling method, the survey targeted 300 college students who participated in physical education classes. A total of 293 valid samples were selected for the analysis, excluding seven samples which were deemed to have low confidence level. The general characteristics of the survey subjects are as follows. Male students were 155 (52.9%) and female students were 138 (47.1%). The number of 1st grade students was 90 (30.7%), 2nd grade students 85 (29.0%), 3rd grade students 67 and 4th grade students 51 (17.4%). Based on study subjects, 93 students majored in humanities and social sciences (31.8%), 75 students in health sciences (25.6%), 88 students in business schools (30.0%) and 37 students in convergence science (12.6%).

Study tools: Health Perception Questionnaire (HPQ) developed before¹³ to measure health perception and questionnaires revised in¹⁴ and¹⁵ were used. Next, in order to measure wellness behaviors, reconstructed questionnaires as described in¹⁶ based on¹⁷ and¹⁸ studies were used. These questionnaires were measured using a 5-point Likert scale of 'Very likely, 5 points', 'Likely, 4 points', 'Normal, 3 points', 'Not likely, 2 points' and 'Not very likely, 1 point'.

Exploratory factor analysis and reliability: Exploratory factor analysis was used to test the validity of the questionnaire. Bartlett's unit matrix check was used to identify the independence of individual variables, and the goodness-of-fit of factor analysis was assessed via the sample goodness-of-fit of KMO. In addition, an eigenvalue higher than 1.0 was set for the reference and only the questionnaires with values higher than 0.4 were selected for factor loading. Additionally, Cronbach's alpha coefficient was used to analyze the reliability. Only the questionnaires with an eigenvalue higher than 0.6, were used. The Bartlett unit matrix of health perception was 4716.269, the significance of probability was 0.001 and KMO index was 0.931, suggesting appropriate selection of variables. Based on this analysis, the two factors were extracted following the factor analysis using 8 questionnaires, which showed an approximately 71.5% of explanation of the total variance.

The loading values of physical motion perception ranged from 0.806 to 0.875 and those of psychopathological motions varied from 0.713 to 0.882. In addition, the reliability values varied from 0.690 to

0.698, suggesting relative reliability. The Bartlett unit matrix of wellness oriented behaviors was $\chi^2=1172.084$, with a significance probability is 0.001 and a KMO index of 0.825, which suggests reliable selection of variables. Factor analysis of 24 questionnaires based on these results showed 5 extracted factors, with approximately 70.6% explanation of the total variance. The loading values of wellness products purchased ranged from 0.665 to 0.815 and those of environment-friendly behaviors varied from 0.631 to 0.823. Loading values of dietary wellness ranged from 0.548 to 0.818 and exercise-oriented loading values varied from 0.500 to 0.828. Hobby-oriented loading values ranged from 0.875 to 0.901 and the reliability values varied from 0.615 to 0.814, suggesting reliability.

Data processing: Completed questionnaires were immediately collected at the site. Double-double-entry and non-entry data were excluded from the data analysis and only valid samples were coded according to the coding guidelines. Coded data were processed using the statistical program, SPSS 21.0 ver., for the analysis of frequency, exploratory factors, reliability, correlation

and multiple regression. The significance level of all data was set at $p < .05$ level.

RESULTS

Correlation analysis: As shown in Table 1, Pearson’s correlation coefficient was calculated to identify the correlation between health perception and wellness behaviors of college students who participated in physical education. A statistically significant positive correlation was observed between sub-factors of health perception and wellness behaviors. Specifically, physical health perception showed a significantly positive correlation with wellness product purchase ($r = .779$), exercise orientation ($r = .735$), environment-friendly behaviors ($r = .684$), dietary wellness ($r = .442$) and hobbies ($r = .286$). Mental health perception showed significantly positive correlation with hobbies ($r = .573$), wellness product purchase ($r = .241$), exercise orientation ($r = .194$), dietary wellness ($r = .154$) and environment-friendly behaviors ($r = .135$). These results satisfy the validity of the variables.

Table 1: Correlation analysis

Sub-factors	A	B	C	D	E	F	G
Physical health perception	-						
Mental health perception	.299***	-					
Wellness product purchase	.779***	.241**	-

*** $p < .001$, ** $p < .01$, * $p < .05$

Effects of health perception on wellness behaviors: Multiple regression analysis was conducted to identify the effects of health perception on wellness behaviors. In the SPSS program, tolerance and variance magnification index (VIF) were used to identify multi-collinearity. The tolerance in this study was 0.910 and VIF was 1.098.

Effects of health perception on wellness product purchase: The results of a regression analysis as shown in Table 2 suggest that health perception had a significant effect on wellness product purchase. The significance of the total regression equation was $F = 220.898$ ($p < .001$), and the explanatory power was approximately 60.7% ($R^2 = .607$) of the total variance. Beta value, a relative effect of health perception on wellness product purchase, showed significant effects of physical health perception ($\beta = .776$).

Table 2: Effects of health perception on wellness product purchase

*** $p < .001$

Effects of health perception on environment-friendly behaviors: As shown in Table 3, health perception had a significant effect on environment-friendly behaviors. The significance of the total regression equation was $F = 128.111$ ($p < .001$), and the explanatory power was approximately 47.3% ($R^2 = .473$). Beta value, a relative influence of health perception on environment-friendly behaviors, indicates significant effects on physical health perception ($\beta = .706$).

Constant	.733	.257		2.845**	168.312***	.541
Physical health perception	.822	.046	.743	17.696***		
Mental health perception	-.036	.053	-.028	-.675		

* $p < .05$, *** $p < .001$

Effects of health perception on hobby orientation: As shown in Table 6, health perception had a significant effect on hobby orientation. The significance of the total regression equation was $F = 74.417$ ($p < .001$), and the explanatory power was approximately 34.2% ($R^2 = .342$) of the total variance. Beta value, a relative influence of health perception on hobby orientation, shows significant effects of physical health perception ($\beta = .126$).

DISCUSSION

In recent years, interest and studies investigating health perception and effects of health on quality of life have increased. Such developments have occurred in the context of significantly increased life expectancy due to technological and medical advances, and a decrease in patients with acute illness and an increase in patients with chronic illness. The management of most chronic illnesses is not focused on healing but minimizing the exacerbation of current symptoms while improving the patients' abilities. In recent years, the emphasis in health management has been on health perception, because actions are based on perceptions and feelings¹⁹. Perception controls a person's behavior and is also a subjective phenomenon of the environment. It is a concept based on behaviorism and also humanitarian psychology, which links individual attitude and behavior with the individual adaptation to the environment. It is determined by the characteristics of the perceptual field of each individual.

Meanwhile, university students are only allowed genuine leisure time after admission to university, while during their high school years they are asked to suppress the desire for leisure time or activities²⁰. In a human life cycle, standards for value judgment are established in university years based on an ego-consciousness followed by various adjustments to the psychological and social environment while experiencing positive human relations, which help to establish a concept of self. Voluntary leisure or sports activities during this period not only help in promoting the individual health during their transformation to adults, but can also help establish life-long hobby and leisure activities²¹.

Physical education enriches the university curriculum by assisting students in the formation of a wider range of peer relationships, promotes stress release, and brings vibrancy to university life. Therefore, this study reviewed the effects of health perception of university students who participated in optional sports classes on their wellness behavior. The study found a significant positive correlation between individual health perception and behavioral wellness. A comprehensive review showed that perception of physical health resulted in a positive effect on the purchase of wellness products, environment-friendly behavior, wellness diets, fondness for exercise and hobbies. Perception of mental health had a positive effect on fondness for hobbies. This finding

shows that the health perception of university students following participation in optional physical education classes in university had a positive effect on their wellness behavior. According to Younghan Kim and Heejung Im²² wellness can change an individual's life style, and wellness products and markets will grow worldwide as the consumption culture is altered. Our study findings support this forecast, as university students participating in optional physical education classes exhibited a positive effect on their purchase of wellness products, as well as on their environment-friendly behavior and wellness diets. Other studies also noted that wellness behavior affects health consumption behavior and health management²³. Therefore, this finding indirectly suggests that the health perception of university students who participate in optional sports classes affects their behavioral wellness. Moreover, consumers involved in natural healing and health product markets show health-oriented behaviors consistent with their value system²⁴, and therefore, suggest an association between health perception and wellness behavior reported in this study.

As university students are the future talent of society who assume the lead in establishing life-long sports patterns, it is important to offer them a positive sports experience during their university years. This study showed that the health perception of university students who participated in optional sports classes exhibited a higher sentiment and expectation for wellness behavior, compared with other factors.

CONCLUSION

The purpose of this study was to identify the effects of health perception on wellness behaviors among college students who participated in physical education. Toward this end, a survey was conducted targeting 293 four-year college students and the following results were obtained.

First, the college students who participated in physical education showed a statistically significant positive correlation between sub-factors of health perception and sub-factors of well-being-oriented behaviors.

Second, physical health perception among the sub-variables of health perception had a positive effect on wellness product purchase, environment-friendly behaviors, dietary well-being and exercise orientation.

Third, physical and mental health perception among the sub-variables of health perception showed a statistically significant effect on hobby orientation. Thus, university students who participated in optional sports classes manifested a positive effect not only on the purchase of wellness products and services, but also on their life styles, including exercise, meditation, wellness diets, leisure or hobby activities.

Factors Affecting the Quality of Life of Male Workers According to the Type of Job

Myoung-Jin Kwon¹, Sung-Yun Ahn²

¹Assistant Professor, Dept. of Nursing, Daejeon University, Korea; ²Assistant Professor, Dept. of Nursing, Pai Chai University, Korea

ABSTRACT

Background/Objectives: The present study was conducted to investigate the factors affecting the quality of life of male workers according to the type of job.

Method/Statistical analysis: The present study used raw data from the 6th National Health and Nutrition Examination Survey (2015). The subjects were 1,037 male office workers; service and sales workers; experts in agriculture, forestry, and fishing; technical workers; device-machine operators; and assembly workers. A composite sample analysis plan file was created using the IBM SPSS 23.0 program, then weighted and analyzed. The significance level was set at .05.

Findings: The factors affecting quality of life among the office workers included stress and subjective health, and their explanatory power was 34.5% ($F = 2.03, p = .003$). The factors affecting quality of life among service and sales workers included age, number of family members, subjective health, and continuous depression for more than two weeks, and their explanatory power was 36.3% ($F = 2.10, p = .002$). The factors affecting quality of life among experts in agriculture, forestry, and fishery included economic status, number of family members, hours of sleep, presence or absence of diabetes mellitus, time spent sitting per day, and subjective health; their explaining power was 41.7% ($F = 61.46, p < .001$). The factors affecting quality of life among technical workers, device-machine operators, and assembly workers included economic status, education level, rate of aerobic physical activity practice, time spent sitting per day, and subjective health status; their explanatory power was 26.3% ($F = 2.87, p < .001$).

Improvements/Applications: Therefore, in order to improve the quality of life, interventions that take into account different influencing factors depending on occupation are required.

Keywords: *Quality of Life (QOL), Male Workers, Type of Job, NHANES, Subjective Health Status*

INTRODUCTION

The quality of life of workers in the workplace is very important. This is because quality of life encompasses the subjective and objective aspects that explain the well-being of a human in an integrated way and reflects the needs of those seeking internal and external balance¹. It has been evaluated that workers in South Korea not only have the second longest working

hours in the OECD countries, they also have a high level of stress due to performance-oriented assessment and high job insecurity², threatening their quality of life. In particular, changes in the type of employment, such as non-regular workers, resulting from changes in the industrial structure, and labor flexibility are regarded as new threats related to job stress³, which are evaluated to threaten the quality of life⁴. Work life⁵, which not only takes a long time in one's life, but occupies a large portion in terms of importance, has a direct impact on individuals' lives, and thus is considered to be closely related to quality of life.

If the quality of life among workers deteriorates, it may not only adversely affect work performance, but also cause a lot of social costs. In particular, because male

workers account for a large proportion of the total number of workers, and also have acted traditionally and culturally as patriarchs within their family, it can be assumed that the quality of life in male workers is highly related to the quality of life of their family. Meanwhile, the quality of life of all workers cannot be assessed collectively, since the situation in the workplace is unique to each worker, depending on the type of job. Consequently, the working environment of individual workers can affect their quality of life⁶, the type of job affects the situation, and their quality of life has subjectivity that may be perceived differently according to the type of job. Therefore, quality of life, rather than other factors, is more likely to be affected by the type of job.

Although among studies conducted so far, there are many studies on quality of life that limit the subjects by type of job^{4,7-9}, but studies on quality of life using the type of job as a variable are scarce. Therefore, the present study aims to investigate the factors affecting the quality of life of male workers according to the type of job, which can be used as baseline data for the development of effective intervention programs to enhance the quality of life in male workers.

The specific objectives of the present study are as follows. First, the present study aims to identify differences in general, physical, and psychological characteristics according to the type of job. Second, the present study aims to investigate the factors affecting quality of life according to the type of job.

MATERIALS AND METHOD

Study design: The present study is a descriptive research designed to investigate the factors affecting the quality of life of male workers according to the type of job using a secondary analysis of the data from the 2015 National Health and Nutrition Examination Survey.

Participants: The present study used raw data from the 6thNational Health and Nutrition Examination Survey (2015). The 6thNational Health and Nutrition Examination Survey (2015), conducted by the Ministry of Health and Welfare Affairs and the Centers for Disease Control and Prevention in South Korea, involved a total of 7,380 people, including 1,037 male office workers; service and sales workers; experts in agriculture, forestry, and fishing; technical workers; device-machine operators; and assembly workers.

Research variables

General characteristics: The variables for the general characteristics of the participants included age, economic status, education level, number of family members, marital status, hours of sleep, health examination status, and quality of life.

- **Age:** divided into those aged 40 years or younger, those in their 40s, those in their 50s, and those aged 60 years or older.
- **Economic Status:** divided into “high,” “medium-high,” “medium-low,” and “low” economic status based on individual income.
- **Education level:** divided into “elementary school graduates or below,” “middle school graduates,” “high school graduates,” and “college graduates or above.”
- **Number of family members:** divided into “1,” “2-3,” and “more than 4.”
- **Marital status:** divided into “married” and “single.”
- **Hours of sleep:** divided into “less than 3 hours,” “7-8 hours,” and “more than 9 hours.”
- **Health examination status:** “yes” or “no.”
- **Quality of life:** measured using the EQ-5D (EuroQol-5Dimension).

Physical-psychological characteristics: The physical-psychological characteristics included presence or absence of hypertension, presence or absence of diabetes mellitus, presence or absence of dyslipidemia, weight control for one year, monthly drinking rate, current smoking rate, work-moderate-intensity physical activity, aerobic physical activity, time spent sitting per day, body mass index (BMI), subjective body shape perception, stress, subjective health status, and continuous depression for more than two weeks.

- **Presence or absence of hypertension:** this refers to responding with “No” or “Yes” to the question about doctor-diagnosed hypertension.
- **Presence or absence of diabetes mellitus:** this refers to responding with “No” or “Yes” to the question about doctor-diagnosed diabetes mellitus.
- **Presence or absence of dyslipidemia:** this refers to responding with “No” or “Yes” to the question about doctor-diagnosed dyslipidemia.

- **Intended weight control for one year:** divided into “efforts to reduce weight,” “efforts to maintain weight,” and “no effort to control weight.”
- **Monthly drinking rate:** this refers to responding with either “non-drinking for a lifetime or less than one drink per month for the past year” or “drinking one or more drinks per month for the past year.”
- **Current smoking rate:** this refers to responding with either “former smoker or non-smoking”, or “current smoker.”
- **Work-moderate-intensity physical activity:** this refers to responding to the question, “Does your job involve a medium-strength physical activity that lasts for at least 10 minutes, with a little bit increased respiration or heart rate?”
- **Aerobic physical activity:** this refers to responding with either “not practicing moderate-intensity physical activity for more than 2.5 hours per week, not practicing high-intensity physical activity for 1.25 hours, or not practicing a mix of moderate- and high-intensity physical activities for an equivalent time per week” or “practicing moderate-intensity physical activity for 2.5 hours per week, high-intensity physical activity for 1.25 hours, or a mix of moderate-intensity and high-intensity physical activities for an equivalent time per week.”
- **Time spent sitting per day:** divided into “less than 5 hours,” “5-9 hours,” and “more than 10 hours.”
- **Body Mass Index (BMI):** calculated as body weight/height (m²), and categorized into “<25kg/m²” and “≥ 25kg/m².”
- **Subjective body shape perception:** Being “very thin” or “thin” was classified as “thin,” being “normal” as “normal,” and being “very fat” as “very fat.”
- **Stress:** “Feeling almost no stress” or “feeling a bit of stress” was classified as “a low level of stress,” and “feeling a lot of stress” or “feeling very much stress” were classified as “a high level of stress.”
- **Subjective health status:** “Very good” or “good” was classified as “good,” being “normal” was classified as “normal,” and “poor” or “very poor” were classified as “poor.”
- **Continuous depression for more than two weeks:** this refers to responding with “Yes” or “No” to the relevant question.

Data analysis method: In this study, we extracted data on male office workers; service and sales workers; experts in agriculture, forestry, and fishery; technical workers; device-machine operators; and assembly workers from the 6th National Health and Nutrition Examination Survey raw data, which was collected by a stratified cluster systematic sampling method, and investigated the factors affecting the quality of life among the participants. A composite sample analysis plan file was created using the IBM SPSS 23.0 program, then weighted and analyzed. The significance level was set at .05.

The general, physical, and psychological characteristics of the workers were analyzed using frequency and percentage. Frequency was calculated using actual values, but the percentage was calculated by considering weight. The factors affecting the quality of life of male workers were analyzed using composite sample logistic analysis.

RESULTS AND DISCUSSION

Comparison of general characteristics: As shown in Table 1, significant differences were found in age, economic status, education level, and marital status, according to the type of job ($p < .001$), and significant differences were also found in the number of family members and health examination status, according to the type of job ($p = .001$).

Those aged <40 years old were most commonly (51.0%) office workers, whereas those aged ≥60 were most commonly (57.1%) among the experts in agriculture, forestry, and fishery. In terms of economic status and education level, “high” economic status and “college graduates or above” were the most common among the office workers. Conversely, those with “low” economic status and “elementary graduates or below” were the most common among the experts in agriculture, forestry, and fishery. Those who live alone or are unmarried were the most common among technical workers, device-machine operators, and assembly workers. In terms of hours of sleep, the office workers had the fewest hours of sleep. The workers who were least likely to undergo health examination were technical workers, device-machine operators, and assembly workers.

Table 1: Comparison of General Characteristics

Characteristics		Office worker(251) n(weight %)	Service and sales people(227) n(weight %)	Experts in agriculture and forestry fishing(161) n(weight %)	Function source, device · machine operation and assembly worker(398) n(weight %)	$\chi^2(p)$
Age	<40	104(51.0)	83(46.9)	2(2.9)	92(31.6)	203.58 ($<.001$)
	40-49	70(26.3)	46(23.4)	89(12.7)	97(29.7)	
	50-59	62(19.9)	53(19.1)	35(27.3)	118(26.1)

	Medium-low	49(19.9)	59(23.6)	56(30.6)	126(33.1)	
	Medium-high	67(28.6)	72(33.9)	33(19.1)	89(21.2)	
	High	104(39.8)	46(18.9)	31(17.2)	84(19.1)	
Educational status	\leq Elementary school	3(0.5)	25(6.3)	74(40.2)	62(13.5)	332.77 ($<.001$)
	Middle school	5(1.3)	17(6.3)	36(20.6)	71(13.6)	
	High school	60(23.5)	91(42.5)	37(28.3)	197(51.6)	
	\geq College	183(74.7)	94(44.8)	13(10.9)	68(21.3)	
Number of family member	1	15(6.0)	13(6.5)	12(5.7)	35(7.4)	29.52 (.001)
	2-3	124(45.7)	115(49.1)	125(73.4)	210(50.0)	
	≥ 4	112(48.3)	99(44.4)	24(20.8)	153(42.6)	
Marital status	Married	198(73.8)	165(66.5)	157(95.2)	340(81.5)	44.83 ($<.001$)
	Single	53(26.2)	62(33.5)	4(4.8)	58(18.5)	
Hour of sleeping	≤ 6	139(53.2)	87(37.9)	61(36.5)	178(43.7)	40.87 ($<.001$)
	7-8	109(45.6)	120(52.3)	71(48.5)	202(51.8)	
	≥ 9	3(1.3)	20(9.7)	29(15.0)	18(4.5)	
Health examination status	Yes	200(77.6)	137(60.2)	111(67.4)	255(61.2)	25.48 (.001)
	No	51(22.4)	83(39.8)	50(32.6)	142(38.8)	

Comparison of physical-psychological characteristics: As shown in Table 2, significant differences were found in the presence or absence of hypertension, presence or absence of diabetes mellitus, presence or absence of dyslipidemia, one-year weight control, monthly drinking rate, aerobic physical activity, time spent sitting, subjective body shape perception, stress, and subjective health status, according to the type of job ($p < .005$).

Hypertension and diabetes were the most common among the experts in agriculture, forestry, and fishery, whereas dyslipidemia was the most common among technical workers, device-machine operators, and assembly workers. Office workers made the most effort to lose weight and had the highest monthly drinking rate. The service and sales workers were the most engaged in practicing aerobic activities, and had the longest time spent sitting. Office workers had the highest rate of perceiving themselves to be obese, while the service and sales workers perceived themselves to be the healthiest, and office workers had the highest level of stress.

Table 2: Comparison of Physical-psychological Characteristics

Characteristics		Office worker(251) n(weight %)	Service and sales people(227) n(weight %)	Experts in agriculture and forestry fishing(161) n(weight %)	Function source, device · machine operation and assembly worker(398) n(weight %)	$\chi^2(p)$

Factors affecting quality of life: The factors affecting the quality of life by occupation are shown in Table 3.

The factors affecting quality of life among the office workers included stress and subjective health, and their explanatory power was 34.5% (F = 2.03, p = .003). As stress was lowered and subjective health was perceived as healthier, the quality of life was higher.

The factors affecting quality of life among service and sales workers included age, number of family members, subjective health, and continuous depression for more than two weeks, and their explanatory power was 36.3% (F = 2.10, p = .002). Quality of life among service and sales workers was higher for those in their 40's than those in the 60's or older; those with 2-3 family members than those with 4 or more family members; those whose subjective health status was good; and those with no continuous depression for more than two weeks.

The factors affecting quality of life among experts in agriculture, forestry, and fishery included economic status, number of family members, hours of sleep, presence or absence of diabetes mellitus, time spent sitting per day, and subjective health; their explaining power was 41.7% (F = 61.46, p < .001).The quality of

life among the experts in agriculture, forestry, and fishery was lower than all the other groups when compared to those with “high” economic status. Quality of life was also higher in those with 2-3 family members than those with more than 4 family members; those with 7-8 hours of sleep than those with more than 9 hours of sleep; those without diabetes than those with diabetes; those with less than 5 hours spent sitting per day than those with more than 10 hours spent sitting per day; and those whose subjective health was “good” or “moderate” than those whose subjective health was “bad.”

The factors affecting quality of life among technical workers, device-machine operators, and assembly workers included economic status, education level, rate of aerobic physical activity practice, time spent sitting per day, and subjective health status; their explanatory power was 26.3% (F = 2.87, p < .001).Quality of life was lower in the other groups than in those with “high” economic status, and quality of life was higher for “high school graduates” than “college graduates or above,” those who practiced aerobic physical activity than those who did not practice aerobic physical activity, those with less than 5 hours spent sitting per day than those more than 10 hours spent sitting per day, and those with good subjective health status.

DISCUSSION

In the results of the present study involving male workers, the common characteristic affecting quality of life was found to be subjective health status. This result is similar to the results of previous studies^{7, 10} of office workers indicating that quality of life was higher in those whose perceived health status was good than those whose perceived health was not good. In addition, the results of the present study are consistent with the results of several previous studies involving workers with industrial injuries^{11, 12}, showing that better subjective health status was associated with a higher quality of life. The results of the present study are in line with the results of a previous study¹³, in which the quality of life of workers was directly influenced by health status. Therefore, these results suggest that subjective health status is a very important variable for male workers.

In addition to the common characteristics affecting the quality of life, the factors differently affecting the quality of life according to the type of job type are as follows. The results of this study showed that, in particular, stress affected the quality of life of office workers. This result is consistent with a previous study⁷ reporting that job stress was inversely correlated with the quality of life, and evidence can be found in a study of Ghanaian professional women showing that managerial women had higher job-related tension and lower energy activity than blue-collar workers, and were thus more exposed to stress¹⁴. Therefore, stress management is essential for the quality of life of office workers.

The present study showed that in the case of service and sales workers, depression affected their quality of life. This result is in line with the results of a previous study¹⁵ revealing that emotional dissonance arises from workers' expressing distorted emotions, rather than their actual emotions, which might increase the level

of depressive symptoms because service workers are required to perform standardized emotional expression in the process of emotional labor. Therefore, it can be seen that the management of depressive symptoms potentially caused by emotional labor is important for the quality of life of service and sales workers.

In the case of experts in agriculture, forestry, and fishery, quality of life was higher in those with "high" economic status than those with "medium" or "low" economic status; those with 2-3 family members than more than 4 family members; those with 7-8 hours of sleep than those with more than 9 hours of sleep; and those with less than 5 hours spent sitting per day than those with more than 10 hours spent sitting per day. This result is considered to be related to the occupational characteristics of agriculture, forestry, and fishery where working hours are not fixed and income cannot be guaranteed, compared to other occupations. It is assumed that less sleep, less time spent sitting, and a smaller number of family members are likely to be associated with a better economic status. This result is consistent with a previous study¹⁶ showing that the quality of life of the elderly in rural areas, unlike the elderly in urban areas, is affected by economic status. Therefore, in order to improve the quality of life of experts in agriculture, forestry, and fishery, efforts should be made to improve their economic status.

In the case of technical workers, device-machine operators, and assembly workers, quality of life was higher in "high school graduates" than "college graduates or above". This result is considered to be related to the occupational characteristics of this occupation that require mainly an educational level of graduation from a vocational high school, and is regarded as downward employment for college graduates¹⁷. Therefore, in order to improve the quality of life of those in this occupation,

it is important to activate a career development path by policy that enables vocational high school graduates to begin their profession immediately after their graduation so as to increase their competency.

CONCLUSION

The present study is significant in that it investigated the factors affecting the quality of life of male workers according to the type of job, and provided baseline data to improve the quality of life of male workers that may differ according to the type of job. It is suggested that the results of the present study be utilized for the development of programs to enhance quality of life among male workers.

The Relationship Between Eccentric Strength and Various Dynamic Balance Exercises in Male and Female

Su-Hyeon Cha¹, Yong-Min Ji¹, Dong-Yeop Lee², Ji-Heon Hong², Jin-Seop Kim², Jae-Ho Yu²

¹Student, ²Professor Department of physical therapy, Sunmoon University, Asan-SI, Chungnam, Korea

ABSTRACT

Background/Objectives: The purpose of this study was to investigate the gender difference and correlation in eccentric strength and dynamic balance exercises.

Method/Statistical analysis: Thirty-four healthy adults (17 males and 17 females) with a mean age of 21 participated in this study. The angular velocity of isokinetic equipment was set to 90 degrees with the eccentric peak torque values of knee flexion and extension, ankle dorsiflexion and plantar flexion recorded while giving verbal comments. Electromyography(EMG) which was used to measure muscle activation during exercise was attached to rectus femoris, biceps femoris, tibialis anterior and gastrocnemius muscles respectively. A total of 5 movements including side step, calf raise, step down, lunge, and chair sit/one-leg squat was performed.

Findings: According to muscle values, there was a significant difference in eccentric peak torque between sexes($p < .05$). However, there was no significant difference in muscle activity between sexes in dynamic balance exercise($p > .05$). Both eccentric peak torque and dynamic balance exercises displayed a positive correlation($p < .001$).

Improvements/Applications: A better understanding of the correlation between eccentric strength and dynamic balance may be helpful in creating effective balance training interventions for athletes and those in need of balance stabilization.

Keywords: Eccentric strength, Dynamic balance exercise, Muscle activity, Low muscle

INTRODUCTION

Balance refers to the ability to maintain the center of gravity within a given base of support. It is composed of a series of complex processes which are influenced by diverse factors^[1]. That is, less effort is required to maintain balance with a normal ability. This is as a result of the complexity of occurrences that arise in order to maintain the center of gravity within the base of support. The ability to maintain balance depends on the effective conveyance of sensory information from the body to the muscle and joints. This may appear to be very complex

but it happens unconsciously. When we walk, we do not consider what muscle should be contracted or what sequence the muscles should be contracted in. It occurs naturally if not instinctively. If we happen to analyze all movements of the body including appropriate muscle functions, walking would be the most challenging matter in the world.

Balance is mainly classified into static and dynamic balances. Static balance occurs when the center of gravity of an object is located within the axis of rotation. In other words, it is the ability of the object to maintain a stationary state on the horizontal axis without applying a brake force. On the other hand, dynamic balance can be defined as an ability to maintain the center of gravity within the base of body support while performing an intended motion^[2]. The important element required to maintain balance is stability of the rectus femoris(RF), biceps femoris(BF), tibialis anterior(TA), and gastrocnemius(GCM) muscles, knee and ankle joints as

well as core muscles such as abdominals and obliques. For dynamic balance training, one-leg squat, calf raise, side step, lunge, step down, etc. were performed.

To maintain balance, although concentric contraction might be considered important, eccentric contraction plays a relatively substantial role in the same sense. Eccentric contraction occurs when a muscle contracts while being stretched. This reflects the rule that states that the direction of a moving object is opposite to the direction of the force applied. In a kinematic sense, although a muscle contracts when stretched, it is accompanied by deceleration. In addition, eccentric contraction is important for daily movements carried out by human beings which include mobility, stability and muscular strength. The high and low energy cost of eccentric contraction is particularly appropriate for athletic training and rehabilitation. This empirical evidence of exercise intolerance in various sports injuries proves the reliability of intervention relating to the eccentric exercises. This may prove that performing eccentric training is suitable to enhance motor control than concentric training^[3].

Recent researches have included progressive exercise training over 3 phases in dynamic balance control and exercises which emphasizes on the eccentric lower limb muscle strength and core stability during dynamic balance training. The first phase of dynamic balance exercise is composed of sitting rotation, chair sit/squat, calf raise, side stepping and stepping pattern. The second phase includes standing rotation, step down, toe walking, lateral step-up and stepping pattern while the final phase consists of stepping rotation, lunge, mini-hop, skate stepping and cone walking. This research is aimed at proving that eccentric strength exercises can lead to the improvement of dynamic balance as well as the correlation between the eccentric strength and the dynamic balance. This portrays the moderate relation between the eccentric strength and dynamic balance. In addition, Susan et al.(2003) has suggested that ankle plantarflexion, knee flexion, and extension, and hip extension may result in significant changes in the balance ability with no significant reduction in strength^[4]. Interestingly, except for the hip extension, the force of the same muscle group was intimately related to balance.

Contradictory to existing researches however, Norris and Trudelle-Jackson(2011) observed the star excursion balance test, which measures muscle activation level as a dynamic balance test. The high activation level of vastus medialis was observed in a low level dynamic

balance test, which displayed that low eccentric strength can play a more significant role in dynamic balance. This may be as a result of eccentric contraction which absorbs, decelerates and stabilizes the force applied to the center of the body^[5].

Existing researches have drawn various results concerning the correlation of diverse intervention methods together with eccentric strength to produce balance. However, researches on the connection between dynamic balance and force are centered on the concentric elements that generate force^[6]. There have been no research to reveal the precise correlation between eccentric strength and dynamic balance. In addition, most of the researches have been limited to using knee flexion and extension in measuring the eccentric strength. Research performed by including ankle plantar and dorsiflexion are insufficient and there is still no research conducted while comparing by gender.

This study was therefore, performed to investigate the correlation between concentric force according to genders while performing diverse dynamic balance exercise including ankle plantar and dorsiflexion besides knee flexion and extension to measure the eccentric strength.

MATERIALS AND METHOD

Subject: This study was conducted with the healthy adult male and females attending S University located in Asan, Chungnam. Sufficient explanation on the purpose and method of research was given to all the subjects before participating in the research and those who agreed voluntarily participated in the research. The subjects of this study were the persons who did not receive any surgical operation related to the musculoskeletal diseases of knee joint and ankle joint within recent 6 months and did not exercise regularly and presented their statement to participate in the study. 40 participants were selected by using the output program(G*power 3.1.9.2) in the size of sample and the physical characteristics of the participants are as shown in Table 1. Out of 40 participants recruited initially, 6 participants who received the surgical operation related to the knee in the past or have edema or pain by the knee and ankle diseases or have diabetes, cardiac diseases or any other medical problem were excluded and 34 participants of 20s having any particular problem were taken as subject. In addition, this study was conducted under the approval of IRB(Institutional Review Board)'s institutional bioethics (SM-201705-020-2).

Table 1: General characteristics (N = 34)

Characteristic		Value
Gender	Male	n = 17
	Female	n = 17
Age (year)		21.37 ± 2.00
Height (cm)		167.33 ± 9.10
Weight (kg)		62.95 ± 15.05

All values are mean ± standard deviation(SD)

Procedure: This study was conducted with single group without control group. The subjects were verified if they do correct move by practicing the dynamic balance exercise before the experiment and to be performed the experiment with exact position, the ankle dorsi and plantar flexion were performed in the knee flexion, extension and supine positions. The subjects performed the warm-up with comfortable walk for 5 minutes and then sit on the isokinetic measuring equipment and fixed the trunk and abdominal area using belt. The intervention of other parts except the knee joint was minimized using the belt during the measurement of knee joint. To minimize the intervention of other leg, the subjects were instructed to grab the handle at the both sides after fixing the other leg with belt. Ankle dorsi and plantarflexion were performed by adjusting the shin pad so that it is located at 2cm above the ankle joint from knee joint to be measured and fixing it with the string^[7], and when measuring the ankle joint, the ankle dorsi and plantarflexion fixing the dorsum of foot with string at the supine position. The education on the movement was given by practicing 3 times, when measuring, the verbal encouragement was given in order to make effort as much as possible and the value of peak torque when the knee and the ankle were contracted eccentrically was recorded out of 5 times of exercise using isokinetic equipment after rest for 90 seconds. And when performing the dynamic balance exercise, to measure the muscle activation, the side step, calf raise, step down, lunge and chair sit/one-leg squat were performed. Total 5 motions were exercised and the postures between the motions are shown in Figure 1.

In addition, to consider the muscle fatigue between each posture, the measurement for 3 motions were made two days after the measuring two motions and following motion was measured after 5 minutes of rest from previous motion. Out of the experiment subjects, the persons who dropped out were 6 persons; 2 persons having past knee-related surgery, 3 persons having knee and ankle edema or pain and 1 person having medical illness.

Eccentric strength testing: o find out the eccentric strength, the eccentric peak torque of the knee flexion and extension and the ankle dorsiflexion and plantarflexion was measured by fixing the angular velocity of isokinetic measuring equipment(CSMI, Humax Co, USA, 2010) to 90 degree. The isokinetic evaluation procedure of the knee and ankle joint was followed the procedure proposed by Perrin(1994)^[8]. The education on the movement was given by practicing 3 times, when measuring, the verbal encouragement was given in order to make effort as much as possible and the value of peak torque when the knee and the ankle were contracted eccentrically was recorded out of 5 times of exercise using isokinetic equipment after rest for 90 seconds. The eccentric peak torque of the ankle joint was measured with same method.

Electromyographic Measurements: This experiment was performed using Electromyography (Zero WIRE EMG, EMG OQUS100, Italy, 2009) to find out the muscle activation in the rectus femoris, biceps femoris, tibialis anterior, gastrocnemius during the chair sit/single leg squat, calf raise, side stepping, step down, lunge, which are the dynamic balance exercise. For EMG value, the average value of muscle activation during intermediate 3seconds was recorded and Maximum Voluntary Isometric Contraction(MVIC) was measured with existing manual muscle test(MMT). The subjects were asked to apply maximum force when measuring MVIC and MVIC was measured 3 times during 5 seconds. Before the experiment, the subjects were asked to shave and wear the shorts to reduce the skin resistance in the area where the electromyogram was attached. The analog signal of electromyogram collected in 4 channel was sent to MP150 system to convert into digital signal and was analyzed and processed using sEMG software myoresearch 1.06.44 software in the computer. The sampling rate of signal was set to 1000 Hz and the noise was minimized using band pass filter of 20-500 Hz. The sampled signal was applied to RMS(root mean square). RMS values were computed for each collection period.

Data analysis: All the measured values were processed statistically using SPSS 22.0 version. To draw the physical characteristics of the subjects and to calculate the mean and standard deviation of all variables, the descriptive statistic was used. The correlation between the muscle activation and the eccentric peak torque during the dynamic balance exercise was evaluated using pearson's correlational analysis. For the post hoc test of muscle activity value between the gender by muscle, the independent t-test was used. All the statistical significant level was set to p<.05.

Figure 1: Dynamic balance exercises

RESULTS

Comparison of eccentric peak torque between male and female according to muscle: Compared if there was any difference in the eccentric peak value by the gender according to the muscle[Table 2]. In the results, EP at RF was $t=2.764(p<.01)$, EP at TA was $t=6.316(p<.001)$, BF

was $t=2.253$ and GCM was $t=3.144(p<.05)$. EP of male was relatively higher than EP of female. Therefore, the male has higher EP than the female and it was observed that there is significant difference in eccentric peak torque by muscle according to the gender.

Table 2: Comparison of eccentric peak torque and muscle activity between male and female according to muscle

* $p<.05$, ** $p<.01$, *** $p<.001$, Mean ± standard deviation, M: Male, F: Female, BF: Biceps femoris, RF: Rectus femoris, TA: Tibialis anterior, GCM: Gastrocnemius, EP: Eccentric peak torque, SS: Side step, CR: Calf raise, SD: Step down, CS-OLS: Chair sit/one-leg squat

Comparison of Muscle activity between male and female according to dynamic exercise: Compared if there was any difference in the muscle activity between the gender according to the dynamic exercise[Table 2]. When comparing the activity by muscle during side step, BF was $t=-3.010$, RF was $t=0.972$, TA was $t=1.193$ and GCM was $t=2.853$. Therefore, when performing SS by gender, there was no significant difference in the activity by muscle($p>.05$).

When comparing the activity by each muscle during calf raise, BF was $t=1.252$, RF was $t=-1.419$, TA was $t=-1.879$ and GCM was $t=1.839$. Therefore, there is no significant difference in the activity by muscle according to gender when raising calf($p>.05$). When comparing the activity by muscle during lunge, BF was $t=1.096$, RF was $t=0.504$, TA was $t=1.813$ and GCM was $t=0.367$. Therefore, there was not significant difference in the activity by muscle according to the gender during lunge($p>.05$). When comparing the activity by each muscle during chair sit/one-leg squat, BF was $t=-0.341$, RF was $t=0.514$, TA was $t=0.983$ and GCM was $t=1.547$.

Therefore, it was observed that there is no significant difference in the activity by muscle during the CS-OLS by gender($p>.05$).

Correlation between eccentric strength and dynamic balance exercise: Pearson correlation was performed to find out what correlation between the eccentric peak torque and the dynamic balance exercise. In the results of analyzing the correlation by subfactor of adults male and female, the significant correlation was represented. The correlation between EPKF and CS-OLS was $r=0.871$, the highest positive correlation and the significant correlation was represented in order of lunge $r=0.845$, CR $r=0.837$, SD $r=0.831$, SS $r=0.660(p<.001)$. The correlation between EPKE and SS was $r=0.938$, the highest positive correlation and the significant positive correlation was represented in order of SD $r=0.892$, lunge $r=0.850$, CS-OLS $r=0.838$ and CR $r=0.833(p<.001)$. The correlation between EPDF and SS was $r=0.853$, the highest positive correlation and the significant positive correlation was represented in order of CR $r=0.839$, SD $r=0.824$, CS-OLS $r=0.800$ and lunge

$r=0.793(p<.001)$. The correlation between EPPF and CS-OLS was $r=0.887$, the highest positive correlation and the significant positive correlation was represented in order of CR $r=0.857$, lunge $r=0.836$, SD $r=0.772$ and CS-OLS $r=0.719(p<.001)$

DISCUSSION

This study was intended to find out the difference between the gender and the correlation. To achieve this purpose, the eccentric peak torque(EPT) was measured and the correlation of muscle activation in RF, BF, GCM and TA during the dynamic balance exercise was explained. As a result, the significant difference was found only in the eccentric strength by gender during EPT and dynamic balance exercise, in the dynamic balance exercise, no significant difference was found and the positive correlation was found in both cases.

There was no existing research that compares the male and female through the dynamic balance and eccentric strength. So, this study compared the male and female and in the results, there was no significant difference in the dynamic balance exercise and the significant difference was found only in EPT. The reason is deemed to be the difference in the amount of muscle and the weight by gender and the physiological factor. Also, in the research by Anthony(2009), to explain the difference in the power between the male and female, the isometric strength of the quadriceps, hamstring, external and internal rotator, gluteus maximus and medius was measured. In the results, he reported that the strength of the male was higher than the female and the reason is that there is the difference in the power due to the difference in the height, weight, BMI(Body Mass Index), amount of muscle, navicular drop and Q-angle^[9]. In addition, Cott(2002) conducted the research to explain the difference by gender during landing and in the results, the female has far less knee flexion and the rotation of lower leg during landing than the male and the female took far less time to reach to the maximal knee flexion. In contrast, since the male has less maximum angular displacement, reaching to the maximal knee flexion angle does not take much time and the shock was absorbed more than the female. In this research, it was observed that the physiological structure is different by gender, which has impact on the strength^[10]. As a result, that the strength of the male is higher compared to the female seems to be similar to the results of this study

although there is slightly different from the intervention of this study.

Lunge, one of the dynamic balance exercise not only enhances the hamstring strength and running ability but also is effective for the eccentric exercise^[11]. In addition, since the squat is used in the power phase of training program as the eccentric contracture is considerably important and effective to enhance the motor capability. CR is the exercise good for the power generation and balancing ability and since SS and SD use the muscles in the lower extremity, it is very important for eccentric contracture and used a lot as the balance training. However, no significant difference was found by gender in the dynamic balance exercise. However, if we would have increased the frequency or applied higher load during the dynamic exercise, it would not have different results. Therefore, the follow-up research would be necessary by complimenting the intensity and load.

In the preceding studies related to RF and BF, some authors used Y-balance, which is similar to lunge of dynamic balance exercise in this study with the 50 college football players of 20s and measured the EPT and CMJ(Counter-movement jump) of knee flexion and extension. In the results, there was no correlation between the standard score of Y-balance test and EPT of knee flexion but revealed that EPT of knee extension represents the better dynamic balance performance when the person having great power balances in the bridge. However, Muehlbauer et al.(2013) concluded in the results of measuring the dynamic balance and CMJ from the adults of 20s that the values were independent^[12]. Although in their research, the eccentric strength was expressed as CMJ, this study measured EPT following the procedure proposed by Perrin(1994) using the isokinetic measuring equipment. In addition, as written in the limitation of existing researches, the participants in the study were the persons whose weekly physical activity level was higher than the average of general public. Consequently, this study seems to be similar to the research by previous research and drew the conclusion that there exists the correlation between the knee flexion, ankle dorsi and plantarflexion and the eccentric strength beside the knee extension.

Gonzalez and Marques(2010) who studied the relation between the jumping ability and the eccentric strength beside the balancing focusing on GCM and TA asserted that to maximize the powerful contraction

of lower body muscle particularly, vertical height when jumping, the person having strong eccentric strength is effective^[13]. And as a similar research also claimed that a significant relationship was observed between strength and dynamic balance performance using the non-dominant leg for stance in both groups, which implies that there are many factors having impact on the dynamic balance such as proprioception and vestibular function. In addition, the need of strength training to improve the balancing out of the dynamic activity as the correlation between the eccentric strength and the dynamic balance can be emphasized. However, some authors reported that there was no relation between the knee flexion and the extension strength and the SEBT (star excursion balance test) reach, which are similar to SS in this study. Consequently, similarly with this study, the eccentric strength was measured with isokinetic dynamometer and the dynamic balance ability was measured with SEBT but the participant was limited as they were 23 persons. However, this study found the correlation between the knee and ankle strength and the dynamic balance ability by adding the ankle dorsi and plantarflexion. Therefore, this study showed the similar results with the research of Gonzalez and Marques^[13].

This study has several limitations. First, since the subjects were composed of male and female of 20s, it is hard to generalize the results of the study. Second, in measuring the eccentric peak torque, this study measured the open kinetic chain not the closed kinetic chain and not significant correlation might be observed. Third, in this study, the eccentric strength was limited to the knee and ankle but it is necessary to study by adding other joints beside the knee and ankle for more precise measurement. Therefore, the research that compliments such limitations is deemed to be necessary as a follow-up research.

CONCLUSION

The purpose of this study was to investigate the gender difference and correlation in eccentric strength and dynamic balance exercises. As a result, the correlation between the eccentric peak torque of knee flexion and extension, ankle dorsi and plantarflexion and various dynamic balance exercises showed a positive correlation and there was no significant difference between genders. Therefore, a major comprehension of the correlation between eccentric strength and dynamic balance could

be a guidance as a balance training intervention for athletes and those who lack of balance and stability and may possible to expect a great achievement.

A Study on the Aesthetic Cosmetic Surgery in Nursing Students: Q-Methodology

Hanyi Lee¹, Sunyoung Jang²

¹College of Nursing, Hanyang Univ., 222 Wangsimni-ro, Seongdong-gu, Seoul, Korea;

²Dept. Nursing, Hanseo Univ., 46 Hanseol Ro, Haemi-myun, Seosan-si, Chungcheongnam-do, Korea

ABSTRACT

Background/Objectives: The purpose of this study was to identify the subjectivity of aesthetic cosmetic surgery recognized by nursing students.

Method/Statistical analysis: This study was to describe the characteristics of each type, to identify the types of aesthetic cosmetic surgery, and Q methodology was applied. The 30 nursing students from 'A' University were asked to classify 47 statements about aesthetic cosmetic surgery.

Findings: The collected data were analyzed using QUANL PC program. In this study, nursing students classified the perception of aesthetic cosmetic surgery into 4 factors. Factor 1 was 30.80%, Factor 2 was 8.04%, Factor 3 was 5.85% and Factor 4 was 5.36%. Factor 1 has an explanatory power of 30.80%, which can be regarded as the most explaining factor for aesthetic cosmetic surgery. Of the total of 30 subjects, 8 were in Factor 1, 4 were in Factor 2, 9 were in Factor 3, and 9 were in Factor 4. Each factor corresponds to a group with similar responses to aesthetic cosmetic surgery. The subjectivity types for aesthetic cosmetic surgery were 'Deliberate type', 'Positive type', 'Supporting type' and 'Conservative stance type'.

Improvements/Applications: The study identified the perception of aesthetic cosmetic surgery in nurses in the clinical field and provided basic data on education.

Keywords: *Aesthetic cosmetic surgery, Nursing student, Subjectivity, Q methodology, Nurses*

INTRODUCTION

Until the early part of the 20th century, aesthetic cosmetic surgery was regarded as a violation of ethical standards even in the West and was carried out to restore damage caused by birth defects or physical accidents or to restore function of the body¹. In modern society, appearance management through aesthetic cosmetic surgery is not only for self-satisfaction, but also has many advantages in life such as employment, interviews, and marriage².

Appearance is the easiest information that can be obtained from other people as an external characteristic

that is first seen whenever there is an interaction with others³. Human beings consider the physical attractiveness of the person as an important factor when evaluating others⁴. Appearance is also an important factor in interpersonal relationships, and it also plays an important role in choosing a partner⁵.

As a result of this socio-cultural phenomenon, many people take the economic costs and physical risks to manage their appearance, and as a result, one of the recent steadily increasing methods is aesthetic cosmetic surgery. Aesthetic cosmetic surgery has a great influence on cosmetic and feminine beauty, and is one of the most powerful ways to change the body in terms of cosmetics in modern society⁶.

Nurses are not only the most important part of the healthcare field, but they are also key contacts with the most contacts, and need to provide safe and high quality nursing care within a limited time in a rapidly changing healthcare environment⁷. The subjectivity of perception

Corresponding Author:

Hanseo University, South Korea

Email: sjang@hanseo.ac.kr

when treating subjects in the nursing field has a great effect on the nursing they perform. Therefore, it is important to understand the perception of nurses and prospective nurses.

Previous studies related to aesthetic cosmetic surgery have focused on perception of aesthetic cosmetic surgery, perception and attitude toward self-appearance, motivation and influence factors that determine surgery, and effects of surgery on mental health status.

In addition, the research on aesthetic cosmetic surgery for nursing students is insufficient. The Q methodology is a methodology that enables understanding of characteristics of each type according to the subjectivity structure of human beings⁸, and Because the perception of aesthetic cosmetic surgery in nursing college students is unique subjective experience of the subject, it is an appropriate research method to identify the type of perception of aesthetic cosmetic surgery in nursing college students through the Q methodology, which is a research method considering the subjects' subjectivity.

Therefore, the purpose of this study was to examine the subjectivity structure of aesthetic cosmetic surgery from the perspective of nursing students, and to provide the basic data necessary for the development of differentiated education programs based on the characteristics of each type of aesthetic cosmetic surgery in prospective nurses.

The purpose of this study was to identify the characteristics and types of subjective perception of aesthetic cosmetic surgery of nursing students applying the Q-methodology, to provide information about nursing students starting aesthetic cosmetic surgery and to provide basic data for presenting strategy in education of nursing students starting out in aesthetic cosmetic surgery. Specific objectives for this are as follows.

1. Typify nursing students' subjective perception of aesthetic cosmetic surgery.
2. Analyze and describe the type specific characteristics of perception of aesthetic cosmetic surgery of nursing students.

MATERIALS AND METHOD

Design: In order to achieve the purpose of the study, literature, media data and previous studies on aesthetic cosmetic surgery were reviewed, and subjectivity of

nursing students who experienced aesthetic cosmetic surgery was examined to identify the types of subjective perception of aesthetic cosmetic surgery.

Q population and Q sample selection: The Q population was derived from a review of domestic and international literature, an open questionnaire, and individual in-depth interviews to extract comprehensive statements about the effects of aesthetic cosmetic surgery on current nursing students. Through this process, three domains and 200 Q-populations are derived. In addition, a total of 100 Q-populations are extracted by collecting literature collected from domestic and foreign literature reviews. After reviewing and revising the extracted Q samples, the final 47 samples with high discrimination power were selected.

P sample selection method: The Q-methodology is a qualitative research that emphasizes individual inertia by emphasizing differences in meaning or importance among individuals, not individual differences, and it is based on small sample doctrine where when the P sample is large, several people are biased on one factor and their characteristics are not apparent⁹. The P-sample of this study were 30 students who were enrolled in a nursing course and fully agreed to volunteer their consent to participate in the study.

Q classification and data analysis method: The Q classification process is a process in which individuals who are selected as P samples classify the Q samples as statements of forced and normal distribution and make a spontaneous definition of aesthetic cosmetic surgery⁹. Data were collected using Q-card for 30 current OO University nursing students. The time required for one subject to complete the Q-classification was generally 30-45 minutes. The distribution of the Q sample was classified from the strong positive to the strong negative according to the importance according to the opinion of the subjects. Statements on aesthetic cosmetic surgery (Q1) were classified on a 12-point scale. Thereafter, the subjects and the subsequent interviews were conducted with respect to the statements classified at the extremes. Q factor analysis was performed using Principle Component Factor Analysis (Varimax) method. Type classification was based on Eigen value 1.0 or higher and the number of factors was selected and the results were compared with the total explanatory variables. The collected data were scored from 1 to 12 points, which were assigned to each of the cards forcibly distributed in the distribution chart of the Q sample. The assigned

conversion scores were coded in Q sample order and processed by the main factor analysis by QUANL PC program. Data were analyzed using QUANL pc program.

Ethical considerations for the subjects: After volunteer consent was obtained from the subjects before the study, it was explained to the subjects that they could stop at any time during the study. In order to respect the rights of the subjects and ensure the confidentiality of the subject’s privacy and personal information, all the information collected through this study is treated as an anonymous name in all data analysis, and encoding and Q sorting ensures confidentiality.

RESULTS

Subjectivity and type-specific characteristics of aesthetic cosmetic surgery

Q type structure: Q-factor analysis of the subjectivity of aesthetic cosmetic surgery by nursing students using the QUANL pc program resulted in 4 types.

Type-specific characteristics of aesthetic cosmetic surgery: In order to analyze the subjectivity of aesthetic cosmetic surgery by nursing students by type, the

characteristics of each type were described based on statements belonging to each type. The Q-response of the P sample (subject) was divided into upper and lower questions, and 4 factors were extracted. In the Q methodology, a person with a high factor weight among the individuals belonging to each type indicates a typical or ideal person representing the type.

To analyze the characteristics of each type of aesthetic cosmetic surgery, the meanings of the statements with the standard score (z-score) of ± 1.00 or more were given meaning and interpreted. In this study, for the number of people with a factor weight of 1.0 or higher, Type 1 had 8, Type 2 had 4, Type 3 had 9, and Type 4 had 9.

The subjectivity of aesthetic cosmetic surgery was analyzed using the PC QUANL program, which was followed by three factors, accounting for 50.05% of the total variance. Factor 1 was 30.80%, Factor 2 was 8.04%, Factor 3 was 5.85% and Factor 4 was 5.36%. Factor 1 has an explanatory power of 30.80%, which can be regarded as the most explaining factor for aesthetic cosmetic surgery [Table 1]. Of the total of 30 subjects, 8 were in Factor 1, 4 were in Factor 2, 9 were in Factor 3, and 9 were in Factor 4. Each factor corresponds to a group with similar responses to aesthetic cosmetic surgery.

Table 1: Eigen Value, Variance, and Cumulative Percentage

	Type I	Type II	Type III	Type IV
Eigen Value	9.2408	2.4111	1.7544	1.6089
Variance(%)	.3080	.0804	.0585	0536
Cumulative	.3080	.3884	.4469	.5005

Analysis by type: The subjectivity type for aesthetic cosmetic surgery calculated by the type analysis method is as follows.

a. Deliberate type: Type 1 was composed of 8 subjects. Statements showing a strong positive response for Type 1 subjects were, ‘Since the side effects of aesthetic cosmetic surgery can not be ruled out, it needs deliberation.(Z=2.13)’, ‘Aesthetic cosmetic surgery should be decided after a professional consultation.(Z=1.84)’, and ‘Aesthetic cosmetic surgery does not guarantee success rate.(Z=1.47)’ [Table 2]. In type 1, the subjects with the highest factor weight was No.8 (1.3904), and the most agreeable statements were 3, 13, and 17. Statements showing a strong negative response for Type 1 subjects were, ‘If you have never experienced aesthetic cosmetic surgery, you are already outdone.(Z=-2.79)’, ‘Aesthetic cosmetic surgery should be done only

for therapeutic purposes.(Z=-1.78)’, ‘The cost of dressing up after aesthetic cosmetic surgery increases.(Z=-1.29)[Table 2]. In Type 1, the subject with the lowest factor weight was No.14 (0.4458), and the most negative statements were 9, 23, and 30. Type 1 characteristics suggest that aesthetic cosmetic surgery should still be performed by a specialist because of the high incidence of side effects and high risk. They thought that aesthetic cosmetic surgery should be preceded by counseling of a medical person who has a professional knowledge as well as aesthetic cosmetic surgery, and that side effects should be checked carefully. They were receptive to aesthetic cosmetic surgery if a person lost confidence in their appearance due to birth defects or trauma, or if they could cause psychosocial secondary health problems. Therefore, Type 1 was named ‘Deliberate type’.

Table 2: Q-statements on aesthetic cosmetic surgery type of representative items and Z-scores (N = 25)

Representative items of type				
Factor	No.	Representative items	Mean(SD)	Z-score
Factor1 (N = 8)	3	Since the side effects of aesthetic cosmetic surgery can not be ruled out, it needs deliberation.	11.25(1.488)	2.13
	13	Aesthetic cosmetic surgery should be decided after a professional consultation.	10.63(1.768)	1.84
	17	Aesthetic cosmetic surgery does not guarantee success.	9.75(1.581)	1.47
	18	Aesthetic cosmetic surgery can not change the inner beauty.	8.75(3.576)	1.41
	7	Aesthetic cosmetic surgery is not a secret to hide.	9.25(1.832)	1.25
	9	If you have never experienced aesthetic cosmetic surgery, you are already outdone.	1.38(0.518)	-2.79
	23	Aesthetic cosmetic surgery should be done only for therapeutic purposes.	3.88(1.642)	-1.78
	30	The cost of dressing up increases after an aesthetic cosmetic surgery.	4.88(1.246)	-1.29
	43	Older generation can be rejuvenated by performing aesthetic cosmetic surgery.	4.75(1.982)	-1.17
	41	Once a person undergoes aesthetic cosmetic surgery, they can't stop.	5.13(2.416)	-1.10
Factor2 (N = 4)	38	The age at which aesthetic cosmetic surgery is performed is getting lower.	6.88(1.959)	1.82
	13	Aesthetic cosmetic surgery should be decided after professional counseling	10.63(1.768)	1.71

Factor4 (N = 9)	1	It is dangerous to plan aesthetic cosmetic surgery, led by fashion or curiosity.	10.56(1.590)	1.85
	43	Older generation can be rejuvenated by performing aesthetic cosmetic surgery.	10.33(1.871)	1.79
	10	Aesthetic cosmetic surgery is a good solution to resolve the appearance complex.	9.89(2.369)	1.65
	18	Aesthetic cosmetic surgery can not change the inner beauty.	9.44(2.189)	1.38
	42	The frequency of aesthetic cosmetic surgery in the elderly increases.	9.11(1.691)	1.25
	9	If you have never experienced aesthetic cosmetic surgery, you are already outdone.	2.00(1.500)	-2.54
	41	Once a person undergoes aesthetic cosmetic surgery, they can't stop.	3.78(2.279)	-1.72
	23	Aesthetic cosmetic surgery should be done only for therapeutic purposes.	4.44(2.242)	-1.58
	25	Aesthetic cosmetic surgery can help one meet a good spouse.	4.00(1.323)	-1.53
	14	One of the reasons for hesitating for aesthetic cosmetic surgery is the economic situation.	4.00(1.871)	-1.52

b. Positive type: Type 2 was composed of 4 subjects. Statements showing a strong positive response for Type 2 subjects were, 'The age at which aesthetic cosmetic surgery is performed is getting lower. (Z=1.82)', 'Aesthetic cosmetic surgery should be decided after a professional consultation. (Z=1.71)', 'Unlike other surgeries, the patient decision of aesthetic cosmetic surgery is the first priority.(Z=1.69)' [Table 2]. In type 2, the subjects with the highest factor weight was No.6 (6.3574), and the most agreeable statements were 38, 13, and 31. Statements showing a strong negative response for Type 2 subjects were, 'If you have never experienced aesthetic cosmetic surgery, you are already outdone.(Z=-2.23)', 'Aesthetic cosmetic surgery is an act that undermines the appearance handed down parents.(Z=-1.63)', 'There is regret after undergoing aesthetic cosmetic surgery.(Z=-1.58)'[Table 2]. In Type 2, the subject with the lowest factor weight was No.2 (0.4804), and the most negative statements were 9, 30, and 45. The characteristics of Type 2 were relatively open and positive for aesthetic cosmetic surgery. This type does not think that it is a secret to hide or hide the aesthetic cosmetic surgery, and thinks that it can improve not only simple changes in appearance but also overall life. They also found that the age of aesthetic cosmetic surgery was getting lower and that aesthetic cosmetic surgery was not a behavior that undermined the appearance of the parents. Rather, it was expressed as a choice of aesthetic cosmetic surgery as an alternative to make your

appearance more visible. However, even in this type, they agreed that aesthetic cosmetic surgery should be decided after professional counseling. Therefore, Type 2 was named 'Positive type'.

c. Supporting type: Type 3 was composed of 9 subjects. Statements showing a strong positive response for Type 3 subjects were, 'It is dangerous to plan aesthetic cosmetic surgery, led by fashion or curiosity.(Z=2.63)', 'Unlike other surgeries, the patient decision of aesthetic cosmetic surgery is the first priority.(Z=1.54)', 'Aesthetic cosmetic surgery can not be said to be only for women. (Z=1.46)' [Table 2]. In type 3, the subjects with the highest factor weight was No.21 (1.4629), and the most agreeable statements were 1, 31, and 34. Statements showing a strong negative response for Type 3 subjects were, 'If you have never experienced aesthetic cosmetic surgery, you are already outdone.(Z=-2.38)', 'People want to hide that they had aesthetic cosmetic surgery.(Z=-1.82)', 'Aesthetic cosmetic surgery is an act that undermines the appearance handed down parents. (Z=-1.78)'[Table 2]. In Type 3, the subject with the lowest factor weight was No.12 (0.2589), and the most negative statements were 9, 47, and 30. In Type 3, aesthetic cosmetic surgery can be selected regardless of age, regardless of whether the patient's decision has priority and whether it is female or male. They think that they will not hide or regret about the aesthetic cosmetic surgery, and they will maintain their individuality even if they do aesthetic cosmetic surgery. Overall, they

support the practice of aesthetic cosmetic surgery and support the practitioners. However, they are concerned about aesthetic cosmetic surgery performed for fashion or curiosity. Therefore, Type 3 was named 'Supporting type'.

d. Conservative stance type: Type 4 was composed of 9 subjects. Statements showing a strong positive response for Type 4 subjects were, 'It is dangerous to plan aesthetic cosmetic surgery, led by fashion or curiosity.(Z=1.85)', 'Older generation can be rejuvenated by performing aesthetic cosmetic surgery.(Z=1.79)', 'Aesthetic cosmetic surgery is a good solution to resolve the appearance complex. (Z=1.65)' [Table 2]. In type 4, the subjects with the highest factor weight was No.25 (1.3933), and the most agreeable statements were 1, 43, and 10. Statements showing a strong negative response for Type 4 subjects were, 'If you have never experienced aesthetic cosmetic surgery, you are already outdone.(Z=-2.54)', 'Once a person undergoes aesthetic cosmetic surgery, they can't stop.(Z=-1.72)', 'Aesthetic cosmetic surgery should be done only for therapeutic purposes. (Z=-1.58)' [Table 2]. In Type 4, the subject with the lowest factor weight was No.3 (0.4378), and the most negative statements were 9, 41, and 23. Type 4 believes that choosing aesthetic cosmetic surgery without caution is dangerous, and choosing aesthetic cosmetic surgery is a wrong choice. They think that aesthetic cosmetic surgery can not change the beauty of the inside, and think it will be possible to operate under one's own judgment at middle-aged and older. They did not think that aesthetic cosmetic surgery was performed only for therapeutic purposes, but did not think that someone was behind the trend because of never having experienced aesthetic cosmetic surgery, and did not think that one would meet a good spouse or change one's life through it Therefore, Type 4 was named 'Conservative stance type'.

DISCUSSION

According to the results of the study, the subjectivity types of aesthetic cosmetic surgery perceived by nursing students were Type 1 'Deliberate type', Type 2 'Positive type', Type 3 'Supporting type' and Type

4 'Conservative stance type', and the following will discuss the characteristics of each type.

Type 1 in this study was 'Deliberate type'. This type of subject felt the importance of consultation with a medical professional who had expertise in determining aesthetic cosmetic surgery. They also showed a careful attitude that they should carefully review the various possible problems, including the side effects caused by surgery, and decide on the operation. They thought that, because aesthetic cosmetic surgery is also an operation, a correct perception and critical perception of the risk of surgical procedure and success were needed.

As in the study results¹⁰ that state that in aesthetic cosmetic surgery, patients should be informed about preoperative consultation and surgery without any treatment when there is doubt about the operation, this type requires that one provide accurate information on surgical procedures and side effects and interactions. They thought that planning aesthetic cosmetic surgery could lead to another health problem, and it was thought that it was getting more difficult to make a right judgment because various media highlighted the positive aspect of aesthetic cosmetic surgery. In fact, the mass media has a negative effect on the appearance of the body through self-comparison with the unrealistic body image¹¹, and the thoughts were similar to that of the study¹² where the lower the subjective satisfaction level, the higher the acceptance of aesthetic cosmetic surgery. They looked at the aesthetic cosmetic surgery from a skeptical point of view and thought that if the stability of the operation is not ensured, the more strict management should be applied to cope with the side effects of aesthetic cosmetic surgery. In fact, medical procedures involving surgery, including aesthetic cosmetic surgery, are performed in an invasive manner for the patient, which can lead to various risks and side effects, but as aesthetic cosmetic surgery becomes popular, the social acceptability of cosmetic surgery is gradually increasing, and the risks and side effects are being overlooked.

Aesthetic cosmetic surgery should meet the obligation of the medical practitioner to meet the patient's right to know and have expertise in aesthetic cosmetic surgery. In addition, aesthetic cosmetic surgery should be provided with preventive measures against medical accidents, and a safe and proper choice of aesthetic cosmetic surgery should be provided by strengthening the real name system and patient safety standards of medical personnel.

Type 2 was 'Positive type'. This type of subjects looked at aesthetic cosmetic surgery as a way to fill their shortcomings, to make them feel confident, and not just to change their appearance, but to improve their lives. They considered aesthetic cosmetic surgery as a positive solution as a way of solving psychological problems together with inner beauty.

It could be seen in a similar context to study results showing that higher the acceptability of cosmetic surgery, the lower the self-esteem and appearance control beliefs, and results showing that a person with an inappropriate perception of his or her body considers aesthetic cosmetic surgery¹². However, for the motivation to actually choose aesthetic cosmetic surgery, it was considered in anticipation that physical changes will promote social or emotional changes, but even with the self-esteem, which was temporarily high immediately after surgery, gradually decreases with time, indicating that aesthetic cosmetic surgery can not be a way to increase self-confidence and self-satisfaction¹³. In addition, the evaluation of the satisfaction of the appearance between the patient and the control group before the operation was increased, but the self-esteem and the psychological problem did not change after the operation¹⁴.

Type 3 was 'Supporting type'. They do not encourage aesthetic cosmetic surgery. They also do not think that aesthetic cosmetic surgery has a great effect on people's lives. However, they support the choice of people who have undergone aesthetic cosmetic surgery and value their strengths.

With the improvement of the income level, the economic richness rapidly increased interest in beauty regardless of age or gender. With this socio-economic change, the desire for beauty is becoming an important part not only for women but also for men, and appearance management behavior itself is regarded as a natural phenomenon for the competitiveness of the individual, and the appearance management behavior for the individual beauty appears regardless of gender.

Type 4 was 'Conservative stance type'. This type of subject was a type that perceives the beauty of inner beauty in the sense that external changes can not change inner beauty through aesthetic cosmetic surgery. They believed individual personality does not come from the person's appearance, but from the various things that the person has, including the inside, and they thought

that aesthetic cosmetic surgery which does not have a clear standard and clear reason could not be acceptable.

They emphasized that if they were satisfied with their outward appearance, they would not have to do it, and most of the subjects had a negative view of aesthetic cosmetic surgery as part of their appearance management behaviors for their competitiveness. Similarly to the results of the study¹⁵ where the higher the satisfaction with their appearance, the more they can contribute to the sense of survival and self-esteem, subjects of this type are considered to be subjects with high self-esteem.

The subjects of the 'Conservative stance type' are positive to the subjective body image, and the type that thinks the inner beauty rather than the external beauty as their competitiveness. Therefore, it is necessary to provide information about the therapeutic effect and positive effect that can be obtained through aesthetic cosmetic surgery, and to intervene to differentiate it from others by raising the inner beauty.

This study investigated the subjective perception of aesthetic cosmetic surgery by nursing students and divided them into 4 types. This subjectivity study can be used as a basic data for the education of aesthetic cosmetic surgery subjects who have become recently interested. In addition, it is expected to be utilized as a basic data for the development of differentiated education programs by presenting the subjective structure and type characteristics of aesthetic cosmetic surgery perception of nursing students, who are prospective healthcare providers.

However, the study was based on a single university, and there is a limit to the generalization of the results of aesthetic cosmetic surgery because the subjects were not selected considering the factors affecting perception, and subsequent studies will require further verification of the type by constructing Q samples with diverse backgrounds.

CONCLUSION

The purpose of this study was to apply the Q methodology to provide the basic data necessary to explore the ways of activating aesthetic cosmetic surgery based on the subjective data that was explored and analyzed for subjective perception of aesthetic cosmetic surgery of nursing students. The results of this study showed 4 different factors. The types of aesthetic

cosmetic surgery perception were 'Deliberate type', 'Positive type', 'Supporting type' and 'Conservative stance type'.

This study typified the subjectivity of aesthetic cosmetic surgery of nursing students and provided the basic data necessary for introducing or applying a policy to activate aesthetic cosmetic surgery in the future. In the study, the types of aesthetic cosmetic surgery perception of nursing students were analyzed and their characteristics were confirmed, so it is expected that there will be development of an educational program considering the characteristics of each type. Also additional research on the type analysis by selecting a sample considering various factors, and qualitative research to identify various factors affecting nursing aesthetic cosmetic surgery subjects are suggested.

A Study on the Subjectivity Study of Single Mothers in Nursing Students : Q-Methodology

Sunyoung Jang

Dept. Nursing, Hanseo Univ., 46 Hanseo1 Ro, Haemi-myun, Seosan-si, Chungcheongnam-do, Korea

ABSTRACT

Background/Objectives: The purpose of this study was to identify the subjectivity of single mothers recognized by nursing students, to describe the characteristics of each type, to identify the types of single mothers

Method/Statistical analysis: This study applied Q methodology was applied. 26 nursing students from 'A' University were asked to classify 45 statements about single mothers. The collected data were analyzed using QUANL PC program.

Findings: The subjectivity of single mothers was analyzed using the PC QUANL program, which was followed by three factors, accounting for 48.56% of the total variance. Factor 1 was 35.33%, Factor 2 was 7.11%, and Factor 3 was 6.11%. Factor 1 has an explanatory power of 35.33%, which can be regarded as the most explaining factor for single mothers. According to the research result, the recognition of nursing students was classified into 3 types. In this study, nursing students classified the perception of single mothers into 3 factors. The subjectivity types for single mothers were 'overcoming type', 'pessimistic type', and 'empathetic type'.

Improvements/Applications: The study identified the perception of single mothers in nurses in the clinical field and provided basic data on education.

Keywords: *Single mothers, Nursing students, Subjectivity, Q methodology, Nurses*

INTRODUCTION

The dictionary definition of single mothers is "a mother who does not have a husband or partner"¹. The causes of single mothers vary greatly from country to country, but single mothers were considered social problems after the 19th century industrial revolution, and the occurrence of single mothers is concerned with accidental occurrences depending on individual, cultural, environmental factors and individual living environment factors².

During pregnancy, single mothers may feel their pain projected on the baby and hate the baby, but on the other hand, they feel sorry and pity for the baby and have ambivalence. During pregnancy, single mothers gradually become more and more attached with the baby, suffering from childbirth and increasing attachment to new life. However, single mothers experience a loss of maternal love as most adoption decisions are made due to economic difficulties. The sense of loss experienced by

single mothers is more difficult to overcome than the loss caused by bereavement³. In addition, single mothers are more likely to have a dysfunctional structure, including health risks, school dropouts, loss of job opportunities, experience of abortion wounds, risk of child abuse, and increased likelihood of divorce due to lack of physical, cognitive, and emotional maturity⁴.

Most single mothers who decide to raise their children require full-time nursing intervention for their abortion, childbirth, adoption and child-rearing conflicts after physical check-ups because they suffer from many physical, psychological, social and economic aspects. In the case of teen single mothers, there is larger influence, and Claman and Bell (1991) claimed that teenage pregnant women need nutrition not only for the growth of the fetus but also for their growth, and therefore, inadequate nutritional deficiencies may lead to fetal or neonatal deaths, such as intrauterine fetal growth retardation, premature labor, placental abruption, and amniocentesis⁵. Many studies have

shown an increase in various prenatal, delivery and postpartum complications, including complications such as anemia and prematurity⁶, and the prevalence of hypertensive diseases⁷, low birth weight and surgical labor were high in pregnancy⁸. Therefore, first of all, it is necessary to understand the process of single mothers' decision making of child rearing and to identify factors influencing the decision process.

Nurses are not only the most important part of the healthcare field, but they are also key contacts with the most contacts, and need to provide safe and high quality nursing care within a limited time in a rapidly changing healthcare environment⁹. The subjectivity of perception when treating subjects in the nursing field has a great effect on the nursing they perform. Therefore, it is important to understand the perception of nurses and prospective nurses.

Research on perception of single mothers in nursing students is insufficient. The Q methodology is a methodology that enables understanding of characteristics of each type according to the subjectivity structure of human beings¹⁰, and Because the perception of single mothers in nursing college students is unique subjective experience of the subject, it is an appropriate research method to identify the type of perception of single mothers in nursing college students through the Q methodology, which is a research method considering the subjects' subjectivity.

Therefore, the purpose of this study was to examine the subjectivity structure of single mothers from the perspective of nursing students, and to provide the basic data necessary for the development of differentiated education programs for nursing students based on the characteristics of each type of single mothers in prospective nurses.

The purpose of this study was to identify the characteristics and types of subjective perception of single mothers of nursing students applying the Q-methodology, to provide information about nursing students starting to work with single mothers and to provide basic data for presenting strategy in education of nursing students. Specific objectives for this are as follows.

1. Typify nursing students' subjective perception of single mothers.
2. Analyze and describe the type specific characteristics of perception of single mothers of nursing students.

MATERIALS AND METHOD

Design: In order to achieve the purpose of the study, literature, media data and previous studies on single mothers were reviewed, and subjectivity of nursing students who experienced working with single mothers was examined to identify the types of subjective perception of single mothers.

Q population and Q sample selection: The Q population was derived from a review of domestic and international literature, an open questionnaire, and individual in-depth interviews to extract comprehensive statements about the effects of single mothers on current nursing students. Through this process, three domains and 200 Q-populations are derived. In addition, a total of 100 Q-populations are extracted by collecting literature collected from domestic and foreign literature reviews. After reviewing and revising the extracted Q samples, the final 45 samples with high discrimination power were selected.

P sample selection method: The Q-methodology is a qualitative research that emphasizes individual inertia by emphasizing differences in meaning or importance among individuals, not individual differences, and it is based on small sample doctrine where when the P sample is large, several people are biased on one factor and their characteristics are not apparent^[18]. The P-sample of this study was 26 students who were enrolled in a nursing course and fully agreed to volunteer their consent to participate in the study.

Q classification and data analysis method: The Q classification process is a process in which individuals who are selected as P samples classify the Q samples as statements of forced and normal distribution and make a spontaneous definition of single mothers^[19]. Data were collected using Q-card for 26 current OO University nursing students. The time required for one subject to complete the Q-classification was generally 30-45 minutes. The distribution of the Q sample was classified from the strong positive to the strong negative according to the importance according to the opinion of the subjects. Statements on single mothers (Q1) were classified on a 12-point scale. Thereafter, the subjects and the subsequent interviews were conducted with respect to the statements classified at the extremes. Q factor analysis was performed using Principle Component Factor Analysis (Varimax) method. Type classification

was based on Eigen value 1.0 or higher and the number of factors was selected and the results were compared with the total explanatory variables. The collected data were scored from 1 to 12 points, which were assigned to each of the cards forcibly distributed in the distribution chart of the Q sample. The assigned conversion scores were coded in Q sample order and processed by the main factor analysis by QUANL PC program. Data were analyzed using QUANL pc program.

Ethical considerations for the subjects: After volunteer consent was obtained from the subjects before the study, it was explained to the subjects that they could stop at any time during the study. In order to respect the rights of the subjects and ensure the confidentiality of the subject’s privacy and personal information, all the information collected through this study is treated as an anonymous name in all data analysis, and encoding and Q sorting ensures confidentiality.

RESULTS

Subjectivity and type-specific characteristics of single mothers

Q type structure: Q-factor analysis of the subjectivity of single mothers by nursing students using the QUANL pc program resulted in 3 types.

Type-specific characteristics of single mothers: In order to analyze the subjectivity of single mothers by nursing students by type, the characteristics of each type were described based on statements belonging to each type. The Q-response of the P sample (subject) was divided into upper and lower questions, and 3 factors were extracted. In the Q methodology, a person with a high factor weight among the individuals belonging to each type indicates a typical or ideal person representing the type.

To analyze the characteristics of each type of single mothers, the meanings of the statements with the standard score (z-score) of ± 1.00 or more were given meaning and interpreted. In this study, for the number of people with a factor weight of 1.0 or higher, Type 1 had 10, Type 2 had 8, and Type 3 had 8.

The subjectivity of single mothers was analyzed using the PC QUANL program, which was followed by three factors, accounting for 48.56% of the total variance. Factor 1 was 35.33%, Factor 2 was 7.11%, and Factor 3 was 6.11%. Factor 1 has an explanatory power of 35.33%, which can be regarded as the most explaining factor for single mothers[Table 1]. Of the total of 26 subjects, 10 were in Factor 1, 8 were in Factor 2, and 8 were in Factor 3. Each factor corresponds to a group with similar responses to single mothers.

Table 1: Eigen Value, Variance, and Cumulative Percentage

	Type I	Type II	Type III
Eigen Value	9.1870	1.8489	1.5898
Variance(%)	0.3533	0.0711	0.0611
Cumulative	0.3533	0.4245	0.4856

Analysis by type: The subjectivity type for single mothers calculated by the type analysis method is as follows.

a. Overcoming type : Type 1 was composed of 10 subjects. Statements showing a strong positive response for Type 1 subjects were, ‘There will be difficulties with residence.(Z=2.17)’, ‘Because of the happiness of the child, worries and anxieties will disappear.(Z=1.65)’, ‘They will want to enter the single mother facility.(Z=1.64)’ [Table 2]. In type 1, the subjects with the highest factor weight was No.15 (0.9241), and the most agreeable statements were 24 and 37. Statements showing a strong negative response for Type 1 subjects were, ‘She is afraid of the child being

hurt when they learn about the father after she grows up.(Z=-3.53)’, ‘It’s not possible to ask about the father.(Z=-1.54)’, ‘She will be afraid of the negative gaze around her. (Z=-1.47)’[Table 2]. In Type 1, the subject with the lowest factor weight was No.23 (0.2150), and the most negative statements were 21 and 27. The characteristics of Type 1 are that single mothers can be hard and difficult due to child-rearing and economic situation, but they think that the child will be happy and gain strength as they grow. They did not think that it was difficult for the child to have a social life and thought that single mothers should be more proud. They said that they can raise a child alone, and that if they grow up with a lot

of mother’s love they can grow up to be happier than any other child. They hoped for national and social support for these single mothers, and they actively supported the life of single mothers. They think that a single mothers family is one of the

family types and that it is not simply a disorder of sexual ethics, that it is one of the choices of the individual and the individual should be responsible for it. Therefore, Type 1 was named ‘overcoming type’.

Table 2: Q-statements on unmarried mothers type of representative items and Z-scores (N = 26)

Representative items of type				
Factor	No.	Representative items	Mean (SD)	Z-score
Factor1 (N = 10)	24	There will be difficulties with residence.	6.10(2.331)	2.17
	37	Anxiety and worry will disappear due to the happiness of the child	6.70(2.263)	1.65
	6	They will want to enter the single mother facility.	4.50(2.915)	1.64
	30	It will not be possible to raise a child in happiness.	3.60(2.319)	1.46
	42	She will remember the love she received from the unmarried father, and the psychological arrangement would be difficult.	4.60(2.459)	1.26
	44	She is afraid the child will get hurt when the child hears about the father after they grows up.	7.60(2.675)	-3.53
	35	It’s not possible to ask about the father.	4.90(1.912)	-1.54
	21	She will be afraid of the negative gaze around her.	8.20(2.394)	-1.47
	27	It will be tough because of the social perspective on single mothers.	8.50(1.509)	-1.36
	20	She will have difficulty in relationships with people around her.	5.10(2.807)	-1.19
Factor2 (N = 8)	24	There will be difficulties with residence.	7.00(2.928)	1.69
	29	It is hoped the social outlook will change.	9.00(3.162)	1.65

	35	It’s not possible to ask about the father.	5.88(1.959)	-1.24
	22	She will have difficulty in getting a job.	7.63(2.722)	-1.17

b. Pessimistic type: Type 2 was composed of 8 subjects. Statements showing a strong positive response for Type 2 subjects were, 'There will be difficulties with residence.(Z=1.69)', 'It is hoped the social outlook will change.(Z=1.65)', 'She will have economic burden.(Z=1.47)' [Table 2]. In Type 2, the subjects with the highest factor weight was No.18 (1.2428), and the most agreeable statements were 5 and 29. Statements showing a strong negative response for Type 2 subjects were, 'She is afraid of the child being hurt when they learn about her father after they grows up.(Z=-2.68)', 'She will be afraid of the negative gaze around her.(Z=-1.59)', 'She will have difficulty in getting a job.(Z=-1.48)' [Table 2]. In Type 2, the subject with the lowest factor weight was No.21 (0.2159), and the most negative statements were 31 and 34. The characteristics of Type 2 are that they still think that single mothers in the society will have a heavy economic burden and suffer difficulties in their residence. They said that it would increase the risk of depression and eventually the anxiety about sending a child to adoption. Korea had a prejudice against single parent children, and it has been thought that it is very difficult to raise a single child especially for women. The families of those who decided to become single mothers on their own voluntary basis were opposed or even excluded from their families. Therefore, Type 2, with this older perspective, was named 'pessimistic type'.

c. Empathetic type: Type 3 was composed of 8 subjects. Statements showing a strong positive response for Type 3 subjects were, 'She will find true love after being a single mother.(Z=2.42)', 'She will remember the love she received from the unmarried father, and the psychological arrangement would be difficult.(Z=2.12)', 'There should be more support for single mothers.(Z=1.60)' [Table 2]. In Type 3, the subjects with the highest factor weight was No.11 (1.0824), and the most agreeable statements were 10 and 12. Statements showing a strong negative response for Type 3 subjects were, 'She is afraid of the child being hurt when they learn about her father after they grows up.(Z=-2.99)', 'She will be a parent of a child and will be delighted to receive her change.(Z=-1.78)', 'She will have difficulties

with marriage.(Z=-1.32)' [Table 2]. In Type 3, the subject with the lowest factor weight was No.14 (0.2121), and the most negative statements were 35 and 33. Type 3 thought looking at the case of single mothers, about looking back on one's life and finding true love, especially the importance of contraception. They thought that they would be psychologically difficult because of the memories of the unmarried father, but they saw that they would empower themselves by watching the growing children. They also hoped for increase in social support for single mothers. They looked at the single mothers and found a way to go back to their lives and move in a more happy direction. Therefore, Type 3 was named 'empathetic type'.

DISCUSSION

According to the results, the subjectivity of single mothers recognized by nursing students was Type 1 'overcoming type', Type 2 'pessimistic type', and Type 3 'empathetic type', and the following will discuss the characteristics of each type.

Type 1 in this study was 'overcoming type'. They think that in the case of single mothers who raise their children, it is necessary to strive for independence of single mothers as a living subject and to grow independently with their children in order to be more positive as a mother of a child beyond prejudice. In order to do this, they feel that social perception need to be changed for single mothers so that single mothers can live a normal life away from social prejudice, and that economic, psychological and social support for the burden of child care is needed.

They said that the family of single mothers and the father of the baby had little effect on single mothers' decision to raise children. They said that there was no difference in their support or approval, and that the mother-child family has a strong desire to become independent rather than rely on government assistance¹¹.

The single most important factor for single mothers to stand alone is their attachment to the child. Attachment is the social relationship of infants and mothers that is formed in the early stages of life and is an affectionate and emotional bond that ensures infant survival and stability and continues to adulthood¹². The pattern of early parental interrelationship is highly

dependent on maternal sensitivity, maternal sensitivity is closely related to infant attachment, and maternal sensitivity to interaction with infant signals is essential for effective care behavior. It is an important factor in stable attachment development¹³.

The single mothers identify the situation of the baby at the same time and feel the burden of being a single parent when raising a child. With worries about the child growing up without the father, the biggest complaint was economic difficulties, and this is consistent with the results of research that suggests that social support is needed, such as psychological, social, medical benefits, counseling programs¹⁴.

The single mothers were planning the future by accepting the baby into their lives through the process of identifying their situation and the baby's condition. Because it is her child, her willingness to raise a child is strongly expressed because of her blood, which is expressed in attachment, compassion, and maternal love. However, the maternal image, which is considered to be a good mother to be entirely responsible for the growth of the child prevents the mother and the child from growing independently, and that is why women point out that as a mother of her own life, the mother is independent of the child and must be the mother who grows up with her child¹⁵.

Type 2 was 'pessimistic type'. They feel pessimistic about the situation that single mothers will experience because of prejudices in our existing society. They found that single mothers themselves had a high social and economic burden of care, and that they would be subject to social prejudice and constraints.

The mother-child family centered on single mothers who are raising children in our society is accepted as a defective family, not a normal family in social common sense, which is a reflection of our society's prejudices about single mothers. Prejudice means 'an attitude of emotion to a subject with certain attributes'. Aronson (1980) also argues that prejudice is a generalization of defective or incomplete information that has hostile or negative attitudes toward a particular group. This is a kind of 'prepared attitude' by acting positively or negatively on the subject without investigating whether it is justifiable or not for someone's behavior¹⁶. Single mothers were concerned about social constraints as concerns about social prejudice, and single mothers

were found to have abortion attempts by their family's unconditional recommendation of abortion and by the provision and betrayal of unmarried people as social prejudices against prenatal pregnancy¹⁷.

In addition, they stopped work and school to maintain their pregnancy, and in order to avoid their surroundings, they were placed in a single mothers care facility to give birth. These social prejudices, due to the fear of social gaze from pregnancy to childbirth, lowers self-esteem, causing negative self-perception and loss of self-confidence, making social functioning difficult.

Type 3 was an 'empathetic type'. By projecting their life directly and indirectly to the lives of single mothers, they set the direction of their lives. Also, they draw on the positive and pursuing life that they think. They also hope that support for single mothers will increase.

Single mothers had basic survival needs for economic subsidy, employment, food, shelter, and health, but single mothers did not know the information about the programs or help provided. For single mothers who decided to raise their children, economic support (43.8%) was most needed, and there was family understanding (24.7%), free child care (13.7%), and among family's wishes, 'family understanding' was the highest at 48.6%. Single mothers in the low-income group show complications from pregnancy occurring frequently in babies and mothers, which is due to failure in antenatal care¹⁸. Thus, for single mothers who are raising their children, together with a practical and integrated single mothers support program to support single mothers' employment, including living expenses, child support, education, child care facilities and medical support, it seems that single mothers need psychological and social support to be able to raise their children positively and correctly away from social prejudice.

This study examined the subjective perception of single mothers by nursing students by dividing into 3 types. In this study, most nursing students think that the single mothers family is a new family type, and they felt that they needed a lot of support for the adoptive family. By type, there was 'overcoming type', where one would overcome the situation of being single mothers and actively organize life independently in nurturing, 'pessimistic type', which recognizes the difficulties that single mothers have to undergo by traditional values, and 'empathic type' that directly or indirectly senses

the life of single mothers and reflects their lives in their own lives and realizes their desire to live a desirable life. This subjectivity study could be used as a basic data for the single mothers support program which is of interest recently. In addition, it is expected to be used as a basic data for the development of differentiated education programs by presenting the subjective structure and characteristics of nursing students' perspective on single mothers.

However, the study was based on a single university, and there is a limit to the generalization of the results of single mothers because the subjects were not selected considering the factors affecting perception, and subsequent studies will require further verification of the type by constructing Q samples with diverse backgrounds.

CONCLUSION

The purpose of this study was to apply the Q methodology to provide the basic data necessary to explore the ways of activating support for single mothers based on the subjective data that was explored and analyzed for subjective perception of single mothers in nursing students. The results of this study showed 3 different factors. The types of single mothers perception were 'overcoming type', 'pessimistic type', and 'empathetic type'.

This study typified the subjectivity of single mothers of nursing students and provided the basic data necessary for introducing or applying a policy to activate support for single mothers in the future. In the study, the types of perception of single mothers in nursing students were analyzed and their characteristics were confirmed, so it is expected that there will be development of an educational program considering the characteristics of each type. Also additional research on the type analysis by selecting a sample considering various factors, and qualitative research to identify various factors affecting nursing single mothers subjects are suggested.

Integrative Review of Studies of Service-Learning in Health-Related Disciplines

Youngshin Song¹, Miyoung Lee², Ancho Lim¹, Geumbo Ko¹

¹College of Nursing Chungnam National University, 266 Munwha-ro, Jung-gu, Republic of Korea;

²College of Nursing, Eulji University, 77 Gyeryong-ro, 771 Beon-gil, Jung-gu, Republic of Korea

ABSTRACT

Background/Objectives: Bachelor programs have been expanded to help the community learn about social issues and the accompany in responsibilities. The purpose of this paper is to integrate the studies that conducted service-learning (SL programs) in undergraduate curricula.

Method/Statistical analysis: To identify the relevant studies, an integrative review was conducted. Eight electronic databases were searched for studies published from 2010-2018 in English and Korean. Studies included in this review analysis were all conducted using an experimental study design and focused on a SL program for undergraduate students who were in health care-related disciplines. Study characteristics including the authors, years of publication, study aims, sample size, disciplines, credit status, SL name usage, study design, and main outcomes were coded independently by two coders.

Findings: The initial search revealed 4753 studies, but only 53 of these met the inclusion criteria and were analyzed. The total sample size consisted of 7534 undergraduate students. The most frequently studied disciplines were nursing and medicine; 7 studies amalgamated the various health care disciplines. Among all the studies, 19 studies described SL programs that were applied during the freshman year, while 17 described SL programs that were conducted during the third and fourth years. All SL programs were applied within community settings such as rural areas, schools, low income countries, nursing homes, and long-term care service centers. In 32 studies, the SL program was conducted using an experimental design, and a one-group pre-post test design was used in 15 studies. The main outcome of all the studies was psycho-social-cultural competence. The number of studies published between 2010 and 2014 was 32 (60.4%), whereas 21 studies were published from 2015-2018. The term SL program was used in 12 studies, but specific program names were used in 41 studies. The SL program was offered as an elective course for credit in only 14 studies (26.4%).

Improvements/Applications: SL programs may improve students' community awareness in terms of cultural competence, skills, knowledge, and leadership. The content of the SL programs was well designed. However, in future studies, a reflection process should be applied.

Keywords: Service, Learning, Review, Health, Curriculum

INTRODUCTION

Service-learning (SL) is an educational method focused on community engagement with specific learning objectives and structured reflection ^[1]. To emphasize the relationship between service and learning, a hyphen “-” is used to connect them ^[2]. The key components of service-learning are reciprocity and reflection. Reciprocity assures that experiences are mutually beneficial in terms of outreach through assisting both community and service providers in such a way that all

E-mail: mylee3730@eulji.ac.kr

participants learn from each other in a collaborative, non-hierarchical manner [3]. The goal of bachelors programs in healthcare disciplines such as medicine, nursing, pharmacology, etc. should involve education in not only the major subjects but also social responsibility. Lots of bachelor's program have tried to provide opportunities for undergraduate students to engage in SL projects, in a broad sense of the term. However, the operating system, content, and main outcomes of the SL programs varied according to each program's goal.

Among SL programs, the effects of the SL method have been proven in various bachelor's curricula including nursing, medical, and pharmacy to improve socio-cultural competence, skill, and knowledge. For example, Chen et al. [4] have researched the positive effects of service-learning projects within a community in terms of cultural knowledge and cultural competence. In a study by Fowler [5], 3hrs of a SL program at a non-profit organization were effective in improving nursing professional development for a baccalaureate program. In pharmacy curricula, providing SL opportunities to students may positively influence their teaching skills and patients' health, but time is a barrier to participating in SL programs [6].

In recent years, several studies have been published that synthesized the effects of SL programs using systematic review and meta-analysis. For example, Warren (2012) reported that the SL program had positive effects on empathy, cultural awareness, personal and interpersonal development, social issues, motivation to study, self-efficacy, life skills, and civic engagement/responsibility through 11 included studies [7]. In 40 studies of business education, SL programs were effective in improving understanding of social issues, personal insight, and cognitive development [8].

As such, the positive impact of SL programs on various students' competences have been reported in studies; however, synthesized information was not found among the healthcare disciplines due to a lack of systematic review. Therefore, this review aims to systematically analyze studies focused on SL projects for healthcare students.

MATERIALS AND METHOD

Data sources and review strategy: Data were extracted independently by two coauthors using electronic

databases such as PubMed, EMBASE, the Cochrane Library, CINAHL, KISS, RISS, NDSL, and DBPia by two coauthors independently. Mesh terms and key words such as "service-learning," "students," "leadership," "social justice," "education" were searched from 2010 to 2018 in English and Korean.

When Mesh terms and key words were entered in the database, a total of 4753 articles were identified. After eliminating the duplicated articles, 1117 articles remained. Among them, 496 articles that case study and qualitative study were excluded. The full text of the remaining 621 studies were reviewed, but 568 studies did not meet the inclusion criteria. In final, a total of 53 studies were analyzed.

Inclusion and exclusion criteria: The inclusion criteria were as follows: a) experimental and observational studies of SL programs applied within curricula; b) participants who were undergraduate students; c) health-related curricula from medical and paramedical disciplines such as nursing, dentistry, and pharmacology; and d) studies that were published from 2010-2018.

Studies that were designed using only qualitative methods were excluded, as were systematic reviews and methodological studies.

Data extraction: Extracted data were coded independently by two coauthors. Two coders recorded the study characteristics such as authors, years of publication, study aims, sample size, disciplines, credit status, SL name usage, study design, and main outcomes. After completing the coding, the coders compared their results. If differences were found between the coders' sheets, the principal investigator (PI) settled the discrepancy after reviewing the articles.

Analysis: Included studies (N = 53) were categorized in terms of study design, types of disciplines, students' grades, years of publication, credit status, SL name usage, and types of main outcome variables.

The frequencies and percentages were calculated.

RESULTS AND DISCUSSION

A total of 7534 undergraduate students were enrolled in 53 studies that assessed the application of an SL program. The average sample size was 142, with a range from 7 to 908. SL programs in all the

included studies were for undergraduate students, but the disciplines varied. Regarding year of study, 19 SL programs were applied in freshman courses and 17 studies assessed SL programs conducted in the third and fourth years. Nursing (34%) and medicine (34%) were the major disciplines in which the SL programs were used; 7 studies amalgamated the various health care disciplines. The next most frequent disciplines were pharmacology and dental science. Twelve studies used the generic term “SL program,” but the remaining 41 studies used specific names such as “community health.” SL programs were offered as an elective for course credit in only 14 studies (26.4%). The course design for the SL program was developed by either a community non-profit organization or the university.

SL programs were performed using an experimental design in 32 studies, whereas 21 studies were conducted using mixed methods. Among the experimental studies, 15 used a one-group pre-post test design. Those studies mentioned that it was impossible to establish a control group due to ethical issues. Moreover, there are limitations to the quantitative analysis of the effectiveness of the SL program. The effect of the SL program was evaluated using qualitative data in terms of interviews regarding the satisfaction of the program. When the studies were divided in terms of years of publication, 32 (60.4%) were published between 2010 and 2014, and 21 studies were published from 2015-2018. Therefore, the number of relevant studies has been decreasing in recent years. In all studies, SL programs were applied in community settings such as rural areas, schools, low-income countries, nursing homes, and long-term care service centers. The main outcome of all the studies was psychosocial-cultural competence, and cultural competence in particular was frequently assessed. Because SL programs have been applied in various foreign countries to enhance skills and knowledge, those SL programs were focused on cultural sensitivity and transcultural diversity. Most cultural competence objectives were positively achieved in those studies. Specific skills were also enhanced through SL programs. For example, the skills necessary for cardiovascular risk screening such as blood glucose, blood pressure, waist circumference, and measurement of body mass index were significantly increased in a study by Packard et al. [9].

The SL programs were developed according to the educational years of the students. In lower-level SL programs, psychomotor skills and knowledge were most

often addressed, but in the higher levels, leadership skills and social responsibility were the main outcome variables in several studies. For example, the SL program in a course for leadership and management was effective in increasing leadership practices such as ‘modeling the way’, ‘inspiring a shared vision’, ‘challenging the process’, ‘enabling others to act’, and ‘encouraging the heart’ in a study by Foli et al [10]. In one study, health literacy attitudes and knowledge were assessed as outcomes. The SL programs in a study by Milford et al. [11] were composed of educational program to improve healthy eating and physical activity for children and families in the community. Medical students’ (1st and 2nd years) health literacy attitudes, knowledge, and skill confidence increased after the completion of the SL program.

The content of the SL program consists of a theoretical phase, a phase for participating in a service session, and a reflection phase. Several studies did not apply the reflection phase. Undertaking a reflection process regarding the learning objectives may improve the understanding of the real world, which would in turn improve social responsibility. However, most of the included studies did not report on the reflection process.

Table 1 summarizes the study design.

The findings from this current integrative review showed that there are increasing numbers of studies assessing the application of SL programs in undergraduate curricula within health-related disciplines. The aims of the SL programs were varied, and the outcomes were also well assessed according to the SL program content. However, SL programs were still mainly focused on the nursing, medical, and pharmacy disciplines. SL programs should be extended to various health care disciplines. Moreover, the randomized clinical trial numbers were relatively small compared to the one group pre-post test studies. If the effectiveness of SL program were proved in experimental studies, this would increase the evidence for the power of the SL programs.

The limitations of this study can be considered in light of the interpretation of the results. We did not perform a meta-analysis, and the effect size of the SL program could not be calculated. In future studies, the necessary effect size of the SL program should be calculated by synthesizing the individual studies. Moreover, we did not appraise the methodological quality of the included studies. Despite these limitations, this current integrative review of recent studies can provide an indicator of the scope of SL programs and their main effects.

Table 1: Classifications of SL program (N = 53)

Characteristics	Classification	n (%)
Types of disciplines (*Duplicated)	Nursing	18 (34.0%)
	Medicine	18 (34.0%)
	Pharmacy	14 (26.4%)
	Dental hygiene	3 (5.7%)
	Dentistry	3 (5.7%)
	Para-medicine	4 (7.5%)
	Dietetics	1 (1.9%)
	Biomedical science	1 (1.9%)
	Health administration	1 (1.9%)
Students' grade, Year (*Duplicated)	First Year	19 (35.8%)
	Second Year	12 (22.6%)
	Third Year	17 (32.1%)
	Fourth Year	17 (32.1%)
	Non reported	17 (32.1%)
Credit status (*Duplicated)	Credit	14 (26.4%)
	Non credit	13 (24.5%)
	Non reported	47 (88.7%)
SL name usages	Yes	12 (22.6%)
	No	41 (77.4%)
Year of publication	2010-2014	32 (60.4%)
	2015-2018	21 (39.6%)
Study design	Experiment design	32 (60.4%)
	Mixed methods (qualitative + quantitative)	21 (39.6%)
Outcome variables (*Duplicated)	Cognitive competence	33 (62.3%)
	Psycho-social-cultural competence	53 (100.0%)
	Psycho-motor skills	24 (45.3%)

CONCLUSION

The findings from this integrative review suggest that SL programs were applied in undergraduate health-related disciplines, and their benefits were evaluated. SL programs in bachelor's curricula, irrespective of whether credit was obtained, are effective for improving health care providers' social awareness, various competencies, and senses of responsibility. However, future reviews should investigate and report on studies evaluating the self-reflection process. Moreover, based on this integrative review, a meta-analysis should be conducted in the future to synthesize and calculate the necessary effect size for SL intervention.

ABSTRACT

Background/Objectives: This study identifies nursing students' adaptation to college life and recognition of death according to their degree of adaptation to field practice, and provides data for programs.

Method/Statistical analysis: Data were collected from 252 nursing students in June 2018 and were analyzed using IBM SPSS 21. Frequencies, means, and standard deviations were obtained for the groups' characteristics according to degree of adaptation to field practice. The groups' homogeneity was tested using t-test, Chi-Square test, and Fisher's exact probability test. Differences between the groups in adaptation to college life and death recognition were analyzed using t-test

Findings: The degree of adaptation to college life was higher for the group that showed high degree of adaptation to field practice than the group that showed low degree of adaptation ($t=7.47, p<.001$). The level of adaptation to all other subareas was higher for the group with level of adaptation to field practice that was higher than the lower group ($p<.001$). No statistically significant difference was found between the two groups in death recognition ($t=-1.44, p=.150$), and in the subareas of the level of acceptance of death, the level of denial of death, and death anxiety ($p>.05$). The level of interest in death, however, was higher for the group with level of adaptation to field practice that was lower than the group with higher level of adaptation to field practice ($p<.05$), while respect for life was higher for the group whose level of adaptation to field practice was higher ($p<.05$).

Improvements/Applications: The creation of a support system for individuals in conflict situations to providewith training is necessary, as is the development of education to improve death recognition.

Keywords: *Adaptation, College life adaptation, Death Recognition, Field practice, Nursingstudent.*

INTRODUCTION

Nursing students nurture their aptitudes and plan their future work lives as nurses through nursing classes and field practice^[1]. Many students express difficulty in adapting to their chosen major after they have been admitted to nursing departments. This may be a result of students applying to college or a specific department based on their college entrance scholastic aptitude test scores^[2], or having chosen nursing because of its high

employment rate compared with that of other majors without obtaining any information about the college and regardless of their aptitude for the profession. Furthermore, nursing students are required to commit more time to their studies than students of other majors, and may fear the mistakes that can occur during field practice with actual patients due to the inherent characteristics of nursing^[3]. If a nursing student has difficulty adapting to field practice, adapting to the nursing major, of which practice takes up a large part, will be hard. This will then make the student's future performance as a nurse difficult, which may make it difficult for them to form the beliefs and attitude necessary for efficient nursing, hindering the formation of the nurse's positive professionalism or self-concept^[4].

Difficulty adapting to field practice can also negatively affect nursing students' professional performance after their graduation [5].

Nursing students experience death in field practice more than students in other majors, and they state that they feel a burden or fear and anxiety when they nurse dying patients if their death recognition is unclear [6]. If nursing students' recognition of death can be established by helping them to understand death and think about the meaning of life before they enter field practice, their fear of field practice will be reduced and they will be more adequately prepared to adapt to it [3]. In addition, providing students with proper education for their situation by determining their adaptation to college life and differences in death recognition according to their level of adaptation to field practice will help them more smoothly adapt to college life and be more effective in forming a positive attitude toward death, effectively promoting a change in perception. Since nurses' death recognition and attitudes can significantly influence patient care, it is necessary for nursing students to systematically learn about patients' death, which they will face as nurses in the future [7].

Previous studies have examined the relationship between self-esteem and death anxiety [8], the relationship between life satisfaction and attitude toward death [9], the relationship between spiritual well-being and attitude toward death, and the relationship among religious life, life satisfaction, and attitude toward death [9] in nursing students. Even though there have been a few qualitative studies [10-12] on nursing students' field practice, studies on adaptation to field practice, adaptation to college, and death recognition together have rarely been conducted.

Accordingly, the present study was conducted to provide basic data for organizing program contents for adaptation to college life and the establishment of positive death recognition by determining differences in adaptation to college life and death recognition of nursing students according to their degree of adaptation to field practice.

MATERIALS AND METHOD

Research design: The present study employs a descriptive survey to determine nursing students' adaptation to college life and death recognition according to their degree of adaptation to field practice.

Subjects: Data were collected from junior and senior nursing students in a four-year university in K province from June 1 to June 30, 2018. The sample size was calculated for the t-test with effect size 0.5 (medium), significance level (α) .05, and a power ($1-\beta$) of 95% using G*power 3.10 program [13]. The minimum number of subjects was calculated to be 210, though data were collected from 252 subjects, considering a dropout rate of 20%.

Research instruments: Approval for the use of instruments used to measure adaptation to field practice, adaptation to college life, and death recognition was obtained from those who developed, revised, and supplemented the instruments before they were used in this study.

The instrument for adaptation to field practice was developed by Park [14] and consisted of nine items on a five-point Likert scale. Cronbach's α at the time of instrument development was .73, and Cronbach's α in the present study was .79. A mean score of adaptation to field practice was obtained, and subjects were divided into the high field practice adaptation score group (HFPAS group) if the score was equal to or higher than the mean score and the low field practice adaptation score group (LFPAS group) if the score was lower than the mean score.

For adaptation to college life, an instrument developed by Park [14] was used. The instrument consisted of 34 items on a five-point Likert scale with six subareas of satisfaction with major, excellence in major, academic fidelity, interpersonal relationships, coping competence, and employment preparation. The higher the score, the higher the degree of adaptation. Cronbach's α at the time of instrument development was .92, and Cronbach's alphas of the subscales were .86 for satisfaction with major, .78 for excellence in major, .69 for academic fidelity, .81 for interpersonal relationships, .78 for coping competence, and .68 for employment preparation. Cronbach's α in the present study was .91, and Cronbach's alphas of the subscales were .84 for satisfaction with major, .71 for excellence in major, .61 for academic fidelity, .75 for interpersonal relationships, .68 for coping competence, and .72 for employment preparation.

The instrument for death recognition was developed by Cha [15] and consisted of 36 items on a five-point Likert scale with five subareas of level of acceptance of

death, level of denial of death, death anxiety, level of interest in death, and respect for life. In the case of the level of acceptance of death, level of interest in death, and respect for life, the higher the score, the higher the degree of each subscale, while for the level of denial of death and death anxiety, the lower the score, the higher the degree of each subscale. Cronbach's alphas of the subscales at the time of instrument development was .79 for the level of acceptance of death, .71 for the level of denial of death, .86 for death anxiety, .85 for the level of interest in death, and .75 for respect for life. Cronbach's alphas in the present study were .79 for the level of acceptance of death, .74 for the level of denial of death, .79 for death anxiety, .81 for the level of interest in death, and .63 for respect for life.

DATA ANALYSIS

The collected data were analyzed using IBM SPSS WIN/21.0.

1. Frequencies, means, and standard deviations were obtained for the general characteristics of the subjects according to their degree of adaptation to field practice. The homogeneity of the two groups was tested using a t-test, Chi-Square test, and Fisher's exact probability test.
2. Differences between the two groups in adaptation to college life and death recognition according to their degree of adaptation to field practice were analyzed using a t-test.

Limitations of the study: Generalization of the results of the present study is limited because the present study used nursing students from only one university located in K province.

RESULTS AND DISCUSSION

The general characteristics of the subjects are shown in Table 1.

The ratio of males in the LFPAS group was higher, with 12 males (9.4%) and 116 females (90.6%), than that of the HFPAS group, in which 9 (7.3%) students were males while 115 (92.7%) were females, but the difference was statistically nonsignificant. The mean age of the LFPAS group was higher with 21.69 years than that of the HFPAS group with 21.26 years, but the difference was statistically nonsignificant. In terms

of education level, the LFPAS group had more senior students with 52 (40.6%) juniors and 76 (59.4%) seniors than the HFPAS group in which 63 (50.8%) students were juniors and 61 (49.2%) were seniors, but the difference was not statistically significant. Differences between the two groups in leave of absence from school, religion, living environment, parents' economic power, and grades in the previous semester were statistically nonsignificant. No statistically significant difference was found between the two groups in experience of hospice education, experience of dying well education, experience of death in one's family, and experience of death in clinical practice. In terms of personality, mixed personality types were the most prevalent (74 subjects, 59.7%), followed by extroverted (31 subjects, 25.0%), and introverted (19 subjects, 15.3%) in the HFPAS group, while the highest prevalence was seen for mixed type (93 subjects, 72.6%), followed by introverted (23 subjects, 18.0%) and extroverted (12 subjects, 9.4%) in the LFPAS group, and the difference between the two groups was statistically significant ($X^2=10.87, p=.004$). The HFPAS group had a higher number of meetings with professors, with 2.58 times per semester, than the LFPAS group, which had 2.00 meetings per semester, and the difference was statistically significant ($t=1.99, p=.047$). In terms of the experience of interpersonal conflict, HFPAS group replied "sometimes" (71 subjects, 57.3%), followed by "never" (50 subjects, 40.3%) and "often" (3 subjects, 2.4%), while LFPAS group replied "sometimes" (89 subjects, 69.5%), followed by "never" (30 subjects, 23.4%) and "often" (9 subjects, 7.0%), and the difference between the two groups was statistically significant ($X^2=29.96, p=.007$). Clinical practice satisfaction was higher for the HFPAS group, with 7.37 points, than the LFPAS group with 5.71 points, and the between-group difference was statistically significant ($t=8.30, p<.001$). The HFPAS group showed higher satisfaction with the nursing major, with 6.92 points, than the LFPAS group with 5.60 points, and the difference between the two groups was statistically significant ($t=6.07, p<.001$) [Table 1].

The degree of adaptation to college life according to the subjects' degree of adaptation to field practice is shown in Table 2.

The degree of adaptation to college life was higher for the HFPAS group, with 3.58 points, than the LFPAS group, with 3.21 points ($t=7.47, p<.001$). Satisfaction with major among the subareas was higher for the HFPAS

group, which scored 3.62 points, than the LFPAS group, which scored 3.14 points ($t=6.50, p<.001$). The score of the HFPAS group in excellence in major was 3.13 points, which was higher than that of the LFPAS group, which scored 2.84 points ($t=3.77, p<.001$). The score of the HFPAS group in academic fidelity was significantly higher, with 3.94 points, than that of the LFPAS group, which scored 3.64 points ($t=4.35, p<.001$). The interpersonal relationships score of the HFPAS group was significantly higher, with 3.76 points, than that of the LFPAS group with 3.39 points ($t=6.75, p<.001$). The HFPAS group's coping competence score was higher, with 3.71 points, than that of the LFPAS group with 3.43 points ($t=4.63, p<.001$). The HFPAS group scored 3.12 points on employment preparation, which was significantly higher than that of the LFPAS group, which scored 2.74 points ($t=4.37, p<.001$) [Table 2]. The results of the present study show that the degree of adaptation to college life was higher when adaptation to field practice was high. It is important to help students in adapting to field practice so that they can adapt well to college life. It is difficult to directly compare the adaptation of nursing students to field practice due to the lack of qualitative studies on the subject. In the light of a qualitative study [16] that reported the difficulty of adaptation to field practice in situations in which students experience rejection from patients and read the countenance of the head nurse and other nurses, adaptation to college life can be made smoother when situations of interpersonal conflict are reduced, when a support system that can support students in conflict situations is prepared, and

when training that enables them to cope with conflict situations is provided.

The degree of death recognition of the subjects according to the subjects' degree of adaptation to field practice is shown in Table 3.

No statistically significant difference between the two groups was found ($t=-1.44, p=.150$) for death recognition, for which the HFPAS group scored 3.12 points while the LFPAS group scored 3.18 points. For the level of acceptance of death among the subareas, the HFPAS group scored 3.27 points while the LFPAS group scored 3.29 points, and the difference between the two groups was statistically nonsignificant ($t=-0.33, p=.737$). For the level of denial of death, the HFPAS group scored 3.37 points while the LFPAS group scored 3.45 points, and the difference between the two groups was statistically nonsignificant ($t=-1.13, p=.256$). The score of the HFPAS group in death anxiety was 2.84 points while that of the LFPAS group was 3.03 points, and the difference between the two groups was statistically nonsignificant ($t=-1.85, p=.065$). A statistically significant difference ($t=-2.71, p=.007$) between the two groups was found for the level of interest in death, for which the HFPAS group scored higher with 2.38 points than the LFPAS group, which scored 2.66 points. Respect for life of the HFPAS group was higher ($t=2.36, p=.019$) with 3.32 points than that of the LFPAS group with 3.13 points.

Table 1: General characteristics between field practice adjustment of high group and low group. (N = 252)

Variables	Categories	Field practice adjustment		t or X ²	p

Table 2: Comparison of Degree of College Life Adjustment between Field Practice Adjustment of High Group and Low Group (N = 252)

Item	Field practice adjustment		t(p)
	High Group (n=124) Mean ± SD	Low Group (n=128) Mean ± SD	
College life adjustment	3.58 ± 0.40	3.21 ± 0.37	7.47(<.001)
Major satisfaction	3.62 ± 0.56	3.14 ± 0.60	6.50(<.001)
Major excellence	3.13 ± 0.62	2.84 ± 0.56	3.77(<.001)
Academic fidelity	3.94 ± 0.53	3.64 ± 0.55	4.35(<.001)
Interpersonal relationship	3.76 ± 0.44	3.39 ± 0.41	6.75(<.001)
Active coping	3.71 ± 0.46	3.43 ± 0.50	4.63(<.001)
Job preparation	3.12 ± 0.72	2.74 ± 0.65	4.37(<.001)

Table 3: Comparison of Degree of recognition of Death between Field Practice Adjustment of High Group and Low Group (N = 252)

Item	Field practice adjustment		t(p)
	High Group (n = 124) Mean ± SD	Low Group (n = 128) Mean ± SD	
Recognition of death	3.12 ± 0.34	3.18 ± 0.32	-1.44(.150)
Affirmation of death	3.27 ± 0.60	3.29 ± 0.54	-0.33(.737)
Denial of death	3.37 ± 0.59	3.45 ± 0.51	-1.13(.256)
Anxiety about death	2.84 ± 0.83	3.03 ± 0.80	-1.85(.065)
Concern of death	2.38 ± 0.80	2.66 ± 0.80	-2.71(.007)
Respect for life	3.32 ± 0.70	3.13 ± 0.59	2.36(.019)

The results of the present study showed no statistically significant difference between the two groups in death recognition according to adaptation to field practice. In the case of juniors and seniors, no statistically significant difference between the two groups is expected since education about death and hospice nursing is given mostly through courses in the major. In the case of interest in death and respect for life, however, significant differences between the two groups were found. These differences appear to reflect the intentions of student nurses to avoid the death of patients and nurse them well in the case of a high degree of adaptation to field practice, and the differences in some areas appear to be due to unclearly established death consciousness. Therefore, relevant education is necessary for the establishment of proper death recognition for nursing students.

CONCLUSION

The present study was conducted to identify nursing students' adaptation to college life and differences in death recognition according to their degree of adaptation to field practice. The degree of adaptation to college life and all subareas were higher for the HFPAS group than the LFPAS group. No statistically significant difference between the HFPAS group and the LFPAS group was found for death recognition. There were also no statistically significant differences in the subareas of the level of acceptance of death, the level of denial of death, and death anxiety, but the level of interest in death were higher for the LFPAS group than the HFPAS group, and respect for life were higher for the HFPAS group than the LFPAS group.

The findings of the present study are expected to be used as basic data for organizing the contents of programs for the improvement in the adaptation of

nursing students to major and field practice. A study is suggested in which a program that improves adaptation to major and positive death recognition is designed and implemented based on the present study and in which the effect of the program is investigated.

Ethical Clearance: Not required

Source of Funding: Self

Conflict of Interest: adaptation to college life and recognition of death

The Effects of Computer-Based Cognitive Rehabilitation Program (CoTras) on the Verbal Fluency of Korean Patients with Mild Dementia

Haewon Byeon

Department of Speech Language Pathology, Honam University, Gwangju, South Korea

ABSTRACT

Background/Objectives: The objectives of this study were to identify the effects of computer-assisted cognitive rehabilitation (CACR) program on the verbal fluency among the executive functions of the prefrontal lobe and provide the baseline data for the cognitive-linguistic rehabilitation of dementia patients.

Method/Statistical analysis: This study selected 25 patients who were diagnosed with mild dementia by a psychiatrist among the dementia patients. The subjects were randomly assigned to the treatment group (n=13), which conducted a CACR intervention program, and the control group (n=12), which carried out a traditional cognitive rehabilitation intervention program (e.g., pencil and paper, and table-top activity). CoTras was used for the CACR program. The controlled oral word association test (COWAT) was conducted to measure the cognitive level by using the computerized neurocognitive function test (CNT).

Findings: The results of ANCOVA showed that the changes in the semantic fluency (total score) and MMSE-K (total score) were significantly ($p<0.05$) different between the treatment group and the control group. The results of parameter estimation revealed that the semantic fluency of the treatment group was 1.8 higher than that of the control group on average and the difference was significant. Moreover, the MMSE-K of the treatment group was 1.1 higher than that of the control group on average and the difference was significant. On the other hand, the phonemic fluency was significantly increased after 4 weeks of treatment compared to baseline in both treatment and control groups. However, it was not significantly different between the treatment group and the control group.

Improvements/Applications: The results of this study suggest that the CACR program is more effective in improving the semantic fluency than the traditional cognitive rehabilitation program. Randomized controlled trials are needed to verify the effects of long-term CACR programs.

INTRODUCTION

The elderly population of South Korea has grown rapidly due to aging. As of 2017, the elderly population is over 14% of the total population and it has entered the aged society¹. If the current trend continues, the elderly population will be 19.3% in 2030, becoming a super-aged society¹. Moreover, it is expected that the proportion of the elderly population will be over 40% in 2060¹.

As the elderly population increases, the number of patients with dementia also increases. As of 2012, the prevalence of dementia is estimated to be 9.18% of the elderly over 65 years and the number of patients

is estimated to be 541,000 people (male: 156,000 and female: 385,000)². If the trend persists, the prevalence of dementia of the elderly over 65 years will continue to increase and exceed 15%². The abrupt increase in the mental disorders of the elderly is becoming big individual and social problems.

Dementia is a disease group that is accompanied with at least three mental dysfunctions among various mental activities (e.g., language ability, memory ability, spatiotemporal ability, personality, and cognitive ability) and these intellectual malfunctions are continuously exacerbated. The Diagnostic and Statistical Manual of Mental Disorders³ of the American Psychiatric Association

defines dementia as the status showing complex cognitive disorders interfering with social life and occupational life along with various memory impairments. It accompanies with three or more among cognitive impairments such as agnosia, aphasia, frontal execution dysfunction, and decreased visuospatial function.

If the language and cognition problems persist, they will deteriorate the quality of life by limiting the ability to perform the daily life and will cause difficulties in maintaining social activities⁴. Among various symptoms, the dysfunctions of verbal memory and frontal execution are the main symptoms of dementia⁵⁻⁸. Particularly, the deterioration of executive function and selective attention, among the decline of various neurocognitive functions, are considered as the most sensitive items for predicting the onset of dementia in the mild cognitive dysfunction stage, which is the pre-dementia stage⁹⁻¹¹.

Elliott (2003)¹² defined the executive function as a high-level cognitive processing process that requires a coordination of various subordinate cognitive functions to achieve a specific goal. It is also called the frontal lobe function because it mainly depends on the function of the frontal cortex^{13, 14}. The executive function is a concept that transcends the cognitive function of a single dimension. There are various methods to evaluate it. These methods evaluate the ability to form abstract concepts, the ability to organize information in the working memory, the ability to selectively inhibit inappropriate responses, and the ability to regulate behaviors in a socially relevant manner. Various tests (e.g., stoop, switching, trail making test, and verbal fluency) are used to evaluate these domains¹³. Among them, verbal fluency can not only highly predict the occurrence of dementia with high reliability but also be used easily in the clinical situations without using a special tool⁹.

An executive function is an ability to control and regulate behavior for oneself and it is an essential element in learning or utilizing knowledge. The dysfunction of the executive function makes a patient experience strong frustration and stress and is highly likely to cause fatal damage to daily life^{15, 16}. Therefore, the cognitive-linguistic rehabilitation for maintaining the executive function of the frontal lobe is an important topic for the patient in the early stage of dementia.

Over the past decade, various studies have proved the effectiveness of the traditional cognitive-linguistic

rehabilitation (e.g., occupational therapy, art therapy, and music therapy) on the elderly with dementia^{17, 18}. However, although the traditional cognitive-linguistic rehabilitation is widely used in clinical practices, it is not fully structured and there is not enough information regarding the consistency of treatments and the results of training. These limitations restrict the application of this rehabilitation.

Recently studies have consistently reported that the computer-assisted cognitive rehabilitation (CACR) can improve the cognitive functions (e.g., executive function) and daily life¹⁹⁻²¹. The utilization of CACR is increasing because it is possible to conduct an individualized treatment by stimulating the damaged area, reduce the spatial and temporal costs, and adjust the difficulty of the training according to the individual's cognitive level¹⁹. Nevertheless, the experimental studies conducted in South Korea have evaluated the effectiveness of CACR on the patients with the neurologic disorder (e.g., stroke and traumatic brain injury)^{20, 22}. There are still not enough studies for examining the effectiveness of CACR on the cognitive-linguistic rehabilitation for patients in the early stage of dementia.

The objectives of this study were to identify the effects of CACR program on the verbal fluency among the executive functions of the prefrontal lobe and provide the baseline data for the cognitive-linguistic rehabilitation of dementia patients.

MATERIALS AND METHOD

Subjects: This study selected 25 patients who were diagnosed with mild dementia by a psychiatrist among the dementia patients who visited medical institutes located in Seoul, Incheon, and Gwangju from Oct 2016 to Feb 2017. Among these 25 patients, 13 patients were assigned to a treatment group and 12 patients were assigned to a control group. Before conducting the experiment, the objectives and intentions of the study were explained to patients and patients' guardians in terms of the research ethics and the written and verbal consents of participants were received.

The selection criteria of the subjects are as follows: (1) who did not have issues in vision, hearing, and visual perception in order to conduct a task; (2) who could communicate; (3) whose Korean version of expanded clinical dementia rating (CDR) results fell between

0.5 and 1; (4) who did not have mental retardation; (5) who had been taking psychiatric medication for more than one year after being diagnosed as dementia and were taking the same amount of medication during the treatment period; and (6) who did not participate in a CACR treatment program before. The subjects were randomly assigned to the treatment group (n=13), which conducted a CACR intervention program, and the control group (n=12), which carried out a traditional cognitive rehabilitation intervention program (e.g., pencil and paper, and table-top activity) [Figure 1].

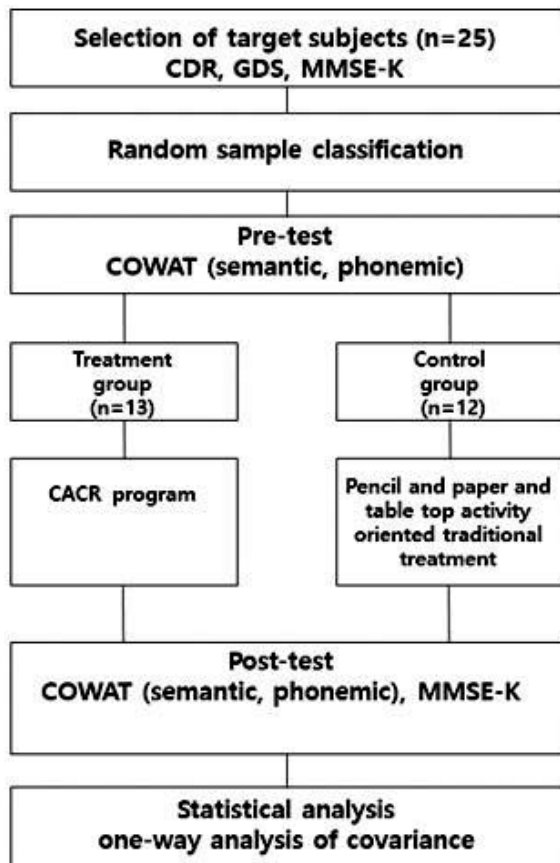

Figure 1: Design of research

Measurement

Procedure of the Program: This study was conducted from Oct 10, 2017, to Jan 9, 2018, for twelve weeks. One session was 30minutes and there were four sessions per week (total 48 sessions). One session was composed of 5 minutes of preparation time, 20 minutes for conducting a program for each activity area, and 5 minutes for sharing thoughts and wrapping up.

CACR: CoTras²² was used for the CACR program. CoTras is composed of five domains: visual perception training, attention training, memory training, orientation

training, and other training (e.g., categorization and ordering)[Figure 2], [Figure 3]. The treatment group received a sequential language recall memory training (finding a figure by a name: 1-5 steps), an association recall memory training (pairing: 1-5 steps), a language categorization memory training (grouping: 1-5 steps), and an integrated language memory training (story memorization: 1-4 steps). The subjects did not receive any cognitive treatment during the experimental period of conducting the CoTras.

Traditional Cognitive Treatment: The control group received the traditional cognitive treatment centered on pencil and paper and table top activity with excluding computer-based treatments. The program was composed of a recall memory training, an association recall memory training, a language categorization memory training, and an integrated language memory training.

Figure 2: Computer-based cognitive rehabilitation program for Koreans: CoTras

Figure 3: Examples of memory training in CoTras

COWAT: The controlled oral word association test (COWAT)²⁴ was conducted to measure the cognitive level by using the computerized neurocognitive function test (CNT). The COWAT is composed of semantic fluency and phonemic fluency. The semantic fluency

was evaluated by speaking words in the ‘animal’ category (e.g., dog and cat) as many words possible within one minute and recording correct responses. The phonemic fluency was carried out by asking a subject to say words starting with ‘/k/’ as many as possible within one minute. The evaluation method is the same as the semantic fluency test. An evaluator records all responses of the subject during the one minute and adds one point for each correct response. In this study, the COWAT was measured by summing the semantic COWAT and the phonemic COWAT.

CDR: The Korean version of expanded clinical dementia rating (CDR) ²³ is a measure of the cognitive and social functions of the elderly with dementia. It is based on the evaluation of six domains such as memory, orientation, judgment, social activities, family life and hobbies, problem-solving, and personal management. It uses a 7-point scale for judging the level of clinical dementia. A higher point indicates a severer degree of dementia.

GDS: The Korea version of global deterioration scale (GDS) ²⁵ is a tool to evaluate the progress of dementia. It is used at the beginning of dementia and can confirm the progress of dementia. The GDS consists of seven steps and each step has one 7-point scale item. A higher point indicates a severer cognitive impairment.

MMSE-K: The Korean mini-mental state examination (K-MMSE) ²⁶ is a common tool to screen dementia and can evaluate the level of the cognitive function quantitatively. It has been widely used because the reliability and the validity of the test are proven. The test consisted of 30 items encompassing orientation, memory, attention, and calculation ability, memory recall, and language and visuospatial ability. It uses a 2-point Likert scale. A higher point indicates a healthier mental status. The reliability of this study was .921.

Longest Occupation: The longest occupation was evaluated based on the response to “What is the longest occupation in your lifetime?” The surveyed occupations can be compared internationally. Based on the 6th Korean Standard Classification of Occupations ²⁷, the responses were reclassified into physical labor (e.g., technician, farmer, fishery, and forester), non-physical labor (e.g., clerk), and not economically active population (e.g., homemaker and unemployed). The not economically active population was added to the conventional classification for this study.

STATISTICAL ANALYSES

We originally aimed to conduct repeated measures ANOVA in order to identify the effects of the intervention on the two groups after the CACR program intervention. However, because the study had a small sample size and the pre-test score and the post-test score were autocorrelated, ANCOVA was used to analyze the changes in verbal fluency and cognitive function after receiving the treatment with using the semantic fluency and phonemic fluency of the pre-test as covariates. All statistical analyses were conducted using IBM SPSS version 24.0 (IBM Inc., Chicago, Illinois).

RESULTS

General Characteristics of Subjects: The general characteristics of the subjects are shown in Table 1. Chi-square test and independent sample t-test were conducted to determine the difference between the groups at the baseline status. There was no significant difference between the groups in age, gender, education level, and longest occupation.

Table 1: The general characteristics of the subjects

Variables	Control group (n = 12)	Treatment group (n = 13)	p
Age (year±SD)	76.53 ± 5.82	74.85 ± 6.31	0.350
Gender			0.870
Male	3	3	
Female	9	10	
Education level (year)	5.65 ± 4.80	5.93 ± 5.12	0.510
Longest occupation, n(%)			0.453
Physical labor	2 (16.7)	2 (15.4)	
Non-physical labor	2 (16.7)	2 (15.4)	
Not economically active population	8 (66.6)	9 (69.2)	

Control group=pencil and paper and table top activity oriented traditional treatment; Treatment group=CACR program

Changes in Semantic Fluency, Phonemic Fluency, and Overall Cognition Level by Intervention Program: A pre-test and a post-test were conducted to evaluate the changes in verbal fluency and overall cognition level of the treatment group (CACR program) and the control group (pencil and paper and table top activity oriented traditional treatment) by intervention method [Table 2].

The interaction between the pre-test and treatment was analyzed in order to test if the data satisfied the basic assumptions of ANCOVA. The results showed that the interaction was not significant so it was confirmed that the pre-test and the slope of the regression analysis were identical between the two groups. Moreover, the Levene test revealed that their variances were homogeneous.

Table 2: Changes in Semantic Fluency, Phonemic Fluency, and Overall Cognition Level by Intervention Program

Variables	Control group		Treatment group		P
	Pre-treatment	Post-treatment	Pre-treatment	Post-treatment	
COWAT					
Semantic	8.38 ± 5.25	10.39 ± 4.33	8.15 ± 6.13	12.03 ± 5.15	<0.001
Phonemic	1.05 ± 2.30	1.42 ± 2.85	1.08 ± 2.60	1.58 ± 2.88	0.567
MMSE-K	16.41 ± 4.10	18.58 ± 3.88	16.15 ± 4.51	19.35 ± 4.27	0.015

Control group = pencil and paper and table top activity oriented traditional treatment; Treatment group =CACR program

DISCUSSION

This study applied the CACR program to patients with mild dementia for four weeks and found that it significantly improved the verbal fluency and overall cognition level. Although it is impossible to directly compare with the results of other studies due to differences in software programs, previous studies have also proved that various CACR programs improved the cognitive function. Lee, Kim, & Han (2012)²⁸ reported that the 4-week RehaCom program improved the problem-solving ability of brain damage patients. Moreover, Jeong et al. (2010) showed that the 5-week COMCOG program significantly increased the daily activity execution ability, cognitive functions (e.g., cognition level determination test, and job performance satisfaction²⁹). Similar results were reported in another study using RehaCom, which is one of the CACR programs. It not only significantly improved the concentration and memory but also significantly enhanced the overall cognitive level and functional independence measure³⁰. Additionally, Galante et al. (2007) applied the CACR program for twelve times to patients with Alzheimer’s dementia and found that the cognitive function of dementia patients did not change over time, while that of those who did not receive the CACR program significantly decreased. The results suggested that the CACR was effective in delaying the progress of cognitive decline in dementia patients and agreed with the results of this study³¹.

The previous studies that reported the cognitive rehabilitation effect of CACR explained that the CACR program was more interesting and increased the active participation and motivation because the CACR was more realistic and 3-dimensional compared to the paper and pencil task³². Moreover, the cognitive rehabilitation is believed to be effective because the training tasks of it can be adjusted easily to various difficulty levels compared to the traditional cognitive rehabilitation and it is also possible to conduct an individualized training suitable for the level of a patient³³. The results of this study suggested that the CACR is effective for enhancing specific cognitive functions such as verbal fluency as well as the overall cognitive function.

Another major finding of this study was that the CACR program improved the semantic fluency of the Korean elderly with mild dementia more than the traditional cognitive program but two programs were not different in the phonemic fluency. This result can be explained by two assumptions.

First, it is suspected that it is difficult to grasp the fine improvement of the phonemic fluency of Korean by only measuring the number of correct responses in the verbal fluency test⁹. The cross-sectional study of Byeon (2014)⁹ evaluated the predictive power of the naming test as a dementia screening test for 594 elderly Koreans and found that phonemic fluency was not a significant predictor for determining the mild dementia

of the elderly after adjusting all confounding variables including Apolipoprotein E epsilon 4 gene (APOE-e4), a dementia gene. The clustering and the switching, that moves word to a lower category, are important in the cognitive process of verbal frequency so it is difficult to evaluate the verbal frequency only using the number of correct responses³⁴.

Another speculation is that the task given in this study may be less related to the phonemic fluency for testing the phonetic language fluency and more related to the semantic fluency. Future studies evaluating the effectiveness of the CACR program by measuring the phonemic fluency are required to conduct qualitative analyses (e.g., semantic clustering, phonemic clustering, and switching) as well as quantitative analyses.

CONCLUSION

The results of this study suggest that the CACR program is more effective in improving the semantic fluency than the traditional cognitive rehabilitation program. Randomized controlled trials are needed to verify the effects of long-term CACR programs.

Ethical Clearance: The study protocol was conducted in accordance with the ethical principles of the Declaration of Helsinki.

Is the Combined Application of Tongue Pressure Training and Tongue Base Exercise More Effective in Improving the Strength of Tongue and Lips in Korean Patients with Flaccid Dysarthria

Haewon Byeon

Department of Speech Language Pathology, Honam University, Gwangju, South Korea

ABSTRACT

Background/Objectives: The objective of this study was to identify the effects of the tongue-pressure exercise protocol and the traditional orofacial exercise on the articulation muscle and percentage of correct consonants of the patients with dysarthria.

Method/Statistical analysis: This study was performed on 21 patients who were diagnosed with flaccid dysarthria due to stroke. The subjects were randomly divided into a control group (tongue-pressure protocol only; n=11) and a treatment group (tongue-pressure protocol and tongue base exercise; n=10). The maximal tongue strength (kPa) and the maximum lip strength (kPa) were estimated by measuring those three times and choosing the highest number.

Findings: The results of ANCOVA showed that the maximal tongue strength, maximal lip strength, and articulation accuracy were significantly different between the two groups ($p < 0.05$). The results of parameter estimation revealed that the treatment group had 3.5kPa higher maximal tongue strength and 1.0 kPa higher maximal lip strength than the control group. On the other hand, the correct articulation (%) was higher in the post-test than the pre-test in both groups, but there was no significant difference between groups.

Improvements/Applications: The results of this study showed that the combined rehabilitation program consisting of the tongue-pressure protocol and tongue base exercise improved the maximal tongue strength and maximal lip strength significantly more than the single rehabilitation program consisting only of the tongue-pressure protocol.

Keywords: *tongue pressure training protocol, tongue base exercise, dysarthria, speech language pathology, maximum tongue strength, the maximal lips strength*

INTRODUCTION

Dysarthria includes speech disorders due to the muscle control disorder of the speech mechanism (e.g., the paralysis, weakness, and incoordination of articulation muscle) owing to the damage of the central or peripheral nervous system¹. The dysarthria is not composed of a group showing the same symptom and the etiology of the disease is very complex. The dysarthria can be classified into spastic dysarthria, flaccid dysarthria, ataxic dysarthria, hypokinetic dysarthria, hyperkinetic dysarthria, unilateral upper motor neuron dysarthria, and mixed dysarthria according to the lesion and speech characteristics². Although it varies by the type, patients with dysarthria generally show the paralysis, weakness, and incoordination of muscles. Therefore, the intensity,

speed, the range of motion, and accuracy of speech is deteriorated and they experience difficulties in oral communication³⁻⁸.

The ultimate goal of the speech intervention strategy of dysarthria speakers is to improve the clarity of articulation^{2,9}. Therefore, it focuses on treating abnormal sounds or changing the major variables of articulation characteristics^{2,9}. Previous clinical studies have focused on controlling the changes in rhythm¹⁰, the articulation speed¹¹, and the training for increasing the vocal intensity¹² of speakers with dysarthria. Particularly, patients with flaccid dysarthria among patients with dysarthria experience difficulties in speech due to various clinical characteristics (e.g., weakness, hypomytonia, and shrinkage of the oral articulation organ)¹³. The oral articulation organ includes the tongue,

lips, and velum and the motor functions of the tongue and lips are important in a speech ².

Many studies have confirmed that the patients with dysarthria had significantly lower oral motor functions than healthy adults ^[1]. However, the relationship between the oral motor function and speech production and the non-speech oral motor treatment based on it are still controversial. Some studies showed that orofacial exercise enhanced the speech production of children and adults with dysarthria ¹⁴. However, other studies reported that they are not related because non-speech oral motor and speech production have different brain activation ¹⁵. Several studies, which reviewed evidence-based previous studies, also indicated that there is not enough evidence that oral motor treatment improved the speech production ^{16,17}.

Although previous studies have shown contradictory results, many speech-language therapists are still using the orofacial exercise to promote the speech production of patients with dysarthria. Especially, since several studies have confirmed that the swallowing function and the speech production are related ¹⁸, the effectiveness of orofacial exercise for enhancing the speech production of patients with dysarthria has been reconsidered.

On the other hand, the tongue-pressure training protocol is used as a non-speech exercise therapy for the purpose of improving the strength and accuracy of the tongue. Yeates et al. (2008) ¹⁹ developed the tongue-pressure training protocol based on the previous studies ^{20, 21} that tongue-exercise helped the increase of the tongue size and strength and reported that the protocol improved the strength and accuracy of the tongue.

Particularly, the tongue-pressure exercise is known to promote the recovery of tongue size and strength²¹. More recent studies reported that the combined application of the tongue-pressure exercise protocol and the traditional orofacial exercise significantly enhanced the recovery of the oral functions of the stroke patients with dysphagia²². However, the effects of the combined therapy of the tongue-pressure exercise protocol and the traditional orofacial exercise on the patients with dysarthria have not been confirmed yet. Therefore, it is urgent to prove the effects.

The objective of this study was to identify the effects of the 4-week long the tongue-pressure exercise protocol and the traditional orofacial exercise on the articulation muscle and percentage of correct consonants of the patients with dysarthria due to the stroke. The results of this study will provide baseline data for establishing the

basis of the non-oral motor therapy for the patients with flaccid dysarthria.

MATERIALS AND METHOD

Subjects: This study was performed on 21 patients who were diagnosed with flaccid dysarthria due to stroke in Seoul and Incheon rehabilitation hospitals from October 01, 2017, to January 31, 2018. All subjects participated in the study with the written consent of the subjects or guardians. The selection criteria of the subjects are as follows: (1) who did not have a problem in hearing and auditory comprehension for performing the given task; (2) who could communicate; (3) who were not classified as severe cognitive impairment with MMSE-K ²³ score equal to or larger than 17; (4) who could take the Iowa Oral Performance Instrument (IOPI) to measure the maximum pressure score of the oral-facial muscle strength; and (5) who did not receive a tongue-pressure training protocol. The subjects were randomly divided into a control group (tongue-pressure protocol only; n=11) and a treatment group (tongue-pressure protocol and tongue base exercise; n=10) [Figure 1].

Measurement

Tongue-Pressure Training Protocol: The conducted tongue-pressure training protocol consisted of isometric tongue strength exercise and isometric tongue accuracy exercise by using Iowa Oral Performance Instrument 8-2201 (IOPI, Carnation WA; IOPI medical, USA). IOPI is an instrument to exercise by pressing the air filled bulb, located on the palate, with the tongue ^{19, 24, 25}. This rubber bulb is located at the front or back of the mouth and shows the pressure (KPa; kilopascals) on the connected LCD [Figure 2]. The location of the IOPI application is shown in Figure 3.

Figure 2: Iowa Oral Performance Instrument (IOPI)

Figure 3: Location of IOPI

The tongue-pressure training protocol consisted of two exercise programs based on Yeates et al. (2008) ¹⁹. The first is an isometric tongue strength exercise. The exercise was performed by pressing the air filled rubber bulb placed at the behind of the upper front teeth with the tongue (=one time). One set was five times and a subject conducted it four sets. Moreover, the air filled rubber bulb was placed at the center of the hard palate. Pressing it with the middle of the tongue was considered one time and one set was composed of five times. A subject conducted it four sets. The second is an isometric tongue accuracy exercise. The accuracy exercise was designed to train the accurate motion of the tongue by

pre-setting the 50%, 75%, and 100% of the maximum isometric tongue strength measured during the isometric tongue accuracy exercise without exceeding 10KPa from the pre-set value.

Orofacial Exercise: The tongue based exercise was used for the orofacial exercise. The tongue based exercise instructs a tongue movement to a patient and the patient performs the movement [Figure 4], [Table 1]. The control conducted the tongue-press training protocol 30minutes per day and five times per week for four weeks. The treatment group performed the tongue base exercise additional to the tongue-pressure training program under the same condition.

Percentage of Correct Consonants: The correct consonants (%) was calculated by dividing the number of correctly pronounced target phonemes out of 37 test words (assessment of phonology and articulation for children (APAC) ²⁶) by seven (the total target phonemes) and multiplying it by 100.

Maximal tongue strength & Maximum Lip Strength: The maximal tongue strength (kPa) and the maximum lip strength (kPa) were estimated by measuring those three times using IOPI and choosing the highest number.

Figure 4: Example of tongue base exercise

Table 1: The procedure of the tongue base exercise

Name	Type	Description
Raising the tip of the tongue	Active Exercise	With closing the lips, raise the tip of the tongue as much as possible and maintain it for 5 seconds. Conduct it with opening the lips.
Raising the tip of the tongue with overcoming the resistance	Resistance Exercise	With opening the lips, raise the tip of the tongue as much as possible with resisting the pressure of a tongue depressor and maintain it for 5 seconds.

Conted...

Moving the tongue left and right	Active Exercise	With closing the lips, move the tongue left and right and maintain each pose for 5 seconds. Conduct it with opening the lips.
Moving the tongue left and right with overcoming the resistance	Resistance Exercise	With closing the lips, move the tongue left and right with resisting the pressure of a tongue depressor. Maintain each pose for 5 seconds.
Pushing the tongue out	Active Exercise	With closing the lips, push the tongue as straight as possible and as far as possible and hold the pose for five seconds. Conduct it with opening the lips.
Pushing the tongue out with overcoming the resistance	Resistance Exercise	With opening the lips, push the tongue as straight as possible and as far as possible resisting the pressure of a tongue depressor. Hold the pose for five seconds.

Statistical Analysis: We originally intended to conduct repeated measures of ANOVA in order to evaluate the effects of programs on the maximal tongue strength, maximum lip strength, and articulation accuracy after the intervention. However, we conducted one-way analysis of covariance (ANCOVA) instead of repeated measures of ANOVA because the same size was too small and the pre-test score could affect the post-test score. ANCOVA used the maximal tongue strength, maximum lip strength, and consonant accuracy, which were pre-scores, as covariates to analyze the changes in the outcome variables after treatments. All statistical analyses were conducted using IBM SPSS version 24.0 (IBM Inc., Chicago, IL, USA).

RESULTS

General Characteristics of Subjects: The general characteristics of the subjects are shown in Table 2. Chi-squared test and independent sample t-test were conducted to determine the difference between the groups at the baseline stage. The results showed that there was no significant difference between the groups in terms of age, gender, and education level.

Changes in maximal tongue strength, maximal lips strength, and articulation accuracy according to intervention method: Pre-test and post-test were conducted to the treatment group (tongue-pressure protocol & tongue base exercise) and the control group (tongue-pressure protocol) in order to identify the changes in maximal tongue strength, maximal lip strength, and articulation accuracy by the intervention method (Table 3). The interaction between the pre-test and treatment was analyzed in order to test if the data satisfied the basic assumptions of ANCOVA. The

results showed that the interaction was not significant so it was confirmed that the pre-test and the slope of the regression analysis were identical between the two groups. Moreover, the Levene test revealed that their variances were homogeneous.

The results of ANCOVA showed that the maximal tongue strength, maximal lip strength, and articulation accuracy were significantly different between the two groups (p<0.05). The results of parameter estimation revealed that the treatment group had 3.5kPa higher maximal tongue strength and 1.0 kPa higher maximal lip strength than the control group. On the other hand, the correct articulation (%) was higher in the post-test than the pre-test in both groups, but there was no significant difference between groups.

Table 2: The general characteristics of the subjects

Variables	Control group (n = 11)	Treatment group (n = 10)	p
Age (year ± SD)	67.03 ± 7.60	65.85 ± 9.23	0.433
Sex			0.420
Male	10	11	
Female	5	6	
Level of education (year)	9.65 ± 2.13	9.47 ± 2.86	0.860
Time since stroke (month), n(%)			<0.001
≤12	8	5	
>13	3	5	

Control group=Tongue-pressure protocol only; Treatment group=Tongue-pressure protocol and tongue base exercise

Table 3: Changes in maximal tongue strength, maximal lips strength, and articulation accuracy according to intervention method

Variables	Control group		Treatment group		p
	Pre-treatment	Post-treatment	Pre-treatment	Post-treatment	
MTS, kPa	11.38 ± 8.14	17.92 ± 15.12	10.76 ± 9.77	20.80 ± 16.88	0.043
MLS, kPa	6.10 ± 3.52	9.30 ± 4.35	5.86 ± 3.81	10.13 ± 5.43	<0.001
CA, %	76.48 ± 13.31	79.13 ± 15.50	73.15 ± 15.85	77.47 ± 17.18	0.670

MTS = maximal tongue strength; MLS = maximal lip strength; CA = correct articulation

DISCUSSION

The maximal tongue strength and maximal lips strength significantly improved more when tongue-pressure training protocol and tongue base exercise were performed together than when only tongue-pressure training protocol was applied alone. However, the two groups did not show a significant difference in the correct articulation. The results revealed that tongue-pressure training protocol and tongue base exercise were effective in increasing the maximal tongue strength and maximal lips strength, while they were not effective in enhancing the correct articulation.

The results can be interpreted in two ways. First, it is possible the strength of the oral muscles did not affect the correct articulation. Researchers who denied the importance of oral muscle strength in the speech production emphasize that the speech production only needs 10-20% of the maximal muscle strength^{15,27}. These results support the results of this study.

Second, it is possible that the correct articulation was already improved sufficiently by performing only the tongue-pressure protocol. The results of this study showed that the correct articulation increased approximately 3% in the post-test compared to the pre-test in both treatment and control groups. The results implied that the combined training of the tongue-pressure protocol and the tongue base exercise was more effective than the tongue-pressure protocol only training in increasing the oral muscle strength but the combined training did not significantly improve the correct articulation compared to the tongue-pressure protocol only. The fact that the maximal strength of that tongue and lips that are directly related to articulation affects the correct articulation is the evidence of this possibility³. However, since this study measured the variables only twice (before and after the treatment), this study

could not fully interpret the changes of effects according to the time of treatment. A longitudinal study using repeated measures of ANOVA is needed to verify the treatment effects over time. Furthermore, future studies are needed to evaluate the effects of the tongue-pressure protocol and orofacial exercise on diverse orofacial motor functions (e.g., the range and directions of tongue motion, fatigue, endurance, masticatory function, and masticatory intensity) as well as the maximal strengths of the tongue and lips.

CONCLUSION

The results of this study showed that the combined rehabilitation program consisting of the tongue-pressure protocol and tongue base exercise improved the maximal tongue strength and maximal lip strength significantly more than the single rehabilitation program consisting only of the tongue-pressure protocol. However, there was no difference in the correct articulation between the two groups. Although the correct articulation is related to the strength of the tongue and lips, it reflects various elements required for speech production such as respiration, resonance, and vocalization in addition to articulation muscles. Future studies are needed to analyze additional variables such as respiration and resonance in addition to correct articulation in order to examine the combined effects of the tongue-pressure protocol and tongue base exercise on the speech production of the patients with dysarthria.

Ethical Clearance: The study protocol was conducted in accordance with the ethical principles of the Declaration of Helsinki.

Source of Funding: This work was supported by the Ministry of Education of the Republic of Korea and the National Research Foundation of Korea (NRF-2018S1A5A8028249).

A Study on General Hospital Nurses' Acceptance of New Medical Technology

Eunju Heo

Lecture, Dept. of Business Administration & Ph. D., Candidate, Dept. College of Nursing, Gyeongsang National University, 501, Jinju-daero, Jinju, KOREA

ABSTRACT

Background/Objectives: This study was designed to examine factors affecting general hospital nurses' behavioral intention to use new medical technology, if introduced, by using the Technology Acceptance Model. So this study is to understand the acceptance of new technology of nurses with self- efficacy and innovativeness of external variables of TAM.

Method/Statistical analysis: The subjects were 140 general hospital nurses who agreed to participate in this study. With a questionnaire form, the study surveyed the participants. Of the collected sheets of the form, 8 ,unfaithfully filled in, was excluded and the remaining 132 were analyzed here using the descriptive statistics, t-test, Mann-Whitney U test, Kruskal-Wallis test, correlation analysis and the multi-regression analysis in accordance with SPSS WIN 20.0.

Findings: General hospital nurses surveyed in this study showed significant differences in perceived usefulness and behavioral intention to use depending on marital status. Those nurses' innovativeness, perceived usefulness and behavioral intention to use varied significantly depending on age. Their level of education was a factor of significant difference in innovativeness and self-efficacy. The surveyed nurses' position brought their innovativeness, self-efficacy, perceived usefulness and behavioral intention to use to be significantly different. For the nurses, positive correlations were found among innovativeness, self-efficacy, perceived ease of use and perceived usefulness. Most affecting perceived ease of use was found perceived usefulness, followed by innovativeness. Both of the factors explained 62.0% of perceived ease of use. General hospital nurses' behavioral intention to use new medical technology was significantly affected by their perceived usefulness, but not by their perceived ease of use.

Improvements/Applications: Information or educational programs for an effective acceptance of new medical technology should be supported by strategies that lead nurses to recognize and innovatively accept the usefulness of such technology.

Keywords: TAM, Health care, Nurses, Perceived usefulness, Perceived ease of use

INTRODUCTION

Keeping pace with dramatic changes in the field of health and medicine, recently, some university hospitals in Korea have brought in an artificial intelligence-based medical diagnosis system called Watson. In a similar vein, the government of the country has begun to increase investment in the 4th industry-based medical technology. These moves including the use of new medical technology are expected to help better decision-makings by medical professionals, especially nurses who spend most of time in caring patients, ultimately contributing to the more specialization of nurses. By the way, terms regarding

technology in the era of the 4th industry, which were presented in Davos Forum, include robot engineering, artificial intelligence, clouding, big data, Internet of Things, linked data, 3D printing, bio technology and body-technology convergence^[1].

For the last decade, there has been a significant improvement in medical services thanks to the introduction of big data, cloud computing and Internet of Things(IoT)^[2]. E-Health Service allows risk prevention and advance treatment by facilitating nursing care and providing patient data^[3]. M-Health allows nurses to do the health management of patients and families, including

chronic disease management, without geographical, temporal or organizational barriers and burden of service costs^[4]. New technology like these, already attracting global attention, has yet to be practically attempted or theoretically considered in Korea, suggesting the need to research in relation to local introduction of such technology based on the 4th industry.

Such types of new medical technology as foresaid are currently attracting global attention, but have been little dealt with in this country. Examples of new medical technology that have been actively researched abroad include compact sensors that detect patients' blood pressure to be utilized as information^[5], wireless sensors that are worn by patients and transmit their skin temperature to medical professionals^[6], hand-washing monitoring sensors that allow medical professionals to monitor the hygienic state of their hands on a real-time basis^[7] and interactive gaming devices that provide child patients with the opportunity of learning while being in hospital^[8]. Thus, E-Health Service allows nurses to practice nursing more easily. It also provide patient data efficiently, preventing health-related risks of patients and making it possible to do advance treatment. In a similar vein, M-Health contributes to solving the health problems of patients and families by providing all of them with health management services that are free of geographical, temporal or organizational barriers and high costs to use^[9]. The ultimate goal of new medical technology such as ICT, M-Health, E-health and big data is to effective raise the quality of patient health which is the indicator of medical business performance. Whether the performance can be really successful with new medical technology depends on how much nurses intend to accept such technology, that is, their behavioral intention to use the technology. In other words, the very first step towards a successful introduction of new medical technology to the field of nursing from the beginning is determining whether and examining how much nurses have the behavioral intention to use such technology.

Previous research have mainly used Technology Acceptance Model(TAM) to explain the intention to accept new technology. TAM is an appropriate model for understanding the individual's intention to accept technology. According to TAM theory, perceived ease of use(PEOU) and perceived usefulness(PU) are two key factors influencing technology adoption. TAM is a theory to explain or predict personal intention of acceptance,

according to which the behavioral intention to use new technology is influenced by perceived usefulness and perceived ease of use^[10]. These belief-related or outside factors were identified by early TAM research^[11]. TAM was studied by adding new variables^[12].

Along with medical market development, now, TAM research has also been attempted on medical services, proving that the model considerably predicts or explains medical professionals' behavioral intention to use ICT technology^[13] and finding that nurses' optimism has a significant effect on their perceived ease of use and perceived usefulness both of which in turn significantly influences the nurses' intention of technology acceptance^[14]. In spite of its advantages, new technology is not easy to be settled in the medical institution. The behavioral intention by medical professionals including nurses to use new medical technology is influenced by both their perceived usefulness of that technology and their perceived ease of using it. To determine the degree to which medical professionals perceive new medical technology as useful or easy to use require understanding their cultures, emotions, habits, personalities and competence to use such technology^[15]. Another obstacles to the acceptance of new medical technology may include the complications of technology itself, political conflicts among groups of technology users and resistance or rejection by nurses or physicians. These obstacles need to be eliminated^[16].

Anyway, leading medical professionals to positively change their behaviors towards accepting new medical technology requires understanding their personal mechanism for the acceptance^[17]. Nurse's personal capacity is especially important for the acceptance of new technology. For medical institutions, understanding factors that affect their personnel's behavioral intention to use new medical technology is necessary for making efficient investments in such technology. Investing equipment in a medical institution is an economic burden. In particular, the cost of technology-based equipment is very high. So this study was designed as an attempt to examine factors influencing general hospital nurses' behavioral intention to use new medical technology. This study is to understand the acceptance of new technology of nurses with self-efficacy and innovativeness of external variables of TAM. Innovativeness is a personal trait that an individual is willing to try out new information technology^[18]. Self-efficacy is a judgment of the ability

to use technology to achieve a specific task^[19]. TAM was used. The objectives of the study are as follows.

Objective 1: Examining how general hospital nurses are different in innovativeness, self-efficacy, perceived ease of use, perceived usefulness and behavioral intention to use depending on their demographic characteristics

Objective 2: Examining relationships among general hospital nurses’ innovativeness, self-efficacy, perceived ease of use, perceived usefulness and behavioral intention to use

Objective 3: Identifying factors that influence general hospital nurses’ intention to accept new medical technology

MATERIALS AND METHOD

Participants: Data was collected by conducting a survey. Participants of this study were nurses from 4 general hospitals who agreed to receive the questionnaire survey given the objectives of the study under their nursing manager’s approval. The survey period was January 1~30, 2018. Nurses who worked in the survey for less than 6 months were excluded. The number of the participants was determined using G*Power program(3.0.1), through which the number of samples required for this study was found 132. In the meantime, the test power of .95, significance level of .05, effect size of .10 and 4 independent variables were designated as conditions for the multi-regression analysis. Considering dropout rates, this study distributed the form of questionnaire to

140 nurses. Of the collected sheets of the form, then, 132 were analyzed here except 8 that were deemed as unfaithfully filled in.

Data analysis and Measures: The questionnaire, which was based on previous research^[11,20], contained items measuring innovativeness(IT), self-efficacy(SE), perceived ease of use(PEoU) and perceived usefulness(PU), behavioral intention to use(BI) on the 5-point Likert scale(5 for strongly agree ~ 1 for strongly disagree). Data from survey with the questionnaire in this study were processed using the descriptive statistics, t-test, non-parametric tests, correlation analysis and the multi-regression analysis. Before the survey, the study got an e-mail consent from the copyright holder of the questionnaire, and then somewhat modified and supplemented it for this research. Items contained in the questionnaire comprised 4 questions for each of the above mentioned variables and questions asking about the participants’ demographic characteristics. To know the validity and reliability of the data, meanwhile, the exploratory factor analysis(EFA) and the reliability analysis with Cronbach’s alpha were made. The analysis found over .80 of data reliability. EFA using the Bartlett test identified a statistically significant level of data validity with KMO=.926, approximate Chi-square=2531.550, df=190 and p=.000. Also, eigen-value was over 1.0 and factor loading value over .593, both accounting for 82.21% of total variance. Table 1 shows the measurement items of the questionnaire, and the test results of data reliability and validity.

Table 1: Survey Scales and Items, Their Source, Internal Consistencies and Item Loadings

Construct	Measurement Item	Factor loading value	Cronbach’s alpha	Source
IT	I’m positive towards the use of new information technology.	.593	.889	[11]
	I tend to purchase or use new, innovative goods earlier than others.	.802		
	I tend to use new technology earlier than my colleagues.	.880		
	I’m in most cases innovative.	.804		
SE	I can collect information with new medical technology.	.759	.928	
	I can do problem-solving with new medical technology.	.754		
	I’m confident in mastering new medical technology.	.739		
	I’m confident in understanding how to use new medical technology.	.682		

Conted...

PEoU	It would be easy to learn how to use new medical technology.	.756	.898	[20]
	It would be easy to get accustomed to using new medical technology.	.755		
	It would be easy to use new medical technology.	.844		
	There would be no trouble in using new medical technology.	.748		
PU	New medical technology would help achieve my goals.	.806	.932	
	New medical technology would help perform my job efficiently.	.851		
	The use of new medical technology would help perform my job conveniently.	.799		
	New medical technology would often be useful.	.755		
BI	I intend to use new medical technology.	.811	.950	
	When new medical technology is introduced, they will be actively used.	.797		
	I will often use new medical technology.	.763		
	I am generally favorable about new medical technology.	.716		

RESULTS AND DISCUSSION

Nurses’ Demographic Characteristics and Difference by Variable: Of the subjects whose responses were analyzed in this study, 3(2.3%) were male and 129(97.7%) female. 83(62.9%) were unmarried and 49(37.1%) married. 63(47.7%) were 20 to 29 in age. 95(72.0%) were staff in position. The normality test to determine inter-variable differences found that all of the variables, except marital status, fail to satisfy normality. This is why this study made non-parametric tests, whose results are shown in Table 2. How general hospital nurses surveyed in this study were significantly different from each other in innovativeness(IT), self-efficacy(SE), perceived ease of use(PEoU), perceived usefulness(PU) or behavioral intention to use(BI) depending on their demographic characteristics can be described as follows. Marital status brought significant differences in perceived usefulness($t=2.729$, $p=.007$) and behavioral intention to use($t=2.444$, $p=.016$). Innovativeness($\chi^2=14.56$, $p=.002$), perceived usefulness($\chi^2=16.55$, $p=.001$) and behavioral intention to use ($\chi^2=14.82$, $p=.002$) all varied significantly depending on age. The level of education made innovativeness($\chi^2=12.40$, $p=.006$) and self-efficacy($\chi^2=8.46$, $p=.037$) significantly different. And position brought significant differences in innovativeness($\chi^2=11.08$, $p=.011$), self-efficacy($\chi^2=11.86$, $p=.008$), perceived usefulness($\chi^2=12.37$, $p=.006$) and behavioral intention to use($\chi^2=15.90$, $p=.001$).

Correlation analysis: Correlations between the variables were analyzed here to know the following. Innovativeness($r=.563, p<.001$), self-efficacy($r=.660, p<.001$), perceived ease of use($r=.573, p<.001$), and perceived usefulness($r=.738, p<.001$) were all found having positive correlations with behavioral intention to use. More details are shown in Table 3.

Table 3: Correlation Analysis

Variables	IT	SE	PEoU	PU	BI
IT	1				
SE	.667***	1			
PEoU	.561***	.675***	1		
PU	.452***	.625***	.536***	1	
BI	.563***	.660***	.573***	.738***	1
*** $p<.001$					

Factors Affecting Behavioral Intention to Use: Table 4 shows the results of multi-regression analysis that this study made to examine the influences of innovativeness(IT), self-efficacy(SE), perceived ease of use(PEoU)and perceive usefulness(PU) on behavioral intention to use(BI). Hypotheses for that analysis was supported by the multi-linearity test that identified the variance inflation factor(VIF) of below 10, tolerance of over 1.0 and the Durbin-Watson statistics of 1.783. The above mentioned factors, as the significance test showed, significantly accounted for 62.0% of behavioral intention to use($F= 54.84, P<.001$). The factor having the biggest influence on behavioral intention to use was perceived usefulness($\beta=.507, p=.000$), followed by innovativeness($\beta=.171, p=.022$).

Compared to this study, previous research^[14] showed that behavioral intention to use new medical technology is not significantly influenced by self-efficacy, but significantly affected by innovativeness. Also, it was previously found^[21] that the behavioral intention by medical professionals including nurses to use new medical technology is significantly influenced by their perceived usefulness of such technology. Furthermore, previous research^[22] showed that nurses’ self-efficacy and innovativeness significantly affect their perceived usefulness of new medical technology that in turn has a significant effect on their behavioral intention to use such technology. Thus, this study confirmed that nurses’ behavioral intention to use new medical technology is most influenced by their perceived usefulness of such technology, followed by their innovativeness, while previous research showed that variables are different in the power of influence on the behavioral intention to use.

CONCLUSION

This study tried to examine factors that influence general hospital nurses' behavioral intention to use new medical technology by using Technology Acceptance Model(TAM). For the examination, the study made a questionnaire survey of some general hospital nurses. Of the sheets of the questionnaire form which were collected after being filled in by those nurses, 132 were analyzed here using SPSS WIN 20.0. The analysis showed that general hospital nurses' behavioral intention to use new medical technology was most influenced by their perceived usefulness of such technology, followed by their innovativeness, both of the influential factors explaining 62.0% of the behavioral intention. Also, it was shown that general hospital nurses were different in the foresaid perceived usefulness and innovativeness depending on their demographic characteristics such as marital status, age, level of education and position. In more details, general hospital nurses' innovativeness was significantly different from each other depending on their age, level of education or position. Also, those nurses were significantly different from each other in self-efficacy depending on their level of education or position. In addition, general hospital nurses' marital status, age and position were all found bringing significant difference in their perceived usefulness of new medical technology. Furthermore, the nurses' behavioral intention to use new medical technology was found significantly varying depending on their marital status, age or position. However, any demographic characteristic of general hospital nurses didn't involve their significant difference in perceived ease of use.

Based on its findings, this study makes the following suggestions. First, medical establishments that want to provide their nurses with information or education programs concerning new medical technology should take supportive strategies should take supportive strategies to make the usefulness of such technology better recognized and innovatively accepted by the nurses as they keep in mind that nurses' behavioral intention to use new medical technology is significantly affected by their perceived usefulness of such technology and innovativeness. In this study, general hospital nurses' innovativeness refers to their attitude in which they are willing to use new information technology or willing to use new or innovative products than any other does. This attitude is, as found in the study, an important factor that influences general hospitals' behavioral intention to

use. In this research, general hospital nurses' perceived usefulness means that they perceive new medical technology would be effective and convenient if used in nursing. The research showed that general hospital nurses' behavioral intention to use new medical technology was significantly affected by their perceived usefulness, but not by their perceived ease of use. Here, that there's no significant effect of general hospital nurses' perceived ease of use on their behavioral intention may suggest that newly introduced medical technology are less likely to be perceived by the nursing professionals as what to be easily learned or mastered because they tend to think that any new technology related to nursing or medical service require a lot of efforts to learn and master.

In the smooth introduction and settlement of new medical technology that practically costs high, it may be quite helpful for medical institutions to take and implement supportive strategies that include providing nurses with information about new medical technology and providing educational programs that lead nurses to perceive such technology as useful and innovative. By the way, it should be noted here that findings of this study need to be more carefully interpreted. This is partly because there's few other similar research locally made to be comparable with this study and partly because 132 general hospital patients as participants are not enough to generalize the study. In the future, it's needed to sample more nurses of different positions and hospitals of different types and check out outside variables related to TAM before researching nurses' behavioral intention to use new medical technology.

Second, internal marketing strategies that improve general hospital nurses' behavioral intention to use new medical technology should be built up provided the fact that perceive usefulness and innovativeness, both of which influence behavioral intention to use, vary depending on demographic characteristics is reflected. For example, this study showed that general hospital nurses who were 50 to 59 in age and managerial in position were higher in perceived usefulness, innovativeness and behavioral intention to use. In the field of nursing, it's almost unexceptional that nurses who are higher in age and position are those who are more experienced in nursing. More experiences in nursing lead to more awareness and expectations of new medical technology and, accordingly, higher behavioral intention to use such technology as found in this study. In other words, more experienced nurses could be innovators who take

the lead in making new medical technology introduced and accepted to the field of nursing. In this country, the teaching and learning of nursing practices are usually made in the mentor-mentee relationship. Here, mentors are in most cases nurses who have more experiences in nursing practice while, mentees nurses who are younger and lower-positioned. By the way, the mentors directly or indirectly influence the mentees' decision-makings while teaching them nursing practices. This suggests that more experienced nurses who are older and higher-positioned could naturally contribute to raising their disciplined younger nurses' behavioral intention to use new medical technology because the former nurses have a direct or indirect effect on the latter ones, which needs to be seriously considered by medical institutions.

Thus, future research needs to focus on programs for the improvement of behavioral intention to use, which are customized in accordance with nurses' demographic characteristics, and examine the effects of the programs. Regarding its limitations, by the way, this study is difficult to be generalized because it used the convenience sampling of general hospital nurses and because it used a self-reported questionnaire which might have not guaranteed the objectiveness of responses from nurses.

¹Dept.ofPhysical Education, Dankook University; ²Dept. of Sports and Health Care, Korea National University of Transportation; ³Dept. of Marine Sports, Hanseo University; ⁴Dept. of Recreation and Leisure Studies, Dankook University

ABSTRACT

Background/Objectives: We investigated the total work, systolic blood pressure, and numerical rating scale at 65% bench press according to the differences in rest time between sets in 8 males aged in their 20s.

Method/Statistical analysis: The subjects of this study included 8 healthy males in their 20s, and living in C city. Following signed voluntary agreement, the bench presses of these subjects under three resting time conditions were cross-distributed. The data were verified with repeated measures' two-way ANOVA and Contrast's repeated method was applied for post-hoc comparison. The significance value was $\alpha < .05$.

Findings: First, the total work decreased significantly as the set progressed. Second, systolic blood pressure did not show any significant difference. Third, in the initial set, the short rest condition (1 min) tended to be higher than the long rest condition (3 to 5 min), but the tendency was reversed as the set progressed.

Improvements/Applications: As the rest interval between sets increases, the total momentum increases. As the rest interval between sets decreases, the NRS value increases. During the 65% bench press all-out exercise, systolic blood pressure was 181-186 mmHg under all conditions.

Keywords: Bench press, Total work, Rest interval, Systolic Blood Pressure, Numerical Rating Scale

INTRODUCTION

Studies have been conducted to achieve exercise goals most effectively by combining the main factors underlying resistance exercise prescription such as exercise intensity, number of sets, number of repetitions, rest interval between sets, exercise order, movement speed, and exercise frequency. Until now, research has been conducted to combine the main elements of resistance exercise prescription to achieve the most effective exercise¹. Modifying only one of these factors led to varying training outcomes. It is important to understand the interaction of these factors for safe and effective training². Exercise intensity and rest

interval between sets are the most important factors in resistance exercise program planning³. The rest interval between sets was an important factor affecting the one-time response to the resistance program and the long-term adaptation⁴. Also, the condition of the rest time not only affected the performance of the next set⁵, but also the metabolism⁶, hormones⁷, and cardiovascular responses⁸. Previous studies have suggested that rest interval between sets should range from 3 to 5 min, 1 to 3 min, and 1 min, respectively, in order to improve the maximum strength, hypertrophy and endurance⁹. On the other hand, it is necessary to define an appropriate rest interval considering the characteristics of the study subjects and the specificity of sports⁴. Resistance training for muscle endurance does not provide a clear rest interval between sets when compared with resistance training for hypertrophy¹⁰. A study of long-term strength training was more effective, and in the case of long rest intervals than in short rest intervals in improving muscle strength^{11, 12}. In case of maximum strength exercise using multi-joint, a rest interval of more than 3 ~ 5 min

is recommended ¹³. ¹² reported 5-week training results: the group with a 30-s rest time showed a 2% increase in muscle strength, while a group with a 3-min rest time showed a 7% increase in muscle strength. In addition, ^[11], showed that the group observing a rest time of 160s compared with the group with the 40-s rest time showed a 5~8% greater improvement in muscle strength. Training with 20-60 s of short rest interval between sets improved the repetition speed during repetitive sub-maximum exercise and increased the maximum torque during high-intensity exercise, which effectively improved muscle contraction and power, In order to improve muscle endurance, it is advantageous to use a short rest interval between sets ⁷. However, ^{14, 15} and ¹⁶, reported that the number of repetitions decreases under short rest intervals between sets. The effective rest interval for improving muscle endurance is still disputed. Changes in blood pressure during resistive training are dependent on cardiac output and peripheral blood vessel resistance, and resistance training during the cardiovascular response is directly affected by the amount of training and intensity of exercise ¹⁷. Systolic blood pressure increases directly in proportion to exercise intensity in endurance training ¹⁸. At rest, the systolic blood pressure of 120 mmHg surpasses 200 mmHg under maximum exercise. A normal, healthy, highly trained athlete has a maximum systolic blood pressure of 240-250mmHg, however, diastolic blood pressure is almost unchanged during endurance training of intensity ¹⁹. In addition, blood pressure is known to rise rapidly even during resistance exercise ²⁰. These changes are also reported to depend on exercise intensity ²¹. These changes in circulation during exercise represent the physiological

changes underlying the supply of necessary oxygen and nutrients to the tissues, such as increased muscle activity, and to prevent the accumulation of waste products. The physiological change is thought to be related to the decrease in the number of repetitions based on individual differences during the resistance exercise to improve muscle endurance(or hypertrophy) ^{22, 2}. In addition, individual differences in exercise performance need to be considered to determine a uniform rest time between sets or to provide guidelines. In terms of recovery, the possibility of error can be increased. As described above, resistance training for muscular endurance includes elements of aerobic exercise in terms of energy metabolism ¹⁸. The rest time between sets is not just a concept of recovery time between sets, The total work and physiological variables such as systolic blood pressure(SBP) and numerical rating scale(NRS) were measured, as well We attempted to present more objective rest time between sets for muscular endurance (or hypertrophy).

METHOD

Subject: The subjects of this study included eight males who were healthy, and aged in their 20s. They live in C city of Chungnam and signed voluntary agreements. The subjects were provided with sufficient preliminary explanations about the study goals and the experimental procedures in advance to enable their participation voluntarily. One week prior to the experiment, they were instructed to limit excessive activity and avoid smoking and drinking alcohol or taking medication. Subject characteristics is shown in Table 1.

Table 1: Subject characteristics

Subject (N)	Age (yr)	Weight (kg)	Height (cm)	body fat (%)
8	23.33 ± 2.52	767.47 ± 7.12	178.07 ± 2.75	14.01 ± 4.21

Study design: Bench press 1RM was measured after the subjects were selected. The subjects were randomly cross-categorized to vary the exercise order according to the three resting conditions (30s, 1min, 3min, and 5min). In addition, exercise performance, physiological variables and pain scale were measured at the resting time of each set for 7 sets of bench press exercise at 65% -1RM load intensity under 3 resting conditions. After the first experiment under each condition, the second experiment was performed similarly at intervals of one week. A total of three experiments were performed similarly.

RM measurements: 1RM measurements were made using a direct measurement method based on an indirect measurement²³, and the exercise load (RM) for 1RM in this study was determined ²⁴. Using the relationship between% RM and repetition maximum(RM)²⁵, 65% -1RM was more accurately measured in this study. The Indirect estimation formula is shown in Figure 1.

$$1 \text{ RM} = W0 + W1$$

$$W0 = 7.8 \text{ RM}$$

$$W1 = W0 \times 0.025 \times \text{Reception}$$

Figure 1: Indirect estimation formula

Total work: The total work was calculated by multiplying the weight by the number of repetitions in each set. The Total work calculation formula is shown in Figure 2.

Total Work = Load (kg) × Reception
Figure 2: Total work calculation formula.

Systolic blood pressure (SBP): SBP was measured using a sphygmomanometer (FT500R PLUS) immediately after each bench press exercise. A total of 7 measurements were taken at each resting condition (1 min, 3 min, and 5 min). The sphygmomanometer is shown in Figure 3.

Figure 3: Sphygmomanometer

Numerical rating scale (NRS): The subjects were measured using NRS, to evaluate the degree of pain according to the scores ranging from 0 (no pain) to 10 (severe pain). NRS range of 0-10 was displayed in a straight line on the table. The pain intensity was indicated as a number. The pain level of the subject was measured based on the immediate response after the bench press exercise set. Pain intensity measurements were made according to the NRS. The 10cm horizontal line is divided into 10 equal numbers, with 0 indicating 'no pain' and 10 denoting 'very painful' at both ends. The higher the score, the greater was the degree of pain. The Numerical rating scale is shown in Figure 4.

Figure 4: Numerical rating scale

Statistical analysis: The SPSS 22.0 statistical program was used for analysis. Data were verified with repeated measures' Two-way ANOVA and Contrast's repeated method was applied for post-hoc comparison. The significance value was $\alpha < .05$.

RESULTS

Change in Total work: Repeated measurements of change in total work were made according to rest time (1, 3, and 5min) and 7set. As a result, a statistically significant difference in the total work with rest time was found between sets ($p = .000$). The total work measured according to the set also showed a statistically significant difference ($p = .000$). Statistically significant differences were also found in the interaction between set and rest time ($p = .000$). Therefore, the change in total work with rest time was significantly reduced at 1- and 3-min intervals ($p = .003$). At 3 and 5 min rest ($p = .006$), the total work according to the set was 1-2 sets ($p = .000$), 2-3 sets ($p = .000$), and 3-4 sets ($p = .000$) with a statistically significant decrease, whereas, 6-7sets maintained a similar level.

Further, the rest time was 1 min to 3 min ($p = .001$) in the 3 min-5 min condition ($p = .004$). The total work of each group showed a significant difference between 1-2 sets. The amount of exercise at the beginning and the amount of movement between the sets were high under longer rest times. Two-way ANOVA test results for Total work are shown in Table 2.

Table 2: Two-way ANOVA test results for Total work according to Rest interval and Set (kg)

Rest time	1set	2set	3set	4set	5set	6set	7set		F	Contrast

Changes in Systolic blood pressure: Changes in SBP were repeatedly measured between sets just after exercise (1, 3, and 5min) and 7set. No statistically significant difference was found in SBP or in terms of interaction between rest time and set. Two-way ANOVA test results for SBP are shown in Table 3.

Changes in Numerical rating scale: Repeated measurement of changes in NRS according to rest time (1, 3, and 5 min) and set (7) showed statistically significant difference (p = .010) according to rest time condition. A significant difference (p = .000) between 1 and 3-min rest times, and 3-and 5-min resting conditions (p = .016) was observed. A statistically significant difference in NRS was found according to the set(p=.000): 1-2sets (P = .000), 2-3 sets (p = .000) and 5-6 sets (p = .020).A significant difference was also detected in the interaction effect between the rest time, set and the NRS (P = .000).

Based on the interaction between NRS, the rest time between sets at1 min and 3 min showed significant differences in 4-5 sets (p = .003) and 6-7 sets (p = .041). Two-way ANOVA test results for NRS are shown in Table 4.

DISCUSSION

The total work can be calculated for each set by multiplying the lifted weight(kg) by the number of repetitions, and the momentum can be calculated from the number of sets and the number of repetitions between sets². The determinants of exercise level include exercise load, the number of repetitions, and the number of sets. Among them, the exercise load is the biggest factor that determines the amount of exercise⁹. In addition, a longer rest period facilitated increased amount of exercise^{14, 15},

and sufficient rest between the sets improved the muscle strength^{11, 12}. In this study, the exercise load was 20RM on 65% of 1RM. Therefore, the total work of seven sets of bench press under a 20RM load was examined. We investigated the effect of rest interval between sets on the changes of total work. A statistically significant difference was detected between the total work under the rest interval and the total work according to the set, and the interaction between the resting time and the set was also statistically significant. The total work was significantly reduced at 1, 3, and 5minute resting

periods. The total work showed a statistically significant decrease in each set with rest interval (1, 3, and 5 min) after 2 sets. The total work under 1-min resting interval tended to decrease to 4 sets, and similarly from 5 to 7 sets. The total work under the 3-min rest interval decreased to 5 sets. However, it increased in 6 sets and decreased again in 7 sets. Further, the total work in three sets of resting interval showed a higher total work than in a single set of resting interval. The total work under 5-min rest tended to decrease significantly in all sets, although the amount of exercise and total work at the beginning of exercise were the highest when compared with 1-min and 3-min resting interval. In the study of ²⁶, the total work decreased following a short resting interval during resistance exercise. This study also showed that the total work decreased substantially under short rest periods of 1 min during resistance exercise, and the total work increased under longer resting intervals of set. These results indicate that under longer set time intervals, the total momentum decreased little suggesting that the 4- to 10-min rest period was required to remove the elevated levels of lactate during high-intensity exercise ²⁷, and to recover muscle ATP and PCr, which provide the energy needed for muscle contraction. It is also believed that short rest intervals resulted in rapid accumulation of high levels of lactic acid during high-intensity exercise, resulting in rapid fatigue, and a sudden reduction in total work ⁶. The findings suggest that the resting time was closely related to the three energy production systems (ATP-PC, glycolysis, and aerobic respiration) ². In the case of a relatively long resting time, energy was restored for muscle contraction. The time required for lactate metabolism and its elimination was longer than under short-term resting conditions. Similar results were obtained in the study under three exercise intensities (60%, 75%, and 90% 1RM) and relaxation times of 1, 3 and 5 min during the bench press exercise of ¹⁶. The results showed that a longer rest interval between sets led to a lower reduction in the total momentum. As a result, the exercise performance and physiological changes in exercise intensity were observed at the 65% 1RM bench press exercise, which showed the total work varied with the rest interval at the same exercise intensity. As shown in previous studies, increasing the amount of exercise under a relatively short rest period has a positive effect on improvement of muscle endurance. However, whether the total exercise amount under short resting times in this study was effective in improving muscle endurance needs to be investigated. Further, the effect of total exercise amount under relatively long

resting periods in improving muscle strength needs to be elucidated ². No statistically significant difference was detected between SBP and SBP immediately after exercise according to the rest time. The SBP was above 180 mmHg in all three conditions (1 min, 3 min, and 5 min) under 1RM 65% rest interval between sets using a bench press. No statistically significant difference was found between SBP and SBP according to rest time. Despite the difference in the total exercise volume per set, the SBP showed a similar tendency due to the fact that the exercise was performed with the greatest effort at each set during the bench press. In addition, it may represent a phenomenon in all-out exercise when using 65% 1RM of bench press as a maximal effort. Usually, muscle-derived pain begins in the skeletal muscle, the tendon, and the fascia. In this regard, protective muscle tension, localized muscle pain, and fascia pain occur acutely. If the problem is not resolved properly, it can develop into a chronic and unmanageable chronic musculoskeletal disorder, if normal and healthy muscles are affected by tissue damage or function due to constant stimulation. Protective muscle tension is induced and the muscles are protected against damage. At this time, if muscle function is restored, it may return to normal state. However, in the case of sustained protective muscle tension, pain-inducing substances such as intramuscular bradykinin, prostaglandin, and substance P are locally released. The resulting structural change and muscle pain induces muscular weakness and reduces the ability for muscle contraction by 33% to 50% ⁷. Pain is an essential element in manifesting the senses in the human body, and can warn against external threats and internal diseases. Pain is used as a major diagnostic indicator for physicians and medical personnel. The NRS is widely used in pain assessment along with VAS ²⁸. In the present study, repeated measurement of the changes in NRS according to rest time (1, 3, and 5 min) and set (7), showed statistically significant differences in the NRS according to resting conditions, especially between 1 min and 3 min, and 3 and 5 min. In the initial set, the short rest condition (1 min) tended to be higher than the long rest (5 min). However, as the set progressed, a significant increase in the rest time condition (5 min) was observed. The pain triggered by muscle fatigue due to exercise after incomplete recovery was attributed to the short rest time between sets during bench press resulting in dysfunction following exercise ¹⁶. Further, muscle dysfunction accelerated muscle fatigue and muscle pain ⁷, apparent from the high degree of pain in the first two sets. Conversely, under prolonged rest between sets (3

and 5 min), muscle function was restored partly due to sufficient rest time at the start of the set. The structural damage of muscles is caused by energy exhaustion and work^[6] due to the progress of the set. It is believed that the degree of pain increased in the latter half of the set due to the release of pain-inducing substances⁷.

CONCLUSION

A 1-min rest between sets led to a low total momentum due to incomplete rest. The NRS value was high from the beginning of the set. Conversely, a 5-min rest interval showed a large total momentum due to a sufficient rest interval between sets and a high NRS value in the posterior set. Therefore, as the rest interval between sets increases, the total momentum increases. As the rest interval between sets decreases, the NRS value increases. During the 65% bench press all-out exercise, SBP ranged from 181 to 186 mmHg in all conditions.

Factors Influencing Suicidal Ideation in Depressed Patients: Based on the 6th Korea National Health and Nutrition Examination Survey

Kyongeun Lee

Assistant Professor, Department of Nursing, Tongmyong University, Republic of Korea

ABSTRACT

Suicidal ideation in depressed patients is important related to their life. The purpose of this study was to identify factors influencing suicidal ideation in patients with depression in Korea. This study carried out secondary analysis using data from the 6th Korea National Health and Nutrition Examination Survey (KNHANES). This population-based survey was a nationwide, stratified, multistage, clustered probability design. The subject samples of this study were selected a total of 151 patients who had a major depression among the 7,380 population. Data were analyzed by using χ^2 -test, t-test, and logistic regression with the SPSS23.0 and STATA 13.0 program. The average age of a total of 151 depressed patients was 53 years (range 20 to 81). Education ($p=.045$), subjective health status ($p=.001$), body discomfort during the past 2 weeks ($p=.038$), perceived stress ($p<.001$), depressive mood more than 2 weeks ($p<.001$), health-related quality of life ($p<.001$), and hospital accessibility during the past 1 year ($p=.005$) were statistically significant. To determine the factors affecting suicidal ideation in patients with depression, logistic regression analysis were conducted with only statistically significant variable in the χ^2 -test and t-test results. As a results, body discomfort during the past 2 weeks (OR=2.53, 95% CI1.29 to 4.95; $p=.007$), depressive mood more than 2 weeks (OR=10.57, 95% CI3.64 to 30.63; $p<.001$), health-related quality of life (OR=0.50, 95% CI0.01 to 0.88; $p=.007$), hospital accessibility (OR=2.33, 95% CI1.06 to 5.13; $p=.001$) were significantly associated with suicidal ideation in patients with major depression. Depending on the results of this study, tailored interventions for patients with major depression are needed to manage each of the factors affecting suicidal ideation.

Keywords: *Suicidal ideation; Depression; National survey; KNHANES; Secondary analysis.*

INTRODUCTION

The suicide rate of Korea was second highest among OECD nations and first among Asian nations [1]. The number of suicides per 100,000 was 27.3 persons, and 13,836 persons committed suicide in 2014 alone [1]. Although the death rate of intentional self-harm (suicide) was reduced by 0.8% and 3.4% respectively in 2015 and 2016, but the suicide rate of Korea is still high [2,3]. The statistics on the causes of death in 2016 shows that suicide is one of 10 leading causes of death for Koreans [3]. Accordingly, the Korean government is making various efforts to reduce the suicide rate. In addition, the academic community is conducting active research on suicide ideation, which affects suicide attempt [4]. Especially, depression is the most dangerous single factor that leads to suicide [5,6]. There are more than 300 million depression patients in the world [7], but the number of depression patients in Korea is increasing at an alarming rate [8].

Studies on suicide ideation are mostly carried out for different life cycle groups. For the adolescent period in Korea, stress and depression caused by various reasons such as school life, academic performance, internet addiction and family background related to parents are the risk factors of suicide ideation [8-11]. Suicide ideation in the adolescent period is known to have a significant effect on suicide ideation in the adulthood, but the difference from suicide ideation in the adulthood and old age is impulsiveness [12,13]. Therefore, this study aims to examine suicide ideation that appears in the life cycle groups of adulthood or older.

In the adulthood, depression, anger, anxiety, stress and low self-respect caused by educational background, economic factors and absence of a spouse were found to affect suicide ideation [14-16]. Also, Korea has become an aging society where old age suicide is a social issue.

Compared to other life cycle groups, suicide attempts have increased in the old age. In the old age group, the dominant causes of suicide ideation are physical weakness, weakened social support, stress, anxiety and pressure from aging, and lowered self-respect^[17,18]. Other studies confirmed that suicide ideation in the old age is not only influenced by psychological and emotional impairment but also by physical factors such as pain, discomfort and limited daily activities^[19,20]. Identifying the factors influencing suicide ideation for different life cycle groups can provide important background data to come up with a method of reducing the suicide rate.

As shown by the results of the previous studies examined earlier, it is important to find the factors influencing suicide ideation for each life cycle group. However, since suicide ideation is a primary risk factor of suicide attempt especially in the group of depression patients^[6,7], it would be necessary to examine the factors influencing suicide ideation in depression patients. There are various studies related to suicidal ideation, however, studies on suicide ideation of depression patients in Korea are seldom found. An Australian study conducted using national data showed that suicide ideation is relatively more common in the subjects with a mental problem^[21]. A recent foreign study reported a decrease in suicide ideation according to improvement in the symptoms of depression^[22]. Another study explained that subjective symptoms are more closely associated with suicide ideation compared to neurovegetative symptoms in depression patients^[22]. In another study, negative emotions of depression patients were found to have a significant relationship with suicide ideation, suggesting that suicide ideation can be significantly reduced by improving negative emotions^[23]. Accordingly, the purpose of this study is to take a comprehensive approach to suicide ideation of all adult depression patients regardless of the life cycle group and to identify the characteristic factors influencing suicide ideation of Korean depression patients. The significance of this study is in finding characteristics of Korean depression patients.

This study intends to examine the characteristic factors that influence suicide ideation in all adult depression patients of Korea using the Korea National Health and Nutrition Examination Survey (KNHANES). The specific purpose of this study is to identify the differences of suicide ideation in depression patients

according to general characteristics and health-related characteristics and to analyze the factors influencing suicide ideation. The results of this study would provide useful data that can help take a factor-specific approach in preventing suicide attempts of depression patients.

METHOD

Study design: In this study, a secondary analysis was carried out using data from the 6th Korea National Health and Nutrition Examination Survey (KNHANES) conducted in 2015.

Sample: The sample population of this study was 7,380 participants of the 6th Korea National Health and Nutrition Examination Survey. Among them, 1,445 participants who did not respond or responded that they are not sure about the question on recent suicide ideation ('Have you felt like dying during the past 1 year?') were excluded. Among 5,935 participants who clearly answered 'Yes' or 'No', 151 depression patients were selected as the subjects of this study.

Ethical considerations: This study analyzed the dataset of the Korea National Health and Nutrition Examination Survey had been collected by the Korea Centers for Disease Control (KCDC). All identifying information was deleted by the KCDC before the dataset was downloaded. The confidentiality and privacy of all the participants were secured.

MEASURE

General characteristics and health-related characteristics: In this study, gender, age, education, occupation, living state, subjective health status, comorbidity, restriction of activity, body comfort, perceived stress, depressive mood, and health-related quality of life were analyzed as general characteristics and health-related characteristics.

Health-related behavioral characteristics: In this study, current smoking status, current alcohol drinking status, regular exercise, individual mental health counseling, and impossibility of visiting a clinic were analyzed as health-related behavioral characteristics.

Data analysis: The 6th Korea National Health and Nutrition Examination Survey can represent all Korean citizens because it calculates the estimator of variance considering a complex sample design by analyzing

the data with weighted values, stratification variables and clustering variables. The data for this study were analyzed using the SPSS 23.0 and STATA 13.0 programs as follows. The differences in suicidal ideation according to general characteristics, health-related characteristics and health-related behavioral characteristics of the 151 depression patients were analyzed by performing frequency analysis, percentage analysis, χ^2 -test and t-test. To identify the factors influencing suicidal ideation, logistic regression was carried out on significant variables found during χ^2 -test and t-test among general

characteristics, health-related characteristics and health-related behavioral characteristics.

RESULT AND DISCUSSION

Results: Out of the 151 depression patients, 61 subjects (40.4%) responded that they recently experienced suicidal ideation and 90 subjects (59.6%) responded that they did not recently have suicidal ideation. The results were considered to be statistically significant at a 5% significance level ($p < .05$).

Table 1: Differences in suicidal ideation according to general characteristics and health related characteristics of subjects (N = 151)

Characteristics	Categories	Suicidal ideation Yes n (%) or M ± SE	Suicidal ideation No n (%) or M ± SE	χ^2 or t (p)

Health-related quality of life		0.74 ± 0.03	0.86 ± 0.01	3.770(<.001)

Note: n(%), M±SE were except missing values.

The differences in suicidal ideation according to general characteristics and health-related characteristics of patients with major depression are as shown in Table 1. The suicide ideation rate according to educational background was 44.3% for elementary school graduate or below, 59.1% for middle school graduate or above, 42.4% for high school graduate or above and 14.1% for university graduate or above. This difference was statistically significant ($p=.045$). The suicide ideation rate according to subjective health status was 35.4% for good subjective health status, 22.7% for moderate health status and 59.6% for bad health status. The suicide ideation rate increased significantly with worsening subjective health status ($p=.001$). The suicide ideation rate according to body discomfort was 53.8% with discomfort and

33.3% without discomfort. The suicide ideation rate was significantly higher when the subjects experienced body discomfort ($p<.001$). The suicide ideation rate according to perceived stress was 19.7% for low degree of perceived stress, 18.4% for moderate degree, 45.6% for high degree and 74.6% for extremely high degree. The suicide ideation rate increased significantly with increasing level of perceived stress ($p<.001$). The suicide ideation rate according to a depressive mood that continued more than 2 weeks was 11.1% without a depressive mood and 57.7% with a depressive mood. This difference was statistically significant ($p<.001$). As for health-related quality of life, the score of 0.74 with suicide ideation was significantly lower than the score of 0.86 without suicide ideation ($p<.001$).

Table 2: Differences in suicidal ideation according to health related behavioral characteristics of subjects (N = 151)

Characteristics	Categories	Suicidal ideation Yes n(%)	Suicidal ideation No n(%)	χ^2 (p)
Current smoking status	Yes	11(52.4)	10(47.6)	1.552(.376)
	No	50(39.7)	80(60.3)	
Current alcohol drinking status	Yes	10(28.5)	16(71.5)	0.009(.933)
	No	14(29.6)	29(70.4)	
Regular exercise	Yes	21(43.7)	34(56.3)	0.101(.801)
	No	40(41.1)	54(58.9)	
Individual mental health counseling	Yes	32(44.1)	41(55.9)	0.253(.641)
	No	29(40.0)	49(60.0)	
Hospital accessibility (during the past 1 year)	Yes	28(63.5)	18(36.5)	10.836(.005)
	No	33(33.9)	72(66.1)	

Note: n(%), M±SE were except missing values.

The differences in suicidal ideation according to health-related behavioral characteristics of patients with major depression are as shown in Table 2. The suicide ideation rate was higher if the subjects wanted to visit hospitals and local clinics during the past 1 year but were unable to visit because of various reasons. Specifically, the suicide ideation rate was 63.5% if they failed to visit hospitals and local clinics and 33.9% if they could visit hospitals and local clinics. This difference was statistically significant ($p=.005$).

Table 3: Risk factors of suicidal ideation patients with major depression

Characteristics	Categories	Suicidal ideation		
		OR	95%CI	p
Education(ref: ≥University)	≤Elementary	2.88	0.82~10.07	.098
	Middle	4.36	1.11~17.13	
	High	2.92	0.88~9.72	
Subjective health status(ref: Good)	Moderate	0.60	0.16~2.29	.455
	Bad	2.81	0.80~9.88	

Conted...

Body discomfort(during the past 2 weeks)(ref: No)	Yes	2.53	1.29~4.95	.007
Perceived Stress(ref : Low)	Very High	0.72	0.65~7.95	.560
	High	2.02	0.18~22.10	
	Moderate	4.00	0.35~45.45	
Depressive mood(more than 2 weeks) (ref: No)	Yes	10.57	3.64~30.63	<.001
Health-related quality of life		0.50	0.01~0.88	.007
Hospital accessibility(during the past 1 year)(ref: Yes)	No	2.33	1.06~5.13	.001

Note: OR=odds ratio; CI=confidence interval.

Multiple logistic regression with only statistically significant variable in the χ^2 -test and t-test results was conducted to determine the factors influencing suicidal ideation as shown in Table 3. Suicide ideation was increased by 2.53 times (95% CI 1.29 to 4.95) when there was body discomfort in the past 2 weeks and 10.57 times (95% CI 3.64 to 30.63) when there was a depressive mood for 2 weeks or longer. In addition, suicide ideation was increased by 0.50 times (95% CI 0.01 to 0.88) as health-related quality of life decreased by a level. Suicide ideation was increased by 2.33 times (95% CI 1.06 to 5.13) if the subjects wanted to but were unable to visit hospitals and local clinics during the past 1 year.

DISCUSSION

World Health Organization (WHO) defines suicide as a continuous process in which one's attempts to take one's own life eventually lead to death, explaining that it is an act of intentional self-harm [24]. Many studies in Korea reported that suicide is influenced by the correlation between psychological and emotional aspects of individuals such as stress, anxiety and depression and various social and environmental aspects affected by family and community systems [14-19]. Such previous studies suggest that there are extremely complicated factors influencing suicide ideation in Koreans for different life cycle groups. This study intends to present a specific policy direction for adult patients with major depression by identifying the common factors influencing their suicide ideation. This study examined the differences in suicide ideation according to general characteristics, health-related characteristics and health-related behavioral characteristics of depression patients, as well as the factors influencing suicide ideation according to general characteristics, health-related characteristics and health-related behavioral characteristics.

As for the differences in suicide ideation according to general and health-related characteristics of depression patients, there were differences caused by educational background, subjective health status, body discomfort in the past 2 weeks, perceived stress, depressive mood longer than 2 weeks and health-related quality of life. Some of these results agreed with a previous study conducted in Korea on elders. However, the results of this study were somewhat different from the previous study, which also showed differences according to economic status, limited activities and number of chronic diseases [25]. An Australian study conducted using national data reported that suicide ideation is influenced by age, gender, marital status, economic status and mental problem, showing different results compared to this study. Such differences are probably caused by differences among nations. Nonetheless, the results of the Australian study suggesting the relevance between mental problem and suicide ideation support the idea of this study limited to patients with major depression [26].

As for the differences in suicide ideation according to health-related behavioral characteristics, the only difference was found shown by hospital accessibility during the past 1 year. Unfortunately, it was difficult to find any Korean or foreign studies that examined hospital accessibility and suicide ideation. Since previous studies presented limited activities, body discomfort and individual mental health counseling as the factors influencing suicide ideation [17-19], this study paid attention to hospital accessibility based on the idea that depression patients would be willing to visit hospitals and local clinics for psychological and physical reasons such as limited activities, body discomfort and individual mental health counseling. Hospital accessibility is assessed by responses to the question, 'Have you experienced an inability to visit a hospital for various reasons (economic difficulty, inconvenient

transportation, difficulty in appointment, etc.)? In this study, the inability to access hospitals and local clinics led to greater suicide ideation. This is probably because hospital accessibility of depression patients affects their negative mood.

The main findings of this study are that suicidal ideation in depressed patients are associated with body discomfort during the past 2 weeks, depressive mood longer than 2 weeks, health-related quality of life, and hospital accessibility during the past 1 year. In a previous study that classified Korean adults into the young adult group, middle-aged adult group and older adult group to find the factors influencing suicide ideation. The young adult group was influenced by education level, self-esteem, stress, depression and anger control problem. The middle-aged adult group was additionally influenced by existence of a spouse. Also, the older adult group was additionally influenced by anxiety [27]. The results of this study differed from the results of the previous study according to adults group. This implies that negative emotions caused by physical discomfort and situational frustration probably lead to suicide ideation in depression patients, instead of general characteristics such as education level and existence of a spouse in regular adults. These results also agreed with a foreign study that associated negative emotions of depression patients with suicide ideation [23]. Accordingly, a follow-up study is required to examine other situations that arouse frustration, despair, depressive mood and physical discomfort of patients with major depression in addition to the situations considered in this study. Evaluation of suicide ideation and interventions to reduce suicide ideation are also necessary. In Korea, a depression test is available for citizens to diagnose depression patients. Therefore, this study suggest to implement a future-oriented education system that can examine situations that lead to suicide ideation of depression patients and find specific plans to prevent suicide attempts on the national level.

The meaning of this study is in utilizing national data representing all citizens of Korea, but the limitation is that this is a cross-sectional study that confirmed factors influencing health-related quality of life at a time point. A cohort study would be required to explain the causal relationship of the factors influencing health-related quality of life in patients with major depression. It is also necessary to conduct a wide range of survey on the number of suicide attempts and suicide planning

which are suggested as primary factors in many suicide studies [28]. To develop a specific intervention for improved health-related quality of life in depression patients, the influential factors found in this study must be investigated further. Despite the limitations of this study, the results of this study using national data can provide valuable health policy suggestions for depression patients by examining the factors influencing health-related quality of life of all Korean adult patients with major depression.

CONCLUSION

The factors influencing suicide ideation in adult depression patients differed from the results of previous studies that examined the factors influencing suicide ideation for different life cycle groups. In this study, the subjects were mainly affected by psychological factors resulting from body discomfort in the past 2 weeks, depressive mood longer than 2 weeks and hospital accessibility during the past 1 year (inability to visit hospitals and local clinics for various reasons such as economic difficulty and inconvenient transportation). Accordingly, it would be necessary to develop personalized intervention programs that can manage negative emotions and reduce suicide ideation of depression patients and come up with a process to encourage active participation in such programs. The present study was meaningful in providing a nationally representative result using national survey data in Korea.

A Study on Information System Introduced to Improve Daily Living-Based Physical Function After Ovariectomy

Seong-Ran Lee

Dept. of Medical information, Kongju National University, Gongju 32588, South Korea

ABSTRACT

The paper is to identify a new method for medical information systems to improve physical function after surgery for ovarian cancer. Experimental group investigated 61 people who were consisted of members by the application of mediating technology, while the normal members of 61 people were consisted of people without mediating technology. The chi-square test was used for the examination of the general variables between two groups. The t-test was performed the difference of life habits by the application of medical information systems. The results are as follows. Firstly, male with 47.5% in the experimental group showed a higher rate than male with 42.6% in the normal people. While female of 52.5% in the test group was observed less than female with 57.4% in the normal group. Secondly, for vitamin intake, the mean point(79.51±0.69) of the group which have eaten vitamin in the post-test by mediating technology system were statistically significantly higher than the mean point(51.84±2.93) of the group in the pre-test by the application of medical information systems ($t=-5.17$, $p=.000$). Thirdly, the data achieved a significantly higher rate in the group observed than the normal group, even the days passed 20 days by the application of medical information systems. Therefore, the paper conducted to evaluate the effectiveness of medical information systems. This impact of medical information system will have a technique on prevention of ovarian cancer.

Keywords: Method, Medical information systems, Physical function, Ovarian cancer, Surgery

INTRODUCTION

Cervical cancer is the most frequent occurrence of female genital organs. But ovarian cancer has the highest mortality rate among female cancer cases in Korea. Surgery for ovarian cancer is commonly performed by salpingo-oophorectomy. Salpingo-oophorectomy is the operative dissection of both ovaries and right or left ovary^{1,2,3}.

Ovarian cancer can not know early stage which appear their symptoms because their body responses are not felt. The first method of ovarian cancer is operation. Ovarian cancer is the sixth most common form of cancer in women. Early symptoms are often absent or associated with other problems; thus early diagnosis is uncommon. When the ovaries are dissected, a female is at a five times more disease of stroke or myocardial infarction^{4,5}.

Surgery for ovarian cancer is factor related to increased risk of osteoporosis and bone fractures. Therefore, the improvement of life quality through the development of clinical information system is

important information technology which can provide to oophorectomy patients. The strategic approach of medical technology system adoption to improve life quality after surgery for ovarian cancer needs to chronic disease patients^{6,7}.

The incidence of ovarian cancer can find when parts in one ovary or right and left ovaries are out of function. Although every ages of women are easy to appear the incidence of ovarian cancer, approximately 95% of female observed with the disease are over 40 years old, and almost illnesses appear in female over 50 years old, according to National Statistical Center. Additionally, the majority of ovarian cancer were in situ(25.6%) or local (49.6%) stage. As noted in above. The National Statistical Center reports that there are much more than 35,294 recent ovarian cancer and about 195,826 mortalities from female ovarian cancer in the U.K. in 2014. Additionally, according to this situation, it occurred from 2013 to 2014, 3.1% of female observed now will be presented illness with ovarian cancer at this environment during women lifecycle. The total six-year associated with proportion of life existence since 2006^{8,9,10}.

This research tries to implement a management control system to raise the performance of an experiment with the objective to achieve to the entire success toward a special strategy for ovarian cancer. Information was collected from the major problems in order to detect the key characteristics of life habits where a change of treatment is needed^{11,12,13}. The system was developed to understand the effect that has the control system in the management of the positive results observed in the analysis of results. In order to maintain the strategies, it was necessary to develop information system to check the system status 14,15.

Therefore, the supply of mediating technology of information system is only solution of the problem of ovarian cancer and the best way that can improve physical status to patients with ovarian cancer after salpingo-oophorectomy. The research is needed to explore the development of experimental technology to improve physical status after operation.

Thus, the paper is to identify a new method for medical information systems to improve physical function after surgery for ovarian cancer. The positive results will play an important role in the establishment of future medical system and data that provides invaluable insights in the effect of a medical information system.

MATERIALS AND METHOD

Predictive Modeling Technology: The design of medical technology system is as follows. 1) planning stage : construction of medical technology system 2) application stage: input, stratege, process, analysis, application 3) Effectiveness stage : physical function, measurement 4) final phase : verifying study, impact, usability of system in Figure 1.

Materials: The data were achieved through fill out the paper of form structured and interview from January 16 to March 30, 2017. It has time to fill out this survey. Experimental group investigated of 61 people who were consisted of members by the application of mediating technology, while the normal members of 61 people were consisted of people without mediating technology.

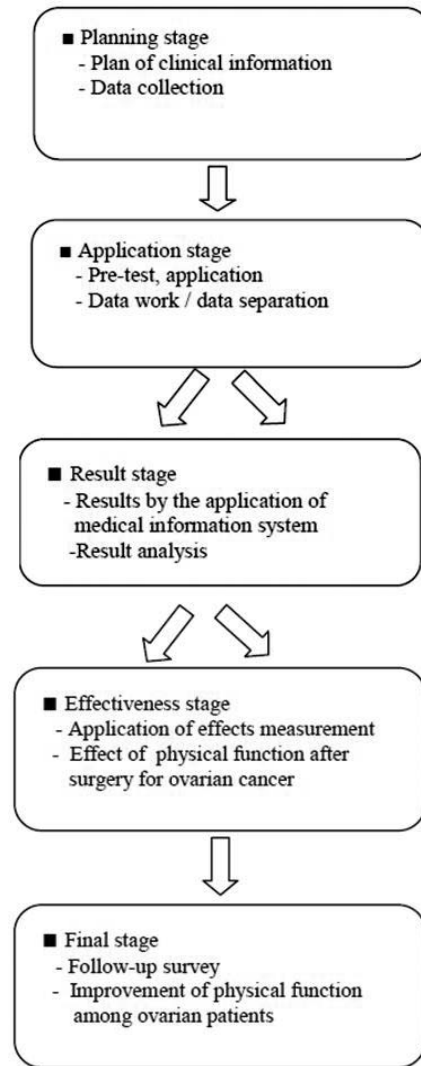

Fig. 1: Design of Advanced Information Systems

Methods: General variables of basic information were measured by percentage and number. The chi-square test was used for the e the general variables of basic information between two groups. In addition, the t-test was performed the difference of life habits by the application of medical information systems. On the other hand, the t-test was performed health change in physical and mental function by medical information systems. The data analyzed physical function after surgery in participants with ovarian cancer using SPSS 18.0.

RESULTS

General Variables of Basic Information: General variables of basic information are next contents(Table 1). The proportion of unmarried subjects(23.0%) in the experimental group were a lower rate than the proportion(26.2%) of normal group. The subject’s sex was analyzed. Male with 47.5% in the experimental group

showed a higher rate than male with 42.6% in the normal people. While female of 52.5% in the test group was observed less than female with 57.4% in the normal group.

Table 1: General Variables of Basic Information

Variables	Exp	Cont	X ²
	No. (%)	No. (%)

Health Changes in Physical and Mental Function: As below, it indicates health changes in physical function by medical information systems in Figure 2. The data achieved a significantly higher rate in the group observed than the normal group, even the days passed 20 days by the application of medical information systems.

In particular, the variation was estimated to increase more rapidly with time elapsed of 30 days after the application of medical information systems.

Fig. 2: Health change in physical function

Health Change in Mental Function: As below, it indicates the health change in mental function by the application of medical information systems in Figure 3. The data achieved a significantly higher rate in the group observed than the normal group, even the days passed 15 days by the application of medical information systems.

However, the effect was decreased rapidly with time elapsed of 35 days after application as compared to before application.

Fig. 3: Health change in mental function

DISCUSSION

The paper is to explore the usability of medical technology to enhance physical function after surgery for ovarian cancer. The conclusions of this research are as next contents. Physical function after surgery for ovarian cancer patients who has eaten vitamin diminished the symptoms of body illnesses. The achieved data was similar with the previous researches on the vaginal cancer^{16,17}.

This study indicated that participants with ovarian cancer should be focused on mediating technology to prevent the observed disease related to the ovarian cancer. From contents on the data obtained, it expects that this may be used an effective data for using and connecting medical information systems for enhancing physical function.

In addition, systematic studies should be established continually in order to prove results of this study. The present work appeared that life habit rate of mediating technology was increased from 61.5% to 71.4% by the mediating technology system, which is similar to data conducted from previous contents^{18,19,20}.

However, it indicated that the mediating technology is not persisted for 40 days of time. Accordingly, in order to persist the mediating technology, it is very important to perform regular training. The conclusion drawn will contribute to improve physical function after surgery for ovarian cancer.

CONCLUSION

The paper is to identify a new method for medical information systems to improve physical function after surgery for ovarian cancer. The results are as follows.

Firstly, for vitamin intake, the mean point(79.51 ± 0.69) of the group which have eaten vitamin in the post-test by medical information systems were statistically significantly higher than the mean point(51.84 ± 2.93) of the group in the pre-test by the application of medical information systems ($t = -5.17, p = .000$). Secondly, the data achieved a significantly higher rate in the group observed than the normal group, even the days passed 20 days by the application of medical information systems. Therefore, the paper conducted to evaluate the effectiveness of medical information systems. This impact of medical information system will have a technique on prevention of ovarian cancer.

ACKNOWLEDGMENT

I want to appreciate about the efforts of people who had experienced for research to enhance physical function after surgery for ovarian cancer. The medical information systems will be useful data for treatment among ovarian cancer patients.

Effects of Participation in Dancesports Program on Age Identity, Existential Identity, and Ego Integrity of the Elderly in South Korea

Yoon-Mi Jong¹, Moon-Suk Lee¹, Jong-Kil Lee²

¹Research Scholar, ²Professor, Department of Sport Science, College of Natural Science, Chungnam National University Daejeon, South Korea

ABSTRACT

For successful aging and welfare of the Korean elderly in the face of ‘super-aged society’, this study aimed to explore the effects of participation in dancesports program on age identity, existential identity, and ego Integrity of the elderly. This study used a pre-posttest non-equivalent control group design as a field study. Subjects of experimental group (n=93) and control group (n=103) were males and females over 65 years old who participated in senior dancesports program or not during three months. Pretest and posttest were administered by using elderly existential identity scale, age identity scale, and ego integrity scale. Statistical methods were an Analysis of Covariance and a multi-level model of structural equation modeling by using M-plus program. Followings are the results of this study. First, participation in dancesports positively affects the elderly’s sense of age identity. In other words, the sense of age identity improved after participation in dancesports. Second, participation in dancesports positively affects the existing identity of the elderly. Therefore, the existential identity feeling after participating in the dancesports is higher than before. Third, participation in dancesports positively affects ego integrity of elderly people. The ego integrity improved significantly after participation in dance sports. Fourth, dancesports participation has a positive influence on age identity, existential identity, and ego integrity both directly and indirectly. In addition, dancesports participation has a positive influence on ego integrity mediated by age identity and existential identity. The effects of participation in dancesports program can provide the empirical evidences for expanding the scope of social welfare for elderly. This study will also contribute to the understanding, specialization, and institutionalization of the potential value of the therapeutic programs for the elderly which has not yet established as a specialized field in South Korea.

Keywords: *dancesports, age identity, existential identity, ego integrity, the Korean elderly*

INTRODUCTION

According to a recent domestic survey^[1], 36.9% of the surveyed think that they are 6 to 10 years younger than their actual age. 26.2% said they were one to five years younger, and 16.6% said they were even 11 to 15 years younger than their actual age. Thus, according to some cultural standards, they are already ‘old people’, but many people have self-concept that does not feel that they are old enough to resist the internalization of stereotypes of age discrimination and to move away from the social stigma associated with ‘Protect self-image and uplift oneself^[2]. These results show that the sense of age identity, which is believed to be young in old age, seems to be a desirable coping strategy in

a culture that negatively affects the elderly because it increases the satisfaction of life for oneself.

The elderly participated in dance sports as a representative social activity of voluntary participation for the elderly. The elderly will be able to improve their subjective health status and life satisfaction as well as obtain compensation from a social role loss by confirming their identity through social activities and forming a social network. In addition, it can be linked to social support and subjective health status, and it may be related to the ego integrity which is the ultimate satisfaction of the elderly’s life. Therefore, specific and experimental researches on the effect of dancing sports participation in the elderly’s major social activities on the completion of ego

integration, which is the result of successful aging, should be continuously carried out^[3]. The purpose of this study is to explore the structural relationship among dancesports and ego integrity related variables by analyzing the changes of age identity and existential identity through participation in dancesports program.

MATERIALS AND METHOD

Research design of this study was a pretest and posttest non-equivalent control group of quasi-experimental design as a field study.

Subjectives: The subjects of this study were 196 seniors(93 participants and 103 non-participants) aged 65 and over selected from 3 to 5 distinctions among 5 elderly welfare centers.

Treatment/Program: The dancesports programs were provided as a treatment of quasi-experimental design for the participants each 50 minutes, twice a week for three months, which were composed of three of four quarters of ChaChaCha, Rumba and Jive, and the most popular Latin American dance events.

Measurement tools: The tools for measuring the variables were used for the self-administrated questionnaires including types of the elderly age identity^[4], existential identity^[5], and ego integrity^[6]

Statistical Methods: The statistical methods to test hypotheses were Analysis of Covariance(ANCOVA) and a multi-level model of structural equation modeling(SEM) by using M-plus program with SPSS and Amos ver.21.

RESULTS

Effect of participation in dancesports program on age identity

Fig. 1: Pretest and posttest of age identity of the groups

Figure 1 show the results of pretest and posttest of age identity of experimental group(participants) and control group(non-participants). Age identity of participants decreased much more after participation in program, while non-participants did not. Actually, there was a significant difference of changes(-.59 and -.01) between two groups. These results indicated that dancesport participants thought themselves much younger than their actual age after dancesports program compared to non-participants. ANCOVA to test main effect of participation validated a statistical significance($F=75.378, df=1, p<.000$).

Effect of participation in dancesports program on existential identity

Fig. 2: Pretest and posttest of of existential identity of the groups

Figure 2 show the results of pretest and posttest of existential identity of experimental group(participants) and control group(non-participants). Existential identity of participants increased much more after participation in the program, while non-participants did not. Actually, there was a significant difference of changes(.36 and .10) between two groups. These results indicated that dancesport participants had much higher sense of existential identity after dancesports program compared to non-participants. ANCOVA to test main effect of the participation validated a statistical significance($F=34.608, df=1, p<.000$).

Effect of participation in dancesports program on ego integrity

Fig. 3: Pretest and posttest of of ego integrity of the groups

Figure 3 show the results of pretest and posttest of ego integrity of experimental group(participants) and control group(non-participants). Ego integrity of participants increased much more after participation in the program, while non-participants did not. Actually, there was a significant difference of changes(1.00 and .22) between two groups. These results indicated that dancesport participants had much higher sense of ego integrity after dancesports program compared to non-participants. ANCOVA to test main effect of the participation validated a statistical significance ($F=31.411, df=1, p<.000$).

Structural relationships among participation in dancesports program, age Identity, existential Identity, and ego Integrity

Figure 4 shows the results of path analysis in multi-level model of structural equation modeling by using M-plus program.

As shown in Figure 4, the direct effect is affected by the participation of dancesports on age identity($\beta = .323$), the effect on existential identity($\beta = .438$), and the effect on ego integrity($\beta = .631$) and the direct effects of age identity on existential identity and ego integrity are $\beta = .128$ and $\beta = .471$. In addition, the direct effect of existential identity on ego integrity is found to be $\beta = .321$, which is statistically significant.

Fig. 4: Verification of the structural relationship among dancesports participation, age identity, existential identity, and ego integrity

As indirect effects, the effect of participation in dancesports on ego integrity through age identity($\beta = .323 \times .471 = .152$) and the effect of participation in dancesports on ego integrity through existential identity($\beta = .438 \times .321 = .140$). Structural effects are the result of total effect of direct effect ($\beta = .2312$) and indirect effect ($\beta = .292$), $\beta = 2.604$ showing high structural effect.

Table I: Index of goodness fit test for the research model

Overall Index	X ²	X ² /df(17)	sig	TLI	CFI	RMSEA
Research Model	130.971	7.70	.000	.926	.915	.082
Fit Index Standard		<3.0	>0.05	≥0.9	≥0.9	≤0.05~0.1

As shown in Table I , goodness of fit-test of this research model was significantly validated as 59.132, TLI = .921 (≥0.9), CFI = .934 (≥0.9), RMSEA = .072 (≤0.05 ~ 0.1)

Therefore, participation in dancesports directly affects the elderly ‘s sense of age identity, existential identity, and ego integrity proves that it is an important factor that indirectly affects ego integrity through age identity and existential identity. As a result, participation in dancesports program has a structural and causal relationship with age identity, existential identity, and ego integrity of the elderly.

DISCUSSION

Participation in dancesports has a statistically significant effect on age identity, existential identity and ego Integrity. In addition, age identity has a significant effect on the existential identity and ego Integrity. Existential identity also appears in the structural relationship that has a statistically significant effect on ego Integrity, while age identity due to participation in dancesports has a positive correlation with existential identity there was. There is also a correlation between all sub-domains of ego integrity and a positive correlation between existential identity and ego integrity. In this study, the elderly who has a young perceived age identity shows a high existential identity. This result is consistent with previous study^[7]. The elderly who participated in the rhythm exercise welfare program can overcome the basic adversity experienced in daily life through interpersonal relationships, feel that they are worthwhile^[8]. In addition, the psychological age is younger than the actual age of the person. By recognizing the age identity, the young person is recognized as a self-concept rather than the actual figure of his or her own, and the elderly is positively affirmed, And that the negative happiness, loneliness, alienation, shame, sickness, and harshness are perceived to be low. Also, Existential identity is a

subjective evaluation that perceives the present state of oneself, leading to successful aging, enhancing existential identity and providing psychological stability with satisfaction of old age. Also relationship with the family should be smooth, healthy, affordable, and active in social activities. It is considered that the active social participation and physical activities such as dance sports have an influence on the existential identity feeling in their subjective evaluation^[9].

Dancesports are artistic and physical activities that express the inner emotions, maintain harmonious relationship within members, enhance emotional stability, positively affect ego-integrity. The results of previous related study^[10] was consisted with this study, which reported that the elderly were more emotional and happy when they participate more in sports activities.

CONCLUSION

This study aimed to identify the effects of participation in dancesports program on age identity, existential identity, and ego integrity of the elderly for effectively preparing the successful aging and welfare of the elderly in face of 'super aged society'. Meaningful conclusions of the study can be summarized as followings: First, participation in dance sports positively affects the elderly' sense of age identity. In other words, the elderly feel much younger rather than their real age after dancesports participation. Second, participation in dancesports positively affects the existential identity of the elderly; the elderly have much higher sense of existential identity after dancesports participation. Third, participation in dance sports positively affects the ego integrity of elderly people; the elderly have much higher sense of ego integrity after dancesports participation. Fourth, dance sport participation had a positive influence on age identity, existential identity, and ego integrity both directly and indirectly. In addition, dancesports participation had a positive influence on ego integrity mediated by age identity and existential identity.

ABSTRACT

Background/Objectives: Korea is focusing to improve its innovative system and performance based on collaborative structure and it is important to analyze impact of R&D collaboration on innovative performance of the nation.

Method/Statistical analysis: We empirically analyze the role of collaborative research and its influence in determining innovative performance. For that, we developed certain hypothesis to examine the role of input factors and its impact and further tested our hypothesis. We empirically analyzed data of national collaborative R&D projects conducted between 2012-2016 in Korea. We used the negative binomial regression method for analysis the result and to find a meaningful implication of our study.

Findings: The result proposes that collaborative research input factors and collaborative partners have significant impact on technology and knowledge innovation outcomes. The study also provides evidence that university, industry and research institutes as research partners has different influence on innovative performance. Moreover, collaborative research factors like number of participants, duration of projects and government investment has specific effects on determining the innovative capabilities of the nation.

Improvements/Applications: The result gives insight on effect of collaborative research on innovative performance and specifies the implications for better management of input factors in order to improve its impact on performance.

Keywords: Collaborative R&D, Innovative performance, Research Input, Innovative Performance, Innovation System

INTRODUCTION

Korea, as a knowledge economy has long history of development and restructuring of its institutions and innovation system. In last 40 years, Korea has undergone various evolutionary processes on its R&D structure for improving and strengthening National Innovation System (NIS). With reorganization of R&D organization structure and reforming the R&D policies, Korea is strengthened innovation system of the country based on collaborative interactions. Korean government made continuous effort to create various policies and programs to boost collaborative network and its role in renovating NIS structure and performance. Moreover, Korea has focused on developing the knowledge and technology intensive industry up to international level,

as these industries are substantial to the development of innovation system¹. Development of these industries and their integration within the country helps to strengthen innovative performance of the nation.

With the different mode and level of collaboration between universities, industries, public, private firms and research institutes in Korean innovation system, each mode has its own efficiency and contribution on NIS performance. There are formal and informal modes at individual level, firm level, regional level and national level. Based on level of linkage and network relations between partners, these collaborations are classified as strategic partnership, consultation based, research contracts or many other types. For example, R&D based collaboration is regarded as formal and at high level in

topology as per involvement and relationship between partners². R&D collaborations, viewed as a major and efficient way of enhancing the contribution of actors and establishing innovation ability in Korean economy. Moreover, R&D collaboration is also an efficient way to utilize external technology and knowledge resources and exchanging internal one, thus enhancing innovation³. Liu et al⁴ showed the coupling relationship between knowledge and technological innovation, and explained that knowledge innovation is the foundation of technology innovation, where technology innovation acts as promoting agent for knowledge innovation⁴. Therefore, collaborative research is important for improving the innovation capability and enabling partners to resolve their technological issues by accessing more resources, sharing expenses and risks.

Although, collaborative research seems useful in improving knowledge base and research productivity, but in reality collaboration has not seen to be very effective in action due to various reasons; one of the major problems is the lack of mutual trust between research partners. In addition, differences in the research objective and motives of the collaborative actor's produce inefficient outcome. Lee et al⁶ analyzed that bonding or cohesiveness between actors is more important than network efficiency in order to improve research effectiveness and productivity. Active interaction and communication between actors are beneficial for development of innovative ideas and outcome performance is deeply interlinked with the relationship of actors⁷. Therefore, although networking is essential for the success of collaboration, mutual trust, communication and relationship are keys to establish relation and improve innovative performance, and consequently lead to a successful collaboration.

LITERATURE REVIEW

Existing literature on collaborative research mostly focused on performance of collaboration at regional level. For example, a study done by Yimet al⁸ described collaboration as a part of regional innovation system for Gyeonggi province of Korea and highlighted the importance of collaboration in regional innovation. Moreover, recent studies on collaboration focused on demonstration of network linkage or structure between partners using network analysis techniques. Shapiro et al⁹ analyzes the inter-regional collaboration and its impact on innovation system based on network

analysis and concluded that decentralization of network structure could be useful for improving knowledge and technological innovation of nation. The study states that obstructions in network structure of collaboration could lead to inefficiency in research capabilities of system. The study Another study done by Yoon¹⁰ states that Korea still needs to improve network interaction and make strong collaboration in order to improve efficiency and capability in innovation system. Improving networking and connection is important to strengthen collaboration, thus it will enhance innovation outcome.

Previous studies also focus on importance of diffusion and flow of knowledge between partners. For instance, Cohen et al¹¹ analyzed that information exchanged through the process of collaboration is important to generate and develop new ideas and thus, contribute to innovation. Subsequently, exchange of knowledge improves innovative performance by integrating the ideas of collaborative actors and improving capability through utilization of external resources. Capaldo et al¹² performed a study on Italian university-industry collaboration states that motive of interaction and networking between partners are critical to make collaboration successful. The study also emphasizes that role of collaboration is significant in solving technology needs and related technological issues efficiently and effectively. This enhance technology capabilities of collaborative actors.

Although, previous studies provide useful insights on importance of collaboration and demonstrates collaborative actors as the part of the NIS, there is limited study on measuring the aspects of collaboration and analyzing the role of collaborative research input on knowledge and technology innovation. This study tries to add on existing research by examining the role of collaborative input activities in production of innovation and commercialization of innovative outcome in Korean NIS. Since Korea is focusing on improving innovative environment and national system of innovation based on collaboration, it is important to understand innovative system concept for further analysis. In addition, the study will help us to analyze the significance effects of collaborative research input in determining the performance of innovative outcome. To understand this effect more, we first discuss the theory and concept related to NIS.

COLLABORATIVE RESEARCH

Collaborative research is helpful in exploitation of resources of organizations and also considered as good source of new resource creation. Different institutions or actors have various input and resources complementary to each other in producing innovative outcome. University is considered as source of basic research whereas industry main motive is product development and commercialization. Efficient collaboration between these two actors provides experts to industry and improve commercialization rate as well as entrepreneurship motive of university. On the one hand industry provides practical experience and future opportunities to manpower, on the other hand university provides consultancy to industry. Thus, university-industry (U-I) relationship is considered beneficial for performance improvement and skill utilization. Korean universities has a source of education and research infrastructure and capabilities provides new and innovative ideas and cultural environment, thus serve complementary role in collaboration⁷. Similarly research institutes are more focused towards applied research activities and technical innovation therefore collaboration of University-Research Institute (U-R) improves technical quality of experts by providing them better lab facilities and resources thus improve technical outcome¹⁶. Industry- Research (I-R) improves commercialization rate of technical outcome of research institutes and it provides better research resources and financial support in technology innovation, thus collaboration helps to reduce the time gap and facilitate research and development.

NATIONAL INNOVATION SYSTEM (NIS)

In the recent years, the concept of innovation and approach to define NIS has undergone considerable changes. There are no universally accepted concept and definition of innovation system. However, traditional approach based on linear model of innovation considering standardization of input output measurement does not explain much about growth and performance of national economy. Therefore, systemic approach, which defines innovation system as nonlinear and iterative model where institutions and culture has greater role in value creation, was developed for better exploration of growth and performance model of a nation. NIS mainly depends on the interaction of the institutions within system that work

to improve innovative performance. Freeman¹³ defined innovation system of a nation as the web of linkage between actors whose action and interactions within the system leads to creation, improvement, absorption, and diffusion of knowledge and technology^{13,14}. Nelson¹⁵ defines NIS as the institutional set within the system that interacts and their interaction measures innovative performance of nation. In short, Institutions or actors are the subsystem of NIS, whose interconnection and activities results generation, diffusion and absorption of new technology by using knowledge and ideas as input. Therefore, collaboration between these actors are important to understand and analyze the system components and innovative performance.

Transition in Korean Innovation Structure: South Korean economy has undergone drastic change in its R&D structure to improve the system. Korea has long history of chaebols which run in house organization and research centers are important part of Korean economy. But after financial crisis of 1997, Korea has done many changes to protect its organization and economy as whole. It improves its research and technology capabilities to enhance its research and economic outcome. Korea not only increased its R&D investment to the highest percentage among OECD nation (around 4.2 percent of GDP in 2015) but also improved its R&D capability to build NIS. Figure 1 shows the evolution of Korean research and innovation system. Korean government has also implemented various policies to improve outcome and performance of innovation system by encouraging collaborative structure. Korean innovative system, majorly divided into major periods as 1970s to 1980s, 1990s, and 2000s onwards as per the major changes in the structure and elements of innovative system of Korea. These periods, recognized as imitation phase, catch-up phase and creative phase respectively. In 1970-80s, Korea primary focus was on building basic infrastructure and industry by imitating technology of foreign nation (Imitation Phase). Government funded research institutes (GRI) served as leading actor during this phase. In 1990s, the period named as catch-up phase, industry served as main role in Korean innovative system. During this period, main agenda was development of indigenous technology and improvement of personal skills of human resources by domestic or international training. However, there was not much focus on collaborative and interactive research till this phase. Period in 2000s and afterwards, considered as the

creative phase of Korean economy, in which university played as major role in innovative society. During this phase, development of research capabilities was the main aim. Government started its focus on collaborative system and research infra and capabilities. In addition, Korean government initiated various policies to foster innovation clusters in the system¹⁰. Establishment of

various research organizations led in strengthening of basic research capacity and improvement of technology transfer rate significantly. Also Transition in role and structure of actors in korean innovation system make it necessary to analyze role of collaborative partners and its impact on innovative performance.

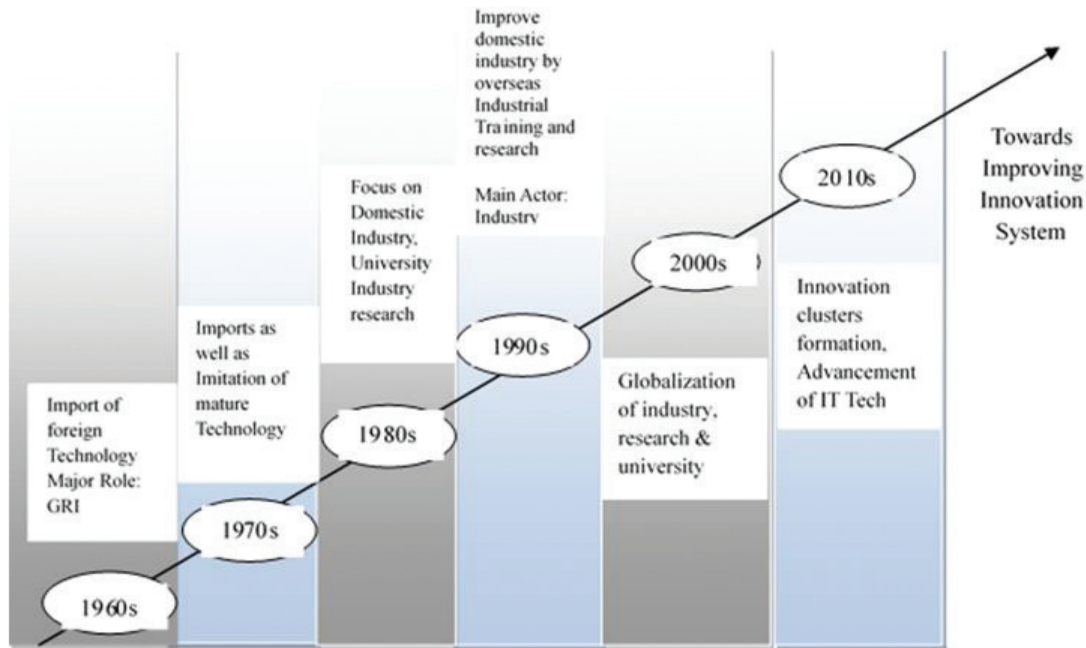

Figure 1: Important Transition in Innovative Structure, Korea

Source: Compiled Based on Previous Literature^{10,32}

HYPOTHESIS DEVELOPMENT

Role of collaborative actors as Research Partner:

University, research institute, industry are main actors in collaborative research. As these research partners has different capabilities and outcome, their performance affects the innovative capability of the nation. These partners in national collaborative research projects lead to knowledge and technology creation, which serves an integral part of Korean innovation system. Universities traditionally serve as foundation for knowledge supply and conduct basic research that adds value to the development and innovation process done by the industry. However, with changing role of universities in economic environment such as academic entrepreneurship, universities are emerging as an important source in technology innovation¹⁷ and it is making its status prominent in national growth and development.

H1a: *There is positive relation between university participating as research partners in collaborative research and innovative and commercial performance of NIS*

Industries, on the other hand serve as source of new product or services mainly focus on commercialization of innovative outcome. Industry is source of technology development beneficial for improving patenting and commercial outcome¹⁶. Consequently, collaboration between universities and Industries increases the chances of R&D success and boosts innovative performances^{7,18}. Industry main aim is revenue generation and profit maximization which provide value for the economic development of nation. Therefore, collaboration with industry has role in enhancing innovative and commercial performance.

H1b: *There is positive relation between industry participating as research partners in collaborative research and innovative and commercial performance of NIS*

Apart from above two actors, public research institutes (PRIs) act as a connecting link between university and industry in Korean innovation system. Research Institutions are source of applied research, acts as supporting base for university and industry. Government and Public Research Institutes assist the university and industry by providing infrastructure, resources support and other facilities to them. These institutes are also cause of knowledge and technology spill over and lead to creation of spin-off firms. Thus, research institutes are also source of technical innovation and beneficial for generation of publication and patents¹⁶. Collaboration with research institutes are beneficial for strengthening the innovative performance and capacity of the national innovation system.

H1c: *There is positive relation between research institutes participating as partners in collaborative research and innovative and commercial performance of NIS*

Factors affecting role of collaborative Research:

The success of collaborative research in generation of innovation depends on composition of input factors. Better availability of input resources and better accessibility of cooperative partners are essential to improve the innovative performance of collaborative projects. To analyze the effects, we do an analysis of input factors used in collaborative research projects and empirically deduce the aspects that have influence on innovation capability and performance in term of technology, knowledge innovation and commercial outcome. This will help us to propose how government could improve innovative performance to develop better innovation system for the nation. Some researchers studied the impact of government investment on research performance. Kang and Park¹⁹ investigated that government fund have a significant effects on technology innovation performance of firms. In addition, government funding in R&D projects supports collaboration and promote innovative outcome^{19,20}. Government support and funding help actors to gain additional resources and facilities for research and innovation, consequently contributes to success of the projects. However, the effect of government subsidy on performance of the outcome is still debatable. As some studies also analyzed that high amount of expenditures has seen no significant impact on research performance. The reason could be due to failure to utilize large amount of public fund in efficient manner²¹. Hence, continuous increase in government investment has decreasing

impact on performance of innovative and commercial output, which will exhibit diminishing performance.

H2: *There is inverse U-shaped relation between government funding in collaborative research and innovative and commercial performance of NIS*

Number of participants working on the projects plays important role in the success of collaborative projects. Success of the projects depends on the performance and coordination of these participants. Innovative performance of the collaborative research depends on researcher ability to take advantage to external knowledge and resources. Imaginative participants stimulate innovative ideas that bring technology innovation. Large number of participants in collaboration has more access to different ideas and solution to technology issues. However, large number of participants increases the management and administrative burden that in turn increases the project cost²². In addition, large number of participants in collaborative projects faces more problems in coordination and communication, thus negatively affect the innovative outcome²³. Innovative performance will affect negatively with increase in number of participants in project. .

H3: *There is inverse U-shaped relation between number of participants in collaborative research projects and innovative and commercial performance of national innovation system.*

The period of collaboration also affects the performance outcome in national innovative system. Long-term cooperation and collaboration between actors help them to build their relationship stronger. Moreover, time is an important factor that helps to develop trust and understanding between partners, critical in determining the innovative outcome of the projects²². Period of collaboration helps collaborative partners to understand each other's motive consequently, improve interaction and coordination between them. With increase in time of collaboration, exchange of resources and information also improves, which makes better utilization of those resources by partners and helps in strengthening innovative performance of system. Therefore, period of collaboration research could exhibit positive relation on innovation performance of NIS.

H4: *There is positive relation between period of collaborative research projects and innovative and commercial performance of national innovation system.*

MATERIALS AND METHOD

Database and Key Variables: For the empirical analysis, we have utilized the data of 30723 national R&D collaborative projects of South Korea from the year 2012 to 2016 and the data is taken from the National Science and Technology Information System (NTIS), Korea. NTIS, Korea manages national R&D projects and it has information regarding national research projects of Korea. The collaborative research have done with different research partners including 14,382 universities, 1798 research institutes 19,224 industries and rest 7858 with others partners (not categorized in first three). While the innovation has been shifted more towards systemic concept, role of collaboration has become more significant in improving innovative performance³. Thus, this study included sample of collaborative research projects to analyze the innovation performance.

We analyzed the data of collaborative research projects in terms of scientific output and graphically represented the status of joint publication, joint patents and commercialization outcome based on different modes of collaborative network. Figure 2 shows scientific outcome based on different collaborative networks. Figure indicates co-publication of SCI papers by different collaboration. It shows around 45.5% co-authorship is from U-I collaboration, 31% from U-I-R collaboration, 19.2% from U-R and 6.8% from I-R. Similarly, 53.9% of co-patents is from U-I collaboration, 30.1% from U-I-R collaboration, 7.4% and 6.8% patent output from U-R and I-R respectively. Trend is similar in case of commercialization outcome with 71.1% of commercialization is from University-Industry collaboration. Thus research outcome shows the university-industry collaboration results more amount of research outcome as compared to any other kind of collaboration.

Figure 2: Research output by type of collaboration

Innovative performance of NIS measured in terms of knowledge and technology innovation, generated from collaborative research projects. Since innovation system depends on the relationship between institutions

whose action and interactions lead to knowledge and technology creation, absorption and diffusion¹⁴. NIS has different layers with various components and elements, which make its measurement difficult. It is also almost impossible to analyze all components of the system at a time. Thus, this research measures specific component of innovation system in terms of knowledge innovation (SCI publications) and technology innovation (patent applied). SCI publications (SCI) and Patents (PAT) considered as indicators of innovation and considered as proxy to quantify the innovation components. Furman et al²⁴ analyzed the patent as knowledge stock that brings technology innovation, an important determinants of innovative capability of a nation. Thus, choice of SCI and PAT appear to be suitable as dependent variables for this research.

With the focus to show commercial value of innovative outcome, we choose commercialization as another dependent variable along with knowledge and technology innovation. This helps to evaluate relationship between collaborative research and economic gain from the innovation performance to the nation. Although, patents itself is considered as a source of commercial output, we choose number of commercialization resulted from collaboration projects separately to check the result. Commercialization is significant for use of knowledge or technology in practice and shows the economic aspects of innovation process. Commercialization leads to utilization of innovation with the objectives of financial gain aided to economy and society²⁵ and is an important source of value generation in NIS. Thus, three variables knowledge innovation outcome, technology innovation outcome and commercial outcome resulted from collaborative research projects, selected as the dependent variables for this research.

Figure 3: Research Model for Empirical Analysis

The objective of this study is to deduce factors that influences the innovative and commercial performance and

test the hypothesis result. Thus, based on the previous studies and hypothesis, we construct the research model for empirical analysis. Figure 3 shows the research model used for empirical analysis with dependent and independent variables. Independent variables consist of factor elements including inputs affecting collaborative research and partners participating in research. Collaborative partners are taken as dummy variables in this study.

Table 1 lists the operational definition of variables used in the study. Research partners taking participation in collaborative projects are taken with value as 1 (otherwise 0). So, if university is available as research partners in collaborative research then its value as 1, and if not then its value taken as 0. Similarly, partners like research institutes, industry and others partners are used as dummy variable.

Table 1: Operational Definition of Variables

Category	Variables	Description
Dependent Variables	KNOWL_INNOV	Total number of SCI papers taken as publication in SCI journals (indicative of knowledge innovation)
	TECH_INNOV	Total number of patent applied taken as source of technology innovation
	COMMER	Total number of Commercialization contributed as commercial output
Independent Variables Input Factors:	INV	Amount of Government Investment in collaborative research projects (In 100 Million KRW)
	INV2	Square Value of Government Investment
	PARTIC PARTIC2	Total Number of Participants in collaborative research Square Value of Participants
	TERM	Total Research Period (Term in Months)
	COLAB_TYPE dummy	-Domestic: Collaboration with domestic partners -International: Collaboration with overseas partners
Research Partners:	UNIV: REI: IND: OTHERS:	-University : Participation of university as partners -Research Institutes: Participation of public research institutes and government funded research institutes -Industry : Participation of small, medium, or large enterprises -Others: Participation of partners not grouped into any of the above category

STATISTICAL METHOD

In order to analyze the effect of collaboration on the development of innovation system, we evaluate our model for each dependent variable. Since our dependent variables are integer count data with non-negative value, linear model is not suitable for analysis as it could cause variation in estimation due to presence of heteroscedasticity or abnormal error distribution and could lead to inconsistent and biased results^{26,27}. To analyze the integer count data, non-linear models like Poisson model is suitable for the analysis.^{28,29}

Poisson model has assumption of Poisson distribution of dependent variable, which means that conditional mean and variance of distribution are equal. As per Poisson model assumption of equal dispersion, conditional mean $E(y_i | x_i)$ is equal to $Var(y_i | x_i)$

$$E(y_i | x_i) = Var(y_i | x_i) = \lambda_i \dots(1)$$

However, comparison of sample mean to variance showed over dispersion in data. Table 5 shows variance to mean ratio of dependent variables in this research have an over-dispersion. Poisson is not efficient to deal with the over dispersion problem

$$Var(y_i | x_i) > E(y_i | x_i) \dots(2)$$

In case of over dispersion of y, introduction of h_i as heterogeneous parameters is required for estimation which replaces the mean, as random error term as in equation 3

$$E(y_i | x_i, \epsilon_i) = \exp(\alpha + x_i\beta + \epsilon_i) = h_i \lambda_i \dots(3)$$

Therefore, to deal with over-dispersion problem, we use negative binomial regression model for our analysis.

RESULTS AND DISCUSSION

Table 2 summarizes the descriptive statistics for the variables. Out of total 30,723 collaborative

projects, 29,396 projects are the projects with domestic collaboration and only 1327 projects are with international collaboration. The average period of research project was seen to be around 2.5 years and government invested an average around 560 million on the collaborative project.

Table 2: Descriptive statistic

Variable		N	Mean	S.D	Min	Max
No. of Participants	PARTIC	30723	5.878	6.290	1	390
	PARTIC2	30723	74.160	1104.080	1	152100
Total Number of SCI Paper	SCI	30723	0.668	2.570	0	102
Number of Patents Applied	PAT	30723	1.285	3.920	0	155
No. of Commercialization	COMMER	30723	0.656	6.010	0	392
Total Research Period (Term in Months)	TERM	30723	31.340	18.950	1	295
Government Investment (In 100 Million KRW)	INV	30723	5.664	8.871	0.07	301.29
	INV2	30723	110.930	1151.290	0.004	90778.41
Collaboration Type	Domestic (0)	29396	-	-	-	-
	International (1)	1327	-	-	-	-
Research Partners	UNIV (1/0)	14382	0.460	0.491	0	1
	REI (1/0)	1798	0.051	0.232	0	1
	IND (1/0)	19224	0.625	0.482	0	1
	OTHERS (1/0)	7858	0.253	0.430	0	1

It also shows that collaborative projects produce more no. of patents in average (1.28) as compared to number of SCI publication but average number of commercialization is low (0.65) from the collaborative research projects. It shows patents, as a source of technology innovation, is main outcome of collaborative research projects.

Our data shows problem of over-dispersion in dependent variables. Since Variance to mean ration of dependent variables are greater than one ($V/M > 1$), it shows over-dispersion in variables. Coefficient of Variation is ration of standard deviation to mean as shown in Table 5 shows index of dispersion and coefficient of variation which indicates high level of dispersion (over-dispersion) around the mean.

Table 5: Over-dispersion in Dependent Variables

Dependent Variables	Mean	Variance	SD	Index of Dispersion VMR	Coefficient of Variation(CV)
KNOWL_INV	0.668	6.610	2.570	9.891	3.841

COMMER	0.656	36.161	6.010	55.112	9.163

We established six models to check the influence of independent variables on innovation and commercial performance. We check our hypothesis by examining the model for each dependent variable based on negative binomial regression analysis method. Table 6 shows all tested models that analyze the effect of collaborative input and partners elements on the innovative performance. Each model examined the collaboration input items, government investment (INV), period of participation (TERM), number of collaborative participants (PARTIC), type of collaboration dummy and research partners dummy as our explanatory variables and check its effects on innovation and commercial outcome performance. First three models are reduced model without squared term of input variables. Last three models (model 4, 5 and 6) are the full and comprehensive models, which includes squared term of government investment and squared number of participants to see the non-linear inverted U-shaped relationship between the variables. While AIC of comparable models (1/4, 2/5, 3/6) have little difference in values but last three full models shows smaller values in comparison, thus, we considered those three models for analysis.

Table 6 shows the result of analysis indicates that university as research partners has positive and significant relationship with knowledge and technology innovation in models, which is consistence with our hypothesis **H1a**.

However, in case of commercial outcome, university shows negative and significant relationship. It indicates that universities are good source of new knowledge and technology creation¹⁷ but universities are lacking behind in commercialization process of innovative outcome. Thus, results partially satisfies hypothesis in terms of innovation outcome but not in commercial outcome (**H1a** partially satisfied) . In case of Industries, the result indicates positive significant relation with innovative and commercial outcome, which fully support our hypothesis **H1b** that industry has positive relation with knowledge, technology as well as commercial outcome performance. Previous study shows that industry improves the likelihood of R&D success and enhances innovative performances^{7,18}. Industries are capable to produce innovative as well as commercial outcome due to its capability to develop new technology and manage resources to convert its outcome into commercial value. However, In case of research institutes, relation is positive and significant with innovation but negative non-significant relation with commercial outcome value. It imply that research institutes are source of technical and knowledge innovation outcome but less role in producing commercial value. This could be due to lack of suitable resources, collaborative structure and poor management³⁰. However, the result indicating impact of research institutes on knowledge and technology creation is consistence to our hypothesis **H1c**.

In case of relation between input factors and innovative performance, government investments exhibit significant relationship in model. With knowledge and technology innovation, investment exhibit inverted U-shaped relationship but fails to exhibit same relation with commercial outcome. This partially support hypothesis **H2**. The evidence could be supported by fact that with increase of government subsidy, innovative outcome start decreasing could be due to inefficiency in utilization of large funding in proper manner to produce innovation²¹. In case of effects of number of participants on innovative performance, it also exhibits statistically significant relation in model 4 and 5, which demonstrates that participants has inverted U-shaped relation with innovative outcome performance which is partially consistence to hypothesis **H3**. Increase of participants has diminishing return on innovation after a point could be due to problem of coordination between

large number of participants²³. Period of collaboration (TERM) exhibit positive and statistically significance relation with knowledge and technical innovation but with respect to commercial outcome, it shows significant negative relation. Collaboration provides efficient solution to technology issue and and effective in saving time and cost¹². This result partially supports to our hypothesis **H4**.

This study developed six hypotheses to analyze input factor elements and research partners elements to deduce their impact on innovative and commercialization performance. The results showed that collaborative input factors like number of participants in projects, government investments, collaboration type, period of collaboration and research partners has significant effect on knowledge (SCI papers), technology innovation (Patents). In case of role of research partners, industries emerged as best partners in production of innovation

as well as commercial outcome. Universities are good source of knowledge and technical innovation but still lagging far behind in commercialization process. Korean government needs to focus more on improving the role of universities as entrepreneurship. Improving coordination and encouraging interaction between university-industry could be the way to improve commercial outcome of university. Similar to university, research institutes has its role in production of innovative and technical output like patenting but has limited impact on commercialization.

Input factors like funding and participants has its impact on creation of new innovative outcome. Since the government, funding shows inverted U-shaped relation with innovation. It is important to consider and analyze associated factors before increasing the funding amount. The success of collaborative research impact on innovative performance depends on the effectiveness of collaboration. Effective utilization of government investment and relation between partners in collaboration could be critical factor that affects innovative outcome. Results also imply that government should decide threshold value of funding based on the aim of the collaborative research and outcome it produces in order to support development of national innovation system. Similarly, improvement of coordination and communication between participants is important to consider in case of increasing their numbers. In case of period of collaboration, it could be significant factor in building the relationship between actors but extended period of projects can make technology outdated for commercialization. So, it is important to consider deadline of projects and consider result impact before extension.

CONCLUSION

We analyzed the data of national collaborative research projects by using negative binomial regression study. The results proposed that collaborative research can be important determinants of innovative performance in the development of NIS. The study provides useful understanding of collaborative research and its impact in improving innovation and commercial outcome performance. The role of research partners and collaborative input came as important determinants in development of innovation. The study provides evidence that collaborative research input - like government investment, number of participants and

period of collaboration is seen as influencing factors in determining the innovative capabilities of the nation. In addition, role of different research partners, university, industry and research institutes are also analyzed in producing innovation and commercial outcome performance. Since national innovation system depends on interaction of collaborative actors, role of these factors in improving innovative outcome is significant. The result findings suggests that better management of input and effective orchestration of partners can improve innovative outcome performance.

The study has limitation that the paper focusses only on role collaboration in terms of public funded R&D projects in Korea national innovation system. Further study on analyzing the other forms of collaboration on innovation system would give more insight. Moreover, more study is required in terms of analyzing the interaction among the actors of collaborative research to strengthen the national innovation system. As the role of collaboration is significant in national innovation system, the comparative study with other country collaborative structure could be useful to generalize the idea and impact on NIS.

Evaluation of Quality of Life in Patients Undergoing Orthodontic Treatment in Eastern India Population

Snigdha Pattanaik¹, Subhrajee Narayan Sahoo², Smruti Bhusan Nanda³, Tusar Kanti Nayak⁴

¹Associate Professor, ²Senior Lecturer, ³Professor & HOD, ⁴Professor, Department of Orthodontics and Dentofacial Orthopaedics, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, Odisha

ABSTRACT

Background: The demand for orthodontic treatment has been increasing with the increase in esthetic concern among people. Quality of life significantly affects various aspects of life including function, appearance, and interpersonal relationship. The concept of oral health related quality of life (OHRQOL) relates the impact of oral health to the individual's life quality thereby shifting the focus of the clinician from the oral cavity alone to a patient as a whole.

Aims: The purpose of this study was to assess to assess whether orthodontic treatment would affect the OHRQOL of general population.

Method and Material: This cross-sectional study was conducted in Department of Orthodontics and Dentofacial Orthopaedics. The sample consisted of 247 individuals aged between 15-30 years who were candidates for orthodontic treatment. Participants were divided into 3 groups as follows: patients with malocclusion, patients undergoing orthodontic treatment and patients after completion of orthodontic treatment. OHRQOL was assessed with the short form of the Oral Health Impact Profile (OHIP-14). Multiple logistic regression was used in the data analysis.

Results: A response rate of 100% was obtained. Patients who had completed orthodontic treatment had fewer oral health-related impacts compared to the other two groups.

Conclusions: Adolescents who had completed orthodontic treatment had a better oral health-related quality of life than those currently under treatment or those who never had treatment.

Keywords: Oral health-related quality of life, orthodontic treatment, orthodontic treatment need, esthetics, quality of life.

INTRODUCTION

The term Quality of life is used to evaluate the general well-being of individuals and societies. WHO defines Quality of Life as "individuals' perception of their position in life in the context of the culture and value

systems in which they live and in relation to their goals, expectations, standards and concerns". Quality of life is a multidimensional concept -- physical, psychological and social function, as well as subjective well being. Majority of dental treatments are seldom life threatening, there is a need to evaluate the impact of dental care on quality of life.¹ According to United States Surgeon General's report on oral health, Oral Health related Quality of Life (OHRQOL) is defined as "a multidimensional construct that reflects (among other things) people's comfort when eating, sleeping, and engaging in social interaction; their self-esteem; and their satisfaction with respect to their oral health."² The concept of OHRQOL is significant to 3 areas of dental health in particular; these are the clinical practice of dentistry, dental research and dental education.³

At the community research level, the concept of OHRQOL is especially vital to promote oral health care and access to care. Dentists can better appreciate the impact of the disease and its effect on the quality of life. People of other profession may only quantify the magnitude of the disease but not the impact of that magnitude on an individual's daily life and general health.³

OHRQOL is a better tool to educate individuals about their oral health. People are more likely to behave positively when they understand how oral diseases affect their general health and quality of life rather than simply the affect of such disease on their teeth or gums.⁴

It is important to establish what the patients' perceptions are towards Dental treatment, since the subject's perception is central to the assessment of treatment. To capture that perception, a number of oral health-related quality of life questionnaires have been developed to assess the impact of treatment on daily living and the quality of life.

However, no studies have ever used OHRQOL criteria in patients undergoing orthodontic treatment in eastern India population. Therefore, the quality of life as related to oral health in patients undergoing fixed orthodontic treatment was evaluated in order to shed more light on the effect of orthodontic treatment on OHRQOL in orthodontic patients in eastern India population.

The objective of this research is to assess whether orthodontic treatment would affect the oral health related quality of life.

MATERIAL AND METHOD

In the present cross-sectional study, the quality of life as related to oral health was evaluated in patients undergoing orthodontic treatment and after the completion of the treatment and was compared with the subjects with malocclusion. The subjects were selected from the patients who reported to the dept. of orthodontics and were diagnosed with a malocclusion by an orthodontist. Total of 247 individuals aged between 15-30 years were included in the study. Subjects were divided into three groups.

Group A : 84 individuals - who were undergoing orthodontic treatment since six months.

GROUP B : 83 individuals - who were not undergoing orthodontic treatment but had orthodontic problem.

GROUP C: 80 individuals –who had completed their orthodontic treatment

The control group subjects were selected from patients who had reported to the dept. of orthodontics with a malocclusion and were candidates for orthodontic treatment. These subjects were included in the study to evaluate the OHRQOL in subjects with malocclusion. Sampling was carried out for all groups consecutively.

A questionnaire was prepared for assessing the impact of orthodontic treatment on Quality of Life. The shortened version of the "Oral Health Impacts Profile (OHIP)" was used to assess oral health-related impacts. Questionnaires were filled out during one of the follow-up sessions after treatment.

The questionnaire consisted of fourteen questions, which measures the quality of life in seven fields of functional limitations, physical problems, mental and emotional problems, physical handicaps, mental and emotional handicaps, social handicaps and complete handicap.

In this questionnaire, question one of each two questions evaluates one of those fields. The interviewee answers each of these questions in relation to experiencing a problem arising from the teeth and the oral condition during the past twelve months. The subject's answers are scored in the Lickert's scale as "zero" for "never", "1" for "seldom", "2" for "sometimes", "3" for "mostly" and "4" for "almost always". On the whole, a score ranging between "0" and "56" is calculated for each subject. Higher scores indicate a lower quality of life for the subjects. In the present study, in the final evaluation of answers, the "zero" response was considered a lack of effect and answers 1 to 4 were considered an effect so that the comparisons would be more comprehensible¹. The original questionnaire is in English, which has been translated into Odia and the validity and reliability of the translated version has been confirmed⁵.

Data was entered and analyzed by SPSS 17 for Windows (SPSS Inc., Chicago, Illinois, USA). Demographic characteristics of case and control groups were compared using Chi-square and independent T test for categorical and numerical variables, respectively. We fitted a linear regression model to predict the mean of

OHIP score considering potential confounding variables. The association between oral health-related quality of life and orthodontic treatment were measured by Chi-squared test and the effect sizes were reported by odds ratio.

RESULTS

A total of 247 subjects were evaluated in the present study, of which 84 individuals were undergoing orthodontic treatment since six months and 80 individuals had completed their orthodontic treatment. In the control group 83 individuals were selected who

were not undergoing orthodontic treatment but had orthodontic problem. All the subjects answered the questionnaire questions (response rate=100%).

Study revealed that few patients who were undergoing orthodontic treatment were not able to eat some foods because of the way their teeth meet and they feel hesitated to eat in public places. Few patients cover their teeth when they meet others for the first time and they hesitate to smile when they were socially out and some patients felt difficulty in pronouncing words. (Table 1).

Statistically significant differences are in **bold** at 5% level of significance.

Table.1 indicates statistical significance with respect to following parameters: (iii), (iv), (v), (viii), (ix), (x), (xi) (xiii).

DISCUSSION

The assessment of oral health-related quality of life has an important role to play in clinical practice. Of all the dental treatments that require the use of oral health-related quality of life measures, the treatment of malocclusion, which has a large psychosocial component, calls for the use of these measures.⁶ Oral health-related quality of life measures can and should be used in the assessment of need and the outcomes of dental care.⁷ That was the basis for this study.

Subjective aspects such as dental aesthetics, self-perception of dental appearance, as well as attitudes toward malocclusion and orthodontic treatment are important factors in deciding to seek orthodontic treatment. The patients undergoing orthodontic treatment were more likely to have oral health impact than those from the untreated group.⁸

People who never had orthodontic treatment were more concerned with aesthetics than with function. Results of this study correlated with study conducted by Oliveira et al¹ (2004) which showed there is negative impact during orthodontic treatment when compared with untreated group. Concern about appearance is the main factor motivating people to seek orthodontic treatment and is recognized as such by orthodontists. It has been estimated that 80% of orthodontic patients seek their services out of a concern for aesthetics, rather than health or function.⁹ Indeed, psychological factors, rather than the severity of the actual occlusal condition, determine demand for orthodontic treatment.¹⁰

CONCLUSIONS

Orthodontic treatment had reduced the quality of life in patients undergoing treatment. Few patients who were

undergoing orthodontic treatment were not able to eat some foods because of the way their teeth meet and they feel hesitated to eat in public places. Few patients cover their teeth when they meet others for the first time and they hesitate to smile when they were socially out. Orthodontic treatment may have negative impacts on quality of life for few patients during the treatment time. Orthodontists should be aware of this impact caused by treatment and regularly remind patients of the positive outcomes.

ABSTRACT

Objectives: Antibiogram and evaluation of the saliva-check mutans (SCM) kit was done to ascertain the presence of *Streptococcus mutans* in saliva samples as a rapid method. It was further compared with conventional methods of microbial diagnosis followed with confirmation with agglutination latex kit.

Methodology: Saliva was collected from all patients under all precautionary aseptic was cultured on Sheep blood agar plates were subjected to incubation for the growth of *S. mutans*. The colony estimation was followed by estimation with agglutination latex kit-D. SCM kit (rapid method) was used chair side to quantify *S. mutans*. The cultures were subjected antibiotic sensitivity test based on Kirby-Bauer's method

Result: Rapid method yielded positive ($p < 0.001$) results for individuals having 3 or more carious teeth and poor oral hygiene. Significant correlation was seen between latex agglutination kit examination and rapid kit experiment. The *S. mutans* strains were highly resistant to gentamicin whereas they were susceptible to vancomycin.

Conclusion: The SCM kit was found to be more accurate than conventional methods. The conventional method was more time consuming and required more proficient observations in comparison to the rapid method; however, it was economical than the rapid method. More clinical trials are required to establish the social benefits of rapid method.

Keywords: *Streptococcus mutans*; Dental caries; Antibiotic sensitivity test; Agglutination latex kit-D; Saliva-Check Mutans kit

INTRODUCTION

Dental caries is an irreparable microbial infection of the calcified tissues of the teeth, characterised by demineralization of the inorganic portion and deterioration of the organic substance of the tooth leading to cavitations¹. The World Health Organisation (WHO) reports corroborates with the worldwide prevalence of dental caries¹. In oral flora, *Streptococcus mutans* (*S. mutans*) is one of the major etiological bacteria causing for dental caries. *S. mutans* primarily gets transmitted from the parents to their child oral flora, where it colonizes for the rest of their life¹.

The detection of *S. mutans* strains by using conventional culture-based assays and chair side culture-based test kits are reported regularly. But in recent past, Saliva-Check Mutans (SCM) kit, an immunoassay-based detection system, has been introduced as rapid detection for *S. mutans* strains, in saliva of patients with more than 10^5 colony forming units (CFU)/ml of saliva². The SCM IgA kit detects secretory anti-mutans *Streptococci* IgA in saliva. As reported, the kit was designed based on the hypothesis that, the colonization of *S. mutans* can be prevented by high levels of salivary IgA by inhibiting its adherence to the tooth surface, whereas, a low titer of anti-mutans *Streptococci* IgA may result in the adherence of *S. mutans* to teeth leading to their subsequent proliferation in the teeth and thereby increasing the risk for the development of dental caries^{3,4}.

The current study evaluates the efficacy and effectiveness of SCM kit (GC America, USA) for quantitative estimation of *S. mutans* as rapid method was analysed and the results were compared to the findings of the conventional method followed with agglutination assay with latex kit.

MATERIAL AND METHOD

Selection and categorization of patients: A total of 100 patients (male 66, female 34) were carefully chosen from patients seeking treatment for their chief complain as dental caries reported at our Institute of Dental Sciences, Bhubaneswar, during last 6-months period (July 2017 –December 2017). They were divided into 3 age groups, where Group 1: patients below 14 years age, Group 2: patients between 14 to 40 years of age and Group 3, where the patients were above 40 years of age. All patients were having mixed diet, excluding 7 patients, who were having exclusively vegetarian diet. Mean caries prevalence calculated was 15.7 ± 8.5 (DMFT). Oral hygiene was found poor in 30 patients, average in 52 patients and good in 18 patients. Good health conditions with no history of antibiotics therapy in past 3 months were taken as inclusion criteria. Prior consent and permission were taken from the patients before the study.

Saliva collection: The saliva sample was collected by making the patient chew a piece of paraffin wax for 3 to 5 minutes. Nearly 5 -6 ml of saliva was collected from each patient. In a sterile container 1 ml of saliva was diluted with 0.05% phosphate buffer (pH 7).

Isolation and identification of *S. mutans* from collected saliva samples: Diluted saliva of 0.1 ml was plated onto Sheep Blood Agar (SBA) for the growth of *S. mutans*⁴. The inoculated SBA plates were incubated aerobically at 37 for 24 hours. Post incubation period, the plates were examined under stereomicroscope where the number of non-haemolytic β streptococci colonies were counted (Figure 1). The CFU per ml of saliva was determined using a colony counter⁵. *S. mutans*, strain number 890 from Microbial type culture collection (MTCC) and Genebank, Imtech, Chandigarh was used as reference control for experiments.

Figure 1: Non-haemolytic β Streptococci on Blood agar

Antibiotic sensitivity of the isolated *S. mutans* strains: All the isolated strains of *S. mutans* were subjected for antibiotic sensitivity by Kirby-Bauer's method⁶. 12 antibiotics discs of 5 different groups were used for the test, as prescribed CLSI, 2018⁷

Latex Agglutination Test: In a sterile test tube, 4 to 5 average sized bacterial colonies were mixed with 0.4 ml of extraction enzyme and it was allowed emulsify thoroughly by 15 minutes incubation at 37. On a reaction card 20 μ l of latex reagent-D was mixed with 20 μ l of well mixed extract for one minute and was observed for agglutination reaction^{8,9} (Figure 2).

Figure 2: Confirmation of *S. mutans* strains by latex agglutination assay

Saliva-Check Mutans Kit Test: In a mixing container 250 µl of the collected saliva sample was mixed with 50µl of Tris-NaOH (reagent #1) thoroughly for 10 seconds. Further, to neutralize the pH of the mixture, 100 µl of Tris-citrate of (reagent #2) was added. After proper mixing, the colour of the solution was allowed to change to green. From the above solution, 0.3 ml of the sample was dispensed to the sample window of the test device with the help of a micropipette. A red line appeared on the control (C) window. Formation of thin line appeared on the test (t) window indicated the presence of *S. mutans* with a count of $>5 \times 10^5$ CFU/ml and the result was recorded as positive. The salivary *S. mutans* count was inferred low in the absence of red line (Figure 3).

Figure 3: Confirmation of *S. mutans* by saliva-check mutans kit

STATISTICAL ANALYSIS

The statistical analysis of the data was done using SPSS 18.0 software. The difference between groups were analysed using ANOVA. The significant level was set at 0.05.

RESULTS

An overall prevalence of 83% *S. mutans* was recorded after examining 100 patients. The prevalence of *S. mutans* is significantly associated ($P < 0.01$) with oral hygiene of the patients, but no association was found between age, gender and diet habit (Table 1). By conventional method, out of 100 samples 73 samples were tested positive cases, while 27 were negative. Using SCM kit 83 positive cases and 17 negative results were reported. Here, 10 patients were having clinically less caries incidence and were negative to latex Kit-D, but showing positive result for SCM kit, suggesting the accuracy of SCM kit. The count of *S. mutans* is more than 105 CFU/ml, which was confirmed by the latex agglutination kit test for anti-D and it had significant association with SCM kit results (Table 2). It was also observed that, the prevalence of *S. mutans* significantly increased with the increase in number of carious teeth. Evaluation of caries risk among patients was done by comparing both latex agglutination test results and SCM test results. Those patients who had both the tests negative were slightly low *S. mutans* count in their saliva and were free from caries risk. Accordingly, those patients who had both the test results positive were high on *S. mutans* count in their saliva and had high caries risk. By taking precautionary measures for high caries risk patients further carious lesions incidences can be avoided.

Antibiotic sensitivity test revealed that the strains were highly resistant to gentamicin (61%), followed by amikacin (59%) and were most susceptible to Vancomycin (18%). The detailed antibiotic sensitivity results are presented in Table 3

Table 1: Evaluation of Latex Agglutination Kit results and Saliva-Check Mutans Kit results with all clinical parameters

DISCUSSIONS

Dental caries is infectious disease that leads to decalcification of the hard tissues of the teeth. Association between *S. mutans* and dental caries in humans is clearly established in medical literature¹. Present study evaluates the use of a rapid kit test for detection of dental caries and compares it with conventional methods. The use and efficacy SCM kit has been established in many other studies where it was used as a reference method for dental caries diagnosis¹⁰⁻¹². Patients showing positive test result for both the test kit have high *S. mutans* count in saliva and should be treated properly to avoid the chance of new carious lesion. Since, a clinic is always necessary the risk factor of future occurrences of dental caries; the test combination predicted that, when compared with the clinical findings, 83 out of 100 patients had a true caries risk (83%). This figure was in cohort with a previous report¹³.

In the present study, it was established that, SCM kit can be effectively used as rapid diagnostic tool for *S. mutans* as compared to the laboratory gold standard. There was a significant correlation between these two ($r=0.684$). Findings in this study were in accordance with results obtained in another study done in Japan¹⁴. As compared to various researchers, in this study also, correlation was not observed with respect to age (0.67), gender (0.49) or diet (0.59) of the patients with their caries incidence^{9,10,15}. However, a positive correlation was found between oral hygiene and *S. mutans* count (0.01) in the patients.

Latex particles were sensitized with antibodies against whole cells of *S. mutans*. These sensitized particles were agglutinated within a few minutes after addition of 1.0–10ng serotype-specific antigen from the homologous organisms or the nitrous acid extract of whole cells at 10^5 – 10^6 cfu/ml. In a clinical trial carried out by Takei et al⁹, found highly significant correlation between latex kit and *S. mutans* count. In our study we considered Latex kit and found similar correlation. Alike another study, in the present study it was found that, the accuracy of SCM kit was more in comparison to the latex kit-D; suggesting that SCM kit is more sensitive for *S. mutans* then the conventional method

CONCLUSIONS

This study highlights the fact that if *S. mutans* count can be detected as earlier as by rapid method in a clinic, it is likely to get better treatment plane to reduce the incidence rate. The SCM Kit is highly effective in detection *S. mutans* in saliva and can help in providing the best oral care for the patients. It can be used a regular diagnostic test for detection of salivary *S. mutans*, however it can be slightly costlier than the conventional methods. Moreover the drug resistance in these strains makes the rapid diagnosis even more important.

Ethical statement: This study was approved institutional ethical board of Siksha ‘O’ Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India with the approval number DMR/IMS.SH/SOA/180048

Evaluation of Post Operative Soft Tissue Complications of Orthodontic Mini-Implants at Different Loading Times— An in-Vivo Study

Subhrajeet Narayan Sahoo¹, Snigdha Pattanaik², Tusar Kanti Nayak³, Smruti Bhusan Nanda⁴

¹Senior Lecturer, ²Associate Professor, ³Professor, ⁴Professor & HOD, Department of Orthodontics and Dentofacial Orthopaedics, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, Odisha

ABSTRACT

Introduction: Achieving absolute anchorage demanding orthodontic treatment is always a challenge for the orthodontics. This lead to search for an ideal anchorage which results in bone borne or skeletal anchorage devices that do not require and is independent of soft tissue on dentition. OMI is one of which can offer great anatomic and biomechanical flexibility in providing anchorage to the effective tooth movement. The objective of this present study was to evaluate and compare post-operative soft tissue discomfort experienced by the patients after insertion of orthodontic mini-implants during different loading size and to formulate a definite clinical protocol for loading of orthodontic mini implants.

Material: 16 subjects between the age group of 18 to 25 years who reported to the department of orthodontics, Institute of Dental Sciences, SUM hospital, for the correction of malocclusion were selected for the study.

Result: The results based on demographic data of the patient and the visual analogue scale score of the questionnaires filled by the patients gave us an idea about success rate and post operative discomfort after the mini-screw placement. The variability between the immediate & delayed loading of the implant was also concluded from the study.

Conclusion: The delayed loading of the OMIs create less pain and discomfort to the patient. The swelling, discomfort and bleeding were reported more with the immediate loading group. Also the patients experienced difficulty during the speech and brushing in the immediate loading group. Mini-screws had a high success rate of approximately 100%, and they provided sufficient anchorage immediately after placement surgery for any orthodontic tooth movement.

INTRODUCTION

Proclination of anterior teeth is one of the most commonly reported malocclusion in an orthodontist's clinic around the globe. It is characterized by dento-alveolar flaring of either maxillary or mandibular teeth, resulting in protrusion of lips & convexity of face. One of the best methods to treat such cases is by extraction of first premolars, followed by retraction of anterior teeth to obtain desired dental & soft-tissue profile changes¹. In such cases preservation of anchorage during space closure is very critical.

Anchorage control throughout the treatment is essential for an uncompromised result. It can be achieved either extra-oral support or tooth-borne. Nance holding arch, Trans-palatal arch, multiple teeth as the anchorage segment and differential moments are so commonly used techniques as tooth-borne anchorage. However these mechanics do not provide absolute anchorage. Extra-oral anchorage can be used to supplement tooth-borne anchorage, delivering excellent results, but it requires maximum patient co-operation. Skeletal anchorage, however, offers tooth movement in any direction by providing an absolute anchorage & so, does not require any patient compliance.

Mini-implants used for orthodontic anchorage, is a versatile option in treatment planning. Mini-implants are smaller in diameter & come in several lengths, can be inserted in any desired location including inter-radicular space. They can be loaded immediately and can withstand orthodontic forces during the entire treatment period. They can also be easily removed, without any invasive procedure after completion of the treatment.

However there are some side-effects of insertion of mini-implants- swelling, and bleeding. The objective of this study is to evaluate & compare post-operative soft tissue discomfort experienced by the patients in immediate & delayed loading groups.

MATERIALS & METHODOLOGY

A total of 16 subjects between the age group of 18 to 25 years who reported to the department of orthodontics, Institute of Dental Sciences, SUM hospital, for the correction of malocclusion were selected for the study.

Ethical committee clearance was obtained from the Ethical committee of Siksha 'O' Anusandhan University for using of mini implant for orthodontic retraction in the study. The treatment protocol was explained to every patient and written consent was obtained from them before including them in the study.

Inclusion criteria: In this present study the total no of 32 mini implants were used in 16 orthodontically treated patients to evaluate the success rate of OMIs under various clinical variables. Under the age group 18 to 25 years of age with Angle's Class I or Class II div 1 malocclusion with average growth pattern (FMA = 25 – 30 degree) crowding less than 2mm requiring extraction of all 1st premolar and enmasse retraction and intrusion.

Exclusion criteria: Un-cooperative patients with compromised periodontal health were excluded from the study. Malocclusion other than Angle's Class I or Class II div 1 malocclusion and horizontal and vertical growth pattern (FMA less than 25 degree and more than 30°) should be excluded from the study. Patients with any Systemic and bone diseases were excluded. Patients with any developmental anomalies including cleft lip & palate were excluded from the study.

Method of study: After the extraction of the first premolars all the patients selected for the study, were bonded with full fixed orthodontic appliances system (American orthodontics) of 0.022 MBT prescriptions. The patients had follow-up appointments at regular intervals. The initial leveling and alignment phase continued until 0.019x0.025 inch stains-less steel arch-wire passively placed. The intra-arch malocclusion and the deep bite was corrected during the initial phase and no active space closure was initiated.

In this study OMIs were selected as the source of absolute anchorage for obtaining maximum orthodontic retraction. All OMIs used in this study were of 1.5mm in diameter by 10 mm in length. Depending on the loading time the implants were divided into two groups. Each group consisted of 16 OMIs which was placed on one of the maxillary quadrant in each patient. The selection of quadrant for the placement of a particular group of OMI was selected by random sampling technique.

Before placement of mini-implants all patients were asked to rinse with 0.2% chlorhexidine mouth wash. The area for implant placement was anaesthetized by buccal infiltration with Lox 2% manufactured by NEON. The mini implants were placed on the buccal side of maxilla between 2nd premolar and 1st molar by a single operator to avoid any intra-operative error and the OMIs were placed directly through the attached gingiva and into bone under manual pressure with the OMI driver supplied by manufacture. The insertion angle ranged between 30 to 45 degree to obtain the maximum cortical bone contact. The vertical height was determined to be little below the mucco gingival junction to ensure the placement of the OMIs in the attached gingiva. Post operatively the patients were advised to use 0.2% chlorhexidine mouthwash (Clohex Plus, Dr.Reddy's Lab) twice daily. All the cases were verified with intra oral peri-apical radiograph to check the position of OMIs and any damage to the adjacent roots were over

ruled. The OMIs in the group I were loaded immediately after their placement. In the group II, the OMIs were loaded after one month of their placement. After the placement, the orthodontic retraction was started by placing the E-chain (American Orthodontics, North America-3524 Washington Avenue) which was extended from the implant head to the crimpable hook that was placed in between lateral incisor and canine on both the site. The retraction force was 250 gm as measured by the Dontrix gauge (Dyanometer, Captain Ortho) per side. The subjects were reviewed on the first day, seventh day, first month, third month and on the sixth month until adequate space closure was achieved. All the OMIs were evaluated every month for any mobility or loss of any implant and for the soft tissue and periodontal health. The mini implant that gets out of the insertion site while loading of the orthodontic force or any peri-implantitis or mobility were also considered as a case of failure.

After 1 month of evaluation of mini-implants to observe presence or absence of the bleeding on probing, presence or absence of any redness/erythema in the colour of the gingiva. The hygiene care around the implant was evaluated by the presence or absence of plaque.

STATISTICAL ANALYSIS

After the collection of the data the chi-square test and the paired ANOVA test was performed to compare the pain and discomfort of each OMIs in 16 subjects with 32 implants that were reported by the patients in the VAS. Any values of P < 0.05 was considered significant. These analysis were made with statistical analysis software (IBM SPSS 20 USA).

RESULTS

The results based on demographic data of the patient and the visual analogue scale score of the questionnaires filled by the patients gave us an idea about success rate and post operative discomfort after the mini-screw placement. The variability between the immediate & delayed loading of the implant was also concluded from the study.

1. Swelling: (Graph-I): In the group – I (immediate loading) the patient complained of mild swelling on the 1st day of insertion which gradually reduced by the 7th day. The group –II (delayed loading) patients did not complain of any swelling due to mini-

implant. The mean score of swelling on a visual analogue scale was 3.56 for immediate loading group & 1.75 for the delayed loading group. In both the groups the patients did not complain of any swelling on subsequent visits. The paired ANOVA test showed a statistically significant difference (p≤0.005) between both the groups.

Graph I: Comparison of the mean values of the swelling between different groups

2. Food Lodgment: (Graph-II): The food lodgment experienced due mini implant showed a significant difference during immediate and delayed loading of the implant.

In the group–A (immediate loading) patients the food lodgment experienced was maximum during insertion of the mini implant which gradually reduced. The group –B (delayed loading) patients also showed a minimum food lodgment experience due to mini-implant. The paired ANOVA test showed a statistically significant difference (p≤0.005) between both the groups.

Graph II: Comparison of the mean values of the food lodgment between different groups

3. Ulceration: (Graph-III): The mean score of ulceration on a visual analogue scale was 3.38 for group-I & 1.56 for group-II. The immediate loading group complained of more ulceration than the delayed loading group. There was a significant difference in the ulceration between both the groups. The paired ANOVA test showed a statistically significant difference ($p \leq 0.005$) between both the groups.

Graph III: Comparison of the mean values of the ulceration between different group

4. Interference During Brushing: (Graph-IV): The interference during brushing reported due mini-implant was statistically significant difference between both the groups.

The mean score of brush interference on a visual analogue scale was 2.81 for immediate loading group & 1.88 for the delayed loading group.

The paired ANOVA test showed a statistically significant difference ($p \leq 0.005$) between both the groups.

Graph IV: Comparison of the mean values of the brushing interference between different groups

DISCUSSION

This study was conducted to evaluate post-operative soft-tissue discomfort due to immediate and delayed loading of OMIs using a Visual Analogue Scale (VAS).

The mini implants used in this study showed a success rate of 100% without any ulceration, peri-implantitis or the loss of implant was reported by the patients. In a similar study conducted by Madhur Upadhyay et al² success rate with mini-implants was about 93% where mini-implants were used as orthodontic anchorage unit. The total success rate in this study (100%) was higher than the 37.0% reported by Kim and Choi³ and 78.6% by Moon⁴ and was similar to the 83.9%–85.0% by Miyawaki et al⁹ and the 81.1%–88.6% reported by Kuroda et al.⁵

In our study a significant differences in the discomfort ($p \leq 0.005$), swelling ($p \leq 0.005$), speech difficulty ($p \leq 0.005$) and chewing difficulty ($p \leq 0.005$) after placement of the OMIs was found between both the groups. The patients experienced more discomfort and swelling by the immediate loading of the implant. Delayed loading of the implant was more comfortable for the patients. Speech interference during brushing and chewing difficulties due to mini implant placement might be correlated with the intensity of swelling. The OMIs used in our study were of self drilling type therefore did not require any pilot drill or incision. They were also placed at the attached gingiva so were less likely to develop infection and inflammation. Very mild bleeding and ulceration was experienced by the patients with immediate loading group which was not statistically significant. These results coincided with the study done by Shingo Kuroda et al.⁵

CONCLUSION

A total number of 16 cases with Angle’s class I malocclusion with bimaxillary dento-alveolar protrusion and Angles class II division 1 malocclusion with average mandibular plane angle (FMA 25-30°) were taken for the study. Analyzing the results obtained from this study, the following conclusions were made-

In cases where absolute anchorage was needed, the treatment of choice is the use of orthodontic mini-screw. This anchorage plan requires a little surgical procedure for the placement of OMIs which might cause pain and

discomfort to the patient. In this study where in patients mini-screw were delayed loaded, there was significantly less pain and discomfort than immediately loaded patients. The swelling, discomfort and bleeding were reported more with the immediate loading group. Also the patients experienced difficulty during the speech and brushing in the immediate loading group.

Conflict of Interest: None

Study on Antimycobacterial Properties of Selected Ethnomedicinal Plants: An Alternative Therapeutic Choice Against Multidrug Resistant *Mycobacterium tuberculosis*

Shakti Rath

Assistant Professor, Faculty of Dental Sciences and Nursing, Central Research Laboratory, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Aim: To evaluate the antimycobacterial efficacy of 10 ethnomedicinal plants against one clinical isolate of *Mycobacterium tuberculosis* and the standard TB strain, H37Rv.

Method: A strain of *M. tuberculosis* was isolated from a patient's sputum sample. It was identified by Ziehl–Neelsen (acid fast staining) method and was cultured on the Lowenstein–Jensen (LJ) medium. Aqueous, ethanol and methanol extracts of 10 plants, *Acacia catechu*, *Acorus calamus*, *Adhatoda vasica*, *Aegle marmelos*, *Andrographis paniculata*, *Catharanthus roseus*, *Moringa oleifera*, *Ocimum basilicum*, *Vitex negundo* and *Withania somnifera* were prepared. The antimycobacterial properties were evaluated by incorporating the extracts into the LJ medium at concentration of 2.5%, 5%, 10% and 20% volume/volume, prior to inspissation and counting the colony forming units (CFU) after incubation period.

Results: Methanol extracts of *A. vasica*, and *M. oleifera* had promising antimycobacterial properties. In general, the methanol extracts were more effective against H37Rv strain, as compared to the clinical isolate. Ethanol extracts of *A. vasica*, *C. roseus*, *M. oleifera* and were also effective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and clinical isolate) on LJ medium. Particularly, at 20% level ethanol extract of *C. roseus*, the CFU count was 17 and 19 for the H37Rv strain and for the clinical isolate, respectively

Conclusions: Bacteria do not become resistant to phytochemicals, because of their complex structure. The aim of isolation of a pure phytochemical against MDR TB strains is rational and achievable. Particularly, plants, *A. vasica*, and *M. oleifera*, can be further be utilized as anti-tubercular drugs.

INTRODUCTION

Tuberculosis is one of the most uncontrollable health hazards. Currently, morbidity and mortality due to TB infection in most developing countries is a serious concern, for the emergence of drug-resistant strains, due to continual usage of tuberculosis-drugs since the last 5 decades¹. In fact, two antibiotics (rifampicin and streptomycin) and two chemotherapeutic agents (ethambutol and isoniazid or INH) are used for the control of this fastidious pathogen in the present treatment regimen as the first line drugs. Most of these have mild to serious side effects. Furthermore, the second lines of TB drugs, capreomycin, cycloserine,

kanamycin, ethionamide have severe side effects². Fluoroquinolones such as, ofloxacin and norfloxacin are also recommended that are too expensive and those are not used. Unfortunately, a TB patient must take the first line drugs for an extended period of 6-8 months to complete the course. Due to irregular intake of anti-tuberculous drugs MDR strains develop, which were recorded as responsible for the 58% morbidity from TB in India³. The situation is alarming realized, as 9.7 million new TB cases worldwide have been recorded in the survey of 2017³. The situation has become recently more complicated because of association of TB and human immune-virus (HIV) that each is endemic in the developing world including India. Eventually, stocks of MDR and at times extremely drug resistant (XDR) TB strains are maintained in the community⁴. Neither HIV nor TB is curable/eradicable, as each is indolent and slow in manifestation. Thus, enough of HIV patients are present in community, who remain as stock for TB, confirming the popular adage in microbiology, "Microbial predators and pathogens do not eliminate their prey and host in environment", said by Martin Alexander (soil microbiologist), as both diseases co-exist. Unfortunately, no new suitable anti-tuberculous drug has been introduced, nor phytochemicals are used yet for the treatment of TB⁴. In this perspective, it is never a choice, rather it is a matter of compulsion to search for alternative drug strategies for MDR/XDR TB strains, because 'ill health begets poverty and poverty begets ill health'. When the infecting TB strain is MDR/XDR the failure of TB chemotherapy with the first line drugs gets often ineffective⁵.

Plants have been regularly used in the contemporary medicinal system as alternative therapeutic agents/drugs against grievous infectious ailments. Very few plants have been specifically identified for the control of infamous/dreadful MDR/XDR TB strains *in vitro*. Thus, practice of medicinal plants for the treatment of tuberculosis is suggested by many research organisations and research work are been carried out to find suitable phytodrugs. In this article, 10 ethnomedicinal plants, namely *Acacia catechu*, *Acorus calamus*, *Adhatoda vasica*, *Aegle marmelos*, *Andrographis paniculata*, *Catharanthus roseus*, *Moringa oleifera*, *Ocimum basilicum*, *Vitex negundo* and *Withania somnifera*, were collected from Kalahandi district, Odisha were evaluated for their antimycobacterial potentiality using a clinical isolate of *M. tuberculosis* and the standard TB strain, H37Rv.

Figure 1: Acid-Fast staining of a sputum sample showing presence of pink coloured *M. tuberculosis* bacilli

MATERIALS AND METHOD

Isolation of identification of *Mycobacterium tuberculosis*: Sputum sample was collected from a person suspected for pulmonary tuberculosis and was subjected for acid-fast bacilli (AFB)/smear test and culturing in the Lowenstein–Jensen (LJ) medium on the same day as mentioned elsewhere⁶. Results was reported viewing under 100 fields as, (i) negative with no red/pink bacteria, or (ii) scanty for 1-9 bacilli, or (iii) + for 10-99 bacilli, or (iv) ++ for more than 100 bacilli, or (v) +++ for bacilli more than 100 per field. Further, duplicate tubes of LJ medium were inoculated from the prepared suspension and were incubated at 37°C for the growth of colonies that were checked up, in 6-8 weeks with weekly intervals⁷.

Preparation of extracts: A lot of 20 g of powder from clean leaf-samples of the 20 medicinal plants were dissolved separately in aliquots of 200 ml sterile double-distilled water for aqueous extract, 200 ml 80% ethanol for ethanol extract and 200 ml in methanol for methanol extract, in wide-mouth bottles and were incubated at room temperature for 72 hours. Each mixture was hand-shaken at every 3-4 hours and filtered. The alcoholic-filtrates (ethanol and methanol) were concentrated in a rotary evaporator at 40°C, till a sticky mass was obtained that was weighed and dissolved in 1 ml of 10% v/v DMSO. For each plant sample, these steps were repeated, and both extracts were stored at 4°C until further use⁸.

Screening of medicinal plants extracts for antimycobacterial activities: The plant extract was incorporated in the LJ medium at concentration of 2.5%, 5%, 10% and 20% volume/volume (1.25 ml, 2.5 ml, 5 ml and 10 ml of fresh plant extract was dissolved into 25 ml of

culture medium) prior to inspissation. Antimycobacterial test was performed with two strains, the standard strain of *M. tuberculosis* strain H37Rv and one clinical isolate, obtained from Department of Microbiology, IMS and Sum hospital. The medium sets inoculated with both the standard and clinical isolate bacterial suspension and were incubated at 37°C for 42 days. For negative control, two extract free control LJ slants (one with standard strain and one with clinical isolate) were used and for the positive control two LJ slants incorporated with 10% v/v rifampicin were used. Results were noted after 3 days of incubation. All the inoculation work was carried out at class III biosafety level.

RESULTS

Antimycobacterial assay of medicinal plants: Ten plants, *A. catechu*, *A. calamus*, *A. vasica*, *A. marmelos*, *A. paniculata*, *C. roseus*, *M. oleifera*, *O. basilicum*, *V.negundo* and *W. somnifera* (Figures 2 to 7) were selected based on their ethnomedicinal and Ayurvedic uses (Table 1). These 10 plants are also listed in the Indian Pharmacopeia for various medicinal uses. Plants reported were collected from Kalahandi forest; 15 hamlets (villages) of Junagarh block of Kalahandi district were surveyed.

Figure 7: *Withania somnifera*

Table 1. Ethnomedicinal uses of 10 antimycobacterial plants used in the study

Plant and Family name	Local Name, Parts used	Ethnomedicinal uses
<i>Acacia catechu</i> (L.f) Willd. Mimosaceae	Khaira, Leaf	In Ayurveda, it is used against cough, asthma, cold, tuberculosis, respiratory problems, UTI, diarrhoea, fever, typhoid, gonorrhoea, wounds, toothache and inflammations.
<i>Acorus calamus</i> L. Araceae	Bacha, Leaf	It is used against cough, tuberculosis and chest congestion and as an antiseptic.
<i>Adhatoda vasica</i> Nees. Acanthaceae	Basanga, Leaf	The leaves, flowers, fruit, and roots are used for treating cold cough, whooping cough, chronic bronchitis asthma and tuberculosis.
<i>Aegle marmelos</i> L. Corr Rutaceae	Bela, Leaf	In Indian traditional medicine it is used against diarrhoea, diabetes, dyspepsia, hepatitis, indigestions, gut-worms and tuberculosis.
<i>Andrographis paniculata</i> (Burm. f.) Wall. ex. Nees Acanthaceae	Bhuinnimba, Leaf	It is used in traditional medicine as an immune system booster, to treat infections in gastrointestinal tract and upper respiratory tract, fever, herpes, sore throat, tuberculosis.
<i>Catharanthus roseus</i> (L.) G. Don. Apocyanaceae	Sadabihari, Leaf	Indian Ayurvedic medicine and traditional herbal systems use this plant for the treatment of diabetes, painful menstruation and tuberculosis.
<i>Moringa oleifera</i> Lam. Moringaceae	Sajana, Leaf	Therapeutic uses of <i>M. oleifera</i> both in Ayurveda and traditional medicine includes anaemia, asthma, blood pressure, bronchitis, diabetes, diarrhoea, hysteria, gut-worms, jaundice, malaria, ulcers, tonsillitis, tuberculosis and UTI
<i>Ocimum basilicum</i> L Lamiaceae	Tulasi, Leaf	Leaves have antibacterial, antifungal, antiviral anti-malarial and antimycobacterial properties.
<i>Vitex negundo</i> L. Verbenaceae	Nirgundi, Leaf	Traditionally leaves are documented to possess antibacterial, antitumor, astringent, febrifuge, vermifuge, antimycobacterial properties.
<i>Withania somnifera</i> L. Dunal Solanaceae	Ashwagandha, Leaf	Leaves used externally, rheumatism, arthritis, dyspepsia, tumours, UTI, throat infections, tuberculosis, and bronchitis.

The antimycobacterial assay of leaf extracts of 10 plants with three different solvents was carried out on LJ medium. 4 different concentrations of each plant extract were used in the study. It was discernible from the study that methanol leaf-extracts of the plant, *A. catechu* and *A. calamus* were completely ineffective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium, as the number colony forming units (CFUs) were more than 50 (50+) at all the 4 concentrations used. Similarly, methanol leaf-extracts of plants, *A. marmelos*, *A. paniculata*, *O. basilicum* and *V. negundo* were completely ineffective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium at 2.5%

and 5% concentrations, whereas, they were moderately effective at 10% and 20% concentration. Methanol leaf-extracts of plants, *A. vasica*, *C. roseus*, *M. oleifera* and *W. somnifera* were effective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium as the number CFUs decreased when the concentration of plant extracts was increased (Table 2). Particularly, at 20% concentration, methanol leaf-extracts of plants, *A. vasica* and *M. oleifera*, the CFU counts were 13 and 16 for H37Rv strain and 17 and 15 for the clinical isolate, respectively. In general, the methanol leaf-extracts were more effective in controlling the growth of H37Rv strain as compared to the clinical isolate (Table2).

Table 2: Antimycobacterial assay of methanol leaf-extracts of 10 medicinal plants in LJ medium

Plant	Colony forming units (mean of three readings)											
	H37Rv				Clinical isolate of <i>M. tuberculosis</i>				Positive control		Negative control	
	2.5%	5%	10%	20%	2.5%	5%	10%	20%	PC 1	PC 2	NC 1	NC 2
<i>A. catechu</i>	50+	50+	50+	50+	50+	50+	50+	50+	3	10	50+	50+
<i>A. calamus</i>	50+	50+	50+	50+	50+	50+	50+	50+				
<i>A. vasica</i>	29	23	15	13	34	30	21	17				
<i>A. marmelos</i>	50+	50+	35	31	50+	50+	50+	40+				
<i>A. paniculata</i>	50+	40+	37	29	50+	39	34	26				
<i>C. roseus</i>	37	32	27	23	40+	34	25	20

<i>V. negundo</i>	50+	40+	33	28	50+	38	34	26				
<i>W. somnifera</i>	40+	37	30	24	39	32	27	21				

Note: PC 1, H37Rv with 10 %v/v rifampicin; PC 2, Clinical isolate of *M. tuberculosis* with 10 %v/v rifampicin; NC 1, H37Rv with no rifampicin or plant extract; NC 2, Clinical isolate of *M. tuberculosis* with no rifampicin or plant extract.

Ethanol leaf-extracts of plants, *A. catechu* and *A. calamus* were completely ineffective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium as the number CFUs were more than 50 (50+) at all the 4 concentrations used. Similarly, ethanol leaf-extracts of plants, *A. marmelos*, *A. paniculata*, *O. basilicum*, *V. negundo* and *W. somnifera* were moderately effective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium at all the 4 concentrations used, as, as the number CFUs slightly decreased when the concentration of plant extracts increased from 2.5% to

20%. Ethanol leaf-extracts of plants, *A. vasica*, *C. roseus*, *M. oleifera* and were effective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on LJ medium as the number CFUs significantly decreased when the concentration of plant extracts was increased. Particularly, at 20% concentration, ethanol leaf-extract of the plant, *C. roseus*, CFU counts were 17 and 19 for H37Rv strain and for the clinical isolate, respectively. In general, the ethanol leaf-extracts were also more effective on H37Rv strain as compared to the clinical isolate (Table 3).

Table 3: Antimycobacterial assay of ethanol leaf-extracts of 10 medicinal plants in LJ medium

Plant	Colony forming units (mean of three readings)											
	H37Rv				Clinical isolate of <i>M. tuberculosis</i>				Positive control		Negative control	
	2.5%	5%	10%	20%	2.5%	5%	10%	20%	PC 1	PC 2	NC 1	NC 2
<i>A. catechu</i>	50+	50+	50+	50+	50+	50+	50+	50+	3	10	50+	50+
<i>A. calamus</i>	50+	50+	50+	50+	50+	50+	50+	50+				
<i>A. vasica</i>	37	32	26	21	40+	34	27	23				
<i>A. marmelos</i>	50+	40+	36	32	50+	40+	39	34				
<i>A. paniculata</i>	40+	40+	33	30	50+	40+	35	31				
<i>C. roseus</i>	40+	34	24	17	40+	30	27	19				
<i>M. oleifera</i>	37	34	31	27	39	33	31	26

Note: PC 1, H37Rv with 10 %v/v rifampicin; PC 2, Clinical isolate of *M. tuberculosis* with 10 %v/v rifampicin; NC 1, H37Rv with no rifampicin or plant extract; NC 2, Clinical isolate of *M. tuberculosis* with no rifampicin or plant extract.

DISCUSSION

In the current study, at 20% concentration, methanol extracts of *Adhatoda vasica*, and *M. oleifera*, the CFU counts were 13 and 16 for H37Rv, the standard strain and 17 and 15 for the clinical isolate, respectively. In general, the methanol plant extracts were more effective against H37Rv strain, as compared to the clinical isolate. Ethanol leaf-extracts of *A. vasica*, *C. roseus*, *M. oleifera* and were effective in controlling the growth of *M. tuberculosis* colonies (both H37Rv and three clinical isolates) on L-J medium. Particularly, at 20% level ethanol extract of *C. roseus*, the CFU count was 17 and 19 for the H37Rv strain and for the clinical isolate, respectively. Antimycobacterial property of alkaloids of *C. roseus* was also reported, elsewhere⁹. In general, the ethanol plant extracts were also more effective on the H37Rv strain as compared to the clinical isolate. Most aqueous leaf-extracts were ineffective as the number of CFUs were less in controlling the growth *M. tuberculosis* colonies (both H37Rv and the clinical isolate) on L-J medium with more than 50+ and 40+.

Aqueous leaf-extracts of *A. paniculata*, *C. roseus* and *M. oleifera* were moderately effective at concentrations, 5, 10 and 20% in controlling the growth of *M. tuberculosis* as colonies. Notably, aqueous leaf-extract of *M. oleifera* at the concentration 20% had the most effective antimycobacterial activity. In a separate study, phytochemicals isolated from aqueous extracts of *M. oleifera* was effective in inhibiting growth of the H37Rv strain¹⁰. Results obtained in this study using aqueous extracts of *A. marmelos*, *A. paniculata*, *O. basilicum* and *V. negundo* corroborated negativity in antimycobacterial properties, studied elsewhere¹¹⁻¹³.

Anti-mycobacterial activity of extracts of medicinal plants (*Lippia origanoides* and *L. alba*, *Swinglea glutinosa*, *Hyptis mutabilis*, *Achyrocline alata*, *Piper auritum* and *P. bogotense*, *Cananga odorata*) have been reported from Colombia. Oil extracts of *A. alata* and *S. glutinosa* were the highly active having MIC values of 62.5±0.1 and 100±36 µg/ml, respectively. Carvacrol, thymol, *p*-cymene, 1, 8-cineole and β-limonene were the major components, recognized in these plant extracts¹⁴.

All the plants, screened for anti-mycobacterial activity *in vitro* so far, have promising results. Incidentally, the drug-targeting endeavour from plant sources for control of TB is very much neglected, particularly with Indian medicinal plants, despite the emergence of XDR/MDR *M. tuberculosis* strains in unhygienic rural communities and urban slums of India¹⁵. It is plausible that the XDR strain should be evolving for resistance to the other second-line drugs^{16,17} due to the lack of a viable emulating check against its natural spread in communities. Further, the probability of resistance is according to the effectiveness of drugs in use, as signposted— (1) High, thiacetazone, ethionamide, capreomycin, cycloserine, viomycin; (2) Intermediate, isoniazid, streptomycin, ethambutol, kanamycin, para-aminosalicylic acid; (3) Lowest: rifampicin^{4,18}.

MDR and XDR strains of TB are reported from a few populous developing countries. These MDR strains are of concern of control, eventually are agents of increase of morbidity. Only *Clavija procera*, a Colombian plant and *Lantana hispida* from Mexico had been reported to have antimycobacterial activity against MDR strains. Phytochemicals have an added advantage as here, if they are exposed in a systematic scientific way. For this reason, neither the first line nor the second line drugs include phytochemicals, nonetheless, a myriad of plants are reported by Gautam et al to have antimycobacterial activity^{19,20}.

CONCLUSION

As it is known bacteria do not become resistant to phytochemicals, because of their complex structure, the present dream of isolation of a pure phytochemical against MDR TB strains is rational and achievable. Hence, our study concludes, plants like *A. vasica* and *M. oleifera* can be subjected for further research to make it a potential antimycobacterial drug.

ABSTRACT

Monoclonal dedifferentiated form of conventional squamous cell carcinoma is recently recognized as spindle cell carcinoma. The biphasic microscopic appearance of this neoplasm simulates many pathological entities. Here we are reporting a case of spindle cell carcinoma in the gingivobuccal sulcus of an adult male with special emphasis on immunohistochemical markers in an effort to differentially exclude similar looking lesions. This report may help the pathologist to diagnose biphasic spindle cell neoplasms with judicial use of immunohistochemistry.

Keywords: *Bi-morphic, Spindle cell carcinoma, Immunohistochemistry,*

INTRODUCTION

Spindle cell carcinoma has been recently defined as a monoclonal dedifferentiated form of conventional squamous cell carcinoma. Although the frequency of spindle cell carcinoma of breast, larynx, oesophagus and lungs has been reported the frequency of oral spindle cell carcinoma is unknown yet because of the less number of reported cases. A single study has focused an occurrence of 63.1% of oral spindle cell carcinoma (SPC) among a total of 103 head and neck mucosal SPC¹. However there are a number of biphasic benign and malignant spindle cell tumours which makes the diagnosis cumbersome. We have delineated few spindle cell lesions with their diagnostic features to help the pathologists reach a conclusive diagnosis.

Case report: A forty-two year old male presented with a painful ulceroproliferative lesion in left side of gingivobuccal sulcus from left lower second premolar to left lower second molar measuring 3 × 4

centimetres in diameter with irregular margin since two months. Tenderness and minimal induration was found during palpation. Left submandibular node was tender and palpable. There was no history of preceding trauma, previous malignancy, radiotherapy and/or any association with co-morbid disease. There was a habit of tobacco chewing since last 5 years. A panoramic radiograph revealed buccal cortical bone loss in relation to left lower molars.

Clinical and radiographic findings were suggestive of a wide spectrum of lesions ranging from localized reactive process to neoplastic proliferations of epithelial, haemato-lymphoid, vascular, odontogenic, and mesenchymal tissues and metastatic carcinoma, sarcoma and non-Hodgkin's lymphoma were the other possibilities too.

The microscopic features (figure 1) of the biopsied tissue revealed tumor cells arranged in an irregular pattern with focal storiform pattern. Among the atypical cells few resemble to epithelial cells with roughly polygonal shape, large hyperchromatic nucleus, altered nucleus cytoplasmic ratio, and few mitotic figures. Predominantly atypical fibroblasts are seen with many mitotic figures distributed in a storiform arrangement. Focal necrosis was present. Ten high power fields (HPF) contained a maximum of 3-4 mitosis. Focally, the tumor was intensely infiltrated by lymphocytes, neutrophils, plasma cells and few histiocytes. The periphery of the lesion is showing few giant cells.

Figure 1: Photomicrograph of Haematoxylin and eosin staining (10X) showing atypical epithelioid cells and fibroblasts

Microscopical differential diagnosis: Because of morphological patterns of compact spindle cells in a solid confluent area and collagen dense pattern² we considered Inflammatory myofibroblastic tumor (IMT). It is composed of myofibroblastic mesenchymal spindle cells accompanied by an inflammatory infiltrate of plasma cells³. Presence of marked cytologic atypia and scarcity of plasma cell in the given tissue excluded the diagnosis of IMT [3]. ALK-1, vimentin, smooth muscle actin and muscle specific actin positivity along with cytokeratin negativity shall help in diagnosis⁴ although focal cytokeratin positivity is found in up to 60% of cases when using AE1/AE3².

High cellularity, pleomorphic tumor cells, areas of haemorrhage and necrosis⁵ in the given tissue also indicated towards Solitary fibrous tumor (SFT). Originally regarded as separate entity, WHO in 2013 unified both SFT and hemangiopericytoma as SFT. Bland spindle cells with vesicular nuclei and thick hyalinised collagen interspersed between tumour cells showing pattern less pattern with alternating hypo and hypercellular areas are typical microscopic features⁶ which insisted us to exclude SFT. The tumor cells are positive for vimentin and CD34⁷.

Initial impression of microscopic findings was giant cell variant of malignant fibrous histiocytoma as it shows areas of necrosis and hemorrhage in addition to giant cells and multiple histiocytes. Recently introduced as undifferentiated pleomorphic sarcomas it shows positivity for only vimentin immunomarker. Histiocytic markers are no longer useful in the diagnosis of MFHs⁸.

Careful observation of proliferating epithelial and mesenchymal cells indicated towards biphasic tumours which include Leiomyosarcoma (LMS), fibrosarcoma (FS), amelanotic melanoma (AMM), head and neck synovial sarcomas (HNSS), spindle cell carcinoma (SPC) and other sarcomatoid carcinoma.

FS is a frequently over diagnosed malignant neoplasm of fibroblast which has been many times applied to any tumour with rich cellularity and collagen forming ability of spindle cells. High-grade lesions show an intense nuclear pleomorphism, rich cellularity and atypical mitosis similar to the present findings⁹ which made us diagnose the lesion provisionally as high grade fibrosarcoma. The positive immunostaining for vimentin along with negativity for muscular immunomarkers and epithelial markers shall help in diagnosing the fibrosarcoma⁹.

Polypoid masses composing of pleomorphic spindle cells, varying degrees of nuclear pleomorphism, hyperchromatism with or without melanin pigments may also indicated us towards AMM. S-100, HMB 45 and anti-vimentin shall serve to rule out this diagnosis¹⁰.

LMS is a malignant mesenchymal neoplasm characterized by densely packed spindle cells with abundant fibrillar eosinophilic cytoplasm and arranged as sheets of sweeping alternating bundles and fascicles. The tumor cells show marked cellular pleomorphism with irregular shaped large hyperchromatic bizarre nuclei similar to our case. Immunohistochemical positivity for smooth muscle actin, muscle specific actin and vimentin as well as negativity for S-100 protein, cytokeratin and desmin shall confirm the diagnosis¹¹. Focal cytokeratin positivity¹² makes the diagnosis difficult in limited biopsy.

Unrelated to synovial tissue HNSS represents a spindle-cell tumor that has variable epithelial differentiation and is associated with the fusion gene SYT-SSX. Biphasic variant is characterized by two distinct cell populations: primary spindle cell elements and secondary epithelioid component most of which disposed to form duct like structures. Absence of duct like structure in the tissue and rarity of this neoplasm were the reasons of exclusion. Along with positivity to cytokeratin, epithelial membrane antigen and vimentin, SS18 gene rearrangement by fluorescent in situ hybridization is ultimate investigation to diagnose HNSS.

The bi-morphic appearance of the tumour, atypical spindle cells as well as tumour epithelioid cells in connective tissue stroma arranged in streaming fashion,

mitotic figures and giant cells together led us to include the possibility of SPC¹⁸. Distinction of intraosseous SPC from sarcomas with a spindle cell appearance is extremely difficult even with the help of IHC because of evidence of sarcoma being cytokeratin positive¹³. Prominent cytokeratin and vimentin positivity shall favor the diagnosis of SPC.

Upon immunohistochemical evaluation the tissue was strongly positive for vimentin (Figure 2) and focally positive for pan-cytokeratin (Figure 3). This helped us reaching a differential diagnosis of SPC and LMS. Negative expression of further immunohistochemistry with smooth muscle actin (Figure 4) confirmed the diagnosis of SPC.

Figure 2: Strong diffuse positivity for vimentin

Figure 3: Focal positivity for pan-cytokeratin

Figure 4: Negative expression of Smooth muscle actin

Microscopic findings	Diagnosis	Exclusion criteria
<ul style="list-style-type: none"> • Atypical epithelioid cells and fibroblast • Focal storiform arrangement of tumour cells • Focal areas of hemorrhage and necrosis • Mixed population of inflammatory cells chiefly lymphocytes • Few histiocytes and giant cells 	IMT	Marked cytologic atypia and absence of plasma cells (H&E) ALK-1, Vimentin, SMA, MSA – (+) Cytokeratin – (-)

Figure 5

DISCUSSION

Four theories have been proposed to explain the histogenetic concept of SPCs. While the collision theory opines simultaneous derivation of spindle cells and epithelial cells from separate stem cells the combination theory suggests that both components are derived from a single stem cell which undergoes a divergent differentiation early in the evolution of the tumour^{14,15}. Composition theory explained that the spindle cell component is a result of pseudosarcomatous stromal reaction to the carcinomatous component. Conversion theory says that sarcomatous element is derived from the carcinoma during the evolution of the tumour by virtue of the driving force of the malignant epithelial cell. The dual antigen positivity for both cytokeratin and vimentin suggests that the cells are in transition and it may represent sarcomatous metaplasia of a squamous cell carcinoma¹⁷. Other markers like epithelial membrane antigens, KI, and K18, vimentin, desmin, S-100, Osteopontin, and BMP are also positive in SPCs¹⁶⁻¹⁸. p53, a transcription factor important for epithelial proliferation and differentiation, is also useful for diagnosing SPC of the head and neck region¹⁹. There occurs a great resemblance of microscopic features among several reactive, benign and malignant lesions owing to a careful systematic evaluation of both hematoxylin eosin stained tissue as well as multiple immunomarkers

CONCLUSION

Microscopic features of spindle cell carcinoma resemble many benign and malignant oral lesions. Therefore careful delineation with the aid of routine haematoxylin and eosin along with immunohistochemistry using appropriate markers is necessary to diagnose spindle cell carcinoma.

Oblique Mandibular Parasymphysis Fracture Treated with Cannulated Herbert Bone Screws: Case Reports

Harsh Mohan Pathak¹, Sobhan Mishra², Subrat Kumar Padhiary³, Bijaylaxmi Panigrahi⁴

¹Reader, ²Professor & HOD, ³Professor, ⁴PG trainee, Dept. of Oral and Maxillofacial Surgery, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to Be University), Bhubaneswar.

ABSTRACT

Introduction: Maxillofacial trauma is in querulous expansion by clinical and biomechanical studies in order to enhance the well-established techniques and to utilize new materials to reduce immobilization period and enhancement of the rigid fixation.²³ The principle of axial compression for better adaptation of fracture segments, with the advantage of increased stability and early function, is a promising means of avoiding the bulky rigid plates used previously.²¹ Since 1984 the cannulated Herbert Bone Screw (HBS) proves to be a successful mean of fracture fixation in various fields of orthopaedic surgery, nonetheless with no sufficient evidence about its performance in the maxillofacial trauma field.²³

Objectives: Purpose of this study was to evaluate clinically and radiographically the performance of Herbert Bone Screw in the treatment of anterior mandibular oblique fractures.

Materials & Method: Three Patients with non-comminuted oblique anterior mandibular fracture who had reported to the dept. of OMFS, Institute of Dental Sciences, Siksha 'o' Anusandhan University (Deemed to be University) following RTA were treated using Herbert bone screw. Clinical follow up was conducted after one week, four weeks, six weeks and twelve weeks for postoperative occlusion, inter-fragmentary mobility, pain and isodensity values on panoramic radiographs.

Results: By the end of the follow up period, all cases showed normal occlusal and good stability, a decrease in level of pain intensity and an uneventful wound healing with no records of developed infection. Mean bone density after twelve weeks showed a statistically significant.

Conclusion: Fixation of anterior mandible fracture using this technique can achieve good stability and appropriate compression.

Keywords: Anterior mandibular fracture, Herbert Bone Screw, Cannulated Screw, Traction Osteosynthesis.

INTRODUCTION

The mandible is the second most commonly fractured part of the maxillofacial skeleton, even though it is the largest and strongest facial bone. Mandibular fractures comprise between 40 and 62% of all facial fractures. The

anterior region of the mandible represents the central horizontal part of the mandible, it is bounded bilaterally by vertical lines just distal to the mandibular canine teeth, including those that run in the midline of the mandible; the symphysis and parasymphysis regions. Anterior mandible fractures (AMFs) represent a considerable entity of mandibular injuries, where the literature gave them as high as 30% of all mandibular fractures.

Open reduction and internal fixation of these fractures is considered the gold standard treatment option in which various hardware were used in order to incline the patients into an early return to the pre-existing state of function and aesthetics. The use of two monocortical miniplates was described by Champy et al following

the concept of ideal lines of osteosynthesis in order to counteract the torsional and rotational trajectories in the anterior mandible.

Traction osteosynthesis was introduced in the maxillofacial region in 1970 by Brons and Boering as a rigid scheme for management of mandibular fracture. This was first utilized in anterior mandibular fractures (AMFs), as this region of the mandible is uniquely shaped for application of the screw. Brons and Boering mandated the placement of two lag screws in AMFs considering the biomechanics of this area. Other studies inquired about the need for two fixation devices, especially in the parasymphiseal region, and they advised the use of a lower border miniplate or lag screw along with a mandibular arch bar. Choosing one treatment modality over the other is based on the surgeon's preference, experience and the armamentarium availability.

In 1984, Herbert and Fisher proposed a new method for rigid fixation to manage scaphoid bone fracture, from this point forth, it demonstrates to be a successful, minimally invasive, mean of providing rigid internal fixation between fracture segments in various terrains of orthopaedic surgery. Their design overcomes the drawbacks of the lag screw, such as limited mobility of adjacent joint and difficulty in determining the screw length. Herbert bone screws (HBS) are a compressive, cortical, headless, cannulated titanium screws. Unlike the lag screws, they gain their compressive power from the differential pitch pattern of threads at both ends of the screw. The distal end threads are of the reverse buttress type, they are longer in length and with a smaller diameter than those at the proximal end which are of the standard V-shaped type. The central shaft of the screw is smooth, which edges over the threaded design of the lag screw were threads cross the fracture line. The utilization of the HBS in the maxillofacial field was recently adopted, where the contemporary literature contains two in-vitro biomechanical studies, a case series for its performance in condylar fractures, a study about its use along with three dimensional navigation systems in angle fractures.²²

The Herbert screw is a headless screw, has threads at both ends and a blank shaft in between. The threads at the leading end have a larger pitch and smaller diameter, while the threads at the trailing end have a smaller pitch and a larger diameter. This screw was introduced mainly to address the disadvantage of the lag screw head,

which interfered in the articulation sur-faces. Due to the differential pitch, the screw does not utilize the head to cause compression between the segments but draws both segments towards each other. As the leading end threads engage the inner cortex, the cortex is pulled out and compression is eventually caused as the trailing end threads engage the outer cortex. A further advantage is the blank shaft in the centre with no threads along the fracture line.²¹

Fig. 1: Bone Tap, Herbert Bone Screw, Depth Gauge

The specific aims were: 1) design and implement a randomized clinical trial, 2) detect and compared the presence of interfragmentary mobility between the different tested fixation modalities, 3) estimate and compare the radiodensitometric mean bone density across the fracture line, and 4) determine the clinical advantages and disadvantages of this newly utilized fixation device.²³

MATERIALS AND METHOD

Patients: Three patients with oblique displaced or undisplaced mandibular fractures requiring open reduction and internal fixation (ORIF), who reported to the maxillofacial unit of Institute of Dental Sciences, Siksha 'o' Anusandhan University (Deemed to be University) were included. Inclusion criteria- Subjects with oblique fractures or sagittally split fractures of the symphysis, parasymphysis with no bone loss, were included.

Exclusion criteria: Subjects with systemic diseases that could have interfered with healing (e.g., diabetes, chemotherapy or radiotherapy, and collagen disorders), comminuted fracture patterns, and patients not willing to participate were excluded from the study.

2a. Pre op picture of occlusion

2b. Pre op occlusal radiograph and OPG

Figure 2: a. Preop Occlusion, b. Mandibular Occlusal view & OPG

Presurgical Phase: Written informed consent was obtained from all of the patients before the procedures. Prior to surgery, full case histories and clinical examinations were recorded on standardized forms. The preoperative radiographic assessment was done using digital panoramic radiographs^(PIC.2b). The radiographs for each patient were standardized by keeping the exposure time, voltage, and patient position constant at each follow-up. Other radiographic views i.e. occlusal radiograph^(PIC.2b) or 3D computed tomography were requested as deemed necessary. The preoperative radiographic assessment was done to identify the fracture lines, presence of a tooth in the line of fracture, degree of displacement, and inferior alveolar nerve location (Fig. 2). All patients were treated by ORIF with titanium Herbert screws by a single surgeon. The Herbert screws used had a shaft diameter of 1.25 mm.

Surgical Phase: Prophylactic antibiotic therapy was administered preoperatively in the form of Cefotaxime 1 gm/12 hours intravenously to prevent postoperative infection. All of the patients were treated under general anaesthesia using nasal intubation. The surgical site is swabbed using povidone iodine solution (Betadine 7.5%), then draped with sterile towels.

The occlusion was secured with temporary IMF and the fracture line was exposed and manually reduced. Fractures anterior to the mental foramen were exposed via intraoral vestibular degloving approach by making a curvilinear incision 3mm apical to the mucogingival junction. Exposure of the fracture site was obtained by standard layered dissection through mucosa, mentalis muscle, and the periosteum in the intraoral vestibular degloving approach.

A 0.8mm Kirschner guide wire was drilled and tapped into the opposite cortex of the distal fracture segment. The depth of the K-wire was measured using a depth gauge to determine the length of the screw to be utilized. A 2mm cannulated spiral drill was used under the guidance of the K-Guide to make the osteotomy, followed by Herbert Bone Screw (2 mm cortical head and 2.5 mm cancellous head and a length ranging from 8 mm to 24 mm) placed with the aid of the cannulated torque shank screwdriver. Two screws were placed if the fractured segments were unstable. All patients received intravenous antibiotics from the time of admission, followed by a course of oral antibiotics for 5–7 days after discharge. Clinical and radiographic postoperative evaluations were performed. The clinical assessment included postoperative occlusion, interfragmentary mobility (assessed by bi-manual palpation across the fracture site), and pain (assessed by visual analogue scale). Nerve sensation was compared with the preoperative condition using mechanoreceptive (static light touch, brush directional stroke, and two-point discrimination) and nociceptive methods (pin pressure). Complications such as bone tap fracture was recorded. The postoperative radiographic assessment was done to determine the density of the healing fracture line and comparing them in the panoramic radiographs taken at each follow up visit. Three points were marked along the fracture line: (1) point A: 1 mm below the upper border of the mandible; in the case of a tooth being involved in the fracture line, then 1 mm below the apex of the tooth. (2) Point B: 1 mm below the inferior corticated border of the inferior alveolar canal; a line was drawn connecting the lower ends of the mental foramen on both sides and

the point formed where this line bisected the fracture line was considered. (3) Point C: 1 mm above the lower border of the mandible.

The occlusion of all patients was checked by releasing the temporary IMF closing wires to confirm stable and reproducible occlusion. The incision sites were irrigated with normal saline solution wound closure in layers was performed, using Vicryl suture material.²²

Fig. 3a. Intraop picture

Fig. 3b & c. Intraop clinical pictures with Herbert bone screw in position

Postoperative Phase-findings: The assessment of occlusion showed that two patient had an abnormal occlusion during the early follow-up period^(pic 2a), which eventually settled^(pic 4).

The inter-fragmentary mobility was absent by the second postoperative follow-up (4 weeks). Postoperative pain was present in the early follow-up period but seen to reduce faster by the second follow-up (4 weeks). All patients recovered uneventfully and were free of any pain at the subsequent follow-up assessments.

Radiographic isodensity values were compared to assess the changes seen from the first to the second, third, and fourth follow-up assessments. The changes from the first to the third and fourth follow up assessments were statistically significant, while the change from the second to the third follow up assessment was not significant and that from the third to the fourth follow-up was also not significant. This indicates that the isodensity attained at the second follow-up (4 weeks) was comparable to the isodensity seen at the third follow-up (3 months), and hence a value comparable to the final follow-up isodensity value was attained by 4 week.

Fig. 4: Postop clinical occlusion, OPG, Mandibular occlusal view Radiograph

CONCLUSION

Despite that it is a technique sensitive treatment modality that requires surgical expertise and strict attention to its placement prerequisites, the use of Herbert Bone Screw for mandibular fractures management showed a satisfactory and predictable wound and bone healing outcomes.

Apicoectomy with Placement of PRF in Periapical Lesions: Case Reports

Subrat Kumar Padhiary¹, Harsh Mohan Pathak², Santosh Subudhi³, Shibasis Biswas⁴

¹Professor, ²Reader, ³Professor, ⁴PG trainee, Dept. of Oral and Maxillofacial Surgery,
Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to Be University), Bhubaneswar

ABSTRACT

Platelet-rich fibrin (PRF), a second-generation platelet concentrate, has shown to be superior to PRP. It was first developed in France. PRF allows one to obtain fibrin membranes enriched with platelets and GF after starting from an anticoagulant-free blood harvest. Recently, studies have demonstrated that the PRF membrane has a very significant slow sustained release of many key GF for at least 1 week and up to 28 days, which means that PRF could release GF with its own biological scaffold for wound healing process. The aim of this case report is to describe two cases of radicular cysts in the maxillary anterior region that were individually managed, depending on the underlying etiology, by using an interdisciplinary approach including nonsurgical restorative and endodontic therapy followed by surgical enucleation of the cyst followed by apicoectomy and placement of PRF.

Keywords: Apicoectomy; Platelet-rich fibrin; Periapical lesions

INTRODUCTION

Periapical lesion is a local response of bone around the apex of tooth that develops after the necrosis of the pulp tissue or extensive periodontal disease. The successful treatment of periapical inflammatory lesion depends on the reduction and elimination of the offending organism. Root canal therapy, periapical surgery, or extraction of the tooth might be the treatment alternatives. Periapical surgery includes the curettage of all periapical soft tissues and sometimes application of different biomaterials to enhance the new bone formation in the defect site. Bone grafts and barrier membrane have been used for optimal healing of the periapical defect area after degranulation of the lesion.^[1,2] All these approaches are known as regenerative therapies.^[3]

Platelet-rich plasma (PRP), introduced by Whitman *et al.* in 1997, is a natural source of growth factors (GF) used to enhance bone regeneration. It is an autologous concentrate

of platelets suspended in plasma. It is well known that platelets have many functions beyond that of simple hemostasis. Platelets contain important GF that, when secreted, are responsible for increasing collagen production, recruiting other cells to the site of injury, initiating vascular ingrowth, and inducing cell differentiation. These are all crucial steps in early wound healing.^[4]

On the other hand, platelet-rich fibrin (PRF), a second-generation platelet concentrate, has shown to be superior to PRP.^[5] It was first developed in France by Choukroun *et al.* in 2001.^[6] PRF allows one to obtain fibrin membranes enriched with platelets and GF after starting from an anticoagulant-free blood harvest.^[7-9] Recently, studies have demonstrated that the PRF membrane has a very significant slow sustained release of many key GF for at least 1 week^[10] and up to 28 days,^[11] which means that PRF could release GF with its own biological scaffold for wound healing process.

The aim of this case report is to describe two cases of radicular cysts in the maxillary anterior region that were individually managed, depending on the underlying etiology, by using an interdisciplinary approach including nonsurgical restorative and endodontic therapy followed by surgical enucleation of the cyst followed by apicoectomy and placement of PRF.

CASE REPORTS

Case 1: A 22 year old male patient reported to our Maxillofacial unit with a gross swelling over the maxillary anterior region since last 1 year. Patient also gave a history of intermittent swelling which used to disappear and again reoccur with pus discharge from the palatal aspect.

Patient had a similar problem about 3 years ago for which he had underwent extraction of the lateral incisor from a local dentist. As patient had no old records of his previous visit to the dentitst we did an OPG(Fig: case 1(B)) and also an maxillary occlusal view(Fig: Case 1(C)).

Radiographic evaluation revealed a 2x1.5 Cm lesion involving the upper left incisor and canine.

Management: As the patient was young and willing to keep the tooth we sent the patient for Root Canal Treatment of both the involved teeth. On the day of obturation we had planned for surgical excision of the lesion along with apicoectomy and PRF placement as a growth factor.

The incision was a standard trapezoidal flap and the underlying lesion was exposed(Fig: Case 1(E)) and after that a bony window was created using a round bur to facilitate the exposure of the cystic lining(Fig: Case 1(F)). Cystic lining was enucleated in-toto(Fig: Case 1(G)) and the specimen(Fig: Case 1(H)) was sent for H/p study. The resultant defect was planned to be filled with PRF(Fig: Case 1(I)) as a growth modulator. Root end resection as done and the tip was prepared to receive retrograde filling material which was MTA. PRF preparation was performed using the procedure described by Dohan *et al.*^[7-9] The PRF protocol is very simple. A blood sample was taken without anticoagulant in 10 ml tubes, which was immediately centrifuged at 3000 rpm for 10 min.

After PRF processing, three distinct samples were collected.

- The supernatant represented acellular plasma (or platelet-poor plasma (PPP)
- The fibrin clot (PRF)
- The exudates resulting from PRF clot corresponded to the solution trapped in the fibrin meshes

For collection, it was necessary to leave the PRF clots in a sterile metal cup for approximately 10 min to

let slowly release the serum contained therein The PRF clot was then packed into the defect to completely fill the bony crypt. Wound closure was then obtained with 3-0 silk sutures.

(B)

Case 2: A 26 year old male patient reported to us with a swelling over the right maxillary region since the last months with intermittent discharge of pus from the palatal aspect. Patient also gave a history Trauma to the mid face region about 1.5 years ago due to assault. Radiographic interpretation (Fig: case 2(A))of the patient revealed a lesion a a large lesion about 2.5x2cm size involving the maxillary central, lateral incisors and canine on the right side.

(C)

Management: We started with the normal protocol of Root canal therapy of the involved teeth and on the day of obturation we planned to surgically enucleate the cyst followed with apicoectomy and placement of PRF as a growth modulator.

(D)

Standard Trapezoidal incision was given and the a full thickness flap was elevated. The labial cortical plate was already thinned out due to the underlying lesion (Fig: case 2(C))thus no overlying bone was to be removed. Cyst enucleation was done(Fig: case 2(D)) in toto and the cystic lining was sent for H/P study(Fig: case 2(E)). The resultant defect was planned to be filled with PRF(Fig: Case 2(F)) as a growth modulator. Root end resection as done and the tip was prepared to receive retrograde filling material which was MTA. DISCUSSION

PRF prepared using Choukroun's technique, is prepared naturally, without the addition of thrombin. It is hypothesized that the PRF has a natural fibrin framework that can protect growth factors from proteolysis.¹²It is organized as a dense fibrin scaffold,¹³with a specific slow release of growth factors.¹⁴PRF can be considered as a natural fibrin-based biomaterial to guide cell migration into the wound. In addition, growth factors are active for a relatively longer period and are effective in stimulating tissue regeneration. This leads to the idea of using PRF as a biomaterial for periapical tissue regeneration. The reason PRF can improve periapical osseous healing can be explained as follows. This fibrin matrix can guide the healing processes. Recently, we found that PRF can upregulate phosphorylated extracellular signal-regulated protein kinase expression and suppress osteoclastogenesis by promoting the secretion of osteoprotegerin (OPG) in osteoblasts cultures. PRF also was demonstrated to stimulate osteogenic differentiation of human dental pulp cells and periodontal ligament cells¹³ by upregulating OPG and alkaline phosphatase expression. Many growth factors, such as platelet-derived growth factor and transforming growth factor, are released from the PRF.¹²In addition, PRF may play an important role in the revascularization of the graft by supporting angiogenesis. When all of this is considered, PRF can be recognized as an autologous biomaterial. PRF as a membrane and grafting material offers an improved space-making effect on the barrier, which is conducive to cell events leading to periapical tissue regeneration and facilitation of mineralized tissue formation due to osteoconductive and/or osteoinductive properties possibly inherent in PRF. Thus, this preparation could lessen the treatment duration and may assist in the decision making of upcoming implant or prosthetic processes. It also could be developed as an option coupling for conventional surgical removals. The clinical use of PRF as the sole grafting material in periapical bony defect will need to be studied in further cases. PRF via Choukroun's technique is simple and inexpensive, and the systematic use of this biomaterial for endodontic regeneration seems a very promising option.

CONCLUSION

This case report demonstrates that the use of PRF did not appear to "prevent" healing of the apical lesion in the two reported cases. In addition, it showed satisfactory healing of the periapical pathosis and it positively influenced the apical osseous tissue. As

a shortcase series, this is an innovative topic, but its clinical value is somewhat debatable at this stage as no definitive conclusions can be drawn from two case reports. In addition to the recruitment of other extensive cyst cases, further controlled clinical trials are necessary to determine whether the addition of PRF alone or in combination significantly enhances bone formation and maturation in cyst lesions.

A Complete Displaced Right Mandibular Body and Left Parasymphysis Fracture Operated Using Locking Miniplates: A Case Report

Santosh Kumar Subudhi¹, Satyabrata Pattanaik², Harsh Mohan Pathak³, Sonu Sanyal⁴

¹Professor, ²Reader, ³Senior Lecture, ⁴Post Graduate Student, Department of Oral and Maxillofacial Surgery, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University) Bhubaneswar

ABSTRACT

Background: Several types of bone-plating systems have been evolved to provide proper fixation for the mandibular fractures and osteotomies. The main disadvantage of conventional miniplates system is that the plate must be perfectly adapted to the underlying bone to prevent alterations in the alignment of the segments and changes in the occlusal relationship. The introduction of locking miniplates reconstruction plating systems for the treatment of mandibular fractures and continuity defects has offered certain advantages over other plating systems. The locking miniplates function as internal fixators, achieving stability by locking the screws to the plates. The most advantage of locking screws/plates systems is that it becomes unnecessary for the plate to have intimate contact with the underlying bone, making plate adaptation easier. In this article we report a case of complete displaced mandibular right body and left Parasymphysis fracture, which was operated using locking miniplates.

Keywords: *locking miniplate, Parasymphysis*

INTRODUCTION

The mandibular fractures are the most common facial injuries treated by an oral and maxillofacial surgeon. Fractures of the mandible are the most common and occur more frequently than any other fracture of the facial skeleton.³ The techniques of open reduction and internal fixation of mandibular fractures have evolved during the past several decades.¹

Maxillofacial surgeons have attempted to achieve four main goals for the treatment of mandibular fractures, i.e. anatomical restitution, immobilization, prevention of infection and rehabilitation of function.⁴ Rigid fixation by using compression plates has decreased the period of MMF and provided early return of mandibular function. The basic concept for rigid fixation gives absolute stability and there are several techniques advocated to achieve this goal. According to Champy et.al engaging a single cortex is sufficient to achieve rigid osteosynthesis.

The mini locking- system (UniLock 2.0, Synthes, Oberndorf, Switzerland) developed by the Albert-Ludwigs University of Freiburg in cooperation with the AO/ASIF Institute (Davos, Switzerland) was evaluated

in an in vitro study by Gutwald and co-workers and was shown to provide better accuracy in bone reduction and stability when compared to the conventional miniplates.⁵

Two main principles required to obtain adequate rigid internal fixation for comminuted mandibular fractures are- First, the fixation needs to support the full functional loads (load-bearing osteosynthesis) and Second, absolute stability of the fracture construct must be achieved.^{6,7} Advantage of bone plate osteosynthesis is that the patient does not require to undergo inter-maxillary fixation for several weeks post-operatively.

Open reduction with rigid internal fixation allows improved stability and early mobilization. A potential advantage of the locking head plating system is that fewer screws might be necessary to achieve maximal resistance to load. This would enable use of smaller incisions or fixation of smaller bony segments and still allow full functional loading.²

CASE REPORT

A 22 year old male reported to the Department of oral and maxillofacial surgery, Institute of dental

sciences and SUM hospital, Bhubaneswar with complaints of pain, swelling and inability to chew after RTA with fall from bike under influence of alcohol 3 days before. The patient was stable, well oriented and conscious. He had a diffused swelling in his right cheek and stepped deformity was palpable on right mandibular body and left parasymphysis region of mandible. (Figure no.-1) Intraorally laceration present on lower lip, restricted mouth opening, Coleman's sign positive and displaced anterior segment of mandible. (Figure no.-5) The occlusion was deranged. (Figure no.-2, 3)

Radiograph (Orthopantomogram) and routine blood investigations were advised prior to surgery. The radiograph reveals a displaced fracture in respect to right mandibular body behind the mental foramen extending posteriorly downward in between 44-45 and in left parasymphysis region the fracture site extending from 32-33 region to lower border of mandible. (Figure no.-5) The diagnosis and treatment plan were explained to the patient. He was undergone upper and lower arch bar placement before surgery.

Under aseptic condition nasoendotracheal intubation was done and general anaesthesia administered. Local anaesthetic solution (2% lidocaine with adrenaline) was injected locally at lower vestibular region. The fractured sites were exposed through intraoral incision on the lower vestibule from 35-46 region. (Figure no.-6,7) Proper anatomical reduction of the right body and left parasymphysis region of mandible was done. Right body region was fixed with 1 titanium 4-hole 2mm locking plate above the mental foramen with 8mm 4no.screws and left parasymphysis region was fixed with 1no.titanium 4-hole 2mm locking plate with 8mm 3no.screws at the lower border and 1no. titanium 3-hole 2mm locking plate with 8mm 3no.s screws at the upper border. (Figure no.-8) The incision was closed layer by layer by using 3.0 vicryl. Postoperatively antibiotic therapy (Piperacillin-tazobactam 4.5gm IV BD) was administered. The postoperative course was uneventful and patient was discharged after 3 days with elastic band intermaxillary fixation for two weeks. Post-operative Orthopantomogram was taken, which was showing adequate reduction of the fractured site of both the right mandibular body and parasymphysis region including the lower border of the mandible. (Figure no.9)

DISCUSSION

Locking plate/screw systems have been available for greater than 3 decades, but a recently rejuvenated interest in these systems has occurred. The locking plate/screw system has only minor additions to the instrument armamentarium. This system requires perpendicular placement of the plate/screw interface, thereby requiring a locking drill guide. The technical difficulty added to the case is fairly minor for even the inexperienced surgeon. In fact, the average operating time for the locking system was 6.5 minutes shorter than the standard plate/screw system.⁸

In comminuted or defect fractures fixation with conventional plating systems can lead to secondary dislocation as soon as the pressure between plate and bone is no longer guaranteed. Plate fixation with locking screws can avoid this kind of secondary dislocation. Also in poor quality bone anchoring of screws can lead to screw loosening and subsequent loss of reduction. Due to the secure locking of the screw in the plate this problem can be avoided with the Mini-Locking-System.⁵

The 2.0-mm LMP system has conical threaded holes that lock the corresponding threaded screw to the plate. The screws, plate, and bone form a solid framework with higher stability than the traditional miniplate system. The LMP system has demonstrated higher stability across a fracture/osteotomy gap compared with the conventional nonlocking 2.0-mm miniplate in invitro studies. It is postulated that the LMP requires less precise adaptation of plate to underlying bone and decreases the chance of screw stripping with associated inflammation. Noncompression decreases necrosis of fracture segments and produces less stress shielding.⁹

Although the possible advantages to a locking plate/screw fixation system are theoretical, whether clinical results can be improved could not be measured in this study. To show real improvements in outcomes over conventional nonlocking fixation systems requires a prospective study that compares one fixation system with the other.¹⁰

CONCLUSION

In conclusion, single locking miniplates osteosynthesis provide greater advantage of good stability and early restoration of function, due to less intermaxillary fixation after open reduction and internal

fixation. It was also found that less precision was required in plate adaptation. We suggest that there is not much difference in surgical outcome with the use of either single locking miniplate or two conventional miniplates in anterior mandibular region and single locking miniplate has adequate strength to counter torsional and rotational forces acting in this region. So, we strongly suggest that single 2.0 mm locking miniplate could be a viable option instead of using two miniplates as advocated by Champy, as it provides equally good outcome along with placement of lesser implant material. However, studies with larger sample size are required to validate our findings

A Completely Intraosseous Circumferential Dentigerous Cyst in Close Vicinity of Mental Nerve Associated with Impacted Supernumerary Premolar in Mandible: A Rare Case Report

Harsh Mohan Pathak¹, Sobhan Mishra², Satyabrata Patnaik³, Kalyan Sundar Pal⁴

¹Reader, ²Professor and HOD, ³Reader, ⁴PG trainee, Dept. of Oral and Maxillofacial Surgery, Institute Of Dental Sciences, Siksha 'O' Anusandhan (Deemed To Be University), Bhubaneswar

ABSTRACT

Dentigerous cyst which arises from dental follicle of unerupted permanent tooth is 2nd most common cyst involving the maxillofacial region after radicular cyst. This type of cyst generally associated with unerupted 3rd mandibular tooth. A case of a dentigerous cyst located in the mandible of a 36 year old woman was reported in Dept Of Omfs, Institute Of Dental Sciences, Siksha 'O' Anusandhan (Deemed To Be University), Bhubaneswar. The patient complaining swelling and discomfort in the left mandibular body region. on radiographic examination there was a well circumscribed radiolucent lesion associated with a impacted supernumerary tooth. lesion was excised under local anesthesia and specimen was sent for histopathological examination. Microscopic examination of the excised tissue showed it to be well-circumscribed with fibrous tissues, and the cystic space lined by keratinized epithelium

Keywords: Mandible, Unerupted supernumerary teeth, Dentigerous cyst, Enucleation.

INTRODUCTION

Dentigerous Cyst developed from odontogenic origin. It surrounds the crown of impacted, embedded, developing, unerupted teeth. This is second most common cyst of the oral cavity after radicular cyst. Incidence of dentigerous cyst frequently occurs during 2nd – 3rd decades of life and predominant in male. Also occurs in children and adolescence during mixed dentition period¹.

A dentigerous cyst is an epithelial-lined developmental cavity that encloses the crown of an unerupted tooth at the cemento-enamel junction. A dentigerous cyst almost exclusively occurs in the permanent dentition, especially in association with third molars and maxillary canines, which commonly remain impacted².

CASE REPORT

A ,36 year old lady reported to the Department of Oral And Maxillofacial Surgery, Institute Of Dental Sciences, Siksha 'O' Anusandhan Deemed To Be University, Bhubaneswar complaining asymptomatic swelling in the left lower back teeth region since last 2 year and there is no history of pain in that region. The swelling gradually increasing in size since last 2 years.

On extra oral examination: A hard well circumscribed swelling present in the left mandibular body region which is not compressible nor fluctuant. There is no changes in temperature or colour of overlying skin. Non tender on palpation.^(pic.1)

On intraoral examination: Intraoral swelling in the left mandibular body region in respect to 34,35,36,37 region due to expansion of buccal cortical plate. Vestibular obliteration in the same region. On palpation swelling is hard in respect to 34,35,36 region but soft on palpation in respect to 37. Egg shell crackling present in some places.^(pic.1)

No abnormality detected in the lingual cortical plate.^(pic.1)

Overlying mucosa appears normal in color and there is no draining sinus in respect to the swelling. (pic.1)

There is no paresthesia in that region.

On radiological examination: OPG reveals a well defined unilocular radiolucent area characterized by sclerotic border in the region of permanent left mandibular 1st molar surrounding the crown of vertically impacted supernumerary premolar. Evidence of root resorption of the overlying mandibular 1st molar is also present. IOPAR a radiolucent lesion in respect to 36 and there is root resorption of 36 present. (pic.2)

Occlusal view reveals: Expansion of the buccal cortical plate with destruction of the cortical plate in respect to 37. (pic.2)

On histopathological study: Histopathology suggestive of cystic lesion (dentigerous cyst). (pic.6)

Pic. 2: Diagnostic OPG, Iopar and Occlusal View

DISCUSSION

Dentigerous cysts, which is the second most common occurring cyst in the maxillofacial region usually solitary, slow growing and asymptomatic lesions and generally found during routine radiographs accidentally^{3,4}. They can occur at any location of the jaw but frequently seen

in relation to impacted mandibular third molars followed by the maxillary canines and maxillary third molars but rare in respect to the unerupted supernumerary premolar teeth⁵. Occasionally these cysts become painful when infected causing swelling and erythema. The large cyst may cause the expansion and thinning of the cortex leading to pathological fracture^{6,7}. Although the clinical presentations are classical of a dentigerous cyst, in our case it is associated with vertically impacted supernumerary mandibular premolar which is enucleated and specimen sent for histopathological examination.^(pic.3 and pic.4) Patient examined after 1 week and postoperative radiograph taken.^(pic.5) Surgical reveals proper healing.

Radiographic features are specific to the lesion characterized by a well defined radiolucency circumscribed by a sclerotic border, associated with the crown of an impacted or unerupted supernumerary tooth. The borders become ill-defined when infected. Rarely may they be found with odontoma or a supernumerary tooth⁸. Although they mimic a normal tooth follicle, literatures suggest any follicular space of more than 4 mm to be a dentigerous cyst. Radiographically the cyst is classified according to its relation with the involve tooth crown as central, lateral and circumferential type. The central type is the most common and presents surrounding the crown⁹. In lateral dentigerous cyst the crown partially surrounds by the cystic lining and extends along the side of the root. In circumferential variant lining surrounds both the crown and the root of the involved tooth¹⁰.

Generally the lumen is filled with straw color fluid occasionally blood tinged. In case of infected cyst there is Rushton body present within lining epithelium.

This lesion must be differentiated from radicular cyst, calcifying odontogenic cyst or eruption cyst. In differential diagnosis unicystic ameloblastoma, odontogenic keratocyst must be considered although they are generally involving the molar region.

Histologically, the lumen is lined by 2 to 4 cell layers of cuboidal to flattened nonkeratinized epithelial cells. It may form keratin by metaplasia. The connective tissue is more collagenous when inflamed and contain varying degree of chronic inflammatory cell infiltration. Occasionally the cyst lining may contain ciliated and mucous secreting cells due to pluripotentialities of the lining cell. Dentigerous cysts are treated by means of

Enucleation, Marsupialization and decompression of cyst by fenestration. If the cyst is small in size then it should be enucleated.

CONCLUSION

Several potential complication like ameloblastoma, mucoepidermoid carcinoma may arise from dentigerous cyst, which cause more destruction of jaw. There is chances of relapse of the cyst if any cystic lining remains even after enucleation. Therefore early diagnosis and aggressive treatment procedure needed to treat these type of cystic lesion.

ABSTRACT

Modification of appearance using tattoos, branding, scars or piercings is on a rise with oral ornamentation & decorations. Thus, increasing the concern as body art professionals should be thoroughly trained with a comprehensive approach amongst the dental medical and body art professionals. They should be educated about the vital structures present in the oral cavity with the short term and long-term complications of oral ornamentations. Not only this Dentists encounter complications while treating individuals with tongue piercings; be set up to supervise post infiltrating anaesthesia or intraoral dental appliances or prosthesis leading to complexities in treating such patients

Keywords: Oral Piercings, Tattoos, Dentists

INTRODUCTION

Tooth jewellery, tattooing and oral soft tissue piercing are part of oral ornamentation. It is widely becoming a fashion statement and also acts as a bonus to aesthetics to while restoring function. The trend of oral body art is increasing in India & is primarily adopted from the western culture.¹ Teeth jewellery is a form of oral body art and it involves decoration of the teeth with white and coloured jewels made in gold and silver. Oral piercing too involves the oral cavity which has a prospective concern to the dental practitioners. Even these patients have possible complications during surgery and anaesthesia.^{1,2}

The dental jewellery is identical to chin and cheek piercing with probable damage to intraoral soft tissues during treatment. This fashion trends are primarily

adopted by 18 to 35-year-old mostly hip-hop musical artists and radio/disc jockeys which is believed to have an added effect on to their performance and influence the younger mass. It is becoming a current fashion trend & amongst the higher socio economical group of people. Its presumed to be a non-invasive, harmless procedure with lesser side effects.³ It is comparatively a cheaper procedure with varying prices depending on the designs of the jewels used. It is a less painful procedure which takes approximately 10-15 minutes for its completion.

There is a definite demarcation in ornaments amongst the rural and urban population. The rural prefer gold restoration in the anterior and posterior tooth along with tattooing for status or religious ground where as in urban population people use piercings as a fashion trend.⁴

HISTORICAL ASSOCIATION

The historical association of oral ornamentation dates back to 2500 B.C. The Mayans were initially known to fabricate stone inlays that were carved in prepared cavities on the front teeth. The Native Americans prepared notches and grooves that were restored with semiprecious stones that was believed to amplify their smile. Even in Hindu & Chinese history tattooing was considered holy was primarily used as body art.^{2,3}

Inking customs are additionally regular to clans of South East Asia and sacrosanct Buddhist writings are ordinarily inked by Thai individuals. These texts are believed to possess powers and magical potency.⁴

Types of oral ornamentation: Oral body ornamentations & adornments is typically connected to the lips and the tongue which now includes the teeth. Usually Gold, silver or gems in diverse shapes are used. Traditionally in India gold and silver were used for restorations by the dental practitioners which was considered a status symbol. Lately greater portion of the adornment are transitory and are connected to tooth surfaces with dental glue that could be easily re applied and fixed⁵

These can be broadly classified into HARD TISSUE ornamentations which includes

1. Tooth Jewellery

- Tooth Gems consists of Skyce and Sapphire crystals out of which Skyce adds an extra sparkle.
- Dazzlers are specially delineated to be bonded to the tooth patented backside of an orthodontic bracket.
- Twinkles are pure gold with precious stones like diamond, sapphires and rubies
- Dental crystals are easily available which could be glass mounted on a thin foil of aluminium to establish an attractive smile with varied shapes from diamond, star, triangle, droplet, heart to round.

2. Tooth Tattooing are applied to dental crowns before the crowns are sealed and set in the mouth with varied styles, colours and designs.

3. Characterizing tooth

Ornamentations in the ORAL SOFT TISSUES can also be categorised into

1. Tongue & lip piercing: It involves perforation of the piercing site with a 12- or 16-gauge needle followed by cleansing with a antiseptic mouthwash. A barbell that is initially placed in longer in order to harbour edema. Following a three- to six-week healing time with a shorter permanent barbell. Postoperative instructions are to be strictly followed using an antibacterial

mouthwash after each meal, use new toothbrush, abstinence of smoking, alcohol, chewing gum, spicy, salty or acidic foods and oral sexual contact.⁶

In Tongue the primary lesions disappear after 3-5 weeks & local inflammation within 6-8 hrs after the piercing with peak on day 3 or 4. Though the Inflammation persists for weeks and it is temporary.^{3,4}

2. Tattooing/inking: Done primarily in inner lip inking as a latest trend with the lower labial mucosa being the common site. These are unique, expensive & not readily visible. The inks consist of metallic salts, carbon, aluminium, oxygen, azo pigments and polycyclic compounds.⁶

ADVANTAGES pertaining to oral ornamentation

- Usually Painless & has less chance of harm until infected or piercings done damaging vital structures
- Temporary in case of tooth jewellery and can be removed easily.
- The Materials or metals primarily used do not tarnish/ corrode else could lead to super added infections. 14 or 18K gold, titanium, stainless steel, niobium, tygon, acrylic, stone, wood, bone, or ivory
- The tooth tattooing and characterisation of the tooth are Specifically designed for individual
- These ornamentations & Decorations sometimes conceal the damaged enamel & pigmentations. They could act as a protective mask.⁶

Types of Piercing materials used: Four primary types of piercing jewellery are commonly used in the oral/perioral area.

- 1. LABRET:** It consists of a bar with ball or a disc or point at one end with a flat closing disc at the other.
- 2. BARBELL:** a straight or curved bar with balls at each end. Unclosed ring with a ball at one or both ends.

These materials are designed in such a manner that it consists of two components the jewellery with magnetic force the magnetic force which is 10-fold greater than conventional magnet.

3. Twinkles: It consists of 24-carat gold and white gold different designs Expensive gems Including diamonds, sapphires and rubies are also used.

4. Dental Gems: Mostly consists of Glass crystals of different colours (Diamond, rainbow, ruby, sapphire, emerald, emerald green, aquamarine, pink, sapphire light)⁷

5. Special facet

Procedure for placement of tooth ornaments: Initially the coronal surface is dried and the tooth is isolated. Its etched with 37% orthophosphoric acid for about 20-30 sec. The surface is rinsed with water and blow dried. The light-curing bonding agent is applied to the surface for 20 sec thereafter composite is flown through the tooth surface. The jewel is placed into composite & Composite curing with application of topical fluoride to remineralize the etched area.^{3,4}

COMPLICATIONS

- Mucosal injury by oral/perioral piercings can cause bleeding, erythema, oedema followed by hyperplastic scarring accompanied by agony and oedema damage/parasthesias.
- Tissue overgrowth can be occurred by continuous irritation from the ornaments causing ulcerations and mucosal keratosis forcing evacuation of the gems.
- Tongue piercings may cause alternation in the papillae, leading to alteration in the taste sensations.
- cause gingival recessions, abrasions or ulcerations
- use of unsterilized instruments cause and act as a factor in transmission of disease like hepatitis B and C, HIV, herpes simplex virus.²
- Difficulty in dental procedures as piercings produce radiopaque areas & are not indicated during radiological examinations.
- There is granulomatous inflammation interfering with mastication, swallowing & under severe cases they cause asphyxia or respiratory difficulties.
- In Tongue piercings -there are chances of Infections in 10-20% cases. oral cavity is a complex environment for microbes primarily Staphylococcus aureus, A group *Streptococcus*, *Pseudomonas aeruginosa*, Erysipelas and beta haemolytic *Streptococcus*. Due to proximity of lymph-node and rich vascular supply the chances of Bacteraemia increases leading to Ludwig's angina in severe cases.
- Chances of anaphylactic reactions is possible due to the metals uses post insertion of Ni- alloys.^{3,4}
- In the area of ornamentation and piercing accumulation of plaque and calculus is definite if hygiene is not maintained with retention of food and supra- and sub gingival plaque accumulation & halitosis with Localised recessions in the lower jaw.⁶
- Formation of growth & swellings is common like mucocles, inflammatory fibrous hyperplasia or mucous retention cysts, traumatic fibroma etc could be painful until removed.⁷

Other complications:

- chewing, phonation and speaking distorts the pronunciation of certain sounds, “s”, “sh”, “th”, “ph”, “t” or “v”.⁸
- increased chances of ingestion or aspiration of barbells, labrets or rings is present with a even higher risk for magnetic piercings. This leads to digestive or respiratory disorders primarily due to an incorrect fixing, poor handling during placement or exertion of high pressure.^{6,8}
- Piercings & ornamentations causes sialorrhoea with increased salivary flow in 63% individuals.

CONCLUSION AND RECOMMENDATION

Oral ornamentation is said to have specific problems where in hazardous oral sites like uvula, lateral tongue surface should be avoided. the use of Jewellery that are soft, hypoallergenic, non-toxic should be utilised. Which in turn would minimise the anaphylactic reactions and trauma to adjacent oral structures. The professional artists performing these procedures should be educated on appropriate infection control and sterilization with similar regulations used by health care professionals. The patients with cardiac disorders and have an increased risk for endocarditis be counselled against tongue piercing, because the dental trauma pertaining to oral ornamentation could increase the risk for the development of infective endocarditis.⁹

As oral ornamentation is increasing the generalised lack of awareness of complications should be addressed by the dental professionals. Even researches should be done in pertaining detailed information about knowledge and practice and complications associated with these as majority of it would be unreported.

Individuals should be advised to maintain oral hygiene, educational programmes could be organised about possible complications & dentist should play an active role in examining and informing patients along with treatment of short- and long-term complications. Even there should be a comprehensive approach of body art professionals with dental as well as medical professionals.¹⁰

Conscious Sedation in Pediatric Dentistry

Sthitiprajna Lenka¹, Karishama Rathor², Sashikant Sethy², Narottam Praharaj², Dharamashree. S³, Rucha Varu⁴

¹Associate Professor, Dept. of Oral and Maxillofacial Surgery; ²Lecturer, ³Professor, Dept. of Public Health Dentistry, Institute of Dental Sciences; ⁴Assistant Professor, Dept. of Oral Pathology, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, Odisha

ABSTRACT

Sedation for dental procedures (with or without local anaesthesia) includes the administration by any route or technique of all drugs which result in depression of the central nervous system. Conscious sedation is administered with an aim to produce a degree of sedation without loss of consciousness, in order to perform a desired function without any hindrance. This technique is being widely followed by paediatric dentists, who utilize the method on uncooperative and anxious patients during any treatment. This technique has many adverse effects. This article reviews the various aspects of conscious sedation in general and paediatric dentistry.

Keywords: *Conscious Sedation, Hypnotics and Sedatives, Nitrous Oxide, Dental Anesthesia, Patient Compliance*

INTRODUCTION

Conscious sedation is an effective method of reducing preoperative anxiety in children and in adult patients who suffer from anxiety, especially prior to surgical procedures requiring general anesthesia. When administered before dental treatments, conscious sedation methods have been shown to aid in the reduction of patient pain and anxiety.¹ Conscious sedation is very useful in encouraging patient cooperation and improving overall patient satisfaction with dental treatment. However, conscious sedation methods do involve some level of risk for patients and dental practitioners. It is well known that conscious sedation allows dental practitioners to treat uncooperative patients. Some patients simply cannot be treated with locoregional anesthesia alone for various reasons, generally due to behavioral problems resulting from some form of disability or because the patient is

a child.² In these cases, procedures must be performed with the patient under conscious sedation. However, in some cases requiring very complex dental procedures, or if the patient is in poor condition, conscious sedation may be inadvisable or the class of drugs used may be contraindicated. The adverse effects associated with conscious sedation are a result of the class of drugs used, with hallucinations being the most frequently observed adverse reaction linked to the use of benzodiazepines, propofol and nitrous oxide. Nitrous oxide may also cause damage to immune and hematologic systems, and it can cause fertility problems in women.³ However, the biggest disadvantage of conscious sedation is that it can mask symptoms of a medical emergency, so clinicians should remain very conscious of proper methods of sedation for dental procedures and their importance. Clinics that employ methods of conscious sedation are required to have the equipment necessary to handle medical emergencies such as hypoventilation or central nervous system depression. The most important consideration when dealing with a potential emergency is to have a highly qualified team capable of handling any issues that may arise, especially any respiratory complications.^{4,5} Today, there are a wide variety of drugs that can be used to sedate patients; however, there are relatively few studies that compare the safety and effectiveness of different kinds of sedatives.

Goals of Conscious Sedation:

- Promote patient welfare and safety.
- Facilitate the provision of quality care.
- Minimize the extremes of disruptive behaviour.
- Promote a positive psychological response to treatment.

The drug groups used for paediatric dental sedation include inhalational agents, benzodiazepines, Midazolam (oral sedative), laughing gas (nitrous oxide sedative)

Nitrous Oxide: Nitrous oxide (N₂O) is a non-irritating respiratory tract gas, which presents fast action on induction as well as during recovery (these effects occur within a few minutes). It presents low solubility in the tissues, as well as a minimal alveolar concentration (MAC) which is so high that its anesthetic effect is poor under normal atmospheric pressure.⁶ Machines intentionally designed for the administration of inhalation sedation in dentistry should be used and be capable of administering N₂O to a maximum limit of 70% with not less than 30% of oxygen in volume, even though in the majority of cases, adequate analgesia is achieved with concentrations of N₂O that do not exceed 50% in volume.

These machines must be in conformity with the European (or otherwise applicable) legislation and be maintained and serviced according to the producers' orientations. It is also important that regular maintenance be documented, where all safety rules must be respected, such as for instance, the presence of a device that cannot fail in an emergency (if the oxygen pressure drops, N₂O supply must automatically stop).⁷ Nitrous oxide causes minor depression in cardiac output while peripheral resistance is slightly increased, thereby maintaining the blood pressure. This is of particular advantage in treating patients with cerebrovascular system disorders. Nitrous oxide is absorbed rapidly, allowing for both rapid onset and recovery (two to three minutes). It causes minimal impairment of any reflexes, thus protecting the cough reflex.⁸ Studies have reported negative outcomes associated with use of nitrous oxide greater than 50 percent and as an anesthetic during major surgery.⁹

Nitrous oxide has been associated with bioenvironmental concerns because of its contribution to the greenhouse effect. Nitrous oxide is emitted naturally by bacteria in soils and oceans; it is produced

by humans through the burning of fossil fuels and forests and the agricultural practices of soil cultivation and nitrogen fertilization. Altogether, nitrous oxide contributes about five percent to the greenhouse effect. Only a small fraction of this five percent (0.35 to two percent), however, is actually the result of combined medical and dental applications of nitrous oxide gas.¹⁰ Adverse effects of nitrous oxide: Nitrous oxide has an excellent safety record. When administered by trained personnel on carefully selected patients with appropriate equipment and technique, nitrous oxide is a safe and effective agent for providing pharmacological guidance of behaviour in children. Acute and chronic adverse effects of nitrous oxide on the patient are rare.¹¹ Nausea and vomiting are the most common adverse effects, occurring in 0.5 percent of patients. A higher incidence is noted with longer administration of nitrous oxide/ oxygen, fluctuations in nitrous oxide levels, and increased concentrations of nitrous oxide. The practitioner, however, may recommend that only a light meal be consumed in the two hours prior to the administration of nitrous oxide. The long-term exposure to nitrous oxide used as a general anesthetic has been linked to bone marrow suppression and reproductive system disturbances.¹²

Pyramidal (Oral Sedative):¹⁶⁻¹⁹ Midazolam, one of the commonly used oral sedation agent in children has several characteristics such as safety of use, rapid onset and some degree of amnesia that makes it a desirable sedation agent in children. Therefore, oral midazolam sedation is recommended for short dental procedures in children. A variety of sedative drugs has been used for oral sedation in young children including benzodiazepines. Midazolam is a newer-generation benzodiazepine with wide toxic/therapeutic ratio and safety margin, and does not produce prolonged sedation associated with other benzodiazepine such as diazepam. When taken orally, midazolam is rapidly absorbed in the gastrointestinal tract, produces its peak effect in relatively shorter time of about 30 minutes, and has a short half-life of about 1.75 hours. When given in doses between 0.5 to 0.75 mg/kg of body weight, oral midazolam has been found to be a useful sedative agent for pediatric dental outpatients. Midazolam has also been shown to enhance anterograde amnesia when used preoperatively in pediatric patients. Midazolam is a short acting anxiolytic agent, with short duration of action, that makes its use limited to short dental procedures only. The clinical use of midazolam

is primarily reserved as premedication/sedation drug, though it also has anticonvulsant and muscle relaxant properties. One of the limiting factors in the use of midazolam for sedation is the short length of action. So, midazolam can be used effectively in pediatric patients for short, mildly painful and minimally invasive procedures. Paediatric dosage of midazolam: Midazolam has been used orally at doses between 0.2-1.0 mg/kg with onset of action between 20-30 minutes. Several studies have been conducted to determine an optimal dose of oral midazolam for sedation by comparing various doses of oral midazolam. Oral midazolam in a dose of 0.5 mg/kg is suitable premedication for child patients (ASA Category I) during short dental procedures. Another study compared two dosages of oral midazolam (0.3 mg/kg or 0.5 mg/kg) in 31 physically and neurologically compromised pediatric (3-18 years) dental patients; both dosages proved successful, without intraoperative or postoperative complications.

ORAL MIDAZOLAM WITH NITROUS OXIDE

Oral midazolam is often used in combination with nitrous oxide for dental sedation in children. A study compared the effectiveness of oral diazepam and midazolam alone and in combination with nitrous oxide for sedating autistic patients during dental treatment; the midazolam/nitrous oxide combination was found significantly more effective than diazepam/nitrous oxide combination. A study reported that combination of oral midazolam (0.6mg/kg) and nitrous oxide (30-50%) is effective and safe in young dental patients who need minimal restorative treatment. Some study have also recently reported similar results with combination of 0.5 mg/kg oral midazolam and nitrous oxide (50%) in 4-6 year old children. The use of nitrous oxide may prolong the working time to some extent and simultaneously incorporates its own desirable effects (such as analgesia) in the clinical situation.²⁰⁻²³

COMPLICATIONS

The main complications related to conscious sedation are:^{22,23}

- Hypoxia
- Nausea and vomiting
- Inadvertent general anaesthesia (over sedation).

CONCLUSION

The provision of adequate anxiety control is an integral part of the practice of dentistry. All patients deserve appropriate anxiety control for any dental procedure. The application of conscious sedation should be carried out effectively and precisely so that it maintains a healthy gap from general anesthesia and unconsciousness. More concern should be taken when this process is applied on pediatric patients. Sedationist must be aptly trained to perform sedations on patients.

Recall Scheduling in Removable Prosthesis Patients

Debarchita Sarangi¹, Sitansu Sekhar Das², Abhilash Mohapatra³

¹Assistant Professor, ²Professor, ³Associate Professor, Department of Prosthodontics, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, Odisha

ABSTRACT

A patient provided with a certain removable prosthesis is given instruction regarding how to use, maintain the prosthesis and when to report in the clinic for the clinician's intervention. This article shall review the recall scheduling of patients after insertion of prosthesis for further examination and modification as described by various authors.

Keywords: Recall, removable, scheduling, post-insertion, follow-up, prosthesis

INTRODUCTION

Removable prostheses include complete dentures, partial dentures (treatment partial dentures, cast partial dentures, immediate dentures, etc.), maxilla-facial prosthesis, extra-oral appliances (Fig.1) The need of removable prosthesis may have decreased, but the demand to cater patients still exists from the past. Even the advent of various technologies has not been able to exhibit fall in the requirement of prostheses.

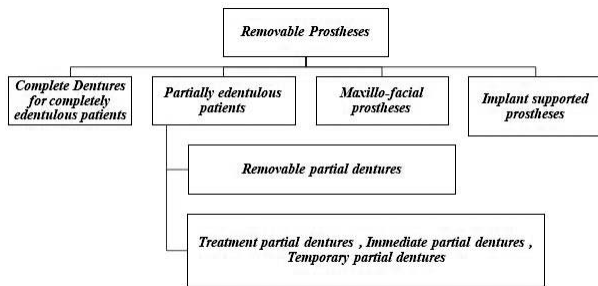

Fig 1: Types of Removable prostheses

Counseling should be done for: insertion and removal of the prosthesis; maintenance of remaining natural teeth and prosthesis; follow-ups. Therefore, maintenance of

prostheses by the patient and follow-up after insertion by the dentist collectively, not only lead to a better longevity of the prostheses, but also better acceptance of the same by the patient. This subsequently amounts to a good doctor-patient relationship and psychological satisfaction of the patient. To achieve this, communication during insertion and follow-ups after it are a must.¹

All the verbal instruction can be given in a printed format as some points may be misunderstood only on explaining. Moreover, written instruction are more impactful, the instruction leaflet can be written down in the following headings: Need of a partial/removable prostheses or appliance; break-in period; learning to speak clearly, eat; sore-spots after insertion; care of the prosthesis; maintenance; hygiene.²

DISCUSSION

There are various approaches to schedule the patient for the next visit after prosthesis insertion. Patient's first follow-up appointment scheduled post-insertion of complete denture is after ten days. By this time, usually the patient is in better state of acceptance. But, during the last visit, the patient should be explained that s/he should call for appointment if a "sore-throat" persists for 3-days continuously. The follow-up schedule after the first follow-up should be:

- 3 weeks from the first (second visit)
- 6 weeks from the first (third visit)
- 3 months after the third visit (fourth visit)
- 3 months after the fourth visit (fifth visit)
- Subsequently every six months³

There is another protocol for scheduling appointments for removable partial dentures:

- First appointment: 24 hours after insertion. Minor changes are supposed to be made if any erythematous areas are examined, only after determining the cause.
- Second appointment: 48 to 72 hours after the first appointment.²

Another protocol for recalling removable partial denture patients:

- First appointment: 24 hours after insertion to correct occlusal errors and to check immediate tissue reaction.
- Second appointment: after 7 days after the first visit.
- The next revisits are: every 3-6 months.⁴

In case of presence of remaining natural teeth, periodontal maintenance is also a must. According to a study by Farooqi et al., periodic recalls for periodontal condition maintenance should be scheduled. There can be no “One size Fits all” rule for such appointments. The recalls vary from patient to patient as per the condition of their remaining teeth.⁵

Patient should report immediately when there is a problem or when adverse tissue reactions are seen .⁶ The patient should report for the first review in a week’s

time and it should be no longer than that .⁷In case of cementation of restorations, the first visit should be ten days after cementation. This is done to chiefly examine the gingival sulcus. Recall visits atleast every 6 months should be planned for patients with cast-restorations.⁸

Boucher has advocated a recall appointment 24 hours immediately after insertion and then a periodic reappointment phase.⁹A single post-delivery adjustment usually is enough but additional adjustments can be made 48-72 hours after the first adjustments. Maintenance visits scheduled every 3,6 and 12 months should be advised to the patient.¹⁰

In case of insertion of insertion of a definitive obturator, the patient is recalled 24 hours after the insertion and necessary corrections are made. The subsequent follow-up depends upon the findings in the above appointment.¹¹The follow-up for palatal lift prosthesis should ideally be within 2-3 days of insertion.¹²The recall visits have been summarized in Table 1,2,3and 4.

According to Wagner, a positive attitude of the patient helps him to get accustomed to the new removable prosthesis . Wearing it regularly helps the patient to be confident with the same. Even though , complete restoration of chewing ability as natural teeth is not expected , healthy nutritious denture-friendly diet should be followed for general well-being .¹³

Table 1: Recall appointments for Complete Denture Patients

Appointment after insertion	John J Sharry ³	Boucher ¹⁰	Basker and Davenport ⁷
Complete Dentures			
First	10 days	24 hours immediately after insertion	In a week’s time and no longer than that.
Second	3 weeks from first	-----	-----
Third	6 weeks from first	-----	-----
Fourth	3 months from third	-----	-----
Fifth	3 months from fourth	-----	-----
Subsequently	Every six months	-----	-----

Appointment after insertion	Grasso and Miller ²	Mccracken’s ⁴	Stewarts ¹⁰
Removable partial dentures			
First	24 hours after insertion	24 hours after insertion	Single post-delivery appointment. (Time not specified)
Second	48-72 hours after first appointment	7 days after first visit	48-72 hours after first appointment.
Subsequently	-----	Every 3-6 months	Maintenance visits every 6 months.

Table 3 : Recall appointments for Maxillo-facial Prosthesis Patients

Appointment after insertion	Definitive obturator ¹¹	Palatal lift prosthesis ¹²
Thomas Taylor: Clinical Maxillofacial Prosthetics		
First	24 hours after insertion	Within 2-3 days after insertion

Table 4: Recall appointments in presence of remaining natural teeth

Appointment after insertion	Farooqi	Rosenstiel
	Periodontal health of remaining natural teeth	Insertion involving a cementation procedure
First	No “One size fits all “appointmentschedule.	10 days after cementation to examine gingival sulcus.
Subsequent visits	Patient recalled periodically according to need.	Recall visits every 6 months

CONCLUSION

The minimum time for each appointment should be around 15minutes .¹⁰ A student may require more time for the same. The patient should report as per the scheduled recall appointment. In conditions when the first recall appointment are scheduled 2-3 days or more after , the patient should report whenever necessary and should discontinue the use of the prostheses for some-time in presence of soreness and pain . The design and maintenance of every removable differs from each other which should be supplemented by the dentist in the post-insertion instruction .Thus, the whole idea of recall visits should be need-driven and be decided by the clinician and not only be theoretically followed.

Soil Stabilization using Lime Precipitation Technique

Heeralal M¹, Pandu Kurre², G V Praveen³

¹Assoc. Professor, Dept. of Civil Engg, National Institute of Technology, Warangal; ²Asst. Professor, Dept. of Civil Engg, Sri Indu Instt.of Engg. & Technology, Hyderabad; ³Professor, Dept. of Civil Engg, S R Engineering College, Warangal

ABSTRACT

Many relevant studies on lime stabilization have been done with regard to swell – shrink behaviour of expansive soils. Sequential lime mixing technique was also proven to be effective in limiting the swell shrink behaviour. But, strength and deformation are generally the most important parameters in assessing the effect of soil stabilization in pavement and other geotechnical practices. Therefore, the impact of these modification techniques has to be studied in terms of unconfined compressive strength of lime-treated soft clays. Such studies would definitely imbibe confidence in the practitioners to take up these advanced stabilization techniques which would in turn make our designs more robust and safer. In this regard, the current investigation is taken up to examine the efficiency of lime precipitation technique by sequential mixing of sodium hydroxide (NaOH) and calcium chloride (CaCl₂). The lime precipitated in expansive soil is likely to change the basic properties by short term modification reaction and long term pozzolanic reactions between soil and lime. In expansive soils, Initial Consumption of Lime (ICL) was established based on the experiment proposed by Eades and Grimm. All the laboratory tests were done by maintaining these moisture and compaction conditions. Lime precipitation was employed on the mixes and its time dependent impact on physico - chemical behaviour of expansive soil and formation of various cementation products were studied. The study discusses the effect of these reactions on Particle size, Unconfined Compressive Strength (UCS) and California bearing ratio (CBR). The soil-lime modification reactions had significant impact on the index properties and Particle size of the expansive soil. Due to strong short time modification reactions and long term pozzolanic reactions, a notable increase in the CBR and UCS values of the expansive soil was observed

Keywords: *Expansive Soils, Lime Precipitation, Soil Stabilization, CBR, UCS*

INTRODUCTION

Locally available expansive soils, which are well known in India by the name black cotton soils, are highly fertile for agriculture but are treacherous for pavements, runways, and light to medium loaded residential buildings resting on them due to the high swell-shrink potentials caused by moisture fluctuation in these soils^[18]. This swell-shrink behavior causes damage to the structures resting on them. The swell-shrink behavior is due to the existence of a mineral called Montmorillonite. This clay mineral, when comes in contact with moisture, expands. Soils rich in these minerals are present in many regions all over the world, particularly in semi-arid and arid regions^[8].

The damage due to expansive soils to the structures built on them is immense. National Science Foundation (NSF) sponsored studies stated that the structural damage

due to expansive soils - mainly to pavements and light buildings is more than any other natural calamity^[4]. As per the detailed review of expansive soils by Gromko (1974), it can be estimated that the annual cost of damage from these soils in the United States alone is \$9 billion^[3]. Problems with expansive soils have been reported worldwide.

Various treatment procedures were recommended to stabilize expansive soils. Based on the soil modification mechanism, soil stabilization have been classified into thermal, physicochemical, chemical and mechanical stabilizations. Among these, the most used methods are mechanical and chemical stabilization as they provide rapid and reliable improvements to soil properties. Even among chemical stabilization, the most popular material used to limit the swell-shrink potential is lime. Stabilization with lime achieves improved plasticity, compressive strength and elastic moduli of expansive clays^{[6][7]}.

Lime Stabilization: With addition of lime to expansive soil either in the form of Quick lime or hydrated lime (Slaked lime), the soil properties are altered by short term modification reaction and long term pozzolanic reaction [11]. Short term modifications partly imparts strength to the soil by modifying the physicochemical properties while long term pozzolanic reactions impart strength by producing cementitious gels such as Calcium-Silicate-Hydrates (CSH) and Calcium-Aluminate-Hydrates (CAH) as the calcium from the lime reacts with the silicates and aluminates [12][13]. The long-term pozzolanic reactions can last for long periods as long as sufficient lime is available and the pH remains greater than 10. Due to these reactions, lime treatment can yield great and lasting increase in strength.

In view of the above difficulties and limitations in certain conditions, Thyagaraj in 2012 proposed a new method called ‘In situ lime precipitation technique’ in which NaOH and CaCl₂ are permeated consequently into the expansive soil from bore holes, such that lime gets precipitated in the soil. Lime precipitation takes place as per the reaction below:

Thyagaraj et al in 2014 compacted expansive soil in cylindrical mould and sequentially permeated with CaCl₂ and NaOH solutions through a hole in the centre filled with soil of high permeability. Results from this model test concluded that the pH of the soil increased to 12 which would be favourable for pozzolanic reactions to occur [16].

Previous studies on in-situ lime precipitation by sequential mixing have reported positive findings; however, it is not examined in detail, especially for pavement applications and this project aims to investigate in detail the effect of sequential mixing of CaCl₂ solution and NaOH solution on the index properties, particle size, UCS and CBR of compacted expansive soils [17].

EXPERIMENTAL STUDY AND METHODOLOGY

The expansive soil used in the study is the Black cotton soil, which is locally available and has the following properties:

Property	Value
pH	8.25
Specific gravity(G _s)	2.65
Grain size Distribution	
Gravel (%)	4
Sand (%)	29
Silt (%)	27
Clay (%)	40
IS classification	CH
Index properties	
Liquid Limit (%)	69
Plastic Limit (%)	25
Shrinkage limit (%)	11
Plasticity Index (%)	44
Compaction characteristics	
Maximum dry density (g/cm ³)	1.68
Optimum moisture content (%)	20
Unconfined compressive strength (kg/cm ²)	2.2
California Bearing Ratio (soaked) (%)	2.15

In the current study chemically pure Sodium Hydroxide (NaOH) and Calcium Chloride (CaCl₂) are used. In-situ lime precipitation can be done by sequential mixing of NaOH and CaCl₂ solutions in the soil. When NaOH and CaCl₂ are mixed in soil, lime is precipitated as per the following equation:

NaOH and CaCl₂ solutions are prepared keeping the ratio of them same and to increase the amount of lime precipitated is increased by adding more concentrated of CaCl₂ and NaOH solutions.

For determining the index properties of the soil, 120g of air dried soil passing 425µm was taken. As the liquid limit of the untreated soil is 69%, 41.4 ml of NaOH solution and 41.4 ml of CaCl₂ solution of desired concentration is mixed and tested after placing the samples in desiccator for 24hr. The corresponding calculated amount of lime precipitated and the % of lime precipitated for various concentrations of CaCl₂ and NaOH is as shown in Table 1. For determining UCS and CBR values of the soil, the samples are prepared at OMC. The index properties of the soil are found out

according to Indian standards [19-23]. The OMC of the soil is 20%, so both UCS and CBR samples are prepared by mixing corresponding amount of CaCl₂ and NaOH solutions. Table 2 shows the corresponding % of lime precipitated for various concentrations of CaCl₂ and NaOH.

Table 1: Index Properties samples-lime precipitation corresponding to different samples

Sample	Percentage of solution con. on weight basis: %	Calculated amount of lime precipitation(g)	% of lime precipitation by weight of soil
S1	10 % CaCl ₂ + 7.3% NaOH	2.78	2.31
S2	20% CaCl ₂ + 14.6% NaOH	5.57	4.63
S3	35 %CaCl ₂ + 25.5% NaOH	9.73	8.08
S4	50 %CaCl ₂ + 36.4% NaOH	13.9	11.55
S5	65 %CaCl ₂ + 47.3% NaOH	18.07	15

Table 2: Engineering Properties (UCS & CBR) samples-lime precipitation corresponding to different samples

Sample	Percentage of solution con. on weight basis: %	% of lime precipitation by weight of soil
S1	10 % CaCl ₂ + 7.3% NaOH	0.67
S2	20% CaCl ₂ + 14.6% NaOH	1.34
S3	35 %CaCl ₂ + 25.5% NaOH	2.3
S4	50 %CaCl ₂ + 36.4% NaOH	3.3
S5	65 %CaCl ₂ + 47.3% NaOH	4.3

RESULTS

Index Properties:

Table 3: Atterberg limits corresponding to % lime precipitated in soil

Sample	Lime %	Liquid Limit	Plastic Limit	Plasticity Index	Shrinkage Limit
S1	2.31	57	29	28	16
S2	4.63	53.5	35	18.5	23.5
S3	8.08	50	38	12	34
S4	11.55	48.5	40	8.5	36.6
S5	15	47.5	41.5	6	39.3

Figure 1: Variation of Atterberg limits with % of lime precipitation

Figure 2: Liquid limit and plasticity index of untreated and lime treated soils plotted in casagrande's Plasticity chart

Fig 1 plots the variations of index properties of soil with percentage lime precipitation occurring (calculated) on sequential mixing of NaOH and CaCl₂ in soil. The liquid limit of samples treated with lime reduced to 47.5 – 57% from an untreated value of 69%. The plasticity index of lime treated samples also reduced to 6–28% from 44%. The shrinkage limit of lime treated specimens increased significantly to 16–39.3% from 11%. It is evident from the figure that the shrinkage potential reduced drastically with the increase in % of lime precipitation. The liquid limit and plasticity index decreased significantly, and plastic limit increased considerably. This can be mainly attributed to strong

short-term lime modification reactions occurring on lime precipitation treatment as most of the pozzolanic reactions occur at curing periods greater than 7 d [1]. The short-term modification reactions occur from the replacement of monovalent exchangeable cations on the negatively charged clay surface by divalent calcium ions (Ca²⁺). This cation exchange decreases the thickness of diffuse ion layer, which in turn increases the net inter-particle attraction and promotes particle flocculation/aggregation, and alters the plasticity characteristics of expansive soil [5][14].

The significant increase in shrinkage limit of lime precipitation treated specimens indicates mainly the amount of clay fraction. As the amount of clay fraction (<0.002 mm) decreases, shrinkage limit increases while shrinkage of the soil decreases. The reduction in shrinkage of lime precipitation treated specimens on drying was due to particle aggregation due to cation exchange and particle agglomeration reactions [8].

The increase in particle flocculation/aggregation changes a part of the clay fraction into a silt size fraction, and alters the plasticity characteristics. This is illustrated in Figure 2, which plots the liquid limit and plasticity index in Casagrande’s plasticity chart.

The lime precipitation treatment alters the expansive clay classification to MI (medium compressible silt) and MH (high compressible silt) from CH (high compressible clay).

Particle Size Analysis:

Figure 3: Variation in gradation curve with % lime precipitation

Figure 3 shows that the grain size distribution of lime treated soil. As the amount of lime added increased there was an increase in sand and silt fractions due to which the clay fractions reduced.

Unconfined Compressive Strength (UCS):

Table 4: UCS at different curing periods and corresponding pH

Specimen designation	Calculated % lime	7 Days		14 Days		28 Days	
		UCS (kg/cm ²)	pH	UCS (kg/cm ²)	pH	UCS (kg/cm ²)	pH
S1	0.67	3.5	9.33	3.7	9.5	4	9.71
S2	1.34	3.7	10.25	4	10.33	4.3	10.4
S3	2.3	4.2	11	4.4	11.25	4.7	11.5
S4	3.3	4.9	12.01	5.1	12.1	5.5	12.1
S5	4.3	5.3	12.14	5.8	12.2	6.7	12.2

Figure 4: Variation of UCS at 7 days curing period and soil pH with lime precipitation %

Figure 5: Variation of UCS at 14 days curing period and soil pH with lime precipitation %

Figure 6: Variation of UCS at 28 days curing period and soil pH with lime precipitation %

Fig 4, 5 and 6 show the variation of UCS of the expansive soil with the calculated % of lime precipitated on mixing of NaOH and CaCl₂. As the % of lime precipitated increased, the UCS of the expansive soil increased. Figures also show that the pH of specimens increases as the % lime precipitation increases. Previous studies suggested that the dissolution of silica (SiO₂) and alumina (Al₂O₃) from the clay lattice begins at a pH of 8.0, and at a pH of about 10.0, maximum dissolution occurs (Barker et al., 2006; Boardman et al., 2001; Rogers et al., 2000). The dissolved alumina and silica combine with calcium ions to form Calcium-Silicate-Hydrate (CSH) and Calcium-Aluminate-Hydrate (CAH), which cements the clay particles together and increases the strength^{[2][9]}. Bell (1988) suggested that at initial periods of curing, the compressive strength increase is due to poorly formed cementation products^[1].

California Bearing Ratio:

Figure 7: Variation of CBR with % lime precipitation and curing period

From Fig 7, it can be concluded that there is a slight variation in CBR at 7 and 28 days of curing for S1 and S2 whereas there is noticeable increase of CBR from S3 to S5. As already discussed, samples having % lime precipitation greater than ICL were found to give good results i.e. precipitated lime improves the soil and provides favourable conditions to pozzolanic reactions to occur. This noticeable increase in CBR is mainly attributed to long term pozzolanic reactions which occur when calcium ions combine with dissolved alumina and silica (in alkaline conditions pH >12) from clay lattice to form CAH and CSH, which cement the clay particles together leading to an increase in CBR (Barker et al., 2006; Diamond et al., 1963; Eades and Grim, 1960; Rajasekaran and Rao, 1998; Wang et al., 1963).

CONCLUSIONS

- The soil modification reactions have significant impact on the index properties and particle size (gradation curve) of the expansive soil.
- The modification reactions shifted the gradation curve to the right as the % lime precipitation increase which shows alteration of fine particles into coarser particles.
- The lime modification reactions along with soil-lime pozzolanic reactions increased the unconfined compressive strength by 3 times at 4.3 % of calculated lime precipitation at 28 days curing period.
- At 4.3% calculated lime precipitation, the CBR of soil samples cured for 28 days improved from 2.15 to 78.9
- The strength properties such as UCS and CBR values of samples have been increased with increase in % lime precipitation and curing period.

ABSTRACT

Long-term behavior of a granular material under repeated loading plays a vital role to understand the behavior of rutting in pavements. Many researchers observed the behavior of permanent strain accumulation in the granular material under cyclic loading condition. The permanent deformation of granular material caused by numerous factors varies with the degree of each factor influence on granular material. This paper summarizes and discusses the impact of individual factors on permanent deformation of granular material through reference to published scientific data. As well, this paper outlines the different constitutive models to find the permanent strain and discusses the permanent strain modelling using shakedown theory.

Keywords: Permanent deformation, Shake down theory, Granular material, Numerical modeling

INTRODUCTION

The growth of developed and industrialized countries depends on the quality and connectivity of roads. Governments invest the significant amount of money on pavement construction and maintenance. In an early 20th century and 19th century, pavements were constructed using the rule of thumb procedure. As there wasn't a standard procedure of pavement construction back in those days, they adopted some methods from the knowledge gathered from long-term observations. Later on, empirical methods were developed and were standardized based on performance observations, but were confined only to the local materials available and thus couldn't be adopted in case of new or alternate materials. Materials were characterized based on simple index tests, and these methods did not consider the procedure of construction and frost susceptibility of pavement materials. The main problem of traditional design methods is that they are restricted only to few types of pavement materials and design procedures. Due to urbanization, the rate of availability of local virgin aggregates decreased, as result engineers were forced to adopt by-products and recycle aggregates as pavement materials. On the other hand, due to increase in traffic, the deformation of roads increased resulting in a hike in maintenance cost. The empirical methods fail to adopt the situations as mentioned above. To overcome these drawbacks, mechanistic design procedures were developed. These techniques are used to figure out deformations of pavement materials and layers

under different loading and environmental conditions. These methods provide resilient modulus factor for better understanding the characterization and permanent deformation used to find out rutting in the pavement layers.

Rutting, generally seen as a groove or despondency on the surface of flexible pavements. It also provides steering difficulties for drivers. To overcome the problems due to rutting, we must understand the elasto-plastic performance of a granular material under different loading conditions. Permanent strain and elastic strain of granular materials are illustrated in Figure.1. This paper summarizes and discusses the impact of individual factors on permanent deformation of granular material and constitutive models.

Factors affecting permanent strain

Figure 1: Strains in granular materials during one cycle of load application

Effect of stress: Stress plays a vital role in the accumulation of permanent deformation of the granular material.

Morgan (1966), Conducted repeated triaxial load test on granular material and observed that with an increase in deviator stress, accumulation of permanent strain decreases and for confining pressure it was seen vice versa. Lashine *et al.*, (1971) studied behavior of crushed stone under repeated load in drained condition and observed that permanent strain interrelated to the ratio of deviator stress to confining stress. Similar results observed by

Raymond and Williams (1978), Pappin (1979), Thom (1988) characterized permanent deformation for static shear test and stated that static failure line is considered as a boundary for permanent strain under repeated loading. Lekarp and Dawson (1998) argued that as the accumulation of permanent strain was not a sudden process, it is not necessary to consider static failure stage in finding the permanent deformation of the granular material.

^[4] studied the behavior of the geo-textile reinforced granular material and found that geo-textile reinforcement does not show a significant effect in the decrement of permanent deformation above 200kpa stress level. ^[14] initiated the study of permanent deformation behaviour of stabilized silty sand with fly ash and fiber. They reported that nearly 21% decrement in permanent strain with silty soil+30% flyash stabilized with coir fiber whereas 18% percentage decrement observed in permanent strain when stabilized with synthetic fiber. They also reported that accumulation of plastic strain of soil (both stabilized and un established soil is directly proportional to deviator stress level and inversely proportional to confining pressure.

Effect of number of load applications: The accumulation of permanent strain is not a sudden process. Each increment of stress in repeated load triaxial test (R.L.T.T) contribute the considerable amount of permanent deformation, so the number of load cycles are to be taken into account in finding permanent deformation.

^[16] observed permanent deformation behavior of the granular material under repeated triaxial test and found that it was increased even after applying two million load cycles. Barksdale (1972) correlated the permanent deformation with log number of repetitions,
