and his studies show that there was a sudden increase in permanent deformation at a higher number of load repetitions. Yang and Huang (2008) studied the long-term behavior of cohesive subgrade and observed that accumulation of permanent deformation was same from 10,000 cycles to 1,00,000 cycles. Similar behavior was observed by Farsakh *et al.*, (2012) for a stabilized granular base with geogrid.

^[14] studied the behavior of reinforced silty sand with fibers and reported that at 100 repetitions fiber reinforcement decreases permanent strain by only 1.35% whereas for 10,000 cycles it was 21%. Anupam *et al.*, (2014) conducted a series of triaxial tests to observe the accumulation of plastic strain of unreinforced and fly ash-rice husk ash stabilized low plasticity clayey soil. They found that 64% reduction in plastic strain when soil stabilized with fly ash whereas 67% reduction observed when soil stabilized with rice husk ash. One more interesting observation observed that up to 1000 load cycles the rate of accumulation of permanent strain is following the same trend for both unstabilized and stabilized low plasticity clayey soil.

Effect of moisture content: The stiffness of granular materials depends on the amount of water present in it. Up to ample amount of water, stiffness increases then decrease. According to Lekarp and Dawson *et al.*, (1998) pore pressure increases and even permanent strain also increases due to the availability of free moisture in the pavement. Similar results were obtained by Saevarsdottir (2013), who studied pavement materials using an A.P.T track

Haynes and Yoder observed 100% more permanent strain when a degree of saturation increased from 60% to 80%. Lin also observed similar behavior for silty subgrade soil and stated that 5-20% increment in optimum moisture results in 300% increment in permanent strain. Barksdale (1972) studied the permanent strain behavior of base course material and came up with the result that 68% of permanent strain was observed for the soaked condition when compared to the partially saturated condition. Similar results were observed by Aiban *et al.* (2006)^[4], who studied the permanent strain behavior of geotextile and cement stabilized subgrade and observed that geotextile stabilized subgrade showed higher loading capacity under soaked condition compared to unsoaked condition. Thom and Brown considered the effect of pore pressure and stated that permanent strain is not only due to the increase in pore pressure but also due to lubricant effect.

Abu-Farsakh considered the effect of reinforcement on resilient and permanent deformation of base materials and observed that the effect of geogrid at optimum moisture stage is more when compared to dry of optimum and wet of optimum. Abu-Farsakh et al., (2012) observed that OMC+2.5% stage untreated granular material show less permanent deformation than geogrid reinforced granular base materials at 100 load cycles. The reason is that sample compacted wet of optimum needs more load cycles to interlock due to dispersed fabric structure. Murab et al. (2014) investigated the effect of cement stabilization on the deformation behaviour of weak subgrade soils and observed that stabilization more effective when soil compacted at wet of optimum condition than optimum moisture condition. They concluded that effect of moisture and deviator stress levels are driven forces for the accumulation of plastic strain.

Effect of density: Effect of density in the granular material is predominantly expressed in terms of compaction effort. In general, the rate of compaction is inversely proportional to permanent strain. Barksdale tested several base course material and 185% increment in permanent strain is observed between 95% and 100% compaction effort. Allen conducted several repeated load tri-axial tests for granular base material and crushed limestone and observed 80% reduction in strain for granular base material and 22% reduction for crushed limestone when the samples were compacted using modified proctor density instead of standard proctor density. It was supported by the Holubec and explained that rounder particles are less pounced than angular particles because of initial higher relative density.

Khedr observed that base and sub-base material mainly consists of crushed rock having same grain size because of which increase of permanent deformation resistance increased with compaction effort. Aiban et al. (2006)^[4] observed that as the density increases the geotextile effect on load carrying capacity decreases. Lin et al. observed 15% decrement in permanent deformation for silt subgrade when density increases from 91% to 95%. Bilodeau et al. (2008) found 41% less permanent deformation for aggregates when the compaction effort changed from 92% to 100%. Wayne studied the behavior of geo-grid stabilized unbound aggregates and stated that geo-grid reinforcement was effective in the decrement of permanent strain even when the lower layers of geogrid are compacted with less density compared to top layers of geogrid.

Effect of fines content: Barksdale^[7] observed the effect of fines content on the granular material and found that with an increase in fines content there was a decrease in permanent deformation resistance. According to Mishra if the fines having plasticity index more than ten, it shows a drastic effect on permanent deformation of the unbound granular material. This was supported by the Cerni et al. (2012), who investigated on unbound granular material with calcareous fines (non-plastic) and silty clay fines under similar stress and moisture and found that calcareous fines have less permanent strain compare to silty clay fines. Mishra *et al.*, observed that 8% fines are limiting value for crushed aggregates whereas 4% fines are limiting for uncrushed gravel and stated that fines effect is more pronounced in permanent deformation compared to the resilient modulus. Soliman and Shalaby (2015) observed that 9% fines are optimum content for gravel material whereas 4.5% for limestone.

Effect of grading and aggregate type: ^[16] observed a decrement in permanent deformation when the relative density is increased by grading under similar compaction effort.

Allen observed plastic strain accumulation for rounded particles is high compared to angular particles (crushed stone) with similar density and surface characteristics due to better interlocking in angular particles. Barksdale^[7] observed that blade shape crushed aggregates are more pronounced to permanent strain accumulation compared to other shapes of crushed aggregates. Rao. C et al. (2002) believed that crushed particles exhibit higher resistance to accumulation of permanent strain compared to uncrushed particles due to the load distribution capacity.

Effect of principal stress reorientation: Principle stress reorientation plays a predominant role in soils stiffness. The concept of reorientation principle is difficult to understand as the lab behavior is not simulating the field condition. Youd (1972) observed that when ever a rotation in principle stress axes occur, there was an increase in density for sands in a shear box. Ansell and Brown (1978) studied behavior of crushed limestone and stated that density is directly associated with the amount of observed cyclic shear. Chan (1990) reported that lime stone shows lesser resistance to permanent strain compared to no shear stress condition when shear stress is used in cyclic tests. From the results, we can observe that bi-directional shear stress pronounce lesser resistance to the accumulation of permanent strain compared to unidirectional shear stress.

Effect of stress history: For granular materials stress history is directly associated with the accumulation of permanent strain. Brown and Hyde observed that immediate application of higher stress pronounced more plastic strain compared to the successive application of stresses due to which materials get stiffer for each load application up to a limited number of load cycles. CEN 2004a introduced multi-stage repeated load triaxial test (M.S.R.L.T) procedure to determine the accumulation of permanent strain in the granular material. M.S.R.L.T test procedure is applied on a single specimen in several stress paths and the test results can be related to field situation due to the inclusion of stress history. Rahman and Erlingsson, (2015) studied the behavior of accumulation of strain using M.S.R.L.T test procedure and revised VTT model developed by Korkiala-Tanttu according to M.S.R.L.T Procedure.

Modelling permanent strain with respect to number of load cycles

Lentz and Baladi conducted a repetitive triaxial test on the sand. Based on the observations, he proposed a model to find out the permanent deformations with a number of load cycles and the difference between principle stresses and co-relate with the static triaxial test results.

$$\epsilon_{1,p} = \epsilon_{0,95s} \ln(1 - q/s) - 0.15 + \ln(N) \left\{ \frac{a(q/s)}{1 - b(q/s)} \right\}$$

Barksdale^[7] conducted several cyclic tri axial tests on base course material to find the relation between the number of load applications and permanent deformation and proposed a relation with respect to the log-number of repetitions.

$$\epsilon_{1,p} = a + \text{blog}(N)$$

Sweere (1990) performed a large number of cyclic triaxial tests on granular base materials using 10,00,000 load repetitions. He didn't agree on regression equation which was proposed by Barksdale^[7] and proposed another equation which is in log-log form.

$$\epsilon_{1,p} = a N^b$$

Khedr(1985) observed permanent strain accumulation of crushed limestone by using cyclic triaxial test and proposed an equation using a number of load cycles under variable confining pressure (VCP).

$$\frac{\epsilon_{1,p}}{N} = A_1 N^{-b}$$

Paute et al. (1988) observed continuous increment in permanent accumulated strain towards asymptotic value. He proposed an equation without considering first 100 load cycles.

$$\epsilon_{1,p}^* = \frac{A_4 \sqrt{N}}{\sqrt{N} + D_4}$$

In the separate study paute et al. (1996) expressed an equation regarding permanent strain with respect to first 100 load repetitions.

$$\epsilon = A * \left(1 - \left(\frac{N}{100} \right)^{-b} \right)$$

According to Lekarp and Dawson (1998), this model is not fit for higher stress conditions.

Modelling permanent strain with respect to a stress condition

Lashine^[26] carried cyclic triaxial test at 20,000 load cycles with different stress levels and proposed below model.

$$\epsilon_{1,p} = 0.9 \frac{q}{\sigma_3}$$

Pappin observed plastic strain behavior of lime stone in the cyclic triaxial test and proposed an equation for an accumulated permanent strain with respect to the length of stress path.

$$\epsilon_{s,p} = (fnN)L \left(\frac{q^0}{p^0} \right)_{\max}^{2.8}$$

Pappin stated that higher permanent strain occurs at static failure stage only.

Paute et al. (1996) proposed a constant value for permanent strain and it changes with maximum shear stress ratio.

$$A = \frac{\frac{q}{(p + p^*)}}{b \left(m - \frac{q}{(p + p^*)} \right)}$$

Theyse, H.L (2002) proposed an equation for permanent deformation with respect to the number of load cycles using heavy Vehicle simulator (HVS)

$$\epsilon_{1,p} (\%) = (m, N) + (A_2) (1 - e^{-B_2 N})$$

Tseng and Lytton (1981) correlated the resilient and permanent deformation with respect to the number of load cycles. This model is used for base, sub-base and sub grade also.

$$\epsilon_p = \beta_1 \left(\frac{\epsilon_0}{\epsilon_r} \right) \epsilon_v^{-(p/N)^B}$$

VTT model is used to determine the accumulated permanent deformation in the unbound granular material(UGM) this model is derived by Korkiala-Tanttu (2005)based on the mohr’s -Columb theory by considering the number of load cycles and stresses.

$$\epsilon_p(N) = BN^b \frac{R}{A - R};$$

$$R = \frac{q}{q_f} = \frac{\sigma_1 - \sigma_3}{q_0 + M_p}$$

$$M = 6. \sin \phi/3 - \sin \phi; q_0 = c, 6, \cos \phi/3 - \sin \phi$$

Modelling of permanent strain with respect to resilient modulus:

Veverka (1979) performed several cyclic triaxial tests on granular materials with respect to the number of repetitions to determine resilient deformation and plastic strain. He correlated resilient modulus and permanent deformation and proposed another model.

$$\epsilon_{1,p} = a\epsilon_r N_b$$

Yang et al. (2008) performed cyclic triaxial tests on cohesive soils and derived a model based on the influence of stresses and load cycles with different moisture conditions with respect to the resilient modulus.

$$\epsilon_p = A \times SL^p \times \left(\frac{M_r}{M_{r,i}} \right)^c \times N^D$$

Mohammad et al. (2006) studied both resilient and plastic deformation on both treated and non-treated base material and correlated with below equation.

$$M_r = 225\epsilon_p^{-0.25}$$

Models based on multi-stage R.LT test: Erlingsson, S., & Rahman, M. (2013) worked on multi-stage repeated load triaxial test (MS RLT) to study the long-term performance of granular material whereas Shu-Rong Yang et al. 2008 and VTT model according to MS RLT condition. These models are validated using different density, moisture conditions, stress levels and grading

Modified VTT model:

$$\epsilon_p(N) = (N - N_{i-1} + N_i^{eq})^{-b} \frac{R}{A - R}$$

Modified Tseng and lytton (1981):

$$\epsilon_p = \beta_1 \left(\frac{\epsilon_0}{\epsilon_r} \right) \epsilon^{- (p/N - N_{i-1} + N_i^{eq}) B} S_{\epsilon_v}$$

Characterization of permanent deformation behavior of granular materials by shake down theory:

For long periods under repeated loading, materials do not behave uniquely up to failure. They follow different stress paths even if all the other conditions are same but for the stress state. Even if a material seemed to have a propensity to attain equilibrium (constant rate of plastic strain accumulation) under a definite load after a certain number of cycles, altering the stress state might cause it to behave quite differently which means there is certain limit of stress for every material above which, after a number of cycles, the material becomes unstable. This limit in literature called the “shakedown limit” or the “critical stress level”. Pauteet al. (1996) observed that the rate of permanent strain accumulation with increasing load cycles decreases constantly to such an extent as to define a limit value for the permanent strain. On the other hand, [16] have reported continuously increasing permanent strain under repeated loading. Maree et al. (1982) also found that for high stress states permanent strain increased at a constant rate but between 5,000 and 10,000 load cycles an exponential increase in permanent strain occurred resulting in failure shortly after. Work by Kolisoja(1998) involving very large numbers of cycles, says that the development of permanent deformation may not be expressible as a simple function. That’s where Shakedown Theory comes in to play. Although Shakedown theory was developed by Melan(1936), it wasn’t until 1983 it was adopted to the pavement engineering field. Sharp and Booker (1984) made use of the shakedown theory for the first time and tried explaining the concept in relation to the response of granular materials under repeated loading. According to Werkmeister et al (2001), the permanent strain development with increasing number of load cycles can follow three different patterns depending on the stress level. (Figure.2)

Figure 2: Permanent deformation behavior of UGM according to shakedown

Range A (Elastic shake down) : The permanent strain accumulation ceases after a certain number of loading cycles. The hysteresis loops will be very narrow but for the slight frictional losses. This type of behavior happens when low-stress level is applied to the material. Stress level is defined as the ration between the applied deviator stress and the deviator stress at failure determined by conducting Static Unconsolidated Undrained triaxial tests. This behavior pattern is attributed to the limited reorientation of the soil particles. This range is also called the plastic shakedown range. Range B (Plastic shake down): The plastic strain accumulation will follow an almost linear pattern with the increased load cycles. This pattern of response will be observed for stress levels greater than the ones for Range A. The plastic strain rate will be low and constant. The plastic strain rate can be defined as follows:

$$\text{Plastic strain rate} = \frac{\epsilon_{p,i+100} - \epsilon_{p,i}}{100}$$

Where $\epsilon_{p,i}$ The accumulated plastic strain is after i load cycles and $\epsilon_{p,i+100}$ Is the accumulated plastic strain at $i+100$ load cycles. This response is attributed to the particle contact attrition and is justified due to the slow accumulation of plastic strain. The hysteresis loops will be wider than in Range A due to frictional losses accompanied with ongoing damage. This stage is also called the plastic creep stage since there is a residual incremental plastic strain. Chen et al. (2013) studied the behavior of Geo-grid reinforced the granular material and found that due to Geo-grid Range B behavior occurrence can be slowdown. Range C (Incremental collapse): The plastic strain accumulation will be rapid and uncontrolled resulting in failure at higher stress levels. This type of behavior is defined as Range C. Hysteresis loops will be very wide indicating higher energy losses. It is not favorable to have this range of materials since sudden collapse might happen. Sudden lead to failure is attributed to particle damage and dilation caused by volume changes during repeated loading. This stage is remarked as the incremental collapse or ratcheting. Range A and Range B can be tolerated in a pavement subgrade but not the range C. The stress level beyond which the material goes unstable is called the Critical Stress level. Rahman and Erlingsson (2015) have studied the shakedown approach and they have selected some prediction models, calibrated and validated them. The models include the VTT model developed by Korkiala-

tanttu (2005) at the VTT Research Centre of Finland and Gidel Model. The VTT model related permanent strain to Stress ratio and a number of loading cycles. This model includes a material parameter and a stress state parameter. Erlingsson & Rahman (2013) conducted Multistage RLT tests instead of Single stage RLT tests to find out the critical stress levels. In the single stage RLT tests (SSRLT), a cyclic loading of constant amplitude is used. To study the influence of various stress levels on the material response, different specimens have to be used. On the other hand, a Multi-Stage RLT test can apply cyclic loading of different magnitudes on the same specimen. This arrangement simulates Field conditions better than SSRLT tests since repeated loadings of varying magnitudes are common in the pavements. Effect of stress history on the material behavior will also be considered in this approach. Research works were mainly done using SSRLT and therefore prediction models are based on the results from them. Rahman et al. (2014) have extended these prediction models for permanent deformation based on the results they obtained from MSRLT tests, by the application of the time hardening formulation.

NOTATIONS

The following symbols are used in this paper:

- $A, B, a, b, c, d, u, \beta$ = regression parameters (A is also limit value for maximum permanent axial strain);
- A_1 = material and stress-strain parameter given (function of stress ratio and resilient modulus);
- A_2-A_4, D_2-D_4 = parameters that are functions of stress ratio q/p ;
- C = apparent cohesion;
- e = base of the natural logarithm
- fnN = shape factor;
- Gp = shear modulus with respect to permanent deformation;
- h = repeated load hardening parameter (function of stress to strength ratio);
- K_p = bulk modulus with respect to permanent deformation;
- L = stress path length;
- m = slope of static failure line;
- M_r = Resilient modulus;
- $M_{r,i}$ = Resilient modulus determined by first 10 load cycles

N = number of load applications;

N_{i-1} = number of load applications end of the (i-1) stress path

p = mean normal stress;

p_{\max} = maximum applied hydrostatic stress;

p^0 = modified mean normal stress = $\sqrt{3} \cdot p$

p_0 = reference stress;

p^* = stress parameter defined by intersection of static failure line and p -axis in p - q space;

q = deviator stress;

q_{\max} = maximum applied deviator stress

q_f = deviator stress at failure

q^0 = modified deviator stress = $\sqrt{\frac{2}{3}} \cdot q$

R_f = ratio of measured strength to ultimate hyperbolic strength;

s = intercept static failure line

S = static strength;

ε_i = permanent strain for first load cycle;

ε_N = permanent strain for load cycle N ;

ε_r = resilient strain;

$\varepsilon_{s,p}$ = permanent shear strain for $N > 100$;

$\varepsilon_{v,p}$ = permanent volumetric strain for $N > 100$;

$\varepsilon_{1,p}$ = accumulated permanent strain after N load repetitions;

$\varepsilon_{1,p}^*$ = additional permanent axial strain after first 100 cycles;

$\varepsilon_{1,p}(N_{ref})$ = accumulated permanent axial strain after given number of cycles N_{ref} ($N_{ref} > 100$);

$\varepsilon_{0.95S}$ = static strain at 95% of static strength;

s_3 = confining pressure; and

ϕ = angle of internal friction

A Study on Data Mining towards Cloud Computing

Komuravelly Sudheer Kumar¹, J. Bhavana¹

¹Assistant Professor, Department of CSE, S R Engineering College, India

ABSTRACT

Data mining is considered as an imperative procedure as it is utilized for finding new, substantial, helpful and reasonable types of data. This paper portrays how data mining is utilized in cloud computing. A hazardous growth of personal and organizational data through different sources like Smart phones , informal communities, sensors, client produced content have raised a few issues regarding data stockpiling on cloud. This blast of crude data and reliance on data administrations has seen a fourfold growth later on time of Internet because of capacity proliferation of data escalated administrations and the advanced. Anyway such foundations are confronting a few research difficulties to be tended to so as to conquer restrictions identified with issues like stockpiling access, versatility, cost, vitality, security, interoperability, proficiency, and so forth. The real issue is settling merchant secure and data.

Keywords: *Data mining, Cloud Computing, Multi-Cloud*

INTRODUCTION

Data mining is the errand of finding fascinating examples from a lot of data, where the data can be put away in databases, data stockrooms or other data storehouses. Consequently, in this exploration an exertion is made to plan an effective Multi-Cloud structure which performs security protected data dissemination and enhances data accessibility. This structure ideally uses the storage room by lessening numerous duplicates of data being put away in cloud^[1]. This data is anchored amid calculation as Hybrid Multi-Cloud framework performs handling of data in-preface by recovering the data put away on various Cloud Service Providers (CSP's). Additionally mCloudmSLA structure is actualized as pluggable module into controller or intermediary server which produces ace Service Level Agreement (mSLA) for capacity and recovery of various kinds of data like chronicle, restorative records and for virtual figuring. In the first phase of research the enterprise data is moved to the Multi-Cloud environment to enhance the security to resolve vendor lock-in and improve data availability as the prime focus. Numerous business endeavors are relocating towards Multi-Cloud to store the venture data.

Aspects regarding Cloud Computing: The late 1960s were hopeful days for innovation progressions, reflected headily in the arrival of Stanley Kubrick's notable 2001: A Space Odyssey and its scandalously

keen PC H.A.L. 9000. Around this time the idea of an intergalactic computing network was first mooted by a specific J.C.R. Licklider, who headed up the Information Processing Techniques Office at the Pentagon. Accused of putting the US on the front foot, innovatively, against the Soviets, ARPA was a hotbed of ground breaking that pushed innovation improvements well past their current points of confinement. Inside this unique situation, Licklider imagined a worldwide network that associated governments, organizations, partnerships and people. He predicted a future in which projects and data could be gotten to from anyplace. Sounds somewhat like cloud computing, doesn't it? This vision really propelled the advancement of ARPANET, an early bundle exchanging network, and the first to execute the convention suite TCP/IP. To put it plainly, this was the specialized establishment of the web as we presently know it. It additionally established the framework for matrix computing, an early precursor of cloud, which connected together topographically scattered PCs to make an approximately coupled network. Thusly this prompted the improvement of utility computing which is nearer to what Licklider initially imagined^[12]. It's likewise nearer to what we consider as the cloud today, with a service supplier owning, working and dealing with the computing foundation and assets, which are made accessible to clients on an on-request, pay-as-you-go premise.

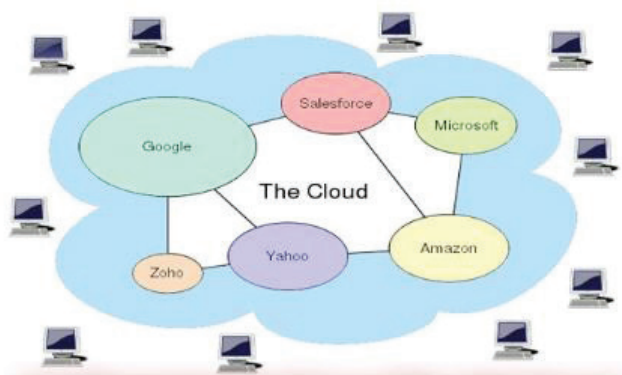

Figure 1: Computing Paradigm Shift

Data mining in Cloud Computing: Data mining involves finding the info, like novels, and useful patterns and applying few algorithms in order to fetch the required data^[13].

From virtualization to cloud: Dovetailing with this is the improvement of virtualization which, alongside expanded data transmission, has been a noteworthy main impetus for cloud computing. Honestly, virtualization finally provoked the ascent of exercises like Salesforce.com in 1999, which led passing on embraced applications by methods for a clear site.

These services firm made ready for an extensive variety of programming firms to convey applications over the web. In any case, the development of Amazon Web Services in 2002 extremely set the cloud ball moving, with its cloud-based services including capacity and figure. The dispatch of Amazon’s Elastic Compute cloud quite a long while later was the principal generally open cloud computing framework service, enabling little organizations to lease PCs to run their own particular PC applications on. It was a divine being send for some private ventures and new companies helping them shun expensive in-house frameworks and get the opportunity to advertise rapidly.

Advantages of Data Mining in Cloud Computing: Data mining in the cloud computing condition can be considered as the eventual fate of data mining in light of the benefits of cloud computing worldview^[14]. For example, the staggering expense of some product as-a-service contributions has gotten a few undertakings out, while the danger of secure with framework as-a-service suppliers is likewise a worry for a few. As the primary flush of cloud computing disperses, endeavors are ending up more wary about being integrated with a

service. The scene is currently set for the eventual fate of cloud, with an emphasis on half and half and multi-cloud arrangements. In five years, phrasing like cross breed IT, multi cloud and oversight services, will a relic of times gone by. It will be guaranteed, and there won’t simply be one cloud arrangement, or one data arrangement, it will be about how clouds interface and about boosting how networks are utilized. Half and half arrangements should imply that remaining burdens.

Benefits of Cloud

There are numerous advantages of clouds. Some of them are recorded underneath.

Lessened Cost: There are different inspirations to property Cloud development with cut down costs. The charging model is pay as indicated by use; the establishment isn’t obtained along these lines cutting down upkeep. Starting expense and rehashing costs are much lower than standard computing.

Increased Storage: With the tremendous Infrastructure that is offered by Cloud providers today, accumulating and upkeep of broad volumes of information is a reality. Sudden outstanding job that needs to be done spikes are moreover supervised enough and viably, since the cloud can scale continuously.

Flexibility: This is a basic trademark. With endeavors altering, substantially more rapidly, to changing business conditions, speed to pass on is fundamental. Cloud computing gives inventive approaches to data mining algorithms. Joining data mining algorithms with cloud computing innovation will turn into the future research drift. As aftereffect of service decent variety in cloud suppliers, choosing cloud suppliers in view of client prerequisite, master rating and past execution of service suppliers, with reasonable service set to shape Multi-Cloud is testing assignment. Additionally, QoS parameters specified in client prerequisite can be clashing or varying level of significance among different cloud suppliers or utilizing diverse strategies for computing characteristics. In view of service decent variety in cloud suppliers, choosing cloud suppliers in light of every one of the three parameters said above is a testing undertaking for the development of Multi-Cloud condition.

Cloud Computing Challenges: In spite of its developing impact, concerns with respect to cloud computing still remain. As we would like to think, the advantages exceed

the downsides and the model merits investigating. Some normal difficulties are:

Data Protection: Data Security is an essential component that warrants examination. Ventures are hesitant to purchase an affirmation of business data security from sellers. They fear losing data to rivalry and the data classification of customers. In numerous occasions, the genuine stockpiling area isn't uncovered, including onto the security worries of ventures. In the current models, firewalls crosswise over data focuses (possessed by endeavors) ensure this delicate data. In the cloud display, Service suppliers are in charge of keeping up data security and endeavors would need to depend on them.

Data Recovery and Availability: All business applications have Service level understandings that are stringently taken after. Operational groups assume a key job in administration of service level understandings and runtime administration of uses. Underway situations, operational groups bolster

Management Capabilities: In spite of there being multiple cloud suppliers, the administration of stage and framework is still in its early stages.

CONCLUSION

In Cloud computing, the data is being moved starting with one server then onto the next server in a distributed exchange. Data mining advancements gave through Cloud Computing is a totally fundamental element for the present organizations to make down to earth, information driven choices as it causes them have future patterns and practices anticipated. Data mining innovations gave through Cloud computing is a completely fundamental trademark for the present organizations to make proactive, learning driven choices, as it encourages them have future patterns and practices anticipated.

This paper gives a diagram of the need and utility of data mining in cloud computing. As the requirement for data mining devices is developing each day, the capacity of incorporating them in cloud computing turns out to be increasingly stringent. Data mining based on Cloud computing is an imperative trademark for the present foundation to improve effective and learning driven choices. This paper gives audit of data mining ideas in

cloud computing and diverse kinds of algorithms that can be utilized for sharing of assets utilizing Data mining and Cloud computing.

Exponential Spline Answer for Boundary Value Problems Employing an Unsure Parameter

C. Balarama Krishna¹

¹Assistant Professor, Department of Humanities and Sciences, S R Engineering College, Warangal

ABSTRACT

The suggested procedure employs period investigation basic principle to handle all the uncertain parameter as well as also the montecarlo Simulations (MCS) have been utilized to confirm that the clear answer and also the truth of the suggested procedure. Additional sensitivity analysis was conducted with different procedures to estimate just how far the remedy is more painful and sensitive for the fluctuations of this perturbation parameter. Numerical results are supplied to reveal that the applicability and efficacy of this suggested system, and it will be ϵ -uniform convergence of virtually instant order.

Keywords: Singular Perturbation Problem, Exponential Spline, Interval Analysis, Monte Carlo Simulations

INTRODUCTION

Various apps in engineering and science believe these sorts of issues that clarify complicated chemical and physical models like heat transport issues, navier stokes stream together with big Reynolds numbers, chemical reactor principle, convection-diffusion procedures, geophysics, aero-dynamics, reaction-diffusion procedures and quantum mechanics and optimum management, etc.,. Its alternative demonstrates 2 layers in both end points of this domainname. The character of this two-parameter dilemma was asymptotically analyzed. It had been unearthed that layer-adapted meshes are essential to acquire a convergent technique however smaller the perturbation parameter ϵ [3] for a lot more information.

Dag and Sahin offered an numerical method of singularly perturbed boundary value issues, making use of finite element system [1]. Their first collocation system was implemented with quadratic and cubic Bspline base works across the geometrically rated net of this domainname. Back in 2010, Rashidina and also Mohammadi [1-2] believed the self-adjoint singularly perturbed TwoPoint border value issues. (2007) [1,3] formulated quintic non- polynomial spline means of its numerical method of fourth sequence Two Point border value issues. At 2006 [14] to get a perturbed normal differential equation using just two modest parameters involving the convection and also diffusion conditions. They utilized Bspline collocation system on piecewise-

uniform Shishkin net, that causes a tridiagonal linear process. Their procedure had been proven to own a uniform convergence of next purchase.

For an even longer moderate investigation of this procedure reply, doubt ought to really be engaged. After the specific significance of some volume is as yet not known, its own approximation and corresponding level of doubt might be hauled through a period, which untimates a wide selection of potential values anticipated to comprise, to start with indicated by numerous mathematicians for bounding round off mistakes, and the period investigation is totally developed from Moore. We will utilize MCS being a tool that is supporting for your own suggested procedure. MCS could be the easiest way of handling any randomness in a method. The arbitrary parameter, a exceptional remedy is characterized by adhering to the p-terministic solver for every one of those realizations. Back in 1967, Stein generalized his version that integrates stochastic consequences as a result of circadian excitations to deal with a supply of post-synaptic possible amplitudes and utilised that the montecarlo procedure for approximating the clear answer. David Edwards FDM way of a special singularly perturbed boundary value issue along with this particular method has been founded on montecarlo techniques.

The principal contribution of the paper would be to build up into a fresh spline system predicated on the Shishkin mesh discretization for acquiring an approximation to your solution of both two-layer border

value issues. Whilst the perturbation parameter isn't deterministic, and so the period investigation will be thought to gauge exactly the solution assortment. The identification of this manufactured solver is going to be accomplished by assessing the same and the approximate remedies of this suggested procedure along with also the MCS results. Even the convergence investigation additionally has been shown invisibly and demonstrates the offered system is all but second-order.

INTERVAL AND SENSITIVITY ANALYSIS

Since doubt is going to be contemplated, the period investigation may function as descriptive actions of doubt in qualitative worth. Thus, the perturbation parameter isn't deterministic, the clear answer must be understood to be an array on the basis of the period of this parameter. Sensitivity steps might be ran with different methods as an example one at a time Sensitivity steps (\pm SD), the Sensitivity Index (SI), the significance Index (II), Differential Sensitivity examination (PD), etc.. We anticipated that the significance steps Employing These approaches One at a Time Sensitivity Steps (\pm SD), "the Sensitivity Indicator, along with also the Differential Sensitivity Examination. One at a time Sensitivity steps (\pm SD) is regarded as most straightforward--yet successful --means of conducting sensitivity analysis, that quotes that the variant of this clear answer whilst the perturbation parameter is raised by means of a variable of its normal deviation or at different words per proportion of its mean worth.

The Sensitivity Index (SI) is yet still another easy way of estimating the sensitivity step will be to compute the comparative solution gap when changing one enter parameter from its minimal value to its highest possible worth, which offers a fantastic indicator of parameter and version variability. The SI is calculated with and maximum answer values, respectively, leading in changing the perturbation parameter within its whole scope.

Differential Sensitivity examination (PD) procedure believes all of random parameters add up with their mean values along with partial distinction of this machine with regard for the arbitrary parameters needs to really be accomplished. The significance coefficient for a Certain parameter -- even perturbation parameter could be quantified in the tight derivative connectiony.

CONCLUSION

A numerical method based on exponential spline using Shishkin mesh discretization is united together with interval analysis viewpoint to evaluate the range of the perfect solution is for its perturbed Two Point border value problems with unclear parameter. The numerical results demonstrate that the present method approximates the alternative very well compared with all the precise option. Therefore, the planned method is almost second-order uniformly convergent with respect for the perturbation parameter. MCS have been used to show the validation and the accuracy of this suggested method. Preliminary investigation Was conducted with distinct Strategies and It's discovered that the solution is not sensitive for this perturbation parameter.

A Study on the Applications of IOT

Siripuri Kiran¹, Shoban Babu Sriramoju¹

¹Research Scholar, Kalinga University, India

ABSTRACT

We are planning to actualize these application for smart city implementation. We are utilizing movement sensor, relay,raspberry pi and IOT concept to build up this application. In this we are distinguishing the movement by utilizing movement sensor and if any movement isn't identified then electrical equipments(like light,fan) are power off and if any movement is recognized then naturally electrical equipments(like light,fan) are power on. It likewise watch the exercises of human like when any individual power on turns and when power off changes as for time by utilizing these data it play out the tasks. This concept can be utilized from a little organization to any big organization.

Keywords: IOT,android device,raspberry pi,sensors, relay.

INTRODUCTION

In change of wired and wireless technologies IOT concept is presented. IOT gets more consideration over recent years for improvement of any application. As per IOT implies that each protest or anything is associated and without human cooperation impart through the Internet^[1]. According to the IOT worldwide activity standard,in the global media transmission union,the IOT concept isn't restricted for physical items it likewise incorporates the virtual articles. It implies that to contrasted machine with machine technology should be possible with help of IOT concept.

Some of smart home application utilizes the concept of IOT. IOT based smart home incorporates an IOT Based Monitoring System utilizes the sensor part and correspondence part. The correspondence part incorporates blue-tooth and WIFI to associate with versatile devices,cloud server and articles^[4]. However, blue-tooth have just 10M territory for correspondence. In any case, IR^[5]can not transmit through dividers and any deterrent. So employments of IR is disadvantage of such application. We are utilizing IOT technology to defeat this downside.

The primary objective of IOT is to improve the nature of human life the IOT incorporates the smart homes,smart building, smart cars,etc in human life. We are developing an undertaking for smart city utilizing IOT based application. We are utilizing movement detector sensor that measure the natural information

an examine this information and give yield. Likewise it incorporates a raspberry pi and relay. Raspberry pi it is only a little processor which process the information for sensors and give the yield to relay. Relay is only an electrical circuit which deal with the power stream agreeing the information given by raspberry processor.

SYSTEM ARCHITECTURE

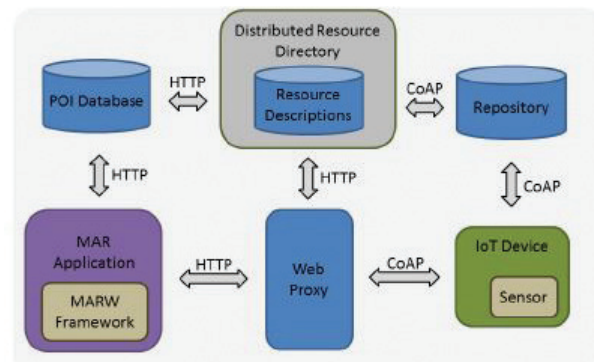

Figure 1: System Architecture

In these application the movement sensors are conveyed in a room or office. The movement sensors are use to distinguish the movement. At that point these sensors send the information to raspberry pi. Raspberry pi process the information as indicated by condition and send the suitable yield to relay. At that point relay take contribution from raspberry pi and perform legitimate activity.

IoT in Applications: Underneath the eyesight of this IoT, software might be totally automatic by minding themselves exposed to some different atmosphere. The

clever behaviour pushed from the machine might be actuated to cope with sudden conditions. Nevertheless, the purposes from the above mentioned domain names will deliver greater analytic consequences in the subsequent hindrances are precisely taken good care of. Apparently the significant players of all set while in the aforementioned application domain names are RFID and GPS. RFID is just one of one of the absolute most useful instruments to transmit and get info via wireless frequency without any cables and in the bottom charge. A obvious downside of the technology may be that the reader crash that might occur once the signs out of more subscribers float or quite a few labels exist in a little location. Even though a lot of systems utilize a anti- accident protocol to allow the tags to shoot turns into transmitting into an individual reader, then that this issue continues to be. Still another sturdy barricade is the fact that the worldwide specifications of RFID aren't yet recognized.

In terms of GPS, it's considered an superb device for information set from various surroundings where by users may generally understand the skies and can access near the items to be mapped. GPS calls for a obvious lineup - of-sight involving your recipient's antenna along with a few orbiting satellites. Whatever concealing the antenna out of the satellite has the potential to impair the sign to this level it gets overly hard to accomplish reliable placement. Obstructions such as trees, buildings, cross-ways, along with other obstacles which block sun may block the GPS signs at which in fact the possibility might be badly paid off (Guo et al.

Due to the fact the conversation of this IoT is no system available over the scope, thus a portable quad-core network that permits devices and people to seamlessly produce a system in parts with no preexisting communicating infrastructure looks like always a greater selection. The greater advantage the further software, and also the further system companies it supports, the more the more greater chances for busy attackers in addition to malicious or malicious nodes to build aggressive strikes. These sorts of assault may badly injury basic purposes of stability, like the ethics, ethics, and solitude of all their node. Right now, the stability aim on mobile networks are only able to be be done as a result of cryptographic mechanics. These mechanics are ordinarily more vulnerable to physical security dangers than mended wired systems. In any case, standardized

communication ports and also dispersed management brains in a business system stay cluttered (López et-al . ,” 2012).

CONCLUSION

In this paper we are utilizing IOT based home monitoring system with the assistance of android devices, relay, sensor, raspberry pi for future smart city application. By utilizing this application we can spare greatest measure of power. The principle focal point of IOT is to enhance nature of human life. By developing this application man endeavors are lessen and without human association machines are worked.

A Study on the Enhanced Approach of Data Mining Towards Providing Security for Cloud Computing

J. Bhavana¹, Komuravelly Sudheer Kumar¹

¹Assistant Professor, Department of CSE, S R Engineering College, India

ABSTRACT

As of late, a few governments have started to use cloud computing models, applications and stages for addressing the necessities of their constituents and conveying administrations. Security possesses the primary rank of hindrances that face cloud computing for administrative organizations and organizations. Cloud computing is encompassed by numerous dangers that may affect administrations and data bolstered by means of this innovation. Likewise, Cloud Computing is one of the promising innovation in which mainstream researchers has as of late experienced. Cloud computing is identified with other research territories, there is no prerequisite for frank enthusiasm for servers or programming licenses, while for the provider, the costs are cut down, since only a singular application ought to be encouraged and kept up. Today SaaS is offered by associations, for instance, Google, Sales drive, Microsoft, Zoho, et.

Keywords: *Cloud computing, Data mining, Cloud security issue*

INTRODUCTION

As per^[4], a cloud is a pool of virtualized assets over the Internet that takes after a compensation for every utilization show and can be progressively reconfigured to fulfill client demands by means of on-the-fly. Likewise, Cloud computing is known as a strategy for expanding the abilities or including limit in powerful way without putting resources into new preparing new staff, framework or authorizing new programming, appropriately it progresses in the direction of broadening the current capacities of Information Technology (IT)^[8]. aS gives principal stockpiling and computing capacities as regulated services over the system. Servers, stockpiling frameworks, organizing hardware, data center space thus around are pooled and made open to manage exceptional jobs that need to be done. The customer would routinely send his own item on the establishment. Some essential delineation is Amazon, GoGrid, 3 Tera, et cetera^[12].

LITERATURE REVIEW

These days, Small and Medium Business (SMB) associations have been comprehended that essentially by getting into the cloud computing, they can acquire quick access to best business applications or progressively fortify the assets of their framework, all at insignificant

expense.^[13]Adventures have been using database organization frameworks in their data center. At first, it was left to fashioners to present, regulate and use their choice of database precedent on the cloud, with the heaviness of all the database association errands being left to the architect. The upside of this is you pick your own specific database and have full control over how the data is regulated. In order to improve the weight on the customers of their cloud commitments, various PaaS traders have started offering database services on the cloud. All physical database association assignments, for instance, support, recovery, managing the logs, et cetera, are regulated by the cloud provider. The obligation with respect to predictable association of the database, including table tuning and request improvement, lies on the originator. An affiliation that allows database service needs to do these errands and offer a motivating force gave it is powerful.

Database service provider gives reliable frameworks to relationship to make, store, and access their databases. Customers wishing to get to data will now get to it using the gear and programming at the service provider as opposed to their own particular affiliation's computing establishment. The application would not be influenced by power outages in view of programming, gear and systems administration changes or frustrations at the

database service provider's site. This would help the issue of purchasing, introducing, keeping up and reviving the item and administrating the system. Instead of doing these, the affiliation will simply use the readied system kept up by the service provider for its database needs.

Database frameworks have wound up being wildly compelling in various cash related, business, and Internet applications. In any case, they have a couple of honest to goodness repressions, for instance,

Database systems are hard proportional.

Database systems are hard to arrange and keep up.

Diversification in accessible systems confuses determination.

Peak provisioning prompts unneeded expenses.

CLOUD COMPUTING AND MAP/REDUCE MODEL

Hadoop is an open source disseminated computing structure [6], which is utilized for dispersed preparing of extensive data sets and intended to fulfill groups scaled from a solitary server to a great many servers. Research in cloud data storage involves many inter-disciplinary fields. This chapter gives background information of these fields and reviews different techniques and architectures involved in achieving secured cloud data storage. The scope of discussion goes beyond traditional information storage to more advanced multi-cloud storage. The review presented in this chapter is limited to the scope of the thesis, and detailed study in other related areas, is available as follows: Survey of error correcting codes, Survey of various cloud security domains, Proof of Irretrievability (POR) and Proof of Possession (POP), Federated Cloud, Composite cloud, Various encryption algorithm and Various Multi Criteria Decision Making algorithms.

Digitization in every business has resulted into explosive rate of growth in data. This Big data is growing beyond our imagination owing to the paradigm shift in Technology

In this digital era, aside from overseeing HR of an organization, there is a need to oversee other unmistakable and immaterial assets. Most significant corporate resource is the data being generated through different gadgets. Compelling storage, access, security and administration of basic data is another test looked by IT

divisions. A typical way is given between storage gadgets and servers as Storage Area Networks (SANs) operate behind the servers not at all like record arranged Network Attached Storage (NAS) arrangements and server based (Direct Attached Storage) DAS arrangements SANs give both square level and document level access to the mutual data. This data is shared between work force and computing assets in SAN arrangements. This innovation utilizes fiber channel arrangement. As of late other new setups like Internet Small Computer System Interface (iSCSI) and Fiber Channel Over Ethernet (FCOE) are getting to be mainstream.

Data Storage is classified into three types like File Storage, Block Storage and Object Storage based on method of storing and accessing data. Since the dawn of the social media like Facebook, Twitter and WhatsApp most of the data is in digital form. This data in an unstructured format had issues of storing and retrieving the information. One of the methods is proposed to resolve these issues.

Encryption Techniques

As touchy data are outsourced to the cloud, these data must be encoded before they are outsourced into the cloud for the protection purpose. In the proposed framework the records are scrambled utilizing RSA encryption work by the executive before outsourcing them into the cloud.

RSA Encryption: RSA calculation is created by Ron Rivest, Adi Shamir and Len Adleman and it is the primary open key encryption calculation. RSA is a square figure in which the plain text and cipher text are numbers among 0 and n-1 for some n.

The accompanying condenses the RSA calculation. Choosing two prime numbers, p and q compute their item n, which is the modulus for encryption and unscrambling. Next, we require the amount $\phi(N)$, alluded to as the Euler totient of n, which is the quantity of positive numbers not as much as n and moderately prime to n. At that point select a whole number e that is moderately prime to $\phi(N)$. At last, compute d as multiplicative opposite of e, modulo $\phi(N)$. To encode a message M the sender gets open key of beneficiary $KU=\{e,N\}$ and processes: $C=Me \text{ mod } N$, where $0 \leq M < N$. To decode the ciphertext C the proprietor utilizes their private key $KR=\{d,p,q\}$ and registers: $M=Cd \text{ mod } N$.

Homomorphic Encryption: A list of catchphrases is developed utilizing record parser interface where the pointless words are disregarded and just the watchwords of the archive is recorded in the vector word file. This record in encoded utilizing homomorphic encryption and transferred to the cloud.

Give p and c a chance to mean the plain text and cipher text of the whole number, separately. Our encryption plan can be communicated as the accompanying detailing: $c=sn+2r+p$ where s signifies the mystery key, n means the different parameter, and r indicates the clamor to accomplish vicinity against savage power assaults. M is the plain text .general society key is $sn + r$.

Based on homomorphism property, the encryption plan can be depicted as four phases: KeyGen, Encrypt, Evaluate, and Decrypt.

Fig 1 demonstrates the holes among desires and saw benefits by cloud clients depends on our understanding [2-5, 7-14]. Additionally a hole between clients' desires and deliverable administrations has been seen. As we would like to think, a considerable lot of the potential customers know about this hole and therefore, they are looking out for the sidelines. Persuading these clients (customers) that the cloud will meet their desire will urge them to join the cloud computing. [2, 7, 8].

Figure 1: Cloud Computing Risks

Figure 2: Understanding Cloud Computing

CONCLUSION

In this paper data security difficulties and arrangements are accommodated these difficulties with a specific end goal to conquer the hazard incorporated into cloud computing. The cost increment of any CSP can be an efficient disappointment, which can be foreseen early. The chairmen of the RACS will move the information from such a CSP much before the disappointment happens. It diverts the put ask for from the fizzled archive to the new store. It won't utilize the fizzled archive forget demands. It spares download and after that transfer of $1/m$ of the aggregate protest information. In another stage, we additionally tallied computational many-sided quality for our last determination.

A Study on Regression Testing towards Cost Optimization

T. Mahesh Kumar¹

¹Assistant Professor, Kakatiya Institute of technology and science, Department of I.T, India & Research Scholar, KL University, India

ABSTRACT

Regression testing is basic type of updating the software. Testing each piece of software each time is particularly costly in light of advancement of test suites as software develops. Accused of putting the US on the front foot, innovatively, against the Soviets, ARPA was a hotbed of ground breaking that pushed innovation improvements well past their current points of confinement. Inside this unique situation, Licklider² imagined a worldwide network that associated governments, organizations, partnerships and people. He predicted a future in which projects and data could be gotten to from anyplace. Sounds somewhat like cloud computing, doesn't it? This vision really propelled the advancement of ARPANET, an early bundle exchanging network, and the first to execute the convention suite TCP/IP. To put it plainly, this was the specialized establishment of the web as we presently know it. It additionally established the framework for matrix computing, an early precursor of cloud, which connected together topographically scattered PCs to make an approximately coupled network. Thusly this prompted the improvement of utility computing which is nearer to what Licklider² initially imagined. It's likewise nearer to what we consider as the cloud today, with a service supplier owning, working and dealing with the computing foundation and assets, which are made accessible to clients on an on-request, pay-as-you-go premise.

Keywords: Code Graph, Regression Testing, Path Complexity, Subgraph, Cost Optimization.

INTRODUCTION

“Software testing is the way toward executing the program with the aim of discovering error”. Dovetailing with this is the improvement of virtualization which, alongside expanded data transmission, has been a noteworthy main impetus for cloud computing. Honestly, virtualization finally provoked the ascent of exercises like Salesforce.com⁷, which led passing on embraced applications by methods for a clear site. These services firm made ready for an extensive variety of programming firms to convey applications over the web. In any case, the development of Amazon Web Services in 2002⁴ extremely set the cloud ball moving, with its cloud-based services including capacity and figure. The dispatch of Amazon's Elastic Compute cloud quite a long while later was the principal generally open cloud computing framework service, enabling little organizations to lease PCs to run their own particular PC applications on. It was a divine being send for some private ventures and new companies helping them shun expensive in-house frameworks and get the opportunity to advertise rapidly.

Fig. 1: Regression Testing

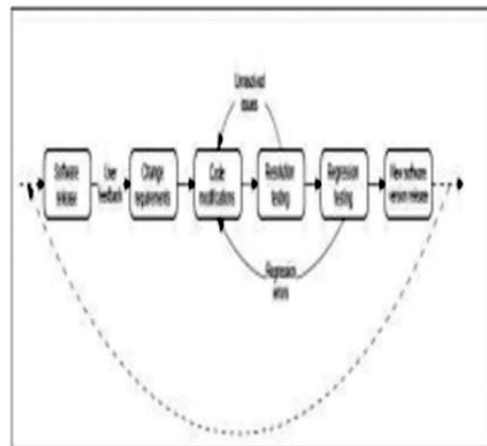

Fig. 2: Activities that take place during software maintenance regression testing

Figure 2 demonstrates the exercises happens in regression testing amid the maintenance phase. As appeared in figure, after software is discharged, While cloud has its advantages, ventures are running into issues, as their relocations proceed. For example, the staggering expense of some product as-a-service contributions has gotten a few undertakings out, while the danger of secure with framework as-a-service suppliers is likewise a worry for a few. As the primary flush of cloud computing disperses, endeavors are ending up more wary about being integrated with a service. The scene is currently set for the eventual fate of cloud, with an emphasis on half and half and multi-cloud arrangements. In five years, phrasing like cross breed IT, multi cloud and oversaw services, will a relic of times gone by. It will be guaranteed, and there won't simply be one cloud arrangement, or one data arrangement, it will be about how clouds interface and about boosting how networks are utilized. Half and half arrangements should imply that remaining burdens.

CODE GRAPH

In, Code Graph strategy we partition the graph into subgraphs by finding minimal cliques and independent sets. This implies you don't get to the data from either your PC's hard drive or over a devoted PC network (home or office network). Cloud computing implies data is put away at a remote place and is synchronized with other web data. One noticeable case of cloud computing is Office 365 which enables clients to store, get to, alter their MS Office archives on the web (in program) without installing the genuine program on their gadget.

Fig. 3: Clisque

In figure 3 the graph contains one maximum clique, the triangle {1,2,5}, and four maximal clique pairs {4,6}, {4,5}, {3,4}, {2,3}.

Fig. 4: Independent Set

Figure demonstrates the total block diagram of the proposed system. This figure gives a short review of exercises occur in code graph i.e. complete process of code graph.

LITERATURE SURVEY

Several regression testing techniques are introduced amid numerous years. For the literature survey several papers were studied and tried to get an approach with the help of previous papers, which can optimize the cost.

The ordinary course of action includes assorted costs. In spite of truth that the costs of gear, programming, and system more inclined to decrease persistently, at any rate people costs don't reduce. Later on, it is likely that computing game plan costs will be overpowered by person's expenses. There is in like manner necessity for database fortification, database restore, and database improvement to recoup space or to restore best strategy of data. Movement beginning with one database frame then onto the following, without influencing course of action openness, is a craftsmanship still in its beginning periods. Parts of database game plan, if not the entire course of action regularly wind up blocked off in the midst of variation change.

Adventures⁴ have been using database organization frameworks in their data center. At first, it was left to fashioners to present, regulate and use their choice of database precedent on the cloud, with the heaviness of all the database association errands being left to

the architect. The upside of this is you pick your own specific database and have full control over how the data is regulated. In order to improve the weight on the customers of their cloud commitments, various PaaS traders have started offering database services on the cloud. All physical database association assignments, for instance, support, recovery, managing the logs, cetera⁶, are regulated by the cloud provider. The obligation with respect to predictable association of the database, including table tuning and request improvement, lies on the originator. An affiliation that allows database service needs to do these errands and offer a motivating force gave it is powerful.

Database service provider⁵ gives reliable frameworks to relationship to make, store, and access their databases. Customers wishing to get to data will now get to it using the gear and programming at the service provider as opposed to their own particular affiliation's computing establishment. The application would not be influenced by power outages in view of programming, gear and systems administration changes or frustrations at the database service provider's site. This would help the issue of purchasing, introducing, keeping up and reviving the item and administrating the system. Instead of doing these, the affiliation will simply use the readied system kept up by the service provider for its database needs. Afterside effect of this paper demonstrates the successful need of finding the faults by covering each one of the criteria's as one.

COST OPTIMIZATION TECHNIQUES

Regression Testing is an emergent area. It is performed whenever any alteration has been placed up into a system. In this digital era, aside from overseeing HR of an organization, there is a need to oversee other unmistakable and immaterial assets. Most significant corporate resource is the data being generated through different gadgets. Compelling storage, access, security and administration of basic data is another test looked by IT divisions. A typical way is given between storage gadgets and servers as Storage Area Networks (SANs) operate behind the servers not at all like record arranged Network Attached Storage (NAS) arrangements and server based (Direct Attached Storage) DAS⁵ arrangements SANs give both square level and document level access to the mutual data. This data is shared between work force and computing assets in SAN arrangements. This innovation utilizes fiber

channel arrangement. As of late other new setups like Internet Small Computer System Interface (iSCSI) and Fiber Channel Over Ethernet (FCOE) are getting to be mainstream.

Data Storage is classified into three types like File Storage, Block Storage and Object Storage based on method of storing and accessing data. Since the dawn of the social media like Facebook, Twitter and WhatsApp most of the data is in digital form. This data in an unstructured format had issues of storing and retrieving the information.

CONCLUSION

Regression testing is a kind of testing that assistance designer to ensure that no imperfections has happened after the performing the alteration. The fundamental point of this framework is to give uprightness as opposed to mystery. Consequently, it is more responsive than proactive. It can withstand a portable enemy like a proactive cryptographic framework. HAIL depends on new convention configuration called as TAR (Test and Redistribute). As clarified before TAR utilizes PORs to recognize any information or document debasement and reallocate the assets when required. Once blame is distinguished by means of test reaction in a given server the customer speaks with the other server. This interchanges encourages the customer to recuperate the ruined offers from the encoded documents disseminated on different servers for cross-server repetition. It later resets the flawed server with the right offer. The new figuring is based on these examination techniques yet with new innovative idea so we can lessen the exertion, cost and time of improvement process.

An Overview of IOT towards Irrigation System

Swathi¹, Rajesh Mothe¹

¹Assistant Professor, Department of CSE, S R Engineering College, India

ABSTRACT

Agricultural division is accepting critical part in Indian economy, in which water system component is of key concern. Our paper plans to locate the right field condition and to control the wastage of water in the field and to give redress controlling of field by using the trickle water system, atomizing the agricultural condition by using the parts and building the imperative gear. For the completely checking and controlling of the farming documented, unmistakable sorts of sensors were used. To execute the proposed framework ARM LPC2148 Microcontroller is used. The water system instrument is observed and controlled simply more proficiently by the proposed framework, or, in other words time criticism control framework. GSM advancement is used to enlighten the end customer about the right field condition. Actually this method for water system framework has been proposed essentially to save resources, yield of harvests and ranch profitability. In India around 70% of populace depends on cultivating and 33% of the nation's capital begins from cultivating. Issues concerning farming have been constantly destroying the change of the country. The principle respond in due order regarding this issue is brilliant agribusiness by modernizing the current regular systems for farming. In this manner the endeavor goes for affecting horticulture to brilliant using robotization and IoT progresses. The including features of this endeavor joins savvy GPS based remote controlled robot to perform assignments like weeding, showering, dampness detecting, winged animal and creature frightening, keeping deliberateness, et cetera. Additionally it fuses brilliant water system with keen control and insightful fundamental authority in perspective of correct ongoing field data. Thirdly, brilliant stockroom organization which consolidates temperature upkeep, moistness support and robbery discovery in the circulation focus. Controlling of each one of these assignments will be through any remote savvy gadget or PC associated with Internet and the exercises will be performed by interfacing sensors, Wi-Fi or ZigBee modules, camera and actuators with smaller scale controller and raspberry pi.

Keywords: automation, IoT, Wi-Fi, WSN, GPS, Smart Device

INTRODUCTION

Water system administration is an unpredictable basic leadership procedure to choose when and how much water to apply to a developing yield to meet particular administration goals. If the rancher is far from the agricultural land he won't be seen of current conditions^[1]. In this manner, proficient water administration accept an essential part in the overflowed agricultural trimming frameworks.

An insignificant exertion elective response for proficient water administration by and by being utilized is dribble water system frameworks that contain a robotized controller to kill on and the control regards, which in this way empowers the ranchers by managing the water to supply to the product fields and further

keeps up the dampness levels of soil that helps in better harvest creation inside the restricted ability to center time.

In this paper an effective response for keeping up the water supply to the harvest fields in perspective of the climate and soil conditions has been proposed. ARM7LPC2148 microcontroller is used for arranging the proposed framework^[2]. GSM based Irrigation Control System is used to support the agriculturists with data about the natural conditions through which the consistency will be kept up. A GPRS included wireless is used for this application which goes about as a correspondence medium between the proposed framework and the end customer (rancher).

Observing natural elements isn't adequate and complete response for improve the yield of the harvests.

There are number of different elements that impact the profitability to unbelievable degree. These components fuse strike of bugs and disturbances which can be controlled by showering the product with genuine bug splash and pesticides. Besides, strike of wild creatures and flying creatures when the harvest grows up. There is similarly likelihood of burglaries when trim is at the period of get-together. For sure, even resulting to gathering, ranchers moreover stand up to issues away of accumulated yield^[4]. Thusly, in order to give answers for each and every such issue, it is critical to make joined framework which will manage all variables affecting the profitability in each stage like; improvement, assembling and post procuring capacity.

This paper in this way proposes a framework which is profitable in observing the field data and what's more controlling the field undertakings which gives the flexibility. The paper goes for making farming shrewd using robotization and IoT developments. The including features of this paper joins shrewd GPS based remote controlled robot to perform errands like; weeding, splashing, dampness detecting, winged animal and creature terrifying, keeping cautiousness, et cetera. Also, it consolidates brilliant water system with shrewd control in light of constant field data. Thirdly, savvy dispersion focus administration which joins; temperature upkeep, dampness support and robbery identification in the stockroom. Controlling of each one of these assignments will be through any remote savvy gadget or PC associated with Internet and the exercises will be performed by interfacing sensors, Wi-Fi or ZigBee modules, camera and actuators with miniaturized scale controller and raspberry pi.

METHODOLOGY

All things considered, the sensors will give basic yield anyway our processor will recognize only the propelled data. So we require a converter ADC^[10], by interfacing the sensors to the ADC coordinate pins which are in-attempted to the processor we get the required sort of yield. The aggregate circuit plan is showed up in the underneath figure (i.e. Fig 1). LCD is for the field indicate reason. Here we are utilizing all out seven sensors to screen the field condition. Those are Temperature, Humidity, Soil dampness, Leaf sensor, PH sensor, Level sensor, Phase sensor. A particular game plan of direction words are used to work the relating

gadgets associated with the smaller scale controller, framing n embedded framework. Right when a working order is set through the controller by the end customer the relating sensor will get instituted and it sends the data it recorded so far which are appeared on the LCD leading group of the framework settled in the field and the yield readings in short casing are send to the mobile phone of the end customer (through which the directions are been started) in the sort of a text. This urges the end customer to response rapidly further to avoid or to give the most ideal supply of water for yield water system.

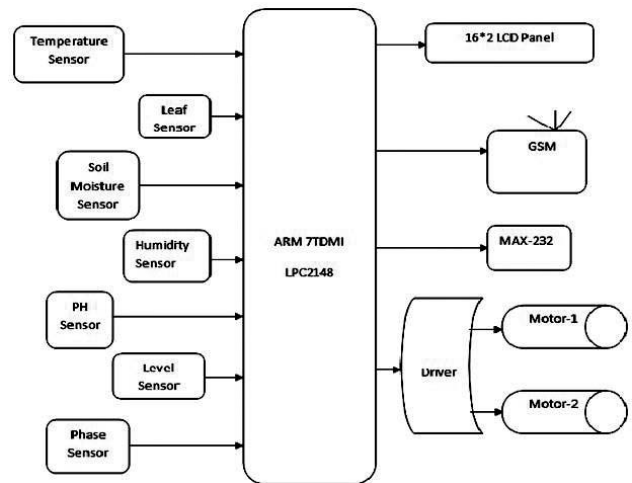

Figure 1: Block Diagram of Real-Time Irrigation System

Figure 2: Overview of the System

Here other vital gadgets are AC engines. For soil module and level detecting applications we are utilizing engines. One engine is used to store water and another is for discharging the put away water into the dirt. The circuit game-plan is given underneath and the bare essential stick affiliations are showed up underneath. These will screen the field and gives the exact results to the customer. Here the Leaf sensor, PH, Soil, Level sensors are used to screen climate leaves are sound or not.

- The PH sensor is used to screen the dirt condition, climate the dirt having ruinous acidic nature or typical base nature. If acidic nature is accessible means we have to debilitate the substance and murder it or we will give the crucial compost.

In example of soil dampness, we will check climate soil is dry or wet. In case it is dry means, this condition is amazingly damaging to plants. So in a split second a SMS will send the rancher to release the water into the dirt and make it wet. For this we will use the level sensor and stage sensor will be outstandingly useful.

- Temperature and moistness are important for the circumstance of checking the climate conditions.

Furthermore, we are utilizing the two cooling engines, one is for the carrying the water into the capacity from ground while another is valuable if there ought to emerge an event of sending water into field from the capacity.

SYSTEM ARCHITECTURE

Node 1:

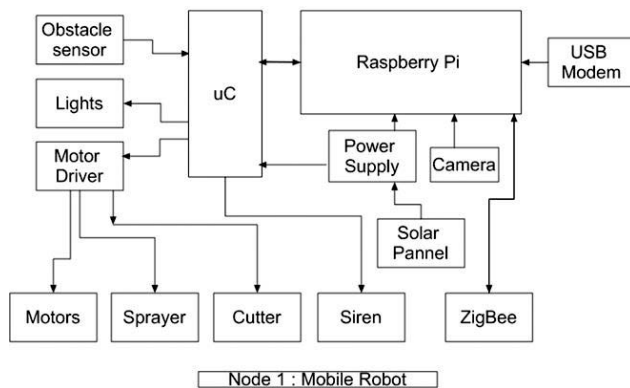

Figure 3: Node 1

Node 2:

It will be the stockroom. Movement indicator will identify the movement in the room when security mode will be ON and on recognition of movement

Figure 4: Node 2

Node 3:

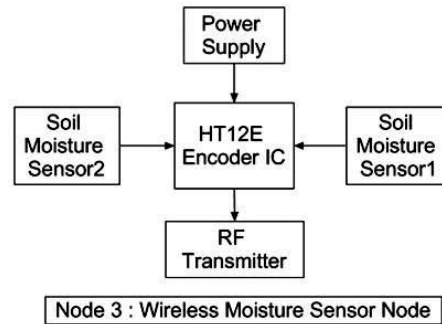

Figure 5: Node 3

In this node, dampness sensor transmits the data utilizing HT12E Encoder IC and a RF transmitter. The transmitted data is gotten by node2 and there it is handled by microcontroller with the end goal to control the assignment of water pump.

CONCLUSION

The sensors and microcontrollers of each one of the three Nodes are adequately interfaced with raspberry pi and remote correspondence is expert between various Nodes. All observations and test tests exhibits that assignment is an aggregate response for field works out, water system issues, and capacity issues utilizing remote controlled robot, shrewd water system framework and a keen stockroom administration framework independently. Use of such a framework in the field can improve the yield of the harvests and as a rule age.

The proposed framework is a continuous criticism control framework which screens and controls the water system framework practices proficiently. The results will be shown on the both LCD board and customer versatile, for testing the yield immediately. GSM is responsible for controlling the water system on field and sends them to the authority. The data is send to the customer on demand for as SMS.

A Study on using HWT towards the Quality Evaluation of Compressing the Colored Image

P. Sudarshan Ray¹, Ch. D. V. Subba Rao², Polem. Vemulamma³

¹Assistant Professor, Department of Information Technology, Kakatiya Institute of Technology And Science, Warngal; ²Professor, Department of CSE, S.V.U. College of Engineering, Tirupati; ³Assistant Professor, Department of CSE, Vaagdevi College of Engineering, Bollikunta, Warangal, India

ABSTRACT

Images require generous capacity and transmission resources, accordingly image compression is worthwhile to diminish these prerequisites. This paper overlays some foundation of wavelet analysis, compression of data and how the wavelets are been and how it can be utilized for image compression. The paper analyzes an arrangement of wavelet functions (wavelets) for usage in a still image compression system and talks about critical highlights of wavelet change in compression of still images, including the degree to which the nature of image is corrupted by the procedure of wavelet compression and decompression. The impacts of various wavelet functions, image substance and compression proportions are surveyed.

Keywords :wavelet analysis, image compression, wavelet functions, lossless and lossy, run-length encoding (RLE), discrete cosine transform

INTRODUCTION

Image compression is a vital field of research that has been contemplated for about three decades now. Image Compression tends to the issue of decreasing the measure of data required to speak to the computerized image. Compression is accomplished by the expulsion of at least one of three essential data redundancies: (a) Coding redundancy, which is available when not as much as ideal code words are utilized;

(b) Inter-pixel redundancy, which comes about because of correlations in between the pixels of image and (c) psycho visual redundancy that is because of data which is disregarded by the human visual system (i.e. visually insignificant information). Demand for correspondence of multimedia data through the broadcast communications arrange and getting to the multimedia data through Internet is developing violently. Compression of images has various applications in different territories, for example, superior quality TV, videophones, medicinal imaging, on-line item lists and other multimedia applications. Another imperative application is perusing, where the attention is on getting high compression.

There are two sorts of compressing the image: lossy and lossless. With lossless compression, the first image

is recouped precisely after decompression. Sadly, with images of common scenes it is infrequently conceivable to acquire blunder free compression at a rate past 2:1. Considerably higher compression proportions can be gotten if some blunder, which is normally hard to see, is permitted between the decompressed image and the first image ^[1]. This is lossy compression. Much of the time, it isn't important or even alluring that there be sans mistake multiplication of the first image. For instance, if some commotion is available, at that point the mistake because of that clamor will as a rule be fundamentally decreased by means of some de-noising technique. In such a case, the little measure of blunder presented by lossy compression might be satisfactory. Dissimilar to lossless compression, lossy compression decreases image quality. You can't recover the first image subsequent to utilizing lossy compression methods. You will lose some data ^[2].

Lossless image compression is typically utilized as a part of manufactured images that contain sharp-edged lines, for example, specialized illustrations, printed designs, funnies, maps or logos. This is on account of lossy compression methods deliver compression ancient rarities to images and sharp-edged lines wind up fluffy particularly when utilizing solid compression. Rather, lossy compression is a decent decision for normal

images, for example, photographs of landscapes where minor misfortune on sharpness is worthy to accomplish littler record measure. With the exposed eye it is difficult to perceive any contrasts between uncompressed normal image and one with compacted by lossy methods if the compression isn't excessively solid^[3]. The most broadly utilized methods of lossless compression in images are run-length encoding (RLE), entropy coding and lexicon coders. Lossy compression is generally in light of techniques by evacuating points of interest that the human eye commonly doesn't take note. Computerized images are generated out of pixels that speak to color data. At the point when a pixel varies just marginally from its neighbors, its esteem can be supplanted theirs. This will lose some data however it is normally scarcely detectable with human eye if the algorithm is adequate. After this e.g. RLE coding can be utilized to pack data.

Other prominent methods are shading quantization (lessening the shading space) and chroma sub-sampling. These methods depend on a reality that the human eye is more delicate to luminance than shading, so record size can be upgraded by putting away more luminance detail than shading point of interest. Likewise fractal compression is utilized yet it's not all that prevalent. The most mainstream image compression technique is depended towards discrete cosine change (DCT)^[4]. In the current past, wavelets have risen as a vital technique for image compression.

IMAGE COMPRESSION USING WAVELET TRANSFORM

Wavelets are functions characterized over a limited interval and having a normal estimation of zero. The essential thought of the wavelet change is to speak to any arbitrary function (t) as a superposition of an arrangement of such wavelets or premise functions. These premise functions or infant wavelets are gotten from a solitary model wavelet called the mother wavelet, by dilations or contractions (scaling) and translations (shifts).

In the course of recent years, the wavelet change has increased across the board acknowledgment in flag handling all in all and in image compression research specifically. In numerous applications wavelet-based plans (additionally alluded as sub band coding) beat other coding plans like the one in light of DCT. Even though there is no particular reason to obstruct the info image and its premise functions have variable length, wavelet coding plans at higher compression abstain from

blocking ancient rarities. Wavelet-based coding^[5] is more powerful under transmission and decoding blunders, and likewise encourages dynamic transmission of images. What's more, they are better coordinated to the HVS qualities. Due to their characteristic multi-determination nature^[6], wavelet coding plans are particularly appropriate for applications where adaptability and decent corruption are critical.

The methods of lossy compression that we might focus on are the accompanying: EZW algorithm and SPIHT algorithm. These are generally late algorithms which accomplish a portion of the most minimal blunders per compression rate and most elevated perceptual quality yet detailed. Before we look at the algorithms recorded above, we should plot the fundamental advances that are basic to all wavelet-based image compression algorithms. The five phases of compression and decompression are appeared in Figs. 1 and 2.

Figure 1: Compression of an image

Figure 2: Decompression of an image

The majority of the means appeared in the compression graph are invertable, subsequently lossless, aside from the Quantize step. Quantizing alludes to a lessening of the accuracy of the drifting point estimations of the wavelet change, which are commonly either 32-bit or 64-bit skimming point numbers. To utilize less bits in the packed change which is fundamental if compression of 8 bpp or 12 bpp images is to be accomplished these change esteems must be communicated with less bits for each esteem. This prompts adjusting error. These estimated, quantized, wavelet transforms will create approximations to the images when a backwards change is performed. In this way creating the error intrinsic in lossy compression. The connection between the Quantize and the Encode steps, appeared in Fig. 1, is the crucial part of wavelet change compression. Every one of the algorithms described underneath adopts an alternate strategy to this relationship. The reason served by the Wavelet Transform is that it creates an expansive number of qualities having focused, or almost zero, magnitudes.

Two generally utilized measures for evaluating the error between images are Peak Signal to Noise Ratio and Mean Square Error. The MSE between two images f and g is characterized by

$$MSE = \frac{1}{N} \sum_{j,k} (f[j,k] - g[j,k])^2$$

where the aggregate over j; k indicates the entirety over all pixels in the images, and N is the quantity of pixels in each image. The PSNR between two (8 bpp) images is, in decibels,

$$PSNR = 10 \log_{10} \left(\frac{255^2}{MSE} \right)$$

EZW algorithm: The EZW algorithm was one of the primary algorithms to demonstrate the full energy of wavelet based image compression. It was presented in the historic paper of Shapiro [7]. Numerous algorithms expand upon the central ideas that were first presented with EZW. EZW stands for Embedded Zerotree Wavelet. We might clarify the terms Embedded, and Zerotree, and how they identify with Wavelet-based compression. An inserted coding is a procedure of encoding the change magnitudes that takes into consideration dynamic transmission of the packed image. Zerotrees are an idea that considers a succinct encoding of the places of noteworthy esteems that outcome amid the implanted coding process. The embedding procedure utilized by EZW is defined as bit plane encoding.

Set Partitioning in Hierarchical Trees (SPIHT encoding): The SPIHT [8] image coding algorithm was created in 1996 by Said and Pearlman and is another more proficient execution of the installed zerotree wavelet algorithm by Shapiro. After the wavelet change is connected to an image, the primary algorithm works by dividing the wavelet decayed image into noteworthy.

There are two goes in the algorithm i.e, arranging pass and refinement pass. The arranging pass is operated on the list of insignificant sets (LIS), list of insignificant pixels (LIP) and the list of huge pixels (LSP). The LIP and LSP comprise of hubs that contain single pixels, while the LIS contains hubs that have relatives. The most extreme number of bits required to speak to the biggest coefficient in the spatial orientation tree is gotten and designated as n_{max} , which is

$$n_{max} = \lceil \log_2(\max_{i,j} \{|c_{i,j}|\}) \rceil \dots(2)$$

Amid the sorting pass, those coordinates of the pixels which stay in the LIP are tried for noteworthy

by utilizing eqn. 2. The result, Sn(T), is sent to the yield. Those that are noteworthy will be exchanged to the LSP and in addition having their sign bit yield. Sets in the LIS (which comprises of nodes with relatives will likewise have their importance tried and, if observed to be critical, will be evacuated and divided into subsets. Subsets with a solitary coefficient and observed to be noteworthy will be combined to the LSP, or else they will be combined to the LIP.

The value of n is decremented by 1 and also refinement and sorting passes are repeated. This proceeds until either the coveted rate is come to or $n=0$, and every one of the nodes in the LSP have every one of their bits yield. The latter case will result in relatively idealize reproduction as every one of the coefficients are handled totally. The bit rate is exactly in the SPIHT [8] algorithm in light of the fact that the yield created is of single bits and algorithm is terminated at whenever. The decoding procedure takes after the encoding precisely and is relatively symmetrical as far as processing time.

RESULTS

Compressing shading images proficiently are one of the principle issues in multimedia applications. So we have tried the effectiveness of shading image compression utilizing EZW and SPIHT algorithm. Reproduced image is confirmed utilizing human vision and PSNR. Table 1 demonstrates the results of image compression.

Table 1: Quality Assessment

	MSE	PSNR	CR	BPP
EZW	10.1191	38.0794	18.0450	4.3308
SPIHT	12.5269	37.1524	12.2350	2.9364

Fig. 1: Original 256 x 256 image

Fig. 2: Compressed image using EZW Haar Wavelet

Fig. 3: Compressed image using SPIHT Haar Wavelet

CONCLUSIONS

We have audited and summarized the characteristics of image compression, need of compression and its standards and EZW and SPIHT image compression algorithms based on Wavelet. We utilize 256×256 shading image for comparison. Any of the two approaches is satisfactory when the 0.5 bits per pixel (bpp) is asked. Nonetheless, for a low bit rate, for example 0.25 bpp or lower, the embedded zero tree wavelet (EZW) approach is superior. Also EZW gives better compression ratio and quality of images. Notwithstanding if For practical applications, we presume that (1) Wavelet based compression algorithms are emphatically prescribed, (2) DCT based approach may utilize an adaptive quantization table, (3) VQ approach isn't appropriate for a low bit rate compression although it is basic, (4)

Fractal approach ought to use its determination free decoding property for a low bit rate compression.

Enhanced Improvement in Dynamic Behavior of Hybrid Active Power Filter using PI Controllers and Fuzzy Logic

N. Madhuri¹, P. Chandra Sekhar¹, M. Suryakalavathi²

¹Associate Professor, Department of EEE, Mahatma Gandhi Institute of Technology, Hyderabad, Telangana;

²Professor, Department of EEE, JNTU College of Engineering Hyderabad, Telangana, India

ABSTRACT

This paper shows a fuzzy-logic, PI managed shunt active power filter used to compensate to get symphonious writhing in three-phase techniques. The Hybrid Vehicle power filter makes use of a more fundamental procedure for its quote of this benchmark settlement present in gentle of Rapid Fourier change. The exhibited Hybrid Power filter may work-in well-balanced, loading requirements. Exceptional filters may perhaps not need sufficient functionality in speedy varied states. Be as it could, automobile trained active electricity filter presents far better results for symphonious minimization, also THD progress. The suggested auto tempered hybrid power filter retains up the THD very well inside of IEEE-519 standards. The suggested strategy is widely Tri-ED with enhanced unique behavior of hybrid power filter making use of fuzzy-logic, PI controls. The outcome are seen to become somewhat satisfactory to medium Distortions, also enhance high quality. The Nitty-gritty reproductions have been finished on MATLAB surroundings to accept the operation.

INTRODUCTION

With the improvement of power electronic devices and these related control advances, increasingly power electronic gear has been introduced in power framework arrange. In any case, numerous power electronic buyers, for example, circular segment heaters and rectifiers, as a result of these unique activity attributes, would cause genuine voltage change, harmonic current contamination, low power factor (PF), less qualitated power and so forth. Hence, a considerable measure of authorities have offered consideration regarding enhancing such power quality issues. Power quality conditioners, for example, static var compensators (SVCs) and active power filters (APFs), which locally relieve the harmonic current, can successfully improve voltage quality and PF and stifle harmonic contamination

Albeit passive power filters (PPFs) can smother restricted trademark recurrence harmonic current, this dynamic filtering performance isn't adequate to keep away from that the harmonic current from passive power filter causes series- parallel reverberation between the filter and the framework. As of late, APFs have been created rapidly in light of this great filtering performance,

yet the confinements of limit and voltage level of power electronic devices keep APFs from applying in medium-high-voltage systems. Hybrid APFs (HAPFs) join the benefits of APFs and PPFs and are appropriate to be prepared in medium-high-voltage framework.

The expanded seriousness of power quality issues and different issues related with the passive filters, for example, substantial size and weight, higher cost, settled compensation, and reverberation issues with loads and systems have required an emphasis on a power electronic arrangement, that is, active power filters (APF) as appeared in Fig.1. As of late, numerous distributions have likewise showed up on the harmonics concealment utilizing active power filters. Determination of a control strategy and appropriate topology of harmonic concealment, most appropriate to specific conditions, requires that points of interest, impediments and confinements of these devices, which show an exceptionally wide scope of properties.

The control methodology for a hybrid active power filter produces the reference current, that must be given by the power filter to remunerate reactive power and harmonic streams requested by the load^[4-6] This includes

an arrangement of ebbs and flows in the phase area, which will be followed creating the changing signs connected to the electronic converter by methods for the fitting shut circle exchanging control strategy, for example, hysteresis or bum control. A few techniques including double prompt genuine and reactive power hypothesis have been proposed for extricating the harmonic content^[2-5].

Figure 1: Shunt current compensation in active filter, a basic principle

All these techniques function admirably under enduring state, balanced and Sinusoidal conditions of supply voltage. Among every one of the techniques exhibited in the writing, the double prompt active and reactive power (P-Q) hypothesis is a standout amongst the most widely recognized and likely it is the best method^[4].

As of late, to evade the inborn bothersome attributes of ordinary control approaches, Fuzzy Logic Controller (FLC) is being produced. FLC offers a semantic way to deal with create control calculations for any framework. It maps the information yield relationship in view of human mastery and consequently, does not require a precise scientific model of the framework and can deal with the nonlinearities that are for the most part hard to demonstrate^[2]. This therefore makes the FLC tolerant to parameter variation and more precise and vigorous.

DESIGN OF APF

Principle of APF: An APF, which is schematically depicted in Fig. 2, contains two-level Voltage Source Converter (VSC), a dc vitality stockpiling device, a coupling transformer associated in shunt to the dispersion arrange through a coupling transformer. The VSC changes over the dc voltage over the capacity device

into an arrangement of three-phase air conditioning yield voltages^[7]. Appropriate modification of the phase and greatness of the APF yield voltages permits successful control of active and reactive power trades between the APF and the air conditioner framework. Such arrangement enables the device to ingest or create controllable active and reactive power^[8].

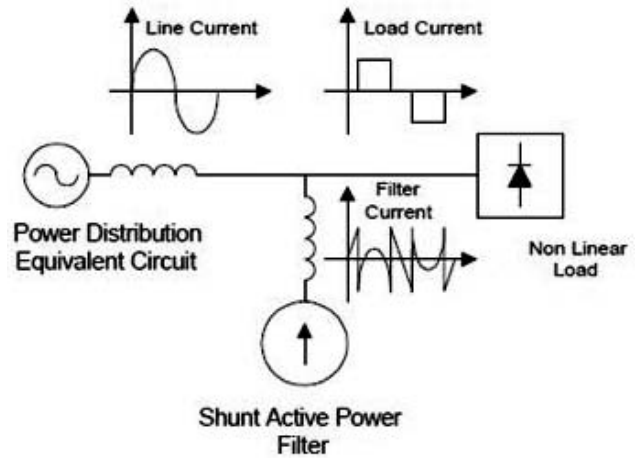

Figure 2: APF Schematic Diagram

The VSC associated in shunt with the air conditioner framework gives a topology which can be utilized for up to three very unmistakable purposes:

1. Compensation of reactive power and Voltage direction
2. Power factor correction
3. Current harmonics elimination.

Here, such device is utilized to give ceaseless voltage direction utilizing an in a roundabout way controlled converter^[9]. As appeared in Fig. 3 the shunt infused current I_{sh} revises the voltage list by modifying the voltage drop over the framework impedance Z_{th} . The shunt infused current I_{sh} can be composed as,

$$I_{sh} = I_L - I_S = I_L - (V_{th} - V_L) / Z_{th} \quad \dots(1)$$

$$I_{sh} / _ \eta = I_L / _ - \theta \quad \dots(2)$$

It might be said that the adequacy of the APF in redressing voltage hang relies upon the estimation of Z_{th} or blame level of the load transport. At the point when the shunt infused current I_{sh} is kept in quadrature with VL, the coveted voltage remedy can be accomplished without infusing any active power into the framework. Then again, when the estimation of I_{sh} is limited, a similar voltage remedy can be accomplished with least evident power infusion into the framework^[10].

Principle of HAPF

Figure 3: HAPF Schematic Diagram

At the point when this gear is associated in arrangement to the air conditioner source impedance it is conceivable to improve the compensation qualities of the passive filters in parallel connection^[12]. This topology is appeared in Fig. 3, where the active filter is spoken to by a controlled source, where is the voltage that the inverter should produce to accomplish the goal of the proposed control calculation.

FUZZY LOGIC CONTROLLER

Fuzzy Logic Controller is a procedure to encapsulate human-like reasoning into a control framework. FLC can be intended to copy human deductive reasoning, that is, the procedure individuals use to derive conclusions from what they know. In an engine control framework, the function of FLC is to change over linguistic control rules into control system in light of heuristic data or master learning. FLC has a settled arrangement of control rules, generally got from master’s information. The membership function (MF) of the related info and yield linguistic variables is for the most part predefined on a typical universe of talk. For the fruitful plan of FLC’s appropriate determination of information and yield scaling factors (picks up) or tuning of the other controller parameters are urgent employments, which as a rule are done through experimentation to accomplish the most ideal control performance. The structure of FLC is appeared in Fig.4. The structure indicates four functions, every one emerged by block.

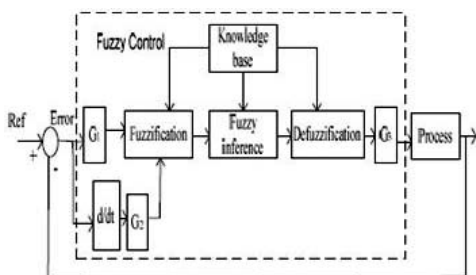

Figure 4: Structure of fuzzy controller

- Membership functions are characterized inside the standardized range (- 1, 1), and related with each name: NB (Negative Big), NM (Negative Medium), NS (Negative Small), ZE (Zero), PS (Positive Small), PM (Positive Medium), and PB (Positive Big). Seven MFs are decided for $e(pu)$ and $ce(pu)$ signs and seven for yield. Every one of the MFs are symmetrical for positive and negative estimations of the variables. Accordingly, most extreme $7 \times 7 = 49$ standards can be framed.
- The membership functions for the sources of info (error and change of error) and yield of fuzzy control for hybrid active power filter.

A learning base (an arrangement of If-Then standards), which contains the meaning of the fuzzy subsets, their membership functions, their universe talk and the entire of the tenets of derivation to accomplish great control
- An surmising instrument (likewise called an “induction motor” or “fuzzy derivation” module), which is heart of a fuzzy control, groups the limit of fake the human choices and copies the master’s basic leadership in translating and applying learning about how best to control the plant.
- A de-fuzzification interface, which changes over the finishes of the surmising instrument into genuine contributions for the procedure.

Fuzzy Logic Membership Functions: Fuzzy controllers don’t require a correct numerical model. Rather, they are planned in view of general information of the plant. Fuzzy controllers are intended to adjust to varying working focuses. The single yield variable (u) is unflinching state flag of the converter, only error free reaction is straightforwardly sustained to the framework.

Fuzzy Logic Rules: The target of this exposition is to control the yield voltage of the converter. The error and change of error of the yield voltage will be the contributions of fuzzy logic controller. These 2 inputs are isolated into seven groups; NL: Negative Large, NM: Negative Medium, NS: Negative Small, ZO: Zero Area, PS: Positive small, PM: Positive Medium and PL: Positive Large and its parameter^[10].

MATLAB/SIMULINK MODELING AND SIMULATION RESULTS

Effects of Short Circuit Fault Currents on Power System: Short circuit fault current depends on the power circuit voltage and configuration, method of neutral connections (solidly grounded, resistance grounded, reactance grounded and ungrounded), presence of the regulating devices (such as shunt reactor, series reactor, shunt and series capacitors and FACT devices), and the speed of disconnection of the faulted circuit section. Different types of short circuit currents can effect the power system in different manners. It is known that, the flow of short circuit currents incident to the occurrence of inter phase short circuits near the generating units frequently results in substantial disturbance to normal operation of the power system.

Simulation results are presented in this section using MATLAB/SIMULINK for Fuzzy based Fault Tolerant control of a four leg Active Power Filter. Initially, we studied Fuzzy based Fault Tolerant Active Power Filter in the presence of open circuit fault/short circuit fault and also line to ground fault and computed total harmonic distortion. Subsequently, we studied the comparison of Fuzzy based Fault Tolerant Active Power Filter with traditional Fault Tolerant Active Power Filter in the presence of fault and also in the absence of fault. The simulation results are obtained for Fuzzy Based Fault Tolerant Active Power Filter in the presence of open circuit/short circuit fault and line to ground fault.

- Sometimes the short circuit takes the form of the arc that may cause considerable damage to the elements of the power system. For example an arc on an over-head transmission lines if not cleared quickly will burn the conductors causing it to break resulting in long time interruption of the supply

Figure 5: Before compensation and after compensation

- Unsymmetrical short circuit faults (such as line to ground, phase to phase, double phase to ground) introduce unbalance in the symmetrical circuits of the power system
- Stability of the power system may be adversely affected and can even lead to complete shutdown or cascade tripping of the power system
- Damage to other apparatus in the power system due to short circuit currents may be caused due to the over-heating and also due to abnormal mechanical stresses or forces set up by the fault
- A reduction in the voltage in power system due to faults will be sometimes be so large that the relays having pressure coils tends to fail

Figure 6: Short circuit analysis

- Due to short circuits in the power system, there may be considerable reduction in the voltage on the healthy feeders connected to the system having fault. This may result in drawing of abnormal high currents by the motors or the operation of no load coils of the motors. In the latter case there will be considerable loss in the industrial output due to the outage of the motors and other drives
- Sometimes in an interconnected systems, when a fault develops it is followed by a fall in voltage and frequency. This may result in loads such as motors which normally takes the power from the supply will start to feed or deliver the power to the fault locations. During the faults, induction motors and synchronous motors feed the fault.

CONCLUSION

The target of this paper is to analyze the time determination performance between conventional controller and artificial intelligence controller (FLC)

controlling the dc interface voltage. A VSI topology for HAPF remunerating air conditioning balanced nonlinear loads and a dc load provided by the dc connection of the compensator is introduced. The proposed Fuzzy based Fault Tolerant control scheme offers continuous operation and gives superior Total Harmonic Distortion in contrast with PI based Fault Tolerant shunt Active Power Filters. A control calculation for conventional pi controller and fuzzy logic controller constituted by a hybrid active power filter, this topology we built up an arrangement active power filter and a passive filter associated in parallel with the load is examined. At long last Matlab/Simulink based model is created and reproduction comes about are introduced.

Critical Success Factors of Contractor's Performance Appraisal System in Malaysian Construction Industry

Khairul Zahreen Mohd Arof¹, Syuhaida Ismail¹, Abd Latif Saleh²

¹Razak Faculty of Engineering and Informatic, Universiti Teknologi Malaysia, Kuala Lumpur, Malaysia;

²Civil Engineering Department, Universiti Teknologi Malaysia, Johor Bahru, Malaysia

ABSTRACT

Performance appraisal system is applied in many organisations to appraise performance of employee. In construction industry, performance appraisal system is applied to appraise contractor's performance with the works done and basically, their performance is appraised based on quality, time and cost performance. In Malaysian construction industry, Construction Industry Development Board (CIDB) has established Contractor's Capability and Capacity (SCORE), Quality Assessment System in Construction (QLASSIC) and Safety and Health Assessment System in Construction (SHASSIC) in 2012. Unfortunately, non-compliance in construction projects still presents. This paper is therefore undertaken with the aim to propose critical success factors (CSFs) towards the efficiency of these performance appraisal systems via literature review, questionnaire survey and expert focus group. A set of questionnaires is designed, undergone the pilot study on 15 respondents for reliability purpose and eventually distributed to 157 contractors from G1 to G7 class upon the confirmation of the questionnaire reliability status. Seven main criteria are found: quality performance; time performance; cost performance; environmental performance; health and safety performance; productivity performance; and human resources performance. Although contractor's performance appraisal system is applied in Malaysian construction industry and benefiting construction players, yet it should be improved. The efficiency of contractor's performance appraisal will be fulfilled by considering these seven CSFs into the current contractor's performance appraisal system in Malaysia.

Keywords: Contractor's Performance; Critical Success Factors; Appraisal System; Malaysian Construction Industry.

INTRODUCTION

A good construction project needs a good project management practice, which will assist those construction players, especially contractors to manage not only people involved in the industry, but also the proper utilisation of resources. Project management refers to the application of knowledge, skill, tool, and techniques to project activities to meet a relatively short-term objective that has been established to complete specific goals and objectives (Project Management Institute¹⁷). This is accomplished through application and integration of the project initiating, planning, executing, monitoring, controlling and closing (Heagney¹³).

Yet, lack of awareness of this part has made copious of construction project do not meet their objectives. Hence, to produce a good outcome, contractors have to come up with a good plan. As the construction project

involves more than one party, thus, a comprehensive project management is very essential. As a matter of fact, to make the project management more effective, an observation, or to be more specific, an appraisal, could be implemented to assess the performance of construction project players, particularly the contractors as they are the major player involved directly in constructing a particular project.

Performance appraisal system is a normal practice in any organisation and is not a new implementation to appraise workers with the quality of work so as in construction industry. In Malaysian construction industry, a few guidelines are established to ensure the works done by the contractor are not just been evaluated for the contractor's performance, but also to enhance their ability and capability by offering a suitable solution, such as training and performance appraisal systems as provided by Construction Industry Development Board

(CIDB). This paper is therefore undertaken with the aim to propose critical success factors (CSFs) towards the efficiency of these performance appraisal systems as currently implemented in Malaysian construction industry.

LITERATURE REVIEW

In Malaysian construction industry, 55 percent of the projects experienced cost overrun, and surprisingly private project is worse than public project (Shehu et al.³⁰). One of the prominent problematic public construction projects, Sultan Mizan Zainal Abidin Stadium's roof, which has collapsed demonstrates that poor technical knowledge and management lead to construction failure (Idris¹⁶). In addition, the stadium construction is also having problem with safety issues, where five workers injured and two were in critical condition (Idris¹⁶).

Collapse of a ramp on the Second Penang Bridge is another example of public construction project failure due to casual and careless manner of the sub-contractor (Mok²²). Another case due to miss behaviour on safety conduct is the falls of 300-tonne concrete span at Mass Rapid Transit (MRT) construction site, where three workers dead (Murad et al.²³). Assaf et al.² have supported this by claiming that accident during construction may lead to time overrun.

Thus, it is observed by this paper that construction industry faces a lot of high-profile problems, such as cost overrun, time overrun, poor quality and even cause of death. In order to solve these problems, contractors should be appraised by authorities to ensure that their performance can be sustained. On top of that, it will also help the authorities or clients in selecting the performed contractors for next construction project. The appraisal also helps the contractors in determining their weaknesses for further improvement.

Performance Appraisal System: Performance appraisal is vitally important for the organisation, who seeks for the improvement of their employee's performance, since through the performance appraisal system, the employer may know what is lacking. As a matter of fact, in the context of human resource management, performance appraisal is directly affecting employees' job satisfaction and the level of organisation commitment towards successful construction project (Deepa et al.⁹).

A successful project management is the management that maintains a balance between the demands of customers, project team and organisation (Hobday¹⁴). Therefore, it is clearly stated that the customers' or clients' satisfaction is not the only party that need to be taken care of, yet the rights and satisfaction of the project players, particularly the contractors as the key players, also need to be dealt with.

Hence, it is important to propose the critical success factors (CSFs) of contractor's performance appraisal system as this will significantly affect the delivery of the construction project. This statement is supported by Benson et al.⁴, who claim that employees with poor perception of performance appraisal were more likely to be dissatisfied with their job, less committed to the organisation and more likely to be contemplating leaving the organisation. Eventually, these low esteemed employees will affect the poor performance of construction industry as well as badly impact the government inspiration in ensuring the National Key Resource Area (NKRA) is successfully achieved.

In Malaysian Construction Industry, Construction Industry Development Board (CIDB) has launched Contractor's Capability and Capacity (SCORE), Quality Assessment System in Construction (QLASSIC) and Safety and Health Assessment System in Construction (SHASSIC) with the aim to appraise the construction contractor's capacity and capability. It turns out that the system is very helpful in selecting the right contractor for the right project in year 2012. This appraisal is strengthened by the newly launched program called Construction Industry Transformation Program (CITP). Four focuses in CITP are: quality, health and professionalism; productivity; environment sustainability and; internationalisation.

SCORE is developed by the Ministry of Work and CIDB, where it is also seen by this paper as an approach that permits the contractor's rating of each class to be based on the basic information of the contractor itself. It also enables contractors to identify their weaknesses and helps the ministry in drafting a programme that can enhance the capability and skill of the contractors. On the other hand, QLASSIC is an independent approach to appraise primarily on the quality of workmanship of building projects undertaken by contractors (CIDB⁵). The components that will be assessed in this appraisal system are structural works, architectural

works, mechanical and electrical (M&E) works and external works. Three main components of contractor’s performance appraisal system in SHASSIC are document check, workplace inspection and employees interview. It covers all components, such as occupational safety and health policy, occupational safety and organisation, hazard identification, risk assessment and risk control (HIRARC), occupational safety and training and promotion, machinery and equipment management, materials management, emergency preparedness, accident investigation and reporting and records management and performance monitoring.

On top of that, CIDB in 2015 has launched CITP, focuses on four strategic thrusts: quality, safety and professionalism; environmental sustainability; productivity and; internationalisation. For quality as well as safety and professionalism, CITP aims to be instilled in the culture of the construction industry (CIDB⁵). For this matter, quality, safety and professionalism are precondition in enhancing the construction industry into a responsible and developed industry. Under environment strategic thrust, CITP aims that sustainable infrastructure in Malaysian construction industry to be a model for the emerging world. CITP also aims to increase productivity by two-and-a-half times, where more than doubling of productivity will be equally matched by higher wages

within the construction industry. The last strategic thrust in CITP is internationalisation, which aims at unlocking the full potential of the global construction market. CIDB realised that there is a critical need to address gaps in domestic capabilities and improve access to financing within the domestic market and overseas market. In ensuring the achievement of CITP’s aim, all appraisal systems from CIDB, namely SCORE, QCLASSIC and SHASSIC need to be appraised in terms of its efficiency for better improvement.

Critical Success Factors (CSFs) towards Efficiency of Contractor’s Performance Appraisal System:

The term critical success factors (CSFs) was first used in construction project management by Rockart²⁷. CSFs can be defined as the criteria that are able to make the organisation successful (Pakseresht et al.²⁶), where if the criteria are not applied, the organisation would fail to reach their goal. Alias et al.¹ and Harison et al.¹² define CSFs as the criteria that help projects management practice to finish project successfully and it is even able to improve project delivery. Therefore, the paper suggests that CSFs in construction industry are defined as criteria that lead to the success of a project and improve project delivery through project management. Table 1 shows the summary of CSFs listed by previous studies.

Source: Adapted and modified from Homtong et al.²¹, Pakseresht et al.²⁶, Omran et al.²⁵ and Saqib et al.²⁸.

Based on Table 1, the criteria of CSFs are divided into seven main criteria, namely cost performance, time performance, quality performance, health and safety performance, environmental performance, productivity and human resource. Based on the previous studies, all the criteria have been discussed in detail by Homtong et al.²¹, Pakseresht et al.²⁶, Omran et al.²⁵ and Saqib et al.²⁸. Each of the main criteria is explained in next following paragraphs.

As in the first main criterion, cost performance has six CSFs elements: experience worker, effective

communication and coordination, effective management and supervision, good availability of sources, good and enough material as well as equipment and less wastage. The first three are the most important CSFs elements as claimed by Homtong et al.²¹, Pakseresht et al.²⁶, Omran et al.²⁵ and Saqib et al.²⁸.

Time performance is another main criterion of CSFs, where skilled worker is the most important element, followed with good change order practice, motivation by incentive, clear and realistic object as well

as rapid decision making. In quality performance, six elements are referred by previous studies: availability of competent staff, good organisational quality assurance, high commitment in quality control by management, good monitoring and feedback as well as good quality of raw material and equipment.

Health and safety performance is also one of the important criteria, which encompasses good coordination, control and management practice, good personal behaviours by all participants, implementation in safety management and practice and good conduct on-site inspection. In addition, proper layout is the most referred element by previous study under environment performance. This is followed with use of environmental friendly materials and equipment as the important elements of CSFs towards the successful construction project. Under productivity criterion, competent manager or supervisor and skilled worker are the most referred elements, followed with good change order practice, offer training to workers, up-to-date technology, well schedule and on time inspection as well as offer training to workers. Lastly, human resource is also claimed as the main criterion in CSFs towards the success of construction project. Enough training is the most critical element in this criterion, followed with good attitudes among employee, legal requirement and good support by senior employee or management.

METHODOLOGY

Data collection is done via questionnaire survey. Initially, 10 percent of expected sample (15 respondents) was distributed for pilot study following Connelly⁷ before the real questionnaire survey is undertaken. The purpose is to examine the respondents' understanding of the questionnaire apart from determining whether the questionnaire is comprehensive enough in obtaining the information for this paper. This is supported by Scheuren²⁹, who claimed that pilot study is conducted prior to the distribution of actual questionnaire to test the feasibility of intended questionnaire to be undertaken as well as to perfect the questionnaire concepts and wording.

The Cronbach's alpha method is used for this purpose, where a coefficient of minimum 0.6 is expected for the reliability of the questionnaire to avoid correction or elimination of some variables in the contents (Cronbach⁸).

Since the questionnaire of this paper was reliable with overall Cronbach's alpha of 0.98, the actual questionnaire survey was undertaken, where a total of responses from 157 respondents selected from convenience sampling was received via on-site and web-based survey distribution. The analysis undertaken were the mean values (mean) and relative importance index (RII). From the RII, the items for each criterion were then ranked by its importance and validated by seven panels of expert that have experience at least 7 years in construction industry.

FINDING AND DISCUSSION

To fulfil the aim of this paper in proposing critical success factors (CSFs) towards efficiency of the contractor's performance appraisal in Malaysian construction industry, seven criteria are discussed in this sub-section based on the findings. Those criteria are cost performance, time performance, quality performance, health and safety performance, environmental performance, productivity and human resources. Relative Importance Index (RII) for each element in each criterion are calculated, thus each element can be ranked based on their respective criteria.

Table 2 illustrates the appraisal of various performance criteria towards the efficiency of contractor's performance appraisal system. All the elements in this criterion have mean values more than 3, which indicate that all the respondents agreed that each element in all performances are important and should be appraised during the appraisal stage. For cost performance, effective communication and coordination is in the first rank that significantly contributes to cost performance, which is also supported by Olawale et al.²⁴. The second rank is effective management and supervision at site, followed by good and enough material and equipment, good availability of sources, less wastage and experienced worker.

Table 2: Various performance criteria towards the efficiency of contractor's performance appraisal system

Elements		Frequency					Mean	RII (%)	Rank
		5	4	3	2	1			
Cost Performance									
1.	Experienced worker	39	84	34	0	0	4.03	80.89	6
2.	Effective communication and coordination	55	76	26	0	0	4.18	83.69	1

3.	Effective management and supervision at site	49	84	24	0	0	4.16	83.18	2
4.	Good availability of sources	47	80	30	0	0	4.11	82.17	4
5.	Good and enough material and equipment	49	83	25	0	0	4.15	83.06	3
6.	Less wastage	47	77	33	0	0	4.09	81.78	5
Time Performance									
1.	Good competency of project stakeholder	50	73	34	0	0	4.10	82.04	6
2.	Good change order practice	55	73	29	0	0	4.17	83.31	4
3.	Skilled worker	54	72	31	0	0	4.15	82.93	5
4.	Motivation by incentives	58	75	24	0	0	4.22	84.33	2
5.	Clear and realistic object	51	84	22	0	0	4.18	83.57	3
6.	Rapid decision making	60	78	19	0	0	4.26	85.22	1
Quality Performance									
1.	Good organisational quality assurance	45	91	21	0	0	4.15	83.06	2
2.	Good monitoring and feedback by stakeholder	42	77	38	0	0	4.03	80.51	5
3.	Good quality of raw material and equipment	45	88	24	0	0	4.13	82.68	4
4.	Good availability of competent staff	51	88	18	0	0	4.21	84.20	1
5.	High commitment in quality control by management	46	87	24	0	0	4.14	82.80	3
Health and Safety Performance									
1.	Good coordination, control and management practice on health and safety	51	78	28	0	0	4.15	82.93	3
2.	Good personal behaviour by all stakeholder	42	79	36	0	0	4.04	80.76	4
3.	Good implementation in safety management and practice	57	71	29	0	0	4.18	83.57	1
4.	Good conduct on-site inspection	53	77	27	0	0	4.17	83.31	2
Environmental Performance									
1.	Proper site layout	57	72	28	0	0	4.18	83.69	3
2.	Use environmentally friendly material (Gowri, 2004 #161)	60	68	29	0	0	4.20	83.95	2
3.	Use environmental friendly equipment	66	68	23	0	0	4.27	85.48	1
Productivity Performance									
1.	Competent manager/supervisor	60	69	28	0	0	4.20	83.95	3
2.	Competent skilled workers	54	74	29	0	0	4.16	83.18	4
3.	Well schedule and on time inspection	43	81	33	0	0	4.06	81.27	6
4.	Good change order practice	40	67	50	0	0	3.94	78.73	7
5.	Offer training to workers	61	67	29	0	0	4.20	84.20	2
6.	Good efficiency equipment	66	68	23	0	0	4.27	85.61	1
7.	Up-to date technology	55	63	39	0	0	4.10	82.04	5
Human Resource Performance									
1.	Good attitude among employees	67	65	25	0	0	4.27	85.35	1
2.	Enough training for employee	64	65	28	0	0	4.23	84.59	2
3.	Legal requirement	60	72	25	0	0	4.22	84.46	3
4.	Good support by senior employee/management	60	69	28	0	0	4.20	84.08	4

As for time performance, appraisal of rapid decision-making is the most important element, which is also supported by Jarkas et al.¹⁸ who found that rapid decision-making will result in better time performance.

In addition, motivation by incentives is in the second rank, whilst clear and realistic object in the third rank, where clear and realistic objective will allow people to follow with less or no mistake may occur resulting in

good time performance. Good change order practice is in the fourth rank because easy understanding contributes to high possibility of works can be completed on time thus will be benefited to time performance. In the fifth and sixth rank are skilled worker and good competency of project stakeholder, respectively.

Quality performance as discussed by many researchers (Alias et al.¹; Kerzner¹⁹; Mir et al.²¹; Todorović et al.³¹) is important in ensuring the success of the project, where from the findings of this paper, good availability of competent staff is the most important element under this criterion, followed by good organisational quality assurance and high commitment in quality control by management. The fourth and fifth ranks are good quality of raw material and equipment and good monitoring and feedback by stakeholder, respectively. The entire mean for each element under quality performance criteria is 4, which indicates that most of the respondents agreed that these elements are important and should be appraised in the contractor’s performance appraisal system.

As for health and safety performance, good implementation in safety management and practice is the main element that should be appraised. This also indicates that this element is important towards the efficiency of contractor’s performance appraisal system. The second, third, and fourth rank are good conduct on-site inspection, good coordination, control and management practice on health and safety and good personal behaviour by all stakeholder, respectively. In terms of the appraisal of environmental performance, the most important element in this criterion is the use of environmental friendly equipment, followed by the use of environmental friendly material and proper site layout. Gowri¹¹ as mentioned by Kibert²⁰ stated that the use of environmental friendly material benefits the construction in terms of sustainability, thus one of the main criteria should be considered during design, construction and post-construction stage.

For the productivity performance, good efficiency equipment is agreed as the most important element that should be assessed, followed by offer training to workers and competent manager or supervisor element. Ranked number four, five, six and seven are competent skilled workers, up-to date technology, well schedule and on time inspection and good change order practice, respectively. As for human resource performance, the first rank is good attitude among employees, which is

described by Bakker et al.³ as will result good outcome towards the successful construction project. The third, fourth and fifth ranks are enough training for employee, legal requirement and good support by senior employee/management, accordingly.

In addition, Table 3 is produced by calculating the mean of RII value for each criterion and the rank is done based on the RII, where the most important criteria should be appraised during the appraisal stage is human resource performance, followed by environmental performance and quality performance. Dissimilar from the rank based on literature review, the first, second and third ranks are productivity performance, cost performance and quality performance, respectively. Only health performance criterion in the same important rank from both findings in literature review of this paper as in the previous Table 1.

Table 3: Average Relative Importance Index (RII) from each performance criterion towards the efficiency of contractor’s performance appraisal system and its rank

No.	Criteria	RII (%)	Rank	Rank from literature
1.	Cost performance	82.46	7	2
2.	Time performance	83.57	3	4
3.	Quality performance	82.65	5	3
4.	Health and safety performance	82.64	6	6
5.	Environmental performance	84.37	2	5
6.	Productivity performance	82.71	4	1
7.	Human resource performance	84.62	1	6

From all the seven criteria: cost performance; quality performance; quality performance; health and safety performance; environmental performance; productivity performance; and human resource performance, all the elements for each criterion is accepted to be the critical success factors (CSFs) towards the efficiency of contractor’s performance appraisal system. A total number of proposed CSFs are listed in Table 4. Those CSFs have been verified by seven panels of expert that have experience at least 7 years in construction industry. They are from top management from Public Work

Department, Project Management Professional (PMP) registered with Project Management Institute (PMI) of United States of America, academician, local authorities, consultant, developer and contractor. The listed CSFs are recommended to be a part of the elements in appraisal system to ensure the high efficiency of contractor's performance appraisal system in Malaysia.

Table 4: Proposed critical success factor (CSFs) towards the efficiency of contractor's performance appraisal system based on importance

Human Resource Performance	
1.	Good attitude among employees
2.	Enough training for employee
3.	Legal requirement
4.	Good support by senior employee/management
Environmental Performance	
1.	Use environmental friendly equipment
2.	Use environmental friendly material
3.	Proper site layout
Time Performance	
1.	Rapid decision making
2.	Motivation by incentives
3.	Clear and realistic object
4.	Good change order practice
5.	Skilled worker
6.	Good competency of project stakeholder
Productivity Performance	
1.	Good efficiency equipment
2.	Offer training to workers
3.	Competent manager/supervisor
4.	Competent skilled workers
5.	Up-to date technology
6.	Well schedule and on time inspection
7.	Good change order practice
Quality Performance	
1.	Good availability of competent staff
2.	Good organisational quality assurance
3.	High commitment in quality control by management
4.	Good quality of raw material and equipment
5.	Good monitoring and feedback by stakeholder
Health and Safety Performance	
1.	Good implementation in safety management and practice
2.	Good conduct on-site inspection

Conted...

3.	Good coordination, control and management practice on health and safety
4.	Good personal behaviour by all stakeholders
Cost Performance	
1.	Experienced worker
2.	Less wastage
3.	Good availability of sources
4.	Good and enough material and equipment
5.	Effective management and supervision at site
6.	Effective communication and coordination

CONCLUSION AND RECOMMENDATION

The aim of this paper is achieved, where seven criteria are listed, evaluated, analysed, and validated by panel of experts. All criteria have their own elements and they are ranked by this paper orderly by their importance index. Based on this index, the mean values for each criterion are calculated and it is found that human resource performance is the most important criterion that should be appraised to ensure the efficiency of this appraisal system. The ranking is based on the findings and are different from the literature review, except in the sixth rank health and safety performance. These criteria should be considered in the appraisal system established by Construction Industry Development Board (CIDB), namely Contractor's Capability and Capacity (SCORE), Quality Assessment System in Construction (QLASSIC) and Safety and Health Assessment System in Construction (SHASSIC) to ensure the efficiency of the contractor's performance appraisal system in Malaysia.

ACKNOWLEDGMENT

The authors would like to express their sincere gratitude to the Ministry of Education Malaysia, Universiti Teknologi Malaysia (UTM) and the Research Management Centre (RMC) for providing the financial support. Graduating With Your First-Choice Degree: Does It Matter?

Lim Hock-Eam¹, Yip Chee-Yin²

ABSTRACT

Since the 1990s, Malaysia has achieved remarkable progress in its higher education enrolment. However, this remarkable achievement could be dampened by the gap between student's preferred and enrolled degree. Using a sample of Malaysian public university graduates, this paper measures the gap between preferred and enrolled degree and estimate its impact on the graduate's probability of unemployment. Results reveal that low parental income could lead to graduating with a not first-choice degree, and the first-choice degree is able to reduce the probability of unemployment. Thus, the government's efforts to increase higher education enrolment should also focus on offering degree programs that best match with the choice of students.

Keyword: *Parity index; Preferred degree; Enrolled degree; First-choice degree; Probability of unemployment.*

INTRODUCTION

The liberalization of the higher education sector in Malaysia since the late 1990s has brought a drastic increase in the number of public universities (Lim⁶). Consequently, the enrolment of public university has increased more than fivefold from 91,509 students in 1993 to 540,638 in 2016 (Ministry of Finance Malaysia^{10,11}). The admission rate into Malaysian public universities also increases substantially (Intake for public²). Nevertheless, the offer of admission does not necessarily come with the student's preferred degree.

There is no official statistics pertaining to the number of admission offers that mismatch with the student's preferred degree. However, there are reports that some high achievement students fail to obtain their first-choice degree (Lim⁸; Pak¹⁸). The Malaysia Ministry of Higher Education has pointed out that there are limited seats in public universities and fulfilling the minimum entry requirement does not guarantee a place of one's preferred degree (Lim⁸). The question that follows is: what is the problem of not getting one's first-choice degree?

There are various benefits of studying in one's first-choice degree. The admission into first-choice degree increases a student's probability of completing the degree and reduces the amount of time taken to complete the degree (Heinesen¹). In addition, Ost, Pan and Webber¹⁷ found that students who scored just above the admission cut-off point (first-choice degree) derive higher earnings than students who scored just below (not first-choice degree).

The Malaysian government has achieved remarkable progress in higher education enrolment and istargeting a further increase to 70% by 2025 (Ministry of Education Malaysia¹²). This remarkable achievement and aspiration could be dampened if there is a substantial gap between preferred and enrolled degree. Previous studies have shown that choice of degree is closely related to a student's talent, interest and ability. Murphy, Seneviratne, Cochrane, Davis and Mires¹⁵ found that high achievement students are more likely to choose their own course components. Indeed, the choice of students in their degree studied is driven by different motivations: career, interest, helping, and loafing (Skatova and Ferguson²⁰). For example, choice of medical degree is driven by helping and career motivation. Thus, graduating with a not preferred degree might lead to a low motivated graduate.

Malaysia is facing a persistent graduate unemployment problem since the financial crisis of 1998

(Lim⁷). Employers have ranked poor attitude a some of the top reasons for graduate unemployment (Jobstreet.com⁴). The poor attitude could be due to the low motivation of graduates. There are extensive studies on graduate unemployment and its determinants are clearly identified, such as English language proficiency, types of degree, academic attainment, ethnic groups, parental income and mismatch of skills(Khattab⁵; Lim and Siew⁹; Morshidi, Rosni, Lim and Mohamed Nasser¹³; Morshidi et al¹³; Pietro and Cutillo¹⁹). Recently, the lack of interest in entrepreneurship and its career choice are also found to be the determinants (Norasmah and Nur Zafirah¹⁶).

Jayasingam, Fujiware and Thurasamy³ found that choosiness could contribute to a graduate's unemployment. Graduates with high level of choosiness are perceived negatively by employers which deteriorates their employability. The not first-choice degree could be a contributing factor in this choosiness because the graduates may wish to choose the careers of their interests, and thus are choosy in their job search. This highlights the importance of first-choice degree to graduate unemployment. Despite the importance of first-choice degree, it appears that the tool to measure the first-choice degree and its impacts is yet to be established. To fill the gaps, this paper aims to measure the first-choice degree and estimate its impact on the probability of unemployment.

DATA AND METHODOLOGY

Data: The targeted population comprised the graduates of Universiti Utara Malaysia (UUM) and Universiti Malaysia Kelantan (UMK). The data were collected using self-administrated questionnaire. There was no sampling design and the graduates were approached at the best effort while they were waiting for their graduation robe. A total of 1,723 respondents were successfully obtained: 169 (UMK) and 1,554 (UUM). The first-choice degree is defined as the graduating degree that matches with the most preferred degree as perceived by the students after completing their studies.

Methodology: First-choice degree Parity Index (FPI) is proposed to measure the ratio between number of students graduated with their first-choice degree (S_j) to number of students graduated with not first-choice degree (S_0). The FPI could be disaggregated by the types of degree or other characteristics(j):

$$FPI = \frac{S_j}{S_0} \quad \text{where } j = 1, 2, \dots, k \quad \dots(1)$$

The value of FPI equals to one indicates a parity between graduates with first-choice degree and graduates with not first-choice degree. The value of FPI more than one indicates a disparity that favours the first-choice degree (more first-choice degree graduates, a good outcome). Values of less than one indicates a disparity that does not favour the first-choice degree (less first-choice degree graduates, not a good outcome).

Assume that there is a latent variable that represents a graduate's underlying tendency to be unemployed. This underlying tendency (latent) is associated with individual employability characteristics (X s) and first-choice degree (z). Let Y^* represents this latent variable and assume Y^* is a linear function of X s and z , the Equation (2) is obtained:

$$Y^* = \beta'X + \delta'z + e \quad \dots(2)$$

where

Y^* = latent variable of tendency to be unemployed

X = variables of individual employability characteristics

z = graduating with one's first-choice degree ($Z=1$) or not ($Z=0$)

β = vector of coefficient for variables in X

δ = coefficient of z (impact of first-choice degree)

e = the error terms

The observed outcome, Y , takes the value of 1 if the graduate is unemployed and 0 if employed. If the error terms are logistically distributed, we obtain a logit model. The maximum likelihood estimation method is used to estimate the probability of being unemployed and the impact of first-choice degree (δ).

RESULTS AND ANALYSIS

Descriptive statistics analysis: Table 1 presents the number of students graduated with their first-choice degree. More than half of the graduates reported that their graduating degree is their first choice (53.88%). The FPI (First-choice degree Parity Index) is found to be 1.168. From Table 2, the entrepreneurship degree is found to have the lowest value of FPI(0.658), i.e., the lowest ratio for first-choice degree; whereas, the professional degrees have the highest disparity (5.306).

Table 1: Graduates with First-choice degree

First-choice degree	Freq.	%	FPI
No	790	46.12	1.168
Yes	923	53.88	

Note: FPI = First-choice degree parity index

Table 2: Graduates with First-choice degree by types of degree

Types of degree	First-choice degree?		FPI
	Yes	No	
Entrepreneur	52	79	0.658
professional	191	36	5.306
Business/eco	501	510	0.982
ICT	67	90	0.744
Islamic	35	25	1.400
Arts	31	18	1.722
Sciences	24	27	0.889

Note: FPI = First-choice degree parity index

Relating to the ethnic groups (Table 3), Indian is found to have the highest disparity for first-choice degree (1.333). It is followed by Malay (1.223) and Chinese (1.016). The FPI is found to be increased over the range of parental income. The highest parental income (above RM5000) has the highest disparity for first-choice degree (3.000); whereas the lowest parental income (RM900 and below) has the lowest (0.897).

Table 3: Graduates with First-choice degree by ethnic groups and parental income

	First-choice degree?		FPI
	Yes	No	
Ethnic groups			
Malay	668	546	1.223
Chinese	194	191	1.016
Indian	40	30	1.333
Others	20	23	0.870
Parental income			
RM900 and below	113	126	0.897
RM901-RM2000	265	273	0.971
RM2001-RM3000	177	141	1.255
RM3001-RM4000	94	58	1.621
RM4001-RM5000	56	33	1.697
Above RM5000	36	12	3.000

Note: FPI = First-choice degree Parity Index

Relating to the employment status (Table 4), 45.18% of the graduates are unemployed and with a good parity between first-choice and not first-choice degree (FPI=1.019). Like unemployed graduates, self-employed (1.72%) and employed with full-time jobs that are not commensurate with qualification (16.96%) have a good parity (1.00 and 1.06 respectively). Graduates who are in full-time employment that commensurate with qualification have the highest disparity (1.405).

Table 4: Graduates with First-choice degree and employment status

Employment outcome	%	First-choice degree?		FPI
		Yes	No	
Unemployed	45.18	371	364	1.019
Further studies	6.58	61	46	1.326
FT employment commensurate with qualification	29.56	281	200	1.405
FT employment not commensurate with qual.	16.96	142	134	1.060
Self employed	1.72	14	14	1.000

Note: FPI = First-choice degree Parity Index; commensurate with qualification refer to full-time (FT) employment that required university degree as entry qualification.

In short, almost half of the Malaysian public university graduates are graduated with degree not of their first choice. The not first-choice degree graduates are more likely to be the non-professional degree, Chinese, low parental incomes, and obtain less favourable employment status.

Econometrics modelling: Table 5 presents the estimated logit models. It is found that students who graduated with their first-choice degree have lower probability of being unemployed than students who graduated with degree not of their first-choice, by 5.33 percent point (see Model 1). However, after controlling the influences of other variables, the impact of first-choice degree reduces and becomes insignificant (see Model 2). To gain further insights, a sub-sample analysis (first-choice and not first-choice degree graduates) is performed.

Table 5: Estimated logit model of being unemployed (full sample)

2. Malay (comparison group: non-Malay)
3. Married (comparison group: not married)
4. Types of degree (comparison group: arts)

Table 6 presents the estimated logit models for the two sub-samples. In the sub-sample of first-choice degree (Model 3), the types of degree obtained matters. Compared to arts degrees, the other degrees are found to have lower probability of unemployment. In the sub-sample of not first-choice degree (Model 4), the types of degree are found to have no significant influences. This in significant result is also confirmed by a restriction test for types of degree (restricted the dummy variables of types of degree being in significant simultaneously). It is the proficiency in English language that influences the probability of unemployment significantly.

DISCUSSIONS AND CONCLUSION

This paper measures the parity between the number of students graduated with degree of their choice and the number of students who are not and estimates the impact of first-choice degree on probability of being unemployed. Students from poor family are less likely to be graduated with their first-choice degree. This jeopardizes the government's efforts to have upward mobility for the poor in the Malaysian society. The unemployed graduates are more likely to have degrees of not their first-choice. Thus, the importance of being graduated with a degree of one's first-choice is clearly shown. Furthermore, results reveal that if the degree obtained is not the graduates' first-choice, the types of degree obtained do not have significant influences on probability of being unemployed, even for a marketable degree. Thus, a marketable degree would not help to improve their employability. These findings suggest that the achievement of Malaysian government in increasing its public university enrolment is dampened. The Malaysian government should focus on public universities' ability to offer places that best match with the choice of students. It is important to note that the findings are based on a sample of graduates from two public universities, i.e., UUM and UMK. Thus, the findings are exploratory. Future studies are suggested

to use a more representative sample to validate these findings and explore further into the issue of first-choice degree in Malaysia.

ACKNOWLEDGEMENT

We would like to thank the Ministry of Education Malaysia and Universiti Utara Malaysia for providing financial support to this study through its FRGS (Fundamental Research Grant Scheme) research grant (Code S/O: 12912). Thanks are also due to the ICOSIA2018 anonymous referees whose comments have improved this paper substantially.

Financial Literacy among Malaysian Households in Managing Income

Noor Afza Amran¹, Norfaiezah Sawandi¹, Hasnah Shaari¹, Ram AlJaffri Saad¹, Abu Sufian Abu Bakar²

¹Tunku PuteriIntan Safinaz School of Accountancy, ²School of Economic, Finance and Banking, Universiti Utara Malaysia, 06010, Kedah, Malaysia

ABSTRACT

This paper examines the level of financial literacy among Malaysian households in terms of financial knowledge in managing their income and debt, financial planning and the elements of financial management. In terms of data collection, questionnaires were distributed to households in Peninsular Malaysia (Kedah, Pulau Pinang, Perak, Selangor, Johor, Kelantan and Terengganu). Findings reveal that around 25% of Malaysians have done financial planning for their daily expenses. About 44% of the decision on spending is done by the breadwinner (man in the family) and 24% is made by both husband and wife. In terms of financial management, it is found that males are wiser in terms of managing the money. The older group has a better understanding of managing their money as compared to the younger generation. The location and level of education also influence the behavior of individuals in managing their money. Thus, relevant authorities, such as Bank Negara Malaysia, need to be more aggressive in educating the public about the importance of financial education and planning.

Keywords: financial literacy, financial management, income, debt, households

INTRODUCTION

The issue of financial literacy and financial management among Malaysians is becoming crucial in today's scenario. The Malaysian Department of Insolvency reported that there were 18,457 individual bankruptcy cases in 2015 (News Straits Times¹⁹). A majority of youth has been found to be living on loans, with 38% relying on personal loans, while 47% on high credit card loans (Asian Institute of Finance, 2015). It has also been found that more than 3,400 youth between the ages of 20 to 30 years sought help from the Credit Counseling and Debt Management Agency in the first eight months of 2017, compared to 3,450 youths for the entire year of 2016.

Whitman Independent Advisors Sdn. Bhd.'s founder and managing director, Yap Ming Hui, said the financial

literacy level of Malaysians today is quite low. For the Generation Y, personal finance is not a priority. Thus, it is vital to educate youngsters on financial matters, especially in terms of investing and its usefulness as a hedge against inflation. They must also be taught how to make their money work for them (The Star Online²³). Thus, based on the unresolved financial issues discussed above, the objective of this study is to measure the level of financial literacy and financial management of Malaysian households.

LITERATURE REVIEW

Financial Literacy: Financial literacy is defined as the people's ability to process the economic information and make informed decisions about financial planning, wealth accumulation, debts and pensions (Mitchell & Lusardi, 2014). An individual is claimed to be financially literate if he or she is competent and able to apply the knowledge (Huston¹³) that is acquired through practical experience and active integration (Idris et al¹⁴). A lack of financial literacy is not only a problem in emerging economies; consumers in developed countries have also failed to demonstrate a strong grasp of financial

Correspondence Author:

Universiti Utara Malaysia, 06010, Kedah, Malaysia

Email: 1afza@uum.edu.my

principles, and have failed to manage financial risks effectively to avoid financial pitfalls. Lusardi and Tufano¹⁸ analyzed the concept of debt literacy and the consideration of taking loans among individuals. There is a significant relationship between debt literacy and both financial experience and debt burden. Individuals with lower levels of debt literacy tend to transact in a high-cost manner, incurring higher fees and using high cost of borrowing. On the other hand, interested groups, such as policymakers, are concerned that consumers lack working knowledge of financial concepts and do not have the tools to make decisions most advantageous to their economic well-being (Braunstein & Welch⁵). These inadequacies are concentrated among particular population sub-groups (those with low income and low education, minority groups and women), where being financially illiterate may render them more vulnerable to economic hardship during retirement (Lusardi & Mitchell¹⁵).

The National Financial Capability Study by the Financial Industry Regulatory Authority has found that only about a third of Americans younger than 40 years of age understand the basic financial concepts of compounding, inflation and risk diversification. In practice, there is widespread financial illiteracy and many households are unfamiliar with the most basic economic concepts needed to make sensible savings and investment decisions. This has serious implications for saving, retirement planning, retirement, mortgage and other decisions (Lusardi & Mitchell¹⁵).

Therefore, the main goal of investor education is to change the 'norms' of saving and investing of ordinary people (Fanto¹⁰). Financial education is knowledge related to any financial affairs in order to gain good financial practices (Hilgert, Hogarth, & Beverly¹²). Oehler and Werner (2003) argued that financial education is the ultimate solution to enhance financial literacy. The Australian Government of Financial Literacy Foundation conducted a study on 7,500 Australians and found that 89% of the sample have high levels of ability to manage their money (Ali et al³). The respondents feel more confident when it comes to everyday money management issues, like dealing with credit, budgeting, saving and managing debt.

Financial Knowledge in Malaysia: Bank Negara Malaysia conducted a Financial Capability and Inclusion Survey in 2015, and found that more than 75% of Malaysians face challenges to raise RM1,000 cash for

an emergency. Only 32% of Malaysians have enough money to cover a week's expenses at most, should they lose their source of income. An ideal situation is to have a financial buffer that is sufficient to cover living expenses of at least three to six months in the event of loss of income. According to the Employees Provident Fund, to live above the poverty line for the next 20 years in Malaysia, individuals need a minimum savings of RM228,000 when they reach 55 years of age. Only 40% of Malaysians consider themselves financially ready for retirement, despite the steadily increasing life expectancy of Malaysians. Many Malaysians are still prone to financial fraud and they also fall victim to financial scams. Statistics from the police have revealed that 1,883 cases related to financial scams were recorded between years 2015 to 2017. The total loss amounted to RM379 million. This suggests that greed and ignorance give way to rational financial decisions for many victims (Ruxyn²²).

According to the New Straits Times¹⁹, young Malaysians still lack of financial knowledge, especially to invest. Opening a savings account seems to be not a good method as inflation and the cost of not investing will decrease the value of savings from year to year. Based on the Personal Wealth Young Investors' Survey 2016 carried out by The Edge, only 7% of the respondents invested more than 30% of their monthly income while 45% only allocate 5% or less of their monthly income for investment.

Thus, initiatives have been taken by Bank Negara Malaysia by developing a five-year national strategy with the aim of elevating financial literacy among Malaysians. The five strategic priorities cover all life stages from nurturing values among young children to inculcating positive behavior for adults and preparing Malaysians to retire comfortably. The vision of Bank Negara Malaysia is to nurture a society characterized by responsible financial behavior, the ability to manage finances well and the achievement of financial security. The implementation of the national strategy is aligned to the longer-term government aspiration under the Finance Cluster initiative of the National Transformation 2050 (TN50). Elevating literacy levels and achieving financial well-being would only remain as hopes and dreams of Malaysians unless "commitment" is made (The Star Online²³).

Factors Influencing Financial Literacy: Many factors may lead to financial literacy, such as age, race, gender, marital status and education level, among others. The following studies relate to the factors mentioned above:

Gender: Most of the studies have found that males are more financially literate compared to females (Al-Tamimi & Al-Anood²; Lusardi & Mitchell¹⁶). Ford and Kent¹¹ revealed that female have lower levels of financial market awareness compared to male. This gap could be due to men normally playing the role as leader, responsible for managing their family’s affairs, including financial matters of their dependents, like wife and children.

Age: Capuano and Ramsay⁸ found that older people over the age of 70 seem to use credit cards more wisely compared to younger people, while young people are easily exposed to and involved in risky financial practices due to lack of financial literacy. On the other hand, Agarwal et al¹ showed financial mistakes are more prevalent among the young and elderly, i.e., those who have the lowest level of financial knowledge.

Marital Status: Married individuals are more financially literate compared to unmarried individuals (Brown & Graf⁶). Men are more knowledgeable about financial markets and instruments; hence they would influence the financial knowledge of their wives (Bashir et al., 2013). Therefore, married women exhibit a better level of financial literacy than single women. Low level of financial literacy in a marriage which can lead to the risk of making bad financial decisions, results in debts and create a rift in the marital relationship (Calamato⁷).

Education Level: Investors with degrees are found to be more knowledgeable than those with high school or college education (Cude⁹; Volpe et al²⁵). An educated, employed male living in an urban area is more financially capable than his peers, especially if his parents are educated (Lusardi et. Al¹⁷). Rooijab et al²⁴ indicated that an increase in financial education leads to wise financial decisions. Bateman et al⁴ found that basic and sophisticated financial competence increases with age, education level and income. Financial mistakes are found to be common among the young and elderly if they exhibit a low level of financial knowledge (Agarwal et al¹).

RESEARCH METHODOLOGY

This study employed a survey method and was carried out in several states of Peninsular Malaysia. Selection of respondents was done using the random sampling technique. The aim of this study is to provide empirical evidence on the level of financial literacy and spending habits among

Malaysian households. This research concentrated on an individual-based analysis. The unit of analysis is households with the age range of 16 years and above. The respondents comprised households from Kedah, Pulau Pinang, Perak, Johor, Selangor, Kelantan and Terengganu with 451 respondents being given questionnaires (as in Table 1). Part of the questions were adapted from Assessing Financial Literacy Organization for Economic Co-operation and Development (OECD) 2015.

Table 1: Breakdown of Sample Respondents by Selected States in Malaysia

States	Sample Household	Percentage (%)
Kedah	50	11
Pulau Pinang	50	11
Perak	50	11
Johor	100	22
Selangor	100	22
Kelantan	50	11
Terengganu	51	11
Total	451	100

RESULTS AND DISCUSSION

Table 2 discusses the result on financial planning. About 163 respondents (25.3%) have their own financial plan in order to achieve their financial goals; while 123 (19.2%) households are cutting down on their expenses in order to achieve their financial goals. Other than that, 97 (15.1%) respondents will do some savings and cash investment to achieve their financial goals. A total of 56 respondents (8.7%) will find a new job or part-time job to fulfill their financial goals; whilst 33 respondents (5.1%) will find another financial loan or refinance their loan to achieve their financial goals. Meanwhile, 20 (3.9%) respondents will increase their savings with the hope that by putting away more savings, they can meet their financial goals more quickly. A total of 149 households (22.7%) do not have any financial planning. This group of people is crucial as they are not aware of the importance of financial planning. This may be due to poor education level, lack of exposure to financial planning among family members or an individual’s behavior. These findings are consistent with a survey done by Bank Negara Malaysia in 2015 that more than 75% of Malaysians face challenge to raise RM1,000 of immediate cash in the event of an emergency (Ruxyn²²).

Table 2: Financial Planning by Malaysian Households

		Frequency (n = 451)	Percent
1.	Prepare financial plan	163	25.3
2.	Reduce spending	123	19.2
3.	Saving or cash investment	97	15.1
4.	Find new job/part time job	56	8.7
5.	Find other financial loans	33	5.1
6.	Increase financial saving	20	3.9
7.	No financial plan	149	22.7

According to Table 3, the results show who is responsible for making household decisions on daily expenses. About 42.1% or 190 respondents make joint husband-wife decisions; whilst 24.8% (112 respondents) mention that household spending decision is done either by the husband or the wife. Also, about 149 respondents

do not know who is responsible for making daily household expenses decisions. Often, it is based on prompt decisions as and when it is needed. These findings support a study done by Whitman Independent Advisors Sdn. Bhd. that financial literacy level of Malaysians is quite low, especially the Generation Y, where personal finance is not a priority for them (The Star Online²³).

Table 3: Households' Daily Spending Decisions

	Frequency (n = 451)	Percent
Decision is made together	190	42.1
Decision is made by the other party	112	24.8
Don't know	149	33.1

Table 4 illustrates the results based on respondents' financial knowledge, financial behavior and debt management. The results reveal the descriptive statistics of 451 respondents from several states in Peninsular Malaysia.

Table 4: Financial Management by Malaysian Households

	N	Time-value of money (%)	Interest on loan (%)	Risk & return (%)	Inflation (%)
Overall	451	49.0	70.1	79.6	84.6
Location					
Urban	290	69.0	71.7	78.8	83.4
Rural	161	47.2	63.1	67.1	72.7
Ethnicity					
Malay	198	49.8	69.4	81.20%	85.4

Based on Table 4, respondents participated and showed their understanding on the five items asked, with the highest response for inflation (84.6%), risk and return (79.6%) and interest on loan (70.1%); and the lowest for the time-value of money (49%). Based on location, urban households show better understanding of financial knowledge and debt management (69% to 83%) compared to rural households (47% to 72%). It is not surprising since urban society may have a better standard of living, better education and exposure in terms of financial management. Past study by Lusardi and Mitchell (2007) have found that an educated, employed male living in an urban area is more financially capable than his peers, especially if his parents are educated (Lusardi et al.¹⁷).

In terms of ethnicity, there are four main groups. The Chinese show that they have a higher understanding of managing their cash and debt. They scored highest for the items of time-value of money (51.7%), interest on loan (74.6%), risk and return (79.7%) and inflation (86.4%) compared to Malay and Indian groups. This may justify that family upbringing and culture may also influence the behavior of people towards financial literacy.

For gender, 204 males and 247 females participated. Male respondents scored higher than female respondents for the items of inflation (83-86%), risk and return (79%), interest on loan (66-74%) and time-value of money (47-51%). Males are more alert to financial management and debt which could be due to their being the breadwinner in the family and hence, need to plan for the family. Past studies have supported these findings that female have lower levels of financial market awareness compared to male. Men normally play the role as a leader and are responsible for managing their family affairs, including financial matters of their dependents, like their wife and children (Ford & Kent¹¹; Al-Tamimi & Al-Anood²).

The older group (age of 51 and above) show better understanding of managing their money. They scored

high on the items of interest on loan, inflation and risk and return, ranging from 84 to 95%. Older people are more concerned with financial and debt management, have more experience and higher savings from their pension fund. These findings are consistent with Capuano and Ramsay⁸ who found older people (over the age of 70) spend more wisely compared to younger people. Most of the age levels scored a low point for the item of time-value of money. Respondents may not really understand the value of savings at a young age in that it may have a compounded value in the future, especially during retirement.

For the education level, the items of interest on loan (84%), risk and return (97%) and inflation (94%) scored high marks compared to time-value of money (69%) for all education levels. Respondents with diploma, degree and master's and above have better understanding of planning their savings and managing their debt. It is consistent with past studies that investors with degrees are more knowledgeable than those with only high school or college education (Volpe et al.²⁵). It is also evident that respondents at primary and secondary levels of education understand financial management. They may have been exposed to the basic knowledge on financial management and debt at school level, but lack the skills to manage and control their money (Lusardi et al.¹⁷; Cude⁹).

CONCLUSION

This study reveals that households in Peninsular Malaysia are still lacking in financial knowledge in terms of managing their wealth and debt. However, it must not be overlooked that they have already started to do some financial planning for the family in order to enjoy a better living standard and have some savings. The financial planning is done by the husband who is usually the breadwinner together with the family. In terms of knowledge on financial matters, this study found that households are aware about the items, such

as time-value of money, interest on loan, risk and return and inflation. As expected, urban society with higher level of education has better financial planning; whilst older people are found to have better financial literacy compared to the younger group. Males are found to be more financially literate and the Chinese seem to have higher awareness and planning in terms of financial management. Thus, it is timely for the relevant authorities, such as Bank Negara Malaysia, Ministry of Education and the Insolvency Department to be more aggressive in educating the public about the importance of financial education and planning. The limitation of this research is that it only covered Peninsular Malaysia and had a limited timeframe for respondents to answer the questionnaire.

ACKNOWLEDGEMENTS

The authors wish to thank the Ministry of Higher Education Malaysia in funding this study under the Fundamental Research Grant Scheme (FRGS), S/O code 13585, and Research and Innovation Management Centre, Universiti Utara Malaysia, Kedah for the administration of this study.

The Impact of Board of Directors' Characteristics and Remuneration on Companies' Performance in Malaysia

Chua Mei Shan¹, Nazrul Hisyam Ab Razak², Aiwan bin Ismail Ali³

^{1,3}Putra Business School, ²Department of Accounting and Finance, Faculty of Economics and Management, Universiti Putra Malaysia, 43400 UPM, Serdang, Selangor, Malaysia

ABSTRACT

This study aims at investigating the impact of board size, board independence, CEO duality, board gender diversity and board remuneration on the performance of public listed firms in Malaysia. Using the fixed effect and random effect models, the result showed that board independence and board remuneration have positively influenced firm performance respectively to ROA and TQ. However, board gender diversity was negatively associated with ROA. These results imply that higher number of board independence and higher amount of board remuneration can enhance firm performance. Though the Malaysian Code of corporate governance, the importance of having more female on board with the quota of 30% has been stressed with the result apparently presented that many female representations on the board may not enhance but deteriorate firm performance. The result of this study supported the notion of board remuneration and board independence that act as effective governance mechanisms to mitigate agency cost. With these results, firms must carefully design the director remuneration and determine appropriate numbers of independent director and female director on the board since they can influence firm performance.

Keywords: Board Independence, Board Gender Diversity, Board Remuneration, Return on Assets, Tobin's Q, Fixed Effects Model, Random Effects Model

INTRODUCTION

Corporate governance is gaining attention worldwide with financial scandals and corporate failures due to mismanagement, fraudulence, corruption and breach of trust. This has raised the issue of governance and its effects on company performance. The corporate scandals such as Enron in 2001, WorldCom and Tyco in 2002, Freddie Mac in 2003, American International Group (AIG) in 2005 and Lehman Brothers in 2008 suggest that even large and strong corporate entities can collapse if they are not well managed and governed. The integrity of corporations, financial institutions and markets is crucial in gaining market confidence as well as protecting shareholders' interests. Since the major corporate scandals have led to the downfall of big corporations, significant changes have been done in the governance, regulation and relationship between managements, boards and shareholders to improve company performance.

Companies with better corporate governance might have better performance than those with poor corporate

governance (Black, Jang, & Kim⁹&Arora & Sharma⁷). In Malaysia, corporate governance has received more attention after the Asian Financial Crisis in 1997. Malaysian securities commission has released the first Malaysian Code of Corporate Governance (MCCG) in 2000 to improve the governance standard in the country. The MCCG has been revised for three times in 2007, 2012 and 2017 to strengthen the framework and address future issues and challenges. The revisions of MCCG in 2007 and 2012 are to be in line with globally recognised best practices and standards, while the MCCG in 2017 has taken a new approach that includes the Comprehend Apply and Report (CARE) approach, shift from "comply or explain" to "apply or explain an alternative" and an introduction to new dimension of "Step Up" practices to urge companies to go further in achieving corporate excellence. All in all, these MCCGs emphasised the importance for having effective board to improve firm performance.

An effective board is often linked with the size of board, greater number of independent directors, separation of CEO-chairman position, board gender diversity and remuneration. Early studies on the

relationship of board characteristics and firm performance have largely concentrated on the developed countries (Horváth & Spirollari²²) while this issue is gaining attention from developing countries only in the recent years. Although studies on board characteristics have been previously carried out in Malaysia, the evidences provided were mixed. This may be due to the failure of ordinary least squares (OLS) in capturing the endogeneity relationship of board structure and firm performance. Furthermore, the use of only one or two board structure variables (Fuji, Halim, & Julizaerma¹⁶; Khan, Hassan, & Marimuthu²⁶; Lee-kuen, Sok-gee, & Zainudin²⁹; Mohd Nor, Shafee, & Samsuddin³⁵) caused the studies to be unable to capture simultaneous relationship of board characteristics and firm performance in a period. What is more, shorter time frame studies (Abdullah¹; Ponnu & Karthigeyan⁴¹; Shukeri, Shin, & Shaari⁴⁷; Yatim⁵³; Shawtari, Salem, Hussain, Alaeddin, & Thabit⁴⁶) may create limitations to draw inferences for another period. Therefore, this study was endeavoured to fill the academic gap by investigating the relationship of board size, board independence, CEO duality, board gender diversity and board remuneration with the performance of 100 public listed firms in Bursa Malaysia for five years period (2012 to 2016). To improve the estimators' efficiency, this study used fixed effect and random effect estimations for robust estimators.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

Two main theories were referred in formulating the hypothesis namely Agency Theory (AT) (Jensen & Meckling²⁵) show its relationship to the 'separation and control' issue, investigate the nature of the agency costs generated by the existence of debt and outside equity, demonstrate who bears these costs and why, and investigate the Pareto optimality of their existence. We also provide a new definition of the firm, and show how our analysis of the factors influencing the creation and issuance of debt and equity claims is a special case of the supply side of the completeness of markets problem. The directors of such [joint-stock] companies, however, being the managers rather of other people's money than of their own, it cannot well be expected, that they should watch over it with the same anxious vigilance with which the partners in a private copartnership frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention

to small matters as not for their master's honour, and very easily give themselves a dispensation from having it. Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs of such a company. Adam Smith. *The Wealth of Nations*, 1776, Cannan Edition (Modern Library, New York, 1937) and Resource Dependency Theory (RDT) (Pfeffer & Salancik³⁹). According to AT, agency conflict occurs due to the different interests between managers (agents) and shareholders (principals). (Jensen & Meckling²⁵) show its relationship to the 'separation and control' issue, investigate the nature of the agency costs generated by the existence of debt and outside equity, demonstrate who bears these costs and why, and investigate the Pareto optimality of their existence. We also provide a new definition of the firm, and show how our analysis of the factors influencing the creation and issuance of debt and equity claims is a special case of the supply side of the completeness of markets problem. The directors of such [joint-stock] companies, however, being the managers rather of other people's money than of their own, it cannot well be expected, that they should watch over it with the same anxious vigilance with which the partners in a private copartnership frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention to small matters as not for their master's honour, and very easily give themselves a dispensation from having it. Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs of such a company. Adam Smith. *The Wealth of Nations*, 1776, Cannan Edition (Modern Library, New York, 1937). To reduce the agency conflict, the shareholders would appoint the board of directors (BODs) as monitor to oversee the management. Meanwhile, the RDT views the BODs as a resource provider that could bring in unique set of human and social capital resources such as education, expertise, skills, access and an individualised set of contacts that may impact the firms in positive ways. (Krishnan & Amin²⁸).

Board size is one of the board characteristics that have been extensively studied by researchers locally and internationally. Yermack⁵⁴) argued that small board size can enhance firm performance since the consensus among members is easier to achieve, requires shorter time in decision making and less communication conflicts among the members. (Horváth & Spirollari²²; Jensen²⁴; Shukeri et al.⁴⁷) political, regulatory, and economic forces have been changing the worldwide economy in

a fashion comparable to the changes experienced during the nineteenth century Industrial Revolution. As in the nineteenth century, we are experiencing declining costs, increasing average (but decreasing marginal). In contrast, large board size is associated with great depth of intellectual knowledge that helps in decision making process (Arora & Sharma⁷). Researchers such as Arora & Sharma⁷ [India], Afrifa & Tauringana³ [United Kingdom], Shawtari et al.⁴⁶ [Malaysia], Rathnayake & Sun⁴² corporate governance and corporate performance in Asia such as China, India, Singapore, Pakistan, Malaysia and Sri Lanka. In addition, this study examines whether there is an impact of ownership structure and ownership concentration levels on firm's performance. This study considers board size, shareholder's independence and age of the corporation are used as corporate governance measures. Firm performance is measured by the return on assets (ROA [Asian countries] and Singh, Tabassum, Darwish, & Batsakis⁴⁸) [Pakistan] discovered that board size is positively associated with company performance. Meanwhile, Malik & Makhdoom³¹ [Fortune Global 500 companies], Wijethilake, Ekanayake, & Perera⁵¹) [Sri Lanka] and Ujunwa⁴⁹ [Nigeria] concluded that board size is negatively related with company performance. Therefore, this current study postulated that:

H1. There is a positive relationship between board size and company performance

Having outside directors is vital as they can act as “. . . providers of relevant complementary knowledge” to the management (Abdullah¹; Fama & Jensen¹⁴). Board independence can be a proxy for overall good governance (Bhagat & Bolton⁸). High representation of independent directors may help to improve firm performance as they are independent, concerned about own reputation, hold better judgment and more trustworthy to hold fair representation of shareholder interest (Shukeri et al.⁴⁷). Jaffar & Abdul-Shukor²³ [Malaysia], Gaur, Bathula, & Singh¹⁷ [New Zealand] and Ahmadi, Nakaa, & Bouri⁵ [French] found a positive relationship between board independence and firm performance. In contrast, Darko, Aribi, & Uzonwanne¹³ [Ghana], Horváth & Spirollari²² [US] and Shukeri et al.⁴⁷ [Malaysia] demonstrated an inverse relationship between the independent directors and performance. Thus, it was hypothesised that:

H2. There is a positive relationship between board independence and company performance.

According to AT, the separation of CEO and Chairman positions may improve the effectiveness of BODs since it reduces the potential conflict among the BODs (Shukeri et al.⁴⁷; Wijethilake et al.⁵¹). Nevertheless, it has been argued that combination role helps in making decisions because dual roles vested in one person can create deeper understanding and knowledge on the operations of a company (Marashdeh³²). Researchers such as Wijethilake et al.⁵¹ [Sri Lanka] and Gaur et al.¹⁷ discovered a positive relationship between CEO duality and firm performance. Nevertheless, Vu, Phan, & Le⁵⁰ [Vietnam] and Shukeri et al.⁴⁷, Ghazali¹⁸ and Ponnu⁴¹) the weight of opinion is that there is a significant relationship between governance structures and firm performance. The aim of this research is to study the effect, if any, of corporate governance structures, particularly board structure and CEO duality, on the performance of Malaysian public listed companies. The literature on these two governance parameters, board structure and CEO duality on firm performance in the context of Malaysia is lacking. Using samples of large publicly traded Malaysian companies, this research aims to examine the relationship between CEO duality and the proportion of independent directors on firm performance as measured by return on assets (ROA [Malaysia] reported insignificant relationship between CEO duality and firm performance. Hence, the third hypothesis of this study is:

H3. There is a positive relationship between CEO duality and company performance.

In Malaysia, the trend of women holding higher positions in the decision making process in public and private sector has gained its momentum. Aiming at gender equality, the government has introduced a policy that women must comprise no less than 30% on board and senior management positions by 2016 for public and limited liability companies with more than 250 employees.

Female representations on the board may strengthen the board monitoring function and more advantages in obtaining and maintaining important resources (Adams & Ferreira²; Nguyen, Locke, & Reddy³⁷). Adding more women on board may widen human capital and channels of communication of the BODs as they can bring in extra knowledge into firms' strategic issues especially those related to female employees, consumers and business partners (Daily, Certo, & Dalton¹²). However, increasing gender diversity may lead to a greater conflict of interests due to difficulties in reaching monotonous strategy decisions in heterogeneous

group and impair the monitoring functions(Campbell & Mínguez-Vera¹⁰; Goodstein, Gautam, & Boeker¹⁹). Darko et al.¹³) and Khan et al.²⁶ [Malaysia] presented a positive relationship between female directors and firm performance. Conversely, Fauzi & Locke¹⁵ and Ujunwa⁴⁹ reported that female directors are detrimental to firm performance. Meanwhile, Shukeri et al.⁴⁷ and Vu, Phan, & Le⁵⁰demonstrated insignificant relationship. Hypothesis 4 is described as below:

H4. There is a positive relationship between gender diversity and company performance.

From the AT perspective, board remuneration is one of the vital mechanisms to solve agency problem(Hassan, Christopher, & Evans²¹; Ruparelia, Njuguna, & Otten⁴⁴). If the remuneration is sufficiently appealing, the company can acquire ability that can prompt a superior management of the firm and encourage directors to perform better (Miyienda, Oirere, & Miyogo³⁴). However, higher compensation packages may impair the directors’ judgment, giving managers the advantage of pursuing their own interests at the expense of performance (Afrifa & Tauringana³). Aggarwal & Ghosh⁴[Indian] found that board remuneration has positively influenced accounting performance with insignificant relationship with market performance. Likewise, Yatim⁵³ and Razali, Yee, Hwang, Tak, & Kadri⁴³)[Malaysia] and Narwal & Jindal³⁶ [India] found that director remuneration is able to improve firm financial performance. However, Afrifa & Tauringana³ [UK] discovered that high remuneration can be harmful to firm performance. Thus, the Hypothesis 5 was

constructed as follows:

H5. There is a positive relationship between board remuneration and company performance.

Data: This study utilised the panel data of financial and BODs’ data collected from Thompson Reuters Datastream and companies’ annual report, respectively. The sample was 100 public listed firms in Bursa Malaysia that came from three largest industries; 40 industrial product, 30 trading and services and 30 consumer product firms. The study period was from 2012 to 2016. Following Krishnan & Amin²⁸ and Shukeri et al⁴⁷, the companies were randomly selected from each sector so that significant number of companies can well represent each respective sector. All financial and unit trust companies were excluded from the sample because of differences in the regulatory requirements. A total of 500 observations were analysed.

Estimation Model: In this study, the following regression model was estimated:

$$\text{Performance}_{it} = \alpha_0 + \beta_1 \text{BSIZE}_{it} + \beta_2 \text{BIND}_{it} + \beta_3 \text{CEODuality}_{it} + \beta_4 \text{GDIVER}_{it} + \beta_5 \text{BREM}_{it} + \beta_6 \text{LEV}_{it} + \beta_7 \text{SIZE}_{it} + \epsilon_{it} \dots(1)$$

Where firm performance is a function of BODs characteristics and some control variables. Firm performance is measured by return on assets (ROA) and Tobin’s Q (TQ). ϵ_{it} denotes the residual (contains random or fixed effects). i represents the firm and t denotes time. (See Table 1 for the definition of the variables.)

Table 1: Definition of the variables

Variables& Symbols	Measurements
Dependent Variables	
Return on Assets (ROA _{it})	Net income available to common stockholders divided by total assets
Tobin’s Q (TQ _{it})	Market value of equity divided by book value of equity
Independent Variables	
Board Size (BSIZE _{it})	Total number of BODs in the company at the end of financial year.
Board Independence (BIND _{it})	Number of Non-executive directors divided by total directors on the board.
CEO Duality (CEODuality _{it})	Dummy variable equal to 1 for duality, 0 for non-duality.
Board Gender Diversity (GDIVER _{it})	Number of female directors divided by total directors on the board.
Board Remuneration (BREM _{it})	Logarithm of total directors’ remunerations including salary, bonuses, fees and benefit-in-kind.
Control Variables	
Firm size (SIZE _{it})	Logarithm of total assets.
Leverage (LEV _{it})	The ratio of total debt to total assets.

ESTIMATION METHOD

The most common estimation of panel data is the Ordinary Least Squares (OLS) estimator. Unbiased and consistent estimators of OLS rely on several assumptions. This suggests that the corporate governance and control variables should be strictly orthogonal to the errors and that the errors are independently and identically normally distributed with a zero mean and a variance equal to σ^2 (Schultz, Tan, & Walsh⁴⁵) we fit a comprehensive model of performance and governance using a range of econometric techniques. Once a dynamic generalized method of moments (GMM). In other words, the error terms in each time period should be uncorrelated with the explanatory variables in the same time period (Marashdeh³²). However, Wintoki, Linck, & Netter⁵² argued that the corporate governance and performance relation may suffer from endogeneities (simultaneity and unobserved heterogeneities). This endogeneities would be captured by disturbance terms. Thus, the violation of the assumptions causes the OLS estimators to be no longer unbiased and consistent. Consequently, any findings drawn from OLS results lead to wrong inferences (Ochieng³⁸). To deal with this, the fixed effects estimation (FE) and random effects estimation (RE) can be applied. The FE model assumes that the individual effect term is constant, whereas

the RE assumes that the individual effect is a random disturbance drawn from probability distribution.

In identifying the appropriate model, Equation (1) was run with OLS estimators followed by RE estimation. For the selection process between the OLS and RE, Lagrange Multiplier test (LM) was utilised. The null hypothesis is that individual-specific or time-specific error variance components are zero. If the p-value of Chi-square distribution is less than 0.05, the RE is better to control the heterogeneity. To differentiate between FE and RE, Hausman test was used, which is a test for correlation between the x variables and the individual random effect. Under the null hypothesis, RE estimator is the preferred model; for alternate hypothesis, FE estimator is the preferred model. If the p-value of Chi-square distribution is less than 0.05, then one can reject the null hypotheses and conclude that FE method is more appropriate.

FINDINGS & DISCUSSIONS

Table 2 demonstrates the characteristics of the variables for 100 firms. The results showed all the 100 firms with healthy performance due to a positive and high percentage of ROA and TQ. The average ROA was 5.8730 ranging from -59.28 to 212.22. It has a SD value of 12.8531. The average TQ was 1.0463 ranging from 0.0853 to 7.9947. The SD for TQ was 1.1393.

Table 2: Descriptive Statistics

Variables	Obs	Mean	Std. Dev. (SD)	Min	Max
ROA	500	5.8730	12.8531	-59.28	212.22
TQ	500	1.0463	1.1393	0.0853	7.9947
BFSIZE	500	7.666	2.0695	4	15
BIND	500	0.6337	0.1814	0.1	1
CEODuality	500	0.15	0.3574	0	1
GDIVER	500	0.1067	0.1218	0	0.44
BREM	500	14.6301	0.9241	12.0494	18.3664
SIZE	500	20.0242	1.5785	17.1082	25.6126
LEV	500	0.1846	0.1535	0	0.6184

Note: ROA (net income available to common stockholders divided by total assets), TQ (market value of equity divided by book value of equity), BFSIZE (total number of BODs in the company at the end of financial year), BIND (number of Non-executive directors divided by total directors on the board), CEODuality (dummy variable equal to 1 for duality, 0 for non-duality), GDIVER (number of female directors divided by total directors on the board), BREM (logarithm of total directors' remunerations including salary, bonuses, fees and benefit-in-kind), SIZE (logarithm of total assets) and LEV (the ratio of total debt to total assets). This table reports the descriptive statistics for dependent variables, independent variables and control variables. The result of control variables are presented in the table but it is not reported in order to save space.

The number of directors on boards was between 4 and 15 with an average BSIZE of 7.666 directors. Sixty three percent of overall board members were seen as independent directors. Sample of this study indicated that only 15% of the firms practice dual leadership. Over the five-year period, the average number of female directors was 0.1067 ranging from a minimum of 0% to a maximum of 44%. In terms of BREM, the average

number of logarithm remuneration was 14.6301 with a range between 12.0494 and 18.3664.

Table 3 depicts the multicollinearity relationship among the variables. It was initially checked by pairwise correlation followed by variance-inflating factor (VIF) (Gujarati & Porter²⁰). The VIF results showed that the sample data did not suffer from multicollinearity problem.

Table 3: Correlation Coefficients

Variables	ROA	TQ	BSIZE	BIND	CEODuality	GDIVER	BREM	SIZE	LEV	VIF
ROA	1									
TQ	0.4534***	1								
BSIZE	0.0738*	0.1306***	1							1.37

Note: This table reports pair-wise correlation coefficients based 100 firms. The values of variance inflation factors (VIFs) are based on the sample of 500 firm-year observations. The variables are as defined in Table 2. *, **, and *** significant at 10%, 5% and 1%, respectively. VIF results less than 10 showed no multicollinearity problem. The result of control variables are presented in the table but it is not reported in order to save space.

Table 4 examines the relationship between board characteristics and ROA. The Hausman test chi-squared result suggested that the null hypothesis of the test cannot be accepted at any conventional level of significance [chi-sq 24.11; p-value = 0.011]. Therefore, the FE approach was employed to control the time invariant unobserved characteristics across firms.

Table 4: The relationship between board characteristics and ROA

Dependent Variable: Return on Assets (ROA)			
	Pooled Ordinary Least Squares (OLS)	Random Effect Model (REM)	Fixed Effect Model (FEM)

Adjusted R ²	0.0482	0.0548	0.0134
Breusch-Pagan LM test	71.51(0.000)		-
Hausman test	-	24.11 (0.011)	
Observations	500		

Note: This table reports findings from estimating Eq. (1). Column 2 reports the outcomes from the OLS estimator with clustering at the firm level. Column 3 exhibits the results gained from Random Effect estimator. Estimation gained from fixed effect estimator is reported in Column 4. ** and *** significant at 5% and 1%, respectively. The result of control variables are presented in the table but it is not reported in order to save space.

From Table 4, the initial significant coefficients under pooled OLS estimation were seen disappeared after unobserved fixed effect was considered. This implies that the results of OLS were likely to be driven by omitted firm level characteristics. The result from FE estimation showed that the BIND was positive and significant at 1% level of significance ($\beta = 28.28669$, p-value = 0.009). The positive evidence showed that increasing the number of independent directors can lead to a better performance. This is because they are able to hold better judgment, provide resources and act on behalf of shareholders' interest (Abdullah¹; Chaghadari & Chaleshtori¹¹; Shukeri et al.⁴⁷). This study result was parallel with that of Jaffar & Abdul-Shukor²³. Hence, this study supported Hypothesis 2.

Meanwhile, GDIVER was found to be statistically negative at 5% level of significance with ROA ($\beta = -33.2074$, p-value = 0.02). This implies that the greater the number of female directors, the lower is firm performance. This was contradicted with this study's prediction that women on board would strengthen the board monitoring function because their existence seem to cause greater conflict of interests and slow down the decision making, thus weakens the firm performance. The result of this study was consistent with that obtained by Fauzi & Locke¹⁵ and Ujunwa⁴⁹. Though the result was significant, it was out from the proposed prediction; therefore, Hypothesis 4 was rejected.

Moreover, the results showed that BSIZE, CEO Duality and BREM were insignificant with ROA ($\beta = -0.3785018$, p-value=0.602; $\beta = -0.1106121$, p-value=0.979; $\beta = -4.401609$, p-value= 0.052, respectively). Thus, it can be deduced that board size, CEO duality and board remuneration are not the effective governance mechanisms to improve financial performance. Thus, Hypothesis 1, 3 and 5 were rejected.

Table 5: The relationship between board characteristics and Tobin's Q

Dependent Variable: Tobin's Q (TQ)			
	Pooled OLS	Random Effect	Fixed Effect
Constant	-3.662604*** (-4.04)	-4.044881*** (-3.49)	-6.688187*** (-4.09)
BFSIZE	0.0473236 (1.74)	0.0416972 (1.92)	0.0434323 (1.89)
BIND	1.099587*** (3.5)	0.5309547 (1.74)	0.5293542 (1.54)
CEODuality	0.1833827 (1.33)	0.0273499 (0.22)	0.0135249 (0.1)
GDIVER	-0.1480475 (-0.37)	-0.2049343 (-0.51)	-0.3056394 (-0.68)
BREM	0.3476296*** (4.84)	0.167191*** (2.57)	0.142337** (1.99)
SIZE	-0.0548022 (-1.24)	0.1070069 (1.83)	0.2562167*** (3.08)
LEV	-1.900788*** (-5.36)	-0.7363877** (-2.55)	-0.6299959 ** (-2.02)
Adjusted R ²	0.1114	0.0624	0.0329
Breusch-Pagan LM test	798.70 (0.0000)		-
Hausman test	-	13.35 (0.0639)	
Observations	500		

Note: This table reports findings from estimating Eq. (1). Column 2 reports the outcomes from the OLS estimator with clustering at the firm level. Column 3 exhibits the results gained from Random Effect estimator. Estimation gained from fixed effect estimator is reported in Column 4. ** and *** significant at 5% and 1%, respectively. The result of control variables are presented in the table but it is not reported in order to save space.

Table 5 tests the relationship of board characteristics and TQ. The Hausman test result (Chi-sq= 13.35, p-value = 0.0639) suggested RE model as the preferred model.

The result of OLS presents two variables that are statistically positive at 1% level of confidence, which are BIND and BREM. However, under RE model, only BREM ($\beta = 0.167191$) remained significant with TQ. The positive coefficient implied that as board remuneration increases, firm market performance increased. In line with Yatim⁵³ and Razali et al.⁴³ CEO duality, firm size, firm age, and leverage; the regression results show director remuneration has positive relationship with firm performance (measured by ROA and ROE, board remuneration appeared to be an effective monitoring mechanism that can help improving firm performance. Hence, Hypothesis 5 was accepted.

The insignificant coefficient of BSIZE, BIND, CEO Duality and GDIVER deduced that they are not the effective mechanisms to enhance the firms' market performance.

CONCLUSION

This study was conducted to investigate the impact of board size, board independence, CEO duality, board gender diversity and board remuneration on the performance of 100 public listed firms in Malaysia from year 2012 to 2016. Using the appropriate model between the FEM and REM, this study showed that board independence was positively related with ROA, while board gender diversity was negatively associated with ROA and board remuneration was statistically positive with TQ. These implied that board independence and board remuneration work as effective governance mechanisms improving firm performance. Though the MCGG has stressed a quota of 30% female on board, the result apparently showed that having more female directors might deteriorate firm performance. The insignificant result of board size and CEO duality neither in ROA nor TQ suggests that both characteristics may not be effective in solving agency conflicts. Hence, firms must carefully design the director remuneration and balance the numbers of independent and female directors on the board.

RECOMMENDATIONS

The research design of this study has its own limitation. Firstly, the sample size was only limited to 100 firms with the study period of only 5 years. For more accuracy, future studies can increase the sample size and

longer time frame. Secondly, this study has only used ROA and TQ as dependent variables; thus, future studies can consider other measures including ROE or PE ratio since different measures produce different results (Li, Lu, Mittoo, & Zhang³⁰) whereas state-controlled firms have insignificant effects, irrespective of whether they are state or locally controlled. The results are robust to a battery of endogeneity checks and are stronger with market-based (Tobin's Q). Finally, future studies could incorporate variables such as director education, age and board busyness as these characteristics may play roles in improving the corporate governance in Malaysia.

ABSTRACT

Integrated research framework approaches are designed to create smart strategies to control dengue diseases in Malaysia. These approaches combine ecosystem approaches to health, or Eco-health, adaptive management and community participation in decision-making process. The processes may look somewhat complex, but each approach has its strength when it comes to control dengue diseases. A review of the collaboration between the various approaches can improve ecosystem services, encourage socio-cultural empowerment, improve health awareness and foster economic growth with less impact on human beings and the environment. Informative knowledge regarding Eco-health is essential for providing an understanding of the ecosystem from measurement in adaptive management. The adaptive management from all expertise will lead good governance and guaranteed community rights with regard to ensure their participation in decision-making process. Therefore, we carried out a survey on 399 respondents in Klang Valley, Malaysia to evaluate their attitudes by looking their participation on developing their trust in key actors and informed consent in terms of implementation on dengue's control techniques. The justification for this study is that we really need an integrated research approaches to make sure the informative knowledge about dengue diseases, that the correct methods for prevention are well known, that safe products with regard to prevention are ready to apply, that health management with regard to dengue is effective, that good governance exists in terms of policy, and the most important is high level of community participation. Consequently, it is necessary to look at the real situation of dengue cases in Malaysia by giving space to all stakeholders involved to choose the best way to preserve environment without dengue, to ensure healthy lives and to help the nation achieve its sustainable development goals.

Keywords: *integrated research approaches, eco-health, adaptive management, community participation, decision-making process, trust on key actors, informed consent, dengue.*

INTRODUCTION

Dengue is mosquito-borne virus diseases that become a major health problem in Malaysia^{1,2}. According to a report from the Ministry of Health, 2014 until 2016 are a dramatic year for Malaysia when the number of dengue cases have raised more than 100,000. However, in 2017, dengue cases were decreased with 83,849 which resulting 177 deaths. Up to August 2018, the number of dengue cases have also decreased by 42,952 that involving 65 deaths. This shows that Malaysia is one of the countries which is trying to achieve the goal

of a global strategy by the World Health Organization (2012) to reduce mortality by at least 50% and to reduce morbidity by at least 25% in 2020 by using the year 2010 as a baseline. Furthermore, this also shows that Malaysia was committed to achieve Sustainable Development Goals (SDGs) agenda in controlling dengue diseases.

Several principles of SDGs that can be encouraged to preserve the environment in controlling dengue which are i) the 3rd principle to ensure a healthy life among all age and ii) the 11th principle to ensure the city and the community in an inclusive, resilient

and sustainable. Both principles are appropriate to ensure that the public is safe from any vector-borne diseases, especially dengue. There is a link between environmental awareness and sustainability in ensuring sustainable development³ which environment needs to be preserved and protected by humans⁴. The concept of sustainable development is a strategy to protect the environment⁵ to ensure its survival so that the entire world is protected for future generations⁶. The concept of environmental sustainability refers to the process of conserving the ecosystem to maintain ecological and life systems⁷ and not contaminated from any damage that will cause various negative effects⁸. Therefore, process of environment preservation needs to integrate social and economic dimensions⁹.

There are many strategies for preventing dengue in Malaysia that focus on vector control management, surveillance, enforcement, emergency preparedness, vector control research and community participation^{1, 2}. Therefore, this research is carried out to propose innovative framework, which combine integrated approaches to ensure environmental sustainability without dengue. These approaches are an innovation to manage a healthy ecosystem in an adaptive approach. There are also involving participation from the community which influenced by their trust in key actors and the provision of informed consent for the implementation of dengue's control techniques. In other words, healthy ecosystem management through an adaptive approach requires community participation by raising public awareness to sustain our environment. The aims of the approaches are, 1) to solve the dengue problem by identifying the factors that cause the symptoms of dengue in such a way as to see the gaps between environment, social and economic dimensions; 2) to implement an appropriate approach to sustain the ecosystem as it applies to human health by using adaptive management, and by educating communities to participate in decision making process to eliminate dengue diseases.

In discussing aspects of dengue, it is important that we have clear information on the causes and challenges of dengue diseases. Aedes mosquitoes are the main vectors that spread the dengue diseases which commonly found in human habitats, especially in urbanized community areas¹. The main vector of this virus is the Aedes Aegypti mosquito, while the Aedes Albopictus mosquito is the second vector most commonly found in Malaysia¹⁰. There are four serotypes of the virus that are classified as *flavivirus* DENV 1, DENV 2, DENV 3, and DENV 4. The virus spreads through the bite of

female Aedes mosquitos that carry the virus^{11, 12}. After someone has been bitten by the infected mosquito, the virus enters the victim's blood stream, probably leading to sudden fever followed by various symptoms such as severe headache, pain behind the eyes, severe abdominal pain and sometimes a heat rash¹³. Currently, there is no specific treatment in the form of vaccines against dengue infection¹⁴, and only preventive therapy treatment is available to treat it¹⁵.

Human activity is the main factor for dengue becoming a dramatic epidemic globally¹. Rapid development in terms of progress, population growth, urbanization, and climate change, especially in cities, have become the factors leading to the worsening of the dengue problem^{1, 16, 17, 18}. Domestic water used by humans has created an opportunity for the Aedes mosquito to breed¹⁹. Some researchers have identified that buckets, flower pots and used tires are commonly used by Aedes to breed¹⁰. In fact, anything that can hold water can also act as a suitable place for the Aedes mosquito to breed^{1, 10, 21}. Weather changes and climate uncertainties are also a major factor that can cause this epidemic to become rampant because they provide conducive conditions for the transmission of dengue diseases²². In fact, environmental factors such as relative humidity and a high ambient temperature will increasing the number of mosquito breeding spots¹⁰.

A lack of community awareness means less participation can cause dengue problem to increase. Community participation depends on how the community involves itself in ensuring the success of dengue preventative strategy²³. However, the community usually is not willing to participate in dengue's control programmes. The community itself tends to suffer from poor communication which leads to a lack of community involvement, lack of knowledge and limited awareness of dengue. Previous research shows that the Aedes population density depends on human behaviour based on public participation and environmental management strategies²⁴. However, good knowledge and understanding does not mean that there will be a positive attitude towards dengue prevention²⁵.

ECO-HEALTH APPROACH

The ecosystem approach to health or eco-health as it is known, is a popular approach to protect environmental health from the stress syndrome that makes an ecosystem sustainable²⁶. The concept of eco-health relates to determining good ecosystem management strategies to improve the conditions of life and good health in order to maintain the sustainability of the ecosystem²⁷. The eco-

health approach creates interactions between ecological and social systems that shape good environmental health dimensions^{28, 29}. Therefore, we need to identify problems with regard to the relationship of the dimensions.

An eco-health approach should consider several factors that contribute to the dengue problem, and which determines the correlation between the dimensions that cause dengue. The environmental dimensions depend on changes in the environment due to climate change, usage of land, water supply and drainage systems, solid waste management, ecological and biodiversity change, as well as taking into consideration the development and urbanization that influences the reproduction of the dengue virus. In addition, social and economic dimensions have also been factoring that cause dengue virus transmission.

Conflicts in terms of the interaction between the environment and social dimensions can occur when humans do not care about the human-made environment that causes the increase in mosquito breeding sites. The gap between the environment and economic dimension occurs when development and population growth is rapid, disrupting the environment in such a way that it can lead to the rapid spread of the dengue. Such a conflict affects the economy because the treatment costs are high and social problems caused by humans will not be successfully handled without changes in public attitudes. Therefore, it is essential to consider problems associated with the interactions in the environment, social and economic dimensions, in order to analyse the causes of dengue diseases (Fig 1). Then, the gaps between the dimensions can be fixed using adaptive management in order to sustain the environment without dengue diseases. This will be described in the next approach on adaptive management approach.

Figure 1: Dengue problems interaction in environment, social and economic dimensions

ADAPTIVE MANAGEMENT APPROACH

Adaptive management approach was initially introduced for the management of forest resources³¹ and was then developed for the management of natural resources³². More research has been carried out using this approach. Adaptive management was used in the early 1990s to understand the interaction between social issues as part of environmental management, by connecting risk factors to human health³³. Adaptive management is a continuous process in terms of the procurement of process data. It involves model development to advance the science and the process of determining the best results when handling any large-scale application³⁴.

Adaptive management is a process aimed at reducing the uncertainties in monitoring the environment effectively without dengue diseases. Previous research has suggested that the purpose of adaptive management is to link the issues related to social and environmental issues and to determine the relationship between environmental risk factors and human health³⁵. Adaptive management is also regularly used to integrate socio-economic factors in order to design a more environmentally-conscious approach, and to use a more sustainable management of natural resources by associating it with issues related to public health and the health of the environment³⁶.

This approach incorporates the involvement of expertise in the fields of biology, ecology, epidemiology and entomology, and on the part of health agencies, stakeholders, national leaders and local community leaders. Through the eco-health framework, we can determine the cause of dengue problems. While adaptive management involves planning development in terms of the ecological system, where management searches for the best solutions to identify dengue vector habitats and for controlling the life cycle of the Aedes mosquito. This approach can also be used to support law enforcement and policy capability with regard to offenders who let mosquitoes breed in their houses or work premises.

Adaptive management can be used to improve the dengue control programme at the national level which needs collaboration on the part of district health officers, vector departments and the Ministry of Health to carry out surveillance by monitoring the situation on a weekly and monthly basis, to provide the efficient and specific data on dengue. The National Public Health Laboratory (NPHL) should improve their services as the national

reference laboratory to coordinate dengue cases. While, services involving 'serologically-confirmed dengue diagnosis' also needs to be available in hospitals and clinics to ensure its effectiveness in accordance with the capabilities when it comes to detecting dengue. Houses or premises inspection in order to identify mosquito breeding sites should be enhanced by imposing a fine on the owners of houses or premises that have allowed the breeding of Aedes. The study of biological data in terms of the geographical distribution of dengue vector habitats, the results of laboratory diagnoses, information on dengue cases, weather data and inspection can improve our ecosystem to sustain healthier environment without dengue.

The Malaysian government has also introduced Clinical Practice Guidelines Management of Dengue Infection (CPG), a Dengue Epidemic Preparedness Plan and Dengue Integrated Vector Management (IVM) to provide clear guidelines to manage dengue diseases that involves the participation of all stakeholders. These methods provide general information about the awareness of dengue on the part of the public, monitoring dengue cases trends, controlling Aedes habitats, handling of dengue prevention, and managing dengue treatment. The implementation of public health policy and the creation of dengue risk mapping can also help reduce the number of dengue cases. The documentation of data in terms of dengue risk mapping needs to be updated in order to address this problem more efficiently. Research on climate change is urgently needed to determine the correlation between rainfall, air humidity and wind speed with this epidemic. The local authorities that deals with urban and rural planning, the management of solid waste flow, and the management of water sources need to work together to reduce the spread of Aedes breeding. The combination of adaptive management through collaborative integration of government, health agencies, scientists, NGOs and medical experts is necessary to fight dengue. With the implementation of surveillance and diagnosis, the extent of mortality can be reduced. Therefore, this adaptive approach is the best management approach when it comes to conducting and controlling dengue in Malaysia.

COMMUNITY PARTICIPATION IN THE DECISION-MAKING PROCESS

The third proposed framework involves a decision-making process which are 1) the administrative authority

and regulatory issues; and 2) the trust in key actors and informed consent from community. Community participation in the decision-making process is very important in order to protect our cities and communities from dengue diseases. The decision-making framework has been suggested in a research study on genetically modified Aedes mosquitoes (GM Aedes). The authors took into consideration the ethical, social and cultural aspects of handling GM Aedes and dengue-related issues³⁷. Another research publication used decision making contexts to understand the link between ecosystems and human welfare to improve ecosystem services³⁸. The decision-making model suggests that there are many factors that influence in the decision-making process such as case factors, organizational factors, external factors and decision maker's factors when it comes to making an appropriate decision before any action is taken³⁹. From this research, it can be concluded that while the policies and existing regulations are important, knowledge and skills in implementing procedures are also needed. Studies evaluating risk are scarce, and the responsibility and support from authorities are a must in order to combat dengue in Malaysia. Through this research, it can be concluded that the law and existing regulations are ambiguous, less attention on implementation procedures, studies of evaluating the risk are limited, while negligence in terms of responsibility and ethical issues in management also occur due to the current political changes.

The ethical management of dengue is essential in order to improve the understanding of public health by increasing knowledge with regard to manage dengue prevention in Malaysia. Therefore, public health education is needed for the local community to have access to more detailed information about Aedes. For this purpose, attention should be paid to strategies that focus on vector control of dengue. Expert authorization is also necessary when handling any process for the dengue prevention. Health information that encourages awareness can help the community to combat dengue. Public opinion and consent must be considered from the outset in terms of the process of the prevention. Their trust in key actors can help to improve the public's awareness of dengue issues. The involvement of the local community is vital when it comes to taking a positive stance as a result of all the campaigns run by the government. For this approach to be successful, ongoing researches should be informed and accepted by the public. Sharing knowledge and a

study of community behaviour must be carried out to find out the community's concerns over dengue cases. The community should also be exposed to information about the risk of dengue-related diseases. As a result, they will be able to inform their consent whether or not the prevention processes performed by the authorities to preserve their lives.

Risk management also a key aspect of vector control programmes. Good bilateral communication and cooperation in the prevention of dengue, such as cleanliness regimes or seminars on dengue are also important to ensure that the number of dengue cases drops to zero. Behavioural improvements can change community behaviour and improve human welfare. Even the government needs to monitor any information in the media to ensure that only the right information is delivered to the public. Interaction with the media is also necessary for successfully disseminating information to the public. Through good media management, by publishing notes and posters on dengue, the government can reduce the impact of dengue and improve people's confidence in the dengue prevention efforts engaged in by the authorities. The information with regard to the Destruction of Disease Bearing Insects Act 1975 must be disclosed thoroughly by the authorities, so that the public can be warned of the dangers of dengue and will observe these laws. Therefore, participation in the decision-making process on the part of communities is a must in order to control dengue in Malaysia.

Nowadays, many dengue prevention techniques have been introduced to combat dengue. However, the extent of public trust in key actors in terms of dengue prevention techniques is still limited, even the extent of agreement upon the implementation of these techniques. Therefore, to conduct effective eco-health and adaptive management, we need to know the Malaysian's attitude towards the dengue prevention techniques by looking at their trust in key actors in terms of their informed consent to these dengue prevention techniques to ensure their participation.

Theoretical Framework on Community Participation: The theoretical framework of Malaysian's attitude towards the dengue's techniques through community participation is adapted, adopted and modified from previous research by Pardo et al.⁴⁰ and Amin and Hashim⁴¹. These studies were based on Fishbein's Attitude Model⁴².

The model begins with the listing of predictor variable factors which refers to community participation. Trust in key actors and informed consent are predictor variable factors that can determine community participation to relate their attitude towards dengue's control techniques. Visschers et al.⁴³ stated that trust in key actors is common factor in the public's acceptance of a technology. While informed consent is always used in ethical aspects involving clinical research or medical practice to channel effective communications about the benefits and risks^{44,45}. To explore the acceptance and involvement of the community in this dengue issue, these two factors are important to assess their attitude towards dengue's control techniques. Therefore, questionnaire instruments are developed based on the listing of predictor variable factors followed by the techniques to be tested on the attitude towards it. The questionnaire was developed in a group among researchers involved with this study and was validated by face and content validity to ensure that the questionnaire was unbiased, easy to understand and could answer the question of study.

RESEARCH MODEL AND HYPOTHESES DEVELOPMENT

The research model of the study as shown in Figure 2 was based on literature related to trust in key actors, informed consent and attitudes to dengue's control techniques. To answer the research's question, the researchers have developed three hypotheses:

- H1: When Malaysian have more trust in key actors, then they will have informed their consent associated with dengue's control techniques.
- H2: When Malaysian have more trust in key actors, then they will have a more positive attitude to dengue's control techniques.
- H3: When Malaysian will have informed their consent associated with dengue's control techniques, then they will have a more positive attitude to dengue's control techniques.

Figure 2: Research Model

To prove the hypotheses and to assess the relevance association between these variables, component-based approach of the PLS-SEM (Partial Least Squares-Structural Equation Modeling) is used with Smart PLS software.

MATERIALS AND METHODS

The research is conducted from September 2016 to September 2017 by survey of 399 respondents (age 18 years old and above). The Klang Valley was chosen as the location of the study because it has recorded as the highest dengue cases in Malaysia. The model requires an instrument measuring to prove what should be measured by performing validity and reliability tests⁴⁶ which include loading factor, composite reliability, convergence and discrimination validity⁴⁷. The loading factor for the variables was accepted because the value

is greater than 0.50 which contributes the total average variance extracted (AVE) exceeds 0.50⁴⁸. The value of composite reliability and cronbach’s alpha for each factor are greater than 0.80. The AVE value score for each variable factor in this study also exceeds 50%⁴⁷. Validity can also be evaluated through Fornell-Larcker Criterion, cross loading and Heterotrait-Monotrait Ratio (HTMT). In the Fornell-Larcker Criterion assessment, each variable factor should have a higher value of square root AVE compared to other variable factors^{49,50}. The study also found that cross loading assessments are in line with the predetermined features which is the loading of each indicator which has a higher value than the loading factor value for other indicators⁵¹. Meanwhile the value of HTMT should not exceed 1 and if the value exceeds 1, it means the indicator for that factor is less than the discriminant factual aspect⁵². Therefore, this study has met the instrument measurement criteria (Table 1).

Table 1: Cronbach’s Alpha (CA), Composite Reliability (CR) and AVE Values, Fornell-Larcker Criterion and HTMT ratio

Factor	CA	CR	AVE	Fornell-Larcker Criterion			Heterotrait-Monotrait Ratio		
				1	2	3	1	2	3
¹ Trust in Key Actors	0.791	0.877	0.703	0.839			1		
² Informed Consent	0.942	0.921	0.632	-0.038	0.795		0.049	1	
³ Attitudes to Dengue’s Control Techniques	0.920	0.935	0.673	0.374	-0.081	0.821	0.420	0.065	1

Finding of Structural Model: Bootstrapping method was used to test structural model. The t-test is conducted to determine the significance coefficient pathways between each factor to answer hypotheses. Based on PLS structural model analysis, the results only showed one significant coefficient pathways to structural prediction modelling for the Malaysian’s attitudes towards the dengue’s control techniques in Table 2.

Table 2: The Relationship Between Trust in Key Actors and Informed Consent that Encourage Malaysian’s Attitude Towards the Dengue’s Control Techniques

Correlation	Coefficient Value	Mean Score	Standard Deviation	T-Values	P-Values	Conclusion
H1: Trust in Key Actors->Informed Consent	-0.038	-0.011	0.080	0.468	0.320	Not Supported
H2: Trust in Key Actors->Attitudes to Dengue’s Control Techniques	0.371	0.376	0.058	6.352	0.000***	Supported
H3: Informed Consent->Attitudes to Dengue’s Control Techniques	-0.067	-0.038	0.080	0.833	0.202	Not Supported

*p < 0.05, **p < 0.01, ***p < 0.001

The analysis of structural model also involves i) testing of co-efficient pathways of determination (R^2), ii) testing the accuracy of the model predictions (Q^2),

and iii) testing of effect size (f^2) on the impact value on attitude towards dengue’s control techniques. The R^2 value of attitude towards dengue’s control techniques

factor is 0.144, suggesting that trust in key actor's factor explain 14.4%. Then, the Q^2 value of attitude towards dengue's control techniques factor is 0.088, which more than 0 to indicates that the exogenous variable (trust in key actors) is appropriate to predict endogenous variable (attitude towards dengue's control techniques)⁵³. The results also showed that trust in key actors ($f^2=0.166$) have medium effect size on attitude towards dengue's control techniques according to the effect size assessment proposed by Cohen⁵⁴.

DISCUSSION AND CONCLUSION

The findings of this study found that the trust in key actors ($\beta=0.371$, $p=0.000$) has been well explained in encouraging positive Malaysian's attitude towards dengue's control techniques. In fact, this study showed consistency with the study of Amin and Hashim⁴¹ when Malaysians have trust in key actors, they will have positive attitude to accept genetically modified mosquitoes to control dengue disease in Malaysia⁴¹. However, the findings also showed that informed consent factors not explaining positive attitude towards dengue's control techniques and trust in key actors no direct association with informed consent.

Therefore, this study gives implications for enriching the literature on the attitudes towards dengue's control techniques based on trust in key actor's factor. The next study may add more predictor factors in assessing the attitude of Malaysian community to the dengue's control techniques. It can even be added with a simplification factor that can identify predictors of factors with their relationship in assessing aspects of attitudes. This model of the research is also seen to be important in improving the quality of health and the environment of the Malaysian community in controlling dengue diseases.

CONCLUSION

The strategy to diminish dengue-related issues should be implemented consistently and closely monitored in terms of its effectiveness and suitability. Dengue vector control should be carried out systematically and law enforcement and police activities should be fine-tuned. Community participation and the support of civil society is indispensable with regard to all shapes and patterns of dengue prevention and control activities, so that this phenomenon ceases to be a major public health

problem in Malaysia. Living freely without the threat of dengue must be implemented through collaborative integration in terms of the framework of the proposal, namely to improve the eco-health by providing a healthy environment, a more efficient adaptive management approach, and higher participation of the community by trusting key actors and by allowing informed consent in terms of making correct decisions in implementing dengue's control techniques is a must.

This is crucial in making the correct decision with regard to dengue-related problems and also the techniques to control it. Thus, an integrated information and education system should be introduced so that the public can act correctly. A healthy living culture should be encouraged and the empowerment of communities in terms of social and economic structures should be used to preserve the environment. As a conclusion, all experiences with regard to controlling dengue prevention in order to ensure healthy living indicate a challenge to maintain sustainable development to ensure sustainable living in Malaysia. Therefore, the integration of these three frameworks and the support of all relevant experts is necessary to provide a greater understanding of the approaches that can be used to ensure healthy living and to promote well-being for all. To do this we must provide new dimensions in dengue management as well as good governance and community rights in terms of decision making with regard to dengue-related issues. This will lead to prevention as part of the effective solutions to dengue control. This will help Malaysia achieve its sustainable development goals in the coming years.

Impacts of Online Social Media on Investment Decision in Malaysia

Shakerin Ismail¹, Radha K. Nair², Rohana Sham³, Siti Norida Wahab⁴

Faculty of Business and Information Science, UCSI University

ABSTRACT

This research aims to study about the investment decision in Malaysia and this study focuses on several impacts of online social media towards the investment decision of investors in Malaysia. The hypotheses are tested through the questionnaires distributed to investors in Malaysia, particularly in Klang Valley area. The collected data are analyzed by using Statistical Package for the Social Sciences (SPSS) Software Version 20. The findings supported all hypotheses as proposed, where the p-value and significance value are all less than 0.05. Therefore, it shows that the independent variables including information in online social media, online community's behaviour in online social media and firm's image in online social media have significant impact on the dependent variable which is investment decision. This research aims to contribute to literature for future research on relevant topic that examines the consequences of social network on movement in capital markets.

Keyword: *Online social media, online community, investment decision*

INTRODUCTION

The early usage of online social media is popular for branding and marketing purpose, where entrepreneurial firm uses online social media as platform to monitor the consumers' conversation and understanding consumer's needs and wants in real-time. Today, communication technology is approaching a foreseen-able singularity. Previously the world used to have various communication method and devices such as telephone, telegram, faxes, printing, post letter and others; but now could be done through a single platform, the Internet. Almost 800 million users of Facebook around the world, 250 million new Tweets by Twitter users each day and 135 million people using LinkedIn to expand their professional social network (Greenfield⁸). According to a research done on Internet Users Survey 2014 published in official portal of Malaysian Communications and Multimedia Commission (MCMC), it shows that 87.1% of internet users are engaged in online social media. These statistical figures proved the extensive use of online social media by people has made online social media an increasing important channel of communication for them to share, connect, and interact with each other about their thoughts, words and decisions. The power of online social media cannot be underestimated and is expected to continue to revolutionize personal and organizational communications and interactions worldwide (Ngai et al.²⁰).

In 2013, few notable events and information attracted the financial community attention in online social media. First, the announcement of the United States Securities and Exchange Commission where companies are allowed to utilize online social media to reveal significant information in compliance with Regulation Fair Disclosure (Regulation FD) as long as investors were aware on which online social media will be used by the companies to disclose the information. Previously, the Regulation FD which applies to company websites is now applies to online social media and other emerging means of communication used by public listed companies. It benefits both the company and its shareholders in the way that the companies can utilize the online social media platform such as Facebook page, Twitter account to selectively make disclosure and provide instant response on what the disclosures are, while the shareholders have the chance to give instant response to the disclosures of the company's post in the online social media account (Hoffman et al., 2013). It shows that both regulators and corporations had taking a step ahead to embrace online social media as a viable channel to disclose significant information (Greenfield⁸).

There are many determinants that influence an investor's decision; whether from economic, political or social. However, there is still a gap in this area of research that explains the impact of online social

media on investor's decisions especially in Malaysia. Online social media has become an important tool that investors use and also rely on to make their investment decisions on the stock market in Malaysia. In this way, the effect of online social media on share costs will undoubtedly turn out to be lesser in the coming years. Besides that, there is an expanding proof that online social media action can support share price. A late study by Arthur O'Connor, an analyst at Pace University stated that the quantity of Twitter adherents, Facebook fans, and YouTube site visits for Nike, Coke, and Starbucks would seem to propose an immediate relationship or connection between these online social media and the share price of those organizations. Another study from Greenwich Associates uncovers that around 80% of institutional investors utilize social media as a major aspect of their normal work process, and roughly 30% of these speculators say data acquired through online social media like Twitter and Facebook has straightforwardly impacted their investment decisions.

As such, this paper examined how the online social media influencing the investment decision made by the investors, especially in Malaysia. The online social media is breaking down into three categories: information, online community behavior and firm's image. This research paper is constructed as follows: we reviewed the literature pertaining to the online social media and investment decision followed by the relationship between online social media and investment decision. Next, we will construct the research framework, describing the methodology to be applied and discussing the research findings.

LITERATURE REVIEW

Investment Decision: Investment is one of the categories in the field of finance. Decision making is crucial in the process of choosing the best option out of all alternatives available that can help individual to achieve their perceived return. According to Jamal¹² suggested in making investment decision, investors often consider the risk-return payoff, which refers to the idea that high risk investment should be compensated with higher expected return. The investment decision is commonly defined as the decision made by investor by measuring the investment subject's financial risk and financial return. Importance of investment decisions towards the economic development can be explained

in two perspectives, micro and macro. In the micro, the firm's investment decision affects the expectation of the investors on the company's future performance. Moving to the macro perspective, the profitability of the aggregate companies will eventually determine a country's economic development.

Information, online community behavior and firm's image: The impact of information on online social media can be broken down into two categories which are consumers and organizations. Information on online social media is utilized by business firms and legislative associations as a specialized device. These substances effectively make utilization of online social media for publicizing, advertising, speaking with clients, building association with clients and branding (Kim¹⁵). In addition, through online social media it is believed to make an advertisement with substantially incurring lesser effort and cost (Kim¹⁵). Online social media can dramatically affect firm in areas, for example, upgrading brand's reputation; improving value, and brand equity; enhance digital advertising and promotion, handling customer service issues, mining innovation ideas and building customer relations (Solis²⁴).

It has a several number of social platforms can be found which are useful in sharing the information. For example, Wikipedia, a free online encyclopaedia, is among the outstanding platform to enable the users to work together on information sharing. Online social media itself definitely play a significant role in providing an information to a wide-ranging people, especially individual investors (Fang, 2009). This suggested that the information gained from online social media such as Twitter and Facebook were useful for investor's trading decisions (Bollen¹⁰).

According to the Gradual-Information- Diffusion model, investors are usually called as news followers who use firm's information on online social media to make economic decisions or traders who use previous changes in stock prices to make investment decisions. This model anticipated that how quickly the changes of stock price in response to new information on online social media. Besides that, a study by Elizabeth Blankespoor⁶ claimed that Twitter, Facebook and other forms of online social media can reducing information asymmetry amongst investors and contribute to higher market liquidity as a result of broad dissemination. Due to that particular reason, it encourages informed traders to seek out

information from online social media in order for them to take an advantage of these opportunities, hence better trading decisions can be made. Moreover, Asheq Rahman¹ has assessed the impact of frequency of online material information on online social media on stock market prices. He demonstrated that the recurrences of announcements are emphatically connected with returns and volumes of securities exchange which will affect investors with the goal for them to make an investment decision.

According to Ridings²², online community should include elements of people who communicating to each other for their own needs or perform special roles by using computer systems in order to support and mediate social interaction and facilitate a sense of togetherness. Online community consists especially of ordinary people who share their opinions, mood or emotions about concrete information. Ngai et al.²⁰ stated that behaviour of online community is crucial for an identification of the social factors in order to stimulate user participation in collective actions in the online social media platforms. Utilizing the social factors that determined from the study of online community behaviour, it can contribute to the strategies development to foster the necessary environments for building and maintaining social communities.

The social factors such as the existing social, psychological and emotional characteristics brought by adolescent into the communication within the online community provide the causal link to the social outcomes of interest. It then shows that the communication behaviours of online community have impact on the social development. Lee et al.¹⁷ mentioned that participation of investors in online community increase the risk in making investment decision. Congenial investors gathered around online communities to educate each other, as well as generate opinions on stock picking, where the less-rational groups of investors are prone to behave according to sentiment (Bukovina⁴). K.Nirmala Devi¹³ found that the sentiment in Twitter, happy and calm by the online community had a high correlation with the stock market prediction. The online social media conversation caused investor's behaviour biased in making investment decision especially during the periods of high volatility in stock market.

Reputation has been characterized as 'a perceptual representation of a firm's past activities and future prospects that depict the firm's general interest to all its key constituents when contrasted with other

driving opponents (Fombrun⁸). According to Spector²⁵, firms create their image by keeping in mind the end goal to impact clients' states of mind towards their items or services. Individuals then again assess these efforts by qualities which more often than not begin from the client's involvement with the company's items or administrations. In this way, firm's picture is a multidimensional idea which relies on the genuine firm picture, its determinants and client assessments (Spector²⁵). There are two main factors which influences a firm's image or reputation on online social media which are consumer perceived value and loyalty. Several studies had proven the relationship between online social media and investment decision. Luo¹⁸ suggested that online social media has significantly affecting a business's value. His research claimed that by having positive online social media posts, investor's confidence and advocacy can be increased, which cause to higher firm value and has an impact on investors trading decision. Naturally, negative online social media posts can contribute to the negative reputations, causing firm's performance to be bad which leads to the firm being unattractive for investments.

Schniederjans²³ examined the linkage between firm's reputation and online social media and found a halfway positive relationship between the utilization of online social media and investment choice, contingent upon the impression management strategy utilized. Negative exposure in online social media specifically can quickly influence investment decisions by investors (Luo, 2013). Brammer³ found that investors make huge returns when they buy stocks of the firms whose reputation has risen tremendously on online social media. This result is an opportunity for firms to invest in their image to create a good reputation for themselves.

RESEARCH METHODOLOGY

This study used questionnaire which adopted from Doan (2011). The questionnaire was structured into three main sections:

- (i) Section I sought to capture the general data about the respondents. For Section I, nominal scales are used to classify objects.
- (ii) Section II was focused with the data on the independent variables that affect investment decisions.

(iii) Section III is the part of investment decision of investors. Under Section II and III, respondents were asked to indicate their degree of how they are influenced by each of the items on 5-points Likert scale. The respondents are required to select their level of agreement within the range of strongly disagree(1), disagree(2), neutral(3), agree(4), and strongly agree(5).

Data analysis method used in this study are descriptive statistics and multiple regression test with the help of Statistical Package for the Social Sciences (SPSS) Software Version 20, which enabled data interpretation and making of statistical inferences. Reliability test was carried out to measure the internal consistency of a set of items of each variable by using Cronbach’s Alpha.

To ensure the normality of data distribution, this study would use the Skewness and Kurtosis results.

Multiple regression test is used to predict the relationship between several independent variables and a dependent variable. A regression equation can then be formed to explain on how the changes in independent variables affect the dependent variable. Significant value which lower than 0.05 ($\text{sig} < 0.05$) is an indication of the existence of significant relationship between independent variable and dependent variable. This study used Multiple R value to measure the strength between the independent variables and dependent variable. Appropriate R value is within the range of -1 and 1 which is similar with the rules of thumb expressed in the correlation test.

RESULTS

Multiple Regression Analysis

Table 1: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimation
1	.821 ^a	0.675	0.665	2.09916

Predictors: (Constant), Information, Online Community’s Behaviour, Firm’s Image

The model indicates that the independent variables explained approximately 67.5% ($R^2 = 0.675$) of the variability of the investment decision. Unfortunately, R^2 tends to overestimate the strength of the association especially if the model has more than one independent variable. R^2 may provide misleading results especially when assessing with small sample size of regression analysis (Matuszewski¹⁹). While the adjusted R-square (adjusted R^2) attempts to give a better estimation of the true population value (Pallant²¹). In addition to this, adjusted R^2 can provide accuracy to the model and give corrected goodness-of-fit measure in regression analysis. Therefore, most of the researchers choose to apply adjusted R^2 rather than R^2 value in the studies. Due to the sample size of this study is small, adjusted R-square has been used in the study.

A coefficient testing is conducted to provide the understanding about the significant level and the degree of impact towards the dependent variable.

Table 2: Results of Coefficient Testing

Coefficients ^a	Unstandardized		Standardized	t	Sig.
	B	Std. Error	Beta		
(Constant)	1.024	1.327		0.77	0.44
Information	0.268	0.09	0.255	2.97	0
Online Community’s Behaviour	0.183	0.081	0.194	2.27	0.03
Firm’s Image	0.479	0.097	0.463	4.92	0

a. Dependent Variable: Investment Decision

The statistical significance of each of the independent variable can be explained by the significant value (Sig.). Generally, those significant values less than 0.05 explains that the independent variables have significant contribution to the dependent variable and vice versa (Pallant²¹). This indicates that all the independent variables in the model have significant impacts on the investment decision.

Other than that, the standardized coefficient Beta value is important to determine and compare the strength of each predictor variable in affecting the dependent variable. Concisely, the variable with a larger Beta value has stronger influence from its contribution to the dependent variable. According to the table, it is found that the variable of firm's image in online social media ($\beta = 0.463$) has the most impact while online community's behaviour in online social media ($\beta = 0.194$) has the least impact among the three predictor variables selected in influencing the investment decision.

DISCUSSION AND CONCLUSION

The significant relationship exists between information in online social media and investment decision. This finding is consistent with the study of Fang (2009) which discussed that online social media play an important role in disseminating information, especially to individual investors. According to the studies by Java¹¹ and Bollen², which explained that the features of online social media which are precise, high volume and real-time, greatly facilitate the diffusion of investing information. Therefore, investors are encouraged to seek out information from online social media in order to take advantage of these opportunities, hence making better investment decisions (Kyle¹⁶).

Besides that, we accepted the second hypothesis which describes that the online community's behaviour in online social media has a significant relationship with the investment decision. This findings is consistent with the study of Lee et al.¹⁷ which mentioned the participation of investors in online community give impact to investors when making investment decision. From the result of the study by K.Nirmala Devi¹³, found that the behaviour in Twitter, happy and calm by the online community had a high correlation with the stock market prediction.

The third hypothesis where the firm's image in online social media significantly affect the investment

decision is accepted. This findings is consistent with the studies by Schniederjans²³ and Luo (2013). Their research discovered that through positive online social media posts, investor's confidence and encouragement can be enhanced which directly affecting to the positive investment decision. Generally, investors make huge returns when they buy stocks of the firms whose reputation has risen tremendously on online social media as according to Brammer³.

Although this research has reached its objectives, there are some unavoidable limitations that had occurred during the research process which may have an effect on the actual findings. The first limitation is the sample size. This study was conducted with a relatively small sample size of only 100 respondents due to the time constraint. Because of this, the sample size that had been selected may not be sufficient enough to represent the entire Malaysian population's perspective on the impact of online social media on investment decision in Malaysia. Hence, the future researchers should increase the sample size by increasing the number of questionnaires distributed to the respective respondents.

In addition, this research paper uses primary data and quantitative method. Due to this, the data collection method used is questionnaire. Hence a 5-point Likert scale is used for all the statements regarding the independent and dependent variables and this has a few limitations whereby the respondents are limited to the Likert Scale and are not able to provide extra information or explanation since it is a close ended questionnaire. So, future researchers also can consider qualitative methods by adding more open-ended questions in the questionnaires so that more accurate opinions and information can be obtain.

This research aims to contribute to literature for future research on relevant topic that examines the consequences of social network on movement in capital markets. Besides, this research can provide some insights to policy maker and standards setter in developing standards in the field of social network and capital market.

The Effects of Perceived Organizational Support, Supervisor Supports and Peer Supports on Transfer of Training

Fadillah Ismail¹, Adibah Abdul Kadir², Fazlulaini Mohd Yunus³, Nur Hayatun Syamila binti Fauzi⁴, Nur Amalina Mohd Rosli⁵

Faculty of Technology Management and Business, Universiti Tun Hussein Onn, 86400 Parit Raja, Johor, Malaysia

ABSTRACT

Organizations have invested a huge amount of time and money into training in order to improve the organizational performance. However, if the training fails, the resources dedicated to it is wasted and the results go unrealized. Thus, the organizational performance can be evaluated by looking on transfer of training that is obtained by employees. The purpose of this study is to determine the effects of dominant factors on the transfer of training. Three factors were proposed by considering the factors of perceived organizational supports (POS), supervisor supports and peer supports. The research was conducted in an organization at Pasir Mas, Kelantan with the population of 90 respondents and the research sample are 82 employees of the organization who had attended Occupational Safety and Health Administration (OSHA) training program. The approach used is quantitative by using survey questionnaire in collecting data 6 months after training program and Statistical Package for the Social Science (SPSS) software to analyze the collected data. The outcome turned out that the level of transfer of training among employees in an organization is very high. Then, peer supports out of other supports has become the most domain factor that affected transfer of training in the organization. Perceived organizational supports, supervisor supports and peer supports are statistically significant correlated with positive relationship towards training transfer.

Keywords: *Transfer of training, Perceived organizational supports, Supervisor, Peer, Supports*

INTRODUCTION

Employees are turning out to be the essential parts that are giving so much functions towards all organizational. Organizations spend significant amounts of time and money into training with the aims of rising the employee performance (Lancaster, Di, Roslyn, Lancaster, & Milia¹¹). The performance of employees can be evaluated by many factors as for one example, the transfer of training that obtained by the employees. Thus, the organizations are focusing on increasing the training transfer in their employees. Transfer of training is an important element in the criteria of training effectiveness, which helps both employees and organizations improve their performance (Bhatti, Battour, Sundram, & Othman, 2013).

The transfer of training can be described as the process of transferring new knowledge, skills and attitude for effective work performance. As the example, considering into the state when there is a disaster taking place, what has been studied in training to get ready for

disasters must to be applied in the workplace or at the location of the rate of the disaster (Lim & Nowell, 2014).

Training transfer can be categorized into the broad areas of trainee characteristics, training design and work environment, yet the study is on the work environment. Work environment can be defined as the character and surrounding of an organization where employees perform their jobs and tasks (Hanaysha⁸). The work environment involve the supports elements that help the organizational to be sustain and improve such as the employer, supervisor, colleagues and subordinates.

TN50 is a long-term development blueprint announced by the Malaysia's 6th Prime Minister, Najib Razak, which is about the process as the product. Najib Razak said TN50 is focusing on development of human capital as a pillar to the national success and thus the excellent human capital can be achieved with the high competency level of people (The Star Online¹⁸). According to New Straits Times¹⁸, the global economic landscape will continue evolving owing

to technological advancement, particularly in the area of digital economy. In the midst of the Fourth Industrial Revolution, raising value-added productivity, alongside innovation, technological advancements and human capital development could unleash further the growth potential of the Malaysian economy. Thus, it shows how important the human capital developments towards TN50.

TN50 has aimed for Malaysia to have sustainable developing organization as one of the issues is Malaysia has lacked of workers who have enough knowledge, skills and attitude (Aun²). According to The Star Online¹⁹, the Malaysia's former Youth and Sports Minister, Khairy Jamaluddin said almost 65% of existing jobs are likely to become redundant or disappear within 30 years or so. These include many construction, manufacturing and administration jobs where robots are replacing manual labor. Malaysia has to make sure the education and training systems are adequate for the jobs of the future. He pointed out that currently Malaysia is "overly dependent" on low-skilled foreign labor and under-invested in the field of automation and robots. He added that the country must grow its productivity level and to move away from labor-intensive sectors (The Star Online¹⁹). Thus, Malaysia surely needs the training systems to be developed well in helping Malaysia to develop human capital, improve the productivity and empowerment in working sector, leading TN50 to be achieved.

PROBLEM STATEMENT

Nowadays, it is so hard to hire employees that are high in their training transfer. The employees that available in the field have low level of training transfer that may affect the performance of organization. Kasim, Omar, Ali & Hashim (2014) stated that there is a majority or mass of the employees who have joined the trainings showed lack of transfer of skills and knowledge. It can clearly being seen in the research study that has been done by Scheineider, Pältz, & Stauche (2014) which noted that there is just 10 percent of the trainings have productively created a positive transfer of learning. Furthermore, Patterson (2009) also in his study have found more than 80 percent of the training outcomes in terms of knowledge, skills and abilities achieved in training programs are not being practiced back into the real workplace.

The money spent on the training transfer program are costly and causing the company and organization to

face losses in their investments for improving employees' performance if their efforts gets into failure. However, in improving their organizational training transfer skills and knowledge, the organizations keep on investing their money onto training program yet, as being stated by Chauhan, Ghosh, & Rai⁵ it has been seen that spending money does not alone help attain the objectives of a training program and the training has to be implemented at the workplace. Otherwise, the return on investment in training is generally considered unsatisfactory.

POS is an important elements to organization as it is functioning in how an employee perceives the degree to which their organization values their contribution to the workplace and cares about their well-being (Rhoades and Eisenberger, 2002). However, the organizational support theory argues that employees pay attention to treatment offered by the organization in an effort to determine the degree of their contributions to the organizations. Supervisor acts the role as ones who are in responsibility in supporting and reminding the subordinates in implementing their skills, they can affect the subordinates to be whether through the positive or negative parts of implementation. Yet, peers also are giving impacts towards the transfer of training as they are acting as the supporters during on the job training and the ones who influence the skills towards employees. Chauhan et al.⁵ during their research, they found out that the influence of peers on transfer is found to be higher than supervisors do. Homklin, Takahashi & Techakanont (2014), have found that different to supervisor support and organizational support, only peer's support is positively being related to transfer.

RESEARCH OBJECTIVES

There are three main objectives to be found out and they were listed as below:

- (i) To determine domain factors that influence the transfer of training on employees at the organization.
- (ii) To identify the relationship between perceived organizational supports, supervisor supports and peer support towards the transfer of training on employees at the organization.

Research Scope: The scope of this study will be as below:

- (i) The research is conducted at an organization at Kelantan.

- (ii) The population of research are 90 employees and the sample are 82 employees of who had attended OSHA training programs organized by organization 6 months after the program.
- (iii) The survey questionnaires about the effects of perceived organizational supports, supervisor supports and peer supports on transfer of training.

Significant of Research: By doing this study of research, we get to know the level of training that have been practiced by the employees in the organization and the factors that leading them towards training transfer. Besides, we also get to know the effect of POS, supervisor supports and peer supports onto the training skills, attitude and knowledge transfer between the employees.

This research is limited in some parts as there are some participants who are not cooperating and not giving the clear answers which causing the surveys to be not reliable and not consistent in result. It is also just includes the ones who had attended the training program that is organized by the company 6 months after the training program. This study also may be one source of reference to who are interested in the field of research to do the further research.

LITERATURE REVIEW

Training and Development: Training can be described as a systematic approach to learning and development to improve individual, team, and organizational effectiveness (Goldstein & Ford 2002). The training program is a strategic function of human capital management, where it focuses on developing overall employee competencies to overcome their daily work problems (Madi & Abdullah¹²). Meanwhile, development refers to activities leading to the acquisition of new knowledge or skills for purposes of personal growth (Aguinis & Kraiger¹). According to Churchill⁶, training is focusing around doing exercises today to develop employees for their present occupations while development is getting employees ready for future parts and obligations.

Training Effectiveness: Training effectiveness can be defined as the study of individual, group, or organizational level factors that influence learning in training and transfer after training (Aguinis & Kraiger¹). According to Kirkpatrick model (1959/1996), training effectiveness can be evaluated using the four levels: reaction, learning, behavioral changes, and results. However, Kirkpatrick argues that the higher the level of training effectiveness

the more difficult, complex, and expensive the measure. This explains why it is very difficult to evaluate all levels of training effectiveness. (Fardaniah & Aziz⁷). Sitzmann & Weinhardt¹⁷ suggest that training effectiveness should be operationalized at the macro, within person, and between-person levels of analysis as well as it affects training effectiveness at each of these levels.

Organizations invest in training because they believe a skilled workforce represents a competitive advantage (Kraiger, Smith-jentsch, Salas & Tannenbaum¹⁰). Skills and knowledge that are learned and adopted from the training programs can produce the employees that are functioning in improving organizational performance.

Evaluation of Training: Evaluation can be defined as the systematic collection and assessment of information for deciding how best to utilize available training resources in order to achieve organizational goals (Topno²⁰). Borate³ states that evaluation ensures whether training has done the expected effect and employees are well capable of implementing the same in their tasks assigned.

One of the most useful models in evaluating training programs is The Kirkpatrick Model. The Kirkpatrick Model has been introduced by Donald Kirk Patrick. It has four levels of evaluation which are results, behavior, learning and reaction.

Yoshikawa et. al.³ state that in order to enable the participants of a training program to effectively practice what they have learn from the training to their work place, it is important to provide a thorough follow-up after the training.

Transfer of Training: Transfer of training can be described as the degree to which trainees apply to their job the knowledge, skills, behavior and attitudes gained in training (Holton et al., 1997), transfer of training is an important element in the criteria of training effectiveness, which helps both employees and organizations improve their performance (Bhatti et al., 2013). According to Goldstein and Ford (2002), transfer of training is a process that occurs after the training is completed and takes place at the employees' workplace.

Meanwhile, Aguinis and Kraiger¹ have described transfer of training as the extent to which new knowledge and skills learned during training are applied on the job. Transfer of training is also being referred as the degree to which trainees regularly apply to their jobs the knowledge, skills, behaviors, and attitudes learned in training (Velada & Caetano²²). An employee is considered

to have transferred the training to his or her workplace when he or she can apply the new learned knowledge, skills and attitudes to their job, and this practice becomes consistent over a period of time (Zumrah, 2015).

However, according to study conducted by Vandergoot et. al.²¹ on their research conducted among healthcare professionals, time since training, was significantly negatively related to training transfer. The result is as it would be expected in that training transfer would be less likely to occur or change the further time passed by.

Perceived Organizational Support: Perceived Organizational Support (POS) can be defined as the extent to which an employee perceives that an organization values their contributions and cares about their well-being (Eisenberger, Huntington, Hutchison, & Sowa, 1986). POS is also can be described as the employees’ general belief that their work organization values their contribution and cares about their well-being (Rhoades and Eisenberger, 2002). POS also refers to how an employee perceives the degree to which their organization values their contribution to the workplace and cares about their well-being (Rhoades and Eisenberger, 2002).

POS can encourage employees to transfer the learning outcomes in the workplace, which, in turn, increase service quality provided to customers (Zumrah, 2015). It can be supported by the research done by Meade & Surface¹³ that states the types of training opportunities offered by an organization are influenced by the organization’s needs and its culture, which, in turn, can influence the effects of training on individual employees.

Hypothesis 1: Perceived organizational supports has a significant impacts on the transfer of training among employees.

Supervisor Supports: Supervisor support can be defined as the extent to which the supervisor behaves in a way that optimizes employees’ use on the job of the knowledge, skills and attitudes gained in training (Nijman, Nijhof, Wognum, & Veldkamp¹⁵). Supervisor support can also be defined as the extent to which supervisor-managers support and reinforce use of learning on the job (Holton, Bates, & Ruona⁹). Chiaburu and Marinova (2005) and Chiaburu and Tekleab (2005) measured supervisor support in terms of “employee development”, “practice new skills” and “constant reminder to apply skills”.

Several authors (e.g. Kontoghiorghes, 1998; Gumuseli and Ergin, 2002; Cromwell and Kolb, 2004) have noted a strong positive correlation between supervisor support and training transfer. Burke and Hutchins (2010) observe that there are studies arguing about strong or moderate relationship between the variables and have also found studies showing mixed results; the authors suggest further research to clarify or to build on the correlation between training transfer and supervisor support.

Hypothesis 2: Supervisor supports has a significant impacts on the transfer of training among employees.

Peer Supports: Peer support has been defined by Holton et al. (1996, p. 183) as the “extent to which peers reinforce and support the use of learning on the job”. Peer supports also can be described as the extent to which peers behave in a way that optimizes the trainees’ use of learning on the job (Nijman et al.¹⁵).

The supports from peers are surely helpful as Hawley and Barnard (2005) has found that peer support behaviors were most influential on transfer networking with peers and sharing ideas about course content helped promote skill transfer 6 months after training. Furthermore, Holton et al. (2007) found that among social support factors, peer support has greater impact on past training behavior and motivation to transfer.

Hypothesis 3: Peer supports has a significant impacts on the transfer of training among employees

Conceptual framework and hypotheses: Based on the literature review discussed, a conceptual framework is formed with the independent variable of perceived organizational supports, supervisor supports and peers. The dependent variable is the transfer of training among employees. In order to answer the research question, the hypotheses are generated.

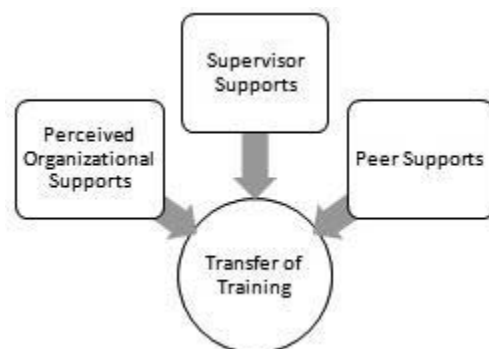

Figure 1: Conceptual framework

Hypothesis 1: Perceived organizational supports has a significant impacts on the transfer of training among employees.

Hypothesis 2: Supervisor supports has a significant impacts on the transfer of training among employees.

Hypothesis 3: Peer supports has a significant impacts on the transfer of training among employees.

METHODOLOGY

Research Design: The research design can be simply defined as the group of methods and procedures that are used in order to collect and to do some measurement on analyzing the variables that have been specified in the research. The descriptive method is used which requires us to do some survey onto the participants to get the results of the population that is being studied. The survey is done by studying the sample from a population by using the questionnaire survey. It is designed to be a quantitative type which is suitable for the questionnaire survey. Quantitative method requires this research to looking up onto objective measurements, statistical, mathematical or numerical analysis of data. The data will be collected through the questionnaire of survey.

In this research, there are few steps of research processes as below:

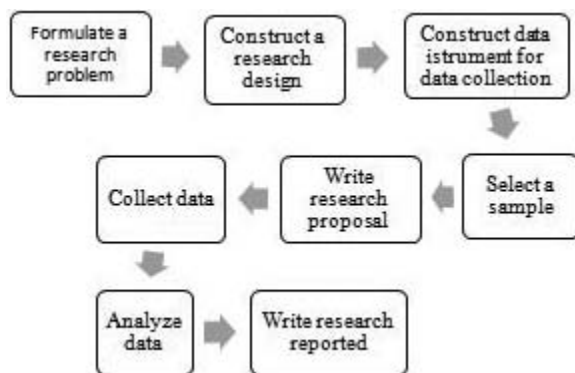

Figure 2: 8-Step Research Process (Kumar, 2005)

For this research study, the location that is chosen is an organization at Kelantan. This organization is functioning in generating, transmitting and distributing electricity in Malaysia. The population of research are 90 employees of that organization. Somehow, it is conducted on 82 samples of respondents who had attended OSHA training programs that was organized by the organization 6 months after the program.

Data Instrument: Research instrument is a tool that is used to collect the data needed for the research. The questionnaire is used to survey the participants. It is divided into various section in order to simplify the data collection and analysis. It is designed in five different sections which are demographic questions, training transfer, perceived organizational support, supervisor supports and peer supports. The 6-point of Likert scale is used.

After data is collected, it is filled and ran into the software package of IBM SPSS. The instrument data is then analyzed according to the objectives of research as below:

Table 1: Data Analysis

Objectives	Data Analysis
(i) To investigate domain factors that influence the transfer of training on employees.	Linear Regression
(ii) To determine the relationship between POS, supervisor supports and peer support towards the transfer of training on employees.	Spearman Correlation

DATA ANALYSIS

Analysis of Demographic Profile: A total of 95 questionnaires had been distributed to the employees in an organization in Pasir Mas and 82 get to be collected and used as sample for research. According to the analysis, male respondents are 73 and female respondents are 9. There are 95.1% of Malay respondents and then followed by Chinese respondents which are 4.9%. Majority are in the age of 30 to 39 years old (41.5%) and the lowest respondents are in the age of 50 years old and above (8.5%). 58.5% of the respondents are married, and the lowest is widowed, 1.2%.

The highest respondents are technician (16 people). Majority of respondents (36.6%) have worked in that organization for 6 to 10 years and the lowest are those with 21 years above (3.7%). All of 82 respondents have attended training programs especially OSHA training.

Reliability Test: Reliability is the degree to which an instrument will get the similar results for the same individuals at the different times.

According to Table of Internal Consistency by Sekaran & Bogie¹⁶, the overall data of Cronbach's Alpha

for this research is 0.933 which its internal consistency is excellent. POS items obtain Cronbach's Alpha of 0.798 which is acceptable and nearly to good result. Item of supervisor supports score 0.747 and it is acceptable. Peer supports items score 0.751 which is acceptable in internal consistency. Transfer of training items has scored 0.837 of Cronbach's Alpha value which is good in internal consistency and it is the highest value scored among all the variables. There is no deleted item in any items of variables of this research.

Regression Analysis: Regression analysis is an analysis that is used to determine which among the independent variables is related to the dependent variable. According to the result, R square is functioning in showing the total percentage of variance explained by perceived organizational support, supervisor supports and peer supports. The value of R square is 0.759, in which means that there is 75.9% of independent variables (perceived organizational supports, supervisor supports and peer supports) have dominated the dependent variables (transfer of training) of the research.

Beta, β is functioning in measuring on how strong independent variables affect the dependent variable. In Table 10, the beta value of peer supports is the highest among other variables. Thus, it means that peer supports is the most domain factors that influence the transfer of training among the employees. Meanwhile, POS scored the lowest as it is the lowest factors in affecting transfer of training.

Normality Analysis: Normality is a test used in determining whether the data of research is normal or not. Kolmogorov-Smirnov is used for respondents not more than 50 and Shapiro-Wilk is used for respondents less than 50. If the P value range more than 0.05, the data is normally distributed and Pearson correlation is used. If it is lower than 0.05, the data is not normally distributed and Spearman correlation is used. Kolmogorov-Smirnov has been used in this study as the respondents are more than 50 as there are total of 82 respondents in the research. By referring to table 11, the data is not normally distributed as each variable have P value that are below than 0.05, thus, Spearman's rho correlation test is needed in order to find the relationship between independent variables and dependent variables in this study.

Bivariate Correlation Analysis: The correlation coefficient can be described as a measure that is used in determining the degree to which two variables'

movement are associated. Based on the result, perceived organizational supports and transfer of training demonstrate a positive relationship between them by correlation of 0.670. Thus, the relationship between POS and TOT is a moderate relationship. The significant value is 0.000 which is less than 0.050, thus, there is statistically significant correlation between these two variables. Hence, H₀ was rejected and H₁ was accepted.

Correlation between Supervisor Support and TOT:

Based on the result, there is positive relationship between supervisor supports and transfer of training with the correlation of 0.660 which means that there is moderate relationship between the two variables. The significant value between these two variables is 0.000 which is lower than 0.050. Thus, there is statistically significant correlation between supervisor supports and TOT. H₀ is rejected, and H₁ was accepted.

Correlation between Peer Supports and TOT: Result of this study shows a positive relationship between peer supports and TOT with correlation of 0.743. Thus, the relationship between these them is a strong relationship. The significant value is 0.000 which is lower than 0.050, thus there is a statistically significant correlation between peer supports and TOT. So, H₀ is rejected and H₁ is accepted.

DISCUSSION

Discussion of first objective: The first objective is to investigate domain factors that influence transfer of training among employees. In Table 17, R square value of transfer of training is 0.759. Thus, there is 75.9% of perceived organizational supports, supervisor supports and peers supports that affect the transfer of training among employees in the organization. Among the factors, peer supports has dominated most of transfer of training as its beta value, 0.410 shows the highest coefficient beta value among other independent variables. Thus, peers supports is the domain factor that affects transfer of training among employees in the organization. Chiaburu (2010) demonstrated that peer support is the most important factor in work environment factors for training transfer by group networking; motivation and encouragement for them to continue apply learned new capability on the job.

Chiaburu et al. (2010) also have established that peer support has more influence on transfer as compared to organizational and supervisor support. Van den Bossche,

Segers & Jansen (2010) had conducted the study that based upon 35 academic employees in the Netherlands discovered co-workers' support, in the form of feedback was indeed important in determining employees' ability to apply what they learned on the job. It is important to note that peer support has its own unique and significant contributions to the transfer of training (Chiaburu, 2010).

Discussion of second objective: The second objective is to identify the relationship between perceived organizational supports, supervisor supports and peer supports towards transfer of training. For POS, the results revealed a positive and moderate relationship with transfer of training. The result of the study turns out to be similar to Zumrah et. al. (2012) which demonstrated that POS has a positive impact on transfer of training. Homklin et al. (2014) also had proposed that organizational support has a positive relationship to transfer of training as organizational supports interacts with learning so that the positive relationship with transfer is stronger for learners with high learning than those learners with low learning. The results indicated that perceived organizational support affect transfer of training among employees in the organization. Thus, POS can encourage employees to transfer the learning outcomes in the workplace, which, in turn, increase service quality provided to customers (Zumrah, 2015).

Supervisor supports was revealed to have a moderate and positive relationship with transfer of training. The result is similar Chiaburu (2010) which demonstrated in his study that the supervisor support has a significantly positive relationship with training transfer. The result of a recent meta-analytic review by Blume, Ford, Baldwin, & Huang (2010) involving 89 studies on training transfer found that supervisory support have strong relationships with transfer of training. It also can be supported by Dermol and Cater (2013) who view that supervisor support is significant for transfer of training as supervisors influence the quality and quantity of training.

Meanwhile, peer supports was found out to have a positive and strong correlation relationship with transfer of training. It can be related to the study by Chiaburu (2010) which demonstrated that support originating from peers has been found to exert a significant influence on employees' ability to apply training in the workplace. It can be related by the study of a recent meta-analytic review by Blume et al. (2010) who found that peer support have strong relationships with transfer

of training. Homklin et. al. (2014) also demonstrated that peer support was significant positively related with training transfer.

RECOMMENDATION

Peer supports turns out to be the domain factor that affects transfer of training among employees the most. Thus, a peer support program should be established as it can helps a lot in improving engagement between employees. POS need to improve by considering employees' goals and values in working environment and help when employees need any help. Organization should show its supports by taking the opinions by employees into consideration Future study can improved by doing the research onto different types of work sectorsso it will compare different types of work sectors by how they handle their transfer of training. Additionally, the future research should be done in a longitudinal study rather than exploratory study in order to assess the consistency of findings with the sufficient resources.

LIMITATION OF STUDY

The research is being done in cross-sectional design which need a lot of time, money and other resources in order to make this research successful and detailed. The results is just based on limited number of population and samples. It is also limited on how the instrument data was collected because some respondents are not answering honestly as they tried not to disclose the negative information about themselves. Thus, the data of the survey may lead the research results in the possible situation of there are some biased information, leading the results to be affected and being in generality.

CONCLUSION

In conclusion, we can see that the level of transfer of training among employees is very high which means that the supports have influenced employees to transfer skills, knowledge and attitude that they get from training program. Thus, it shows the effectiveness of training transfer among employees. Besides, we also can see that peer supports has turned out to be the most domain factors among the others. Thus, it shows that peer has the greatest influence in transferring skills, knowledge and attitude from training program. The relationship between perceived organizational supports, supervisor supports

and peer supports towards transfer of training shows that there are significant correlation relationship between perceived organizational supports, supervisor supports and peer supports towards the transfer of training among employees. Hence, these factors are surely have affected the effectiveness of training among employees, leading them to transfer their training.

Measuring Performance of Islamic Banks Using Maqasid Index

Siti Aida Sheikh Hussin¹, Siti FairuzKamaruzaman¹, Zalina Zahid¹, Siti Shaliza Mohd Khairi¹

¹Department of Statistics and Decision Sciences, Faculty of Computer and Mathematical Sciences
Universiti Teknologi MARA, UiTM Shah Alam

ABSTRACT

Banking Industry plays vital role in a country's economic development therefore it is important to evaluate banks' performance. Islamic Banks performances are measured using the same mechanism, which considers only financial ratios that are shareholder oriented. From Shariah point of view it is insufficient. The objectives of this paper are twofolds, firstly, to determine the performance of Islamic banks in Malaysia by using *Maqasid* Index that integrates the Shariah principles with financial ratios by applying Simple Additive Weightage (SAW). Secondly to identify the indicators contributing to the performance using Panel Data Analysis. The scope of this research is nine local Islamic Banks in Malaysia. The study found that Alliance Bank outperformed the other banks based on *Maqasid* Index. The indicators that significantly contribute to the performance of Islamic banks are fair returns, profit ratio, and investment ratio in real sectors.

Keywords: *Islamic banking, performance measurement, Simple Additive Weightage (SAW) Method, Panel Data Analysis*

INTRODUCTION

Bank industry plays a vital role in a country's economic development. Due to increasing competitive market, it is important to evaluate banks' performance to monitor and improve banks' functions.

Most countries offer dual banking systems the conventional banks and Islamic banks. Islamic banking is a banking system that governs by the principles laid down by *Shariah* (Islamic law). The two sources of Islamic Law are the *Quran* and the *Sunnah* (teaching and practices of Prophet Muhammad). The primal fundamental of *Shariah* compliant finance that differentiate them from conventional finance are the prohibition of interest (*riba*), ensure all transactions are clear of uncertainties (*ghirar*), avoidance of any form of gambling (*masyir/qimar*) and no association as well as investment in prohibited industries/organisations. Islamic economics ensure that the motives and objectives driving the Islamic finance industry are beneficial to society. Balance between material pursuits and spiritual needs as well as balancing individual and social need. Islam doesn't restrict economic activities but then introduce responsible activities that benefit human beings, protects the earth, and honors Allah by promoting zakat (a form of tax from wealthy individuals to people in need) and encouraging shared risk

Islamic Banks performances are measured using the same conventional mechanism, the financial ratios that are shareholder inclined without any element of Islamic measurements. The financial ratios are necessary but insufficient. Therefore, Islamic banks requires a shifting paradigm in term of their performance indicators and measurement that include economics, environmental and social indicators as Islamic banking system main activities, must be focused on benefit approach for wider stakeholders (community). The significance of output from this research includes the awareness of consumers toward Islamic bank performances with regards to both *Maqasid* index and performance ratios. In additions Islamic banks will gain better public confidence in ascertaining the conformance to Shariah Law.

LITERATURE REVIEW

Generally, in the practices of company performance measurement including Islamic banking are usually limited to financial ratio such as Data Envelopment Analysis (DEA), Capital, Asset, Management, Earning, Liquidity, Sensitivity of Market Risk (CAMELS) and Economic Value Added (EVA). These performance measurements that use only financial ratio indicators have many weaknesses. Therefore, Islamic banking that is different from conventional banking both in theory and practice aspects, need performance that are not limited to the financial ratios but also one that conforms to Shariah Law (Yuwono, et al., 2004).

The concept of *Maqasid* Index was adapted from the Islamic law or the main crucial objective of *shariah* which is upholding the welfare and benefit values (*Jalb al-Masalih*) also preventing harm (Antonio, Sanrego, & Taufiq³). According to literature, the three ideal concepts of Islamic Bakings are educating individuals (*Tahdzib alFard*), establishing justice (*Al- 'Adl*) and promoting welfare (*Jalb al-Maslahah*).Refer to Sekaran concept (Figure 1)

The three objectives or concepts are transformed into nine dimensions and ten elements. Performance ratio are calculated using the ten elements. Educating the individual in the first *Maqasid* is to gauge the development of knowledge and expertise to individuals in order to heighten individuals' spiritual values. Islamic banks have to contribute to society by providing educational program or training,with the hope to increase knowledge and expertise among employees and stake holders. Banks also need to provide sufficient information to the stakeholders and educate them on how the products offered are Shariah compliant. Ratio in the first *Maqasid* is education grant, research, training, and publicity (promotion) (Mohammed and Taib, 2009). The second *Maqasid* is justice, Islamic banks must assure that all transactions and activities are execute in honesty and fairness. All transactions must be free from injustice elements such *maysir*, *gharar* and *riba*. The third *Maqasid* is *Maslahah* or welfare, where banks should develop investment projects and social services to improve community welfare. It can be seen from the zakat ratio issued by banks and investments in the real sector,

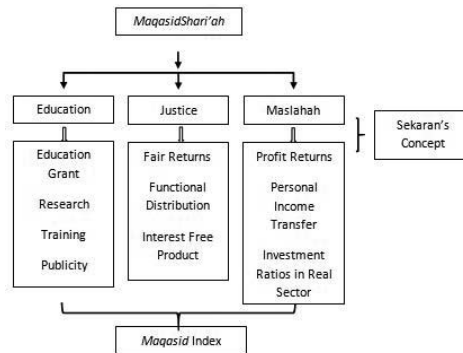

Figure 1: Maqasid Index Framework
Adapted from: Mohammed, Tarique, and Islam⁶

METHODOLOGY

This study covers nine local Islamic banking institutions in Malaysia as listed in table 1. The secondary data are taken from the annual report over period 2012 to 2016 retrieved from the official web site of each bank.

Table 1: List of Local Islamic Banking Institutions in Malaysia

Name
Affin Islamic Bank Berhad
Alliance Islamic Bank Berhad
AmBank Islamic Berhad
Bank Islam Malaysia Berhad
Bank Muamalat Malaysia Berhad
CIMB Islamic Bank Berhad
Hong Leong Islamic Bank Berhad
Public Islamic Berhad
RHB Islamic Bank Berhad

There are two methods used in this study which are Simple Additive Weighting (SAW) and panel data modeling. Simple Additive Weighting (SAW) method is known as a weighted linear combination or scoring method in determining the performance of the banks. The definition and operational variables are as shown in Table 2.

EVALUATION STEPS OF MAQASID INDEX

In order to evaluate the performance of the banks using Maqasid Index, there are three tests that need to adhere to which are the determination of performance ratio, Islamic banking health level depending on the performance indicators, and Islamic banking health level according to *Maqasid* index (Mohammed et al.⁵). The steps are explained as below:

Determination of Performance Ratio: This research considers eight ratios of the individual performance of Islamic banks. The first three ratios are pertaining to Education or *Tahdzib al-Fard*, the next two ratios are regarding to Justice (*Al-'Adl*) and the last three ratios correspond to the Welfare (*Al-Maslahah*).

Performance Indicators (PI) for all three Shari'ah concepts: The individual Performance Indicator will be evaluated for each Shariah concept/objective. For instance, the Performance Indicator for the first, second and third concept denoted by PI (C1), PI (C2) and PI (C3) respectively are computed mathematically as shown below:

First concept (Education)

$$PI(C1) = (W_1 \times D_1^1 \times E_1^1) + (W_1 \times D_1^3 \times E_1^3) + (W_1 \times E_1^4 \times E_1^4) \dots(1)$$

Where;

C1 denotes as the first concept of Shari'ah (Education)

W_1 denotes the weight assigned of C1

D_1^1 denotes the weight assigned to the first element of C1

D_1^3 denotes the weight assigned to the third element of C1

D_1^4 denotes the weight assigned to the fourth element of C1

E_1^1 denotes the performance ratio corresponding to the first element of C1

E_1^3 denotes the performance ratio corresponding to the third element of C1

E_1^4 denotes the performance ratio corresponding to the fourth element of C1

The benchmark of the best performance indicators is based on the weightage of each indicator mentioned in the Table 3. As the percentage of the performance indicators approach to the defined weightage value, the performance of the bank is considered better.

Table 3: Weighted Average Maqasid Index Variables

Concepts	Average Weight (Out of 100%)	Variables	Average Weight (Out of 100%)
Education	$W_1: 30$	E1: Education Grants/Donations	$E_1^1: 24$
		E2: Research	$E_1^2: 27$
		E3: Training	$E_1^3: 26$
		E4:Publicity	$E_1^4: 23$
		Total	100
Justice	$W_2: 41$	E5: Fair Returns	$E_2^1: 30$
		E6: Fair Price	$E_2^2: 32$
		E7: Interest free product	$E_2^3: 38$
		Total	100
Welfare	$W_3: 29$	E8: Bank's Profit Ratios	$E_3^1: 33$
		E9: Personal Income Transfer	$E_3^2: 30$
		E10: Investment Ratios in real sector	$E_3^3: 37$
Total	100	Total	100

*Maslahah covered bank interest and public interest
Adapted from: (Mohammed et al.⁵)

Islamic Banking Number and Rank Determination:

The *Maqasid* Index (MI) is measured by total up the three performance indicators for each bank.

$$MI = PI (C1) + PI (C2) + PI (C3) \quad \dots(2)$$

The nine banks will be ranked from 1 to 9 according to the MI as the largest total value ranked first and smallest total value ranked last. As it approaches 100%, the better the rank indicates the performance of the bank.

In order to reach the second research objective that is to identify the indicators contributing to the *Maqasid* Index of the banks, the Panel Data Analysis will be utilized. The process of panel data analysis is as shown in Figure 1 and need to satisfy all the assumptions.

The variables used in the panel data analysis are based on the weighted ratios of *Maqasid* Index performance. The measurement of the variables is continuous and value in percentage. There are a total of nine variables which are consisting of one dependent variable and eight independent variables as shows in Table 4.

Table 4: Data Description for Panel Data Analysis

Variable	Description	Measurement
MI	Maqasid Index	Percentage
Education	Weighted education grant performance ratio	Percentage
Training	Weighted training expense performance ratio	Percentage
Publicity	Weighted publicity expense performance ratio	Percentage
Fair returns	Weighted profit performance ratio	Percentage
Affordable price	Weighted bad debt performance ratio	Percentage
Profit ratio	Weighted net profit performance ratio	Percentage
Personal income	Weighted zakat performance ratio	Percentage
Investment ratio	Weighted investment performance ratio	Percentage

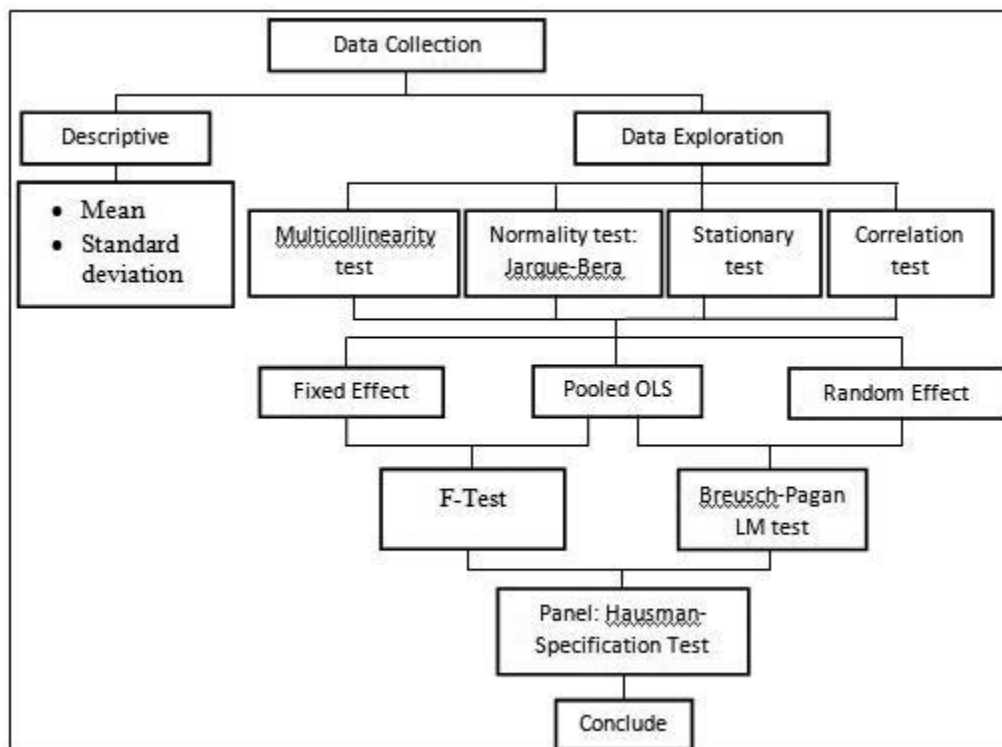

Figure 2: Panel Analysis Research Design

RESULTS AND DISCUSSION

From the results obtained, Alliance Bank is ranked first as the most compliance to Maqasid Index Refer to table 5 to see the rank as well as the percentage of overall index as well as index for each concept. As fo Bank Islam

Malaysia (BIMB) ranked eighth with *Maqasid* Index of 15.53%, the MI is relatively close with the result of the previous research done by Abdul Aziz¹.

Table 5: Islamic Banks based on Maqasid Index (%)

Banks	PI (C1)	PI (C2)	PI (C3)	MI [PI (C1)+ PI (C3)+ PI (C3)]	Ranked
Affin	0.177	6.009	10.260	16.446	5
Alliance	0.378	6.426	12.355	19.158	1
AmBank	0.273	6.505	8.955	15.733	7
BIMB	0.158	5.677	9.699	15.534	8
BMMB	0.326	3.824	11.623	15.773	6
CIMB	0.159	6.554	7.539	14.252	9
Hong Leong	0.184	7.469	8.957	16.610	4
PIB	0.175	8.638	10.095	18.909	2
RHB	0.306	6.998	11.525	18.829	3

Table 9 indicates that all models show that 99% of *Maqasid* Index is explained by the four independent variables which are training, fair returns, profit ratio and investment ratio. The three models which are pooled Ordinary Least Square (OLS) model, random effect model, and fixed effect model have a p-value of F-statistic less than 0.05 which indicates that the models are significant in modeling the *Maqasid* Index with four independent variables. However, the Hausman test results in Table 4.13 concluded that the random effect model is appropriate to be used rather than the fixed effect model.

F-test was used to compare the fixed effect model and pooled OLS model. Based on the result in Table 6, it indicates that the null hypothesis is rejected, and there is at least one dummy parameter (banks) in the dataset that is not equal to zero (F-statistic = 1834.680, p -value = 0.0000 < α = 0.05). Therefore, the fixed effect model is more appropriate compare to pooled OLS model.

Table 6: F-Test for Fixed Effect Model

Test Statistics	Value	Probability
F-statistics	1834.680	0.0000

Breusch-Pagan Lagrange Multiplier (LM) test was used to compare the random effect and the pooled OLS model. The results in Table 7 indicates that the null hypothesis is rejected, and there is at least one specific variance component of the banks or time in the dataset that is not equal to zero (p -value = 0.0002 < α = 0.05). Therefore, the random effect model is more appropriate compare to pooled OLS model.

Table 7: Breusch-Pagan Lagrange Multiplier (LM) Test

Test Statistics	Value	Probability
Breusch-Pagan	13.973	0.0002

Since both hypotheses of the F-test and LM test are rejected, the Hausman-Specification test is conducted to compare which effect models is appropriate for the analysis.

Table 8: Hausman-Specification Test

Chi-Square	p -value
1.3649	0.8503

Based on Table 8, the chi-square shows there is no significant difference in the Hausman test (χ^2 = 1.3649, p -value = 0.8503 < α =0.05). Hence, it can be deduced that Hausman test fail to reject the null hypothesis of random effect model is appropriate. Therefore, the random effect model is observed as

Table 9: Summary of Panel Data Analysis

Variable	OLS	Random Effect	Fixed Effect
Constant	2.2334	2.4749*	2.2627*
	(0.01)	(0.01)	(0.02)
Training	-0.0416	0.6896	1.4435
	(0.94)	(0.41)	(0.20)
Fair returns	0.8897*	0.8963*	0.9159*
	(0.00)	(0.00)	(0.00)

Conted...

Profit ratio	0.8373*	0.7901*	0.7957*
	(0.00)	(0.00)	(0.00)
Investment ratio	1.0231*	1.0193*	1.0188*
	(0.00)	(0.00)	(0.00)
R ²	0.9946	0.9958	0.9975
F-statistic	1834.680	2368.578	1075.890
p-value	0.000	0.000	0.000

The result of random effect model in Table 8 shows that only the independent variable of training does not significant in the model since the p-value is greater than 0.05. Therefore, the final model with the significant independent variables model is as below equation 3.

$$MI = 2.4749 + 0.8963*Fair_returns + 0.7901 + Profit_ratio + 1.0193*Investment_ratio \dots(3)$$

Based on the model 5, the fair returns give an average effect of 0.8963% to the *Maqasid* Index when the fair returns changes across time and between banks by one unit. Also, when profit ratio changes across time and between banks by one unit, the average effect of the profit ratio over the *Maqasid* Index will increase by 0.7901%. Lastly, the *Maqasid* Index will increase by 1.0193% when the investment ratio changes by one unit across the time and between the banks.

CONCLUSION

Consequences from the three aspects of measurement, Alliance Bank rank first in complying to *Maqasid Shariah*, followed by Public Islamic Bank. As for the third to the last rank are RHB Bank, Hong Leong Bank, Affin Bank, Bank Muamalat, AmBank Islamic, Bank Islam Malaysia Berhad, and CIMB Bank, respectively.

The indicators (ratio) that contribute to the *Maqasid* Index performance of Islamic banking in Malaysia are fair returns, profit ratio and investment ratio. Those

indicators give a positive effect on the *Maqasid* Index performance and the investment ratio gives the biggest impact in contributing to *Mqasid* Index performance of the banks.

Analysis of Critical Success Factors of Startups in Thailand

Sutthikarn Khong-khai¹, Hung-Yi Wu²

¹Branch of Management, Maejo University, No.99, Lamae District, Chumphon Thailand; ²Department of Business Administration, National Chiayi University, No.580, Xinmin Rd., Chiayi City, Taiwan

ABSTRACT

Thailand set up Thailand 4.0 Policy as a guideline on country development in the aspects of economic and social strength. It also focuses on the participation of civil state. Startups are significant tools that the government sector promotes and reinforces as economic weapons for driving Thailand's economic system. Collaborations from all sectors such as government sector, private sector, and educational institution are required in order to encourage startup growth and sustainability. This study, therefore, applied the concept of startup ecosystem creation to search for the critical success factors (CSFs)(i.e., criteria/sub-criteria) affecting the startup in Thailand according to experts' viewpoints. Fuzzy Delphi Method (FDM) was used for data analysis based on experts' consensus. The findings indicated that "Human Capital" was the first priority among the criteria influencing startup success. "Entrepreneur Capability," "Innovation Capability," and "Startup Team" were the top three important sub-criteria influencing startup success and growth, respectively. The results can be provided as reference for planning and determining startup strategies in the future.

Keywords: Thailand 4.0, Startup, Critical success factors (CSFs), Fuzzy Delphi Method (FDM)

INTRODUCTION

In the present day, the politic, economy, and social environments at the international level, the regional level, and the domestic level have changed rapidly, causing the dynamic of change which is a business encounters rivals from around the world and all the time. Furthermore, the change is also a challenge to the countries around the world who receive the impact, for example, the change of demographic structure, globalization, and future market, deprivation of natural resources, the climate change, the change of technology and innovation (NIA²⁷). These changes give rise to each country preparing to respond the impact towards its society, economy, and environment, at the least level. Thailand, therefore, specifies Thailand 4.0 Policy as the plan to support this challenging change with the purpose to liberate people from the trap of poverty. Moreover, the influence of internet of things and technology bring about the building of new business model and opportunity for new entrepreneurs in their starting of creative business. These entrepreneurs are called "Startups" and they are regarded as the new business warriors who will construct a new business foundation in Thai's future. Under "3S" business group which contains Startup, SMEs, Social enterprise that the state gives priority to and aims at promoting its strength (Angsathammarat²). For this reason, the "building of economic weapon" or Startup

promotion is added to build the new startup group for economic force in accordance with Thailand 4.0 Policy.

Startup is a new organization formed to search for a repeatable and scalable business model (Blank⁵). It applies technology and/or innovation to be the heart of the business building. The type of business mostly comes from an idea to solve some problem in daily life or the business opportunity that no one has ever done (Worapongdi³⁶). Silicon Valley is the first original source of Startup of the world. It is capable of building jobs and income to the economy of USA. Several countries try to apply the Silicon Valley model in their own country (Bossup Solution⁸; Kshetri²⁴; Cheah, Ho & Lim⁹; Geibel & Manickam¹⁵). The building of good and appropriate startup ecosystem will increase the chance of success and push the holistic economy. Apart from that, the startup ecosystem depends on the politics and the education (Berger & Kuckertz⁴). A startup ecosystem is formed by people, startups in their various stages and various types of organizations in a location, interacting as a system to create new startup companies. These organizations can be further divided into categories: universities, funding organizations, support organizations, research organizations, service provider organizations, and large corporations (Grow advisors¹⁷). In every country, the main factors lead to the different success (Geibel & Manickam¹⁵).

The startup began to be widely recognized in Thailand since 2013. Thailand must push the startup to be the tool for economic repulsion. This study is aimed to analyze the critical success factors (CSFs) of startups in Thailand. In order to achieve the objective, the researchers adopted the startup ecosystem of Isenberg²¹ to answer the question

“what is the main factor that affects the startup business operation in Thailand?” The data received can be applied for decision-making and planning of startup business promotion in Thailand and building of startup ecosystem. The description and main references of each sub-criterion are summarized in Table 1.

Table 1: Summary of the CSFs of startup in Thailand

Criteria	Sub-criteria	Description	References
1. Government Policy	1.1 Taxes	Tax measures are determined in order to promote startup growth	Cheah et al. (2016)
	1.2 Laws	Revise laws that do not facilitate startup establishment as well as growth	National Startup Committee (2016)
	1.3 Financial support from government	Government agencies offer financial support in the way that startup entrepreneurs can simply access sources of low-interest investment funds in real time.	Geibel&Manickam (2016)
	1.4 Investors	Motivation measures must be created to attract qualified investors at the beginning of startups for taking this opportunity to extend their businesses and startup markets, including fundraising from different sources.	Worapongdi (2017); Cheah et al. (2016)
2. Startup support	2.1 Infrastructure	Places, communities, and facilities are provided as learning sources and meeting centers for idea exchange, with the main purpose to support startups	Worapongdi (2017); Cheah et al. (2016); Fuzi (2015)
	2.2 Professional services	Provide and offer services to assist startup entrepreneurs in particular	Cheah et al. (2016); Teeter & Whelan-Berry (2008)
	2.3 Incubator/ Accelerator	Large businesses or those with efficiency to grow further concentrate on business incubation/acceleration. They are advisors and assistants to entrepreneurs at the beginning of startups for faster growth and for taking opportunities to attract investors from potential firms.	Worapongdi (2017); Krajcik&Formanek (2015) Hoffman &Radojevich-Kelley (2012)
	2.4 Startup activities	Hold meetings, seminars, events, and arrange media related to startups for manipulating them as stages to present businesses, bring inspirations, build networks for any updates, and connect collaborations among national and international startups.	Worapongdi (2017); Geibel&Manickam (2016)
3. Human capital	3.1 Entrepreneurial Capability	Entrepreneurs possess excellent views, skills, and competence in businesses and change management so that they can compete with national and international markets.	Cheah et al. (2016); Geibel&Manickam (2016); Colombo &Grilli (2005)
	3.2 Innovation Capability	Able to apply innovative knowledge to fulfill trade activities or to solve problems for customers. Consequently, products innovations as well as process innovations emerge, along with the development of new creations.	Worapongdi (2017)
	3.3 Startup team	Have great work teams with capabilities, work experiences, skills, and concepts in accordance with those of business founders.	Geibel&Manickam (2016); Altman (2014)
	3.4 Foreign talent	Hire foreign experts for jobs that require specialization (Engineering or IT) for cross-cultural learning and sharing new visions of market extension.	NIA (2017)
4. Marketing	4.1 Product	Have outstanding products or services, adequate inventories; and can satisfy customer needs instantly.	Statistic Brain (2016); Altman (2014)
	4.2 Price	Know how to manage emotional pricing.	Statistic Brain, 2016
	4.3 Scale up	Startups are scalable, with products or services certified by international standards; and can deal with both national and international target markets.	Geibel&Manickam (2016)
	4.4 Exit strategy	Be knowledgeable and prepared for exit strategies and withdrawal in case startups are popular and taken over.	National Startup Committee (2016)

Conted...

5. University	5.1 Instruction	Mainly instruct students to obtain knowledge and skills of entrepreneurship, along with the connection between theories and actual practices. In this regard, universities do not take part in business to compete with the business sector.	Illinois Innovation Index (2016); Boh et al. (2015)
	5.2 Research	The center of research and academic advancement; including knowledge, technological, and innovative transfer to advocate, help, and rectify, and improve startups.	Illinois Innovation Index (2016)
	5.3 Startup ecosystem	Make this happen in universities so that they will become learning centers of entrepreneurship, business trials, inspiration creation, and experiences.	Boh et al. (2015); Ratzinger et al. (2013)
	5.4 Alumni	Form up alumni networks to support universities regarding startup activities.	Galloway & Brown (2002)

METHODOLOGY

Questionnaire Design and Data Collection: This study developed the Fuzzy Delphi method (FDM) questionnaire, which was designed from relevant documents, articles, and research papers related to CSFs of startup. The criteria and sub-criteria used in the FDM questionnaire are adapted from the study of Isenberg²¹. The key factors can be divided into five criteria, containing 20 sub-criteria (Table 1) for experts to evaluate the importance (in a scale of 1 to 10) of each sub-criteria. As presented in Table 2, taking the sub-criterion “1.1 Taxes” as an example, the expert evaluates the importance with a range of 5 to 7.

Table 2: Shows the Max-min score from the experts about the key factors leading to the success of Startup Business

Criteria	Sub-Criteria	Definition	Score
1. Government Policy	1.1 Taxes	Tax measures are determined in order to promote startup growth	1 2 3 4 5
		[For example, Tax privilege/ Tax incentive for startup investor].	6 7 8 9 10

The samples of the questionnaire surveys were focused on experts of educational agencies, government sector, and private sector. The experts were those involving in startups, e.g., startup entrepreneurs, incubators/accelerators, co-working space owners, mentors, financiers, academician, and government officials. The experts selected have at least three years of working experience related to startup. The sample sources were from published documents, academic

seminars, and internet database. The questionnaires were reviewed by five startup experts in order to bring their assessment to improve and correct the questions before being sent out.

The Fuzzy Delphi Method (FDM): The Max-min Fuzzy Delphi method was proposed by Ishikawa et al.²² It has an advantage for collecting the appropriated information on the experts’ opinions. The Max-min FDM is simpler since all the experts’ opinions can be synthesized in one time investigation (Ma et al.²⁵).

Figure 1: Max-min FDM Forecasting.

Source: Ishikawa et al.²

The analysis process of FDM in a study can be described in the following steps (Ishikawa et al.²²):

In Step 1, the aggregate allocation function $F_1(X)$ for the highest level (i.e., Max. value) of concurrence as well as the aggregate allocation function $F_2(X)$ for the lowest level (i.e., min. value) of concurrence for each evaluation factor (A_i) must be determined.

In Step 2, the corresponding lower quartile, median and upper quartile of both $F_1(X)$ and $F_2(X)$ must be determined. For display of results, symbols C_p , M_p , D_1 and D_2 , M_2 , C_2 are used.

In Step 3, the level of significance for the topic is the aspect of junction between (C_p, M_p, D_1) and (D_2, M_2, C_2) . Typically called the “grey zone”, the intersecting section of both functions is termed target value X^* . Further, the

aggregate allocation function $F_1(X)$ for the highest level of concurrence and the aggregate allocation function $F_2(X)$ for the lowest level of concurrence both show a grey area, as given in Figure 1. The intersecting regions of their lower quartiles, medians, and upper quartiles (C_1, X^*, D_2) comprise the grey areas.

The expected value (X) of the assessment factor A_i can be acquired based on the previous estimation. Afterwards, a maximum value is typically assigned by specialists for assessing the most significant factors.

The assessment factors appropriate for the study will be identified by the threshold value S , i.e.:

If $X_i \geq S$, then A_i will be accepted as the assessment factor.

If $X_i < S$, then A_i will be rejected.

For further better understanding, the sub-criterion “1.1 Taxes” is taken as an illustrative example. The scores(values) of (C_1, M_1, D_1) , (D_2, M_2, C_2) , and X^* calculated by the above steps of FDM analysis are summarized in Table 3.

Table 3: Example of the Max-min FDM analyses of the sub-criterion “1.1 Taxes”

Taxes												
Assessment value	1	2	3	4	5	6	7	8	9	10	First quartile: C_1	7
F_1 :	0	0	0	0	1	5	3	6	7	8	Second quartile: M_1	8.5
The total occurrences of Maximum value	0	0	0	0	1	6	9	15	22	30	Third quartile: D_1	9.75
F_2 :	5	1	1	2	8	5	3	4	1	0	Third quartile: D_2	6.75
The total occurrences of minimum value	30	25	24	23	21	13	8	5	1	0	Second quartile: M_2	5
											First quartile: C_2	4
											X^*	6.88

RESULTS

Experts’ Demographic Profile: There were 45 questionnaires sent out and 30 completed questionnaires were received. The valid response rate is 66.67%. Each sector hasten experts participated in the survey. Most(70%) of the experts are male; 30% of them are females. The respondents’ ages are most between 31-40 years old (46.67%). Most of the experts have master’s degrees(46.67%) and most of the participants have business startup experience for 3-5 years(70.33%).

The CSFs of Startup analyzed by FDM: After the data analysis was done following the formula (steps) of Max-min FDM, the analytical result of the key factors (i.e.,

sub-criteria) leading to the success of Startup Business is shown in Table 4. According to the experts’ evaluation, the scores of all the X^* are ranging from 6.50~8.00. Thus, in this research, the threshold was set to be 7. Five sub-criteria were deleted. Therefore, 15 sub-criteria were selected finally. To clarify, the result was found the experts agree that the most important criterion influencing Thailand’s startup success is “Entrepreneur capability (8.50),” followed by “Innovation capability (8.13),” and “Startup team (8.13)” with the equal scores. When considering the overall factors, “Human capital” is ranked on the top of all the sub-criteria affecting Thailand’s startup success.

Table 4: Summary of the CSFs of Startup analyzed by FDM

Criteria	Sub-criteria	C_1	C_2	D_1	D_2	X^*
1. Government Policy	1.1 Taxes*	7	4	9.75	6.75	6.88
	1.2 Laws*	7	3	10	7	7

	5.3 Startup ecosystem	7	4	10	8	7.50
	5.4 Alumni	7.25	4.25	10	7	7.13

Note: * indicates the criteria with $X^* \leq 7.00$, which had been deleted.

DISCUSSION

The study was aimed to explore and analyze which factor(s) influenced Thailand's startup success most so as to apply the obtained data for planning or preparing the development and the promotion of Thailand's startup. Most experts agreed that "Entrepreneur Capability," "Innovation capability," and "Startup team" are the first key factors in leading the Startup Business to success and these three sub-criteria are all under the "Human capital" criteria. Human capital is the firm's collective capability to find the best solution by using specific knowledge (Bontis⁷) and is also a source of innovation as well as strategic renewal. As such, to encourage the Startup Business to be the economic weapon in order to drive Thailand, according to Thailand 4.0 policy, the government should increase the entrepreneurs' potential and entrepreneurship and also encourage the entrepreneurs to bring the innovations into their business as well as create a better quality startup team who shares the same direction with the business founders, which corresponds to the study of Geibel and Manickam¹⁵, which remarked that "Even though the results revealed that the internal factors influencing startup success in USA were co-founder, work culture, and employee because startups in this country highly gave precedence to work teams and capability improvement before business conduct."

In Marketing criteria, most of the experts thought that product is the important factor for the successful startup business. Due to at the beginning of the startup business, whether the business will be successful or not,

it depends on the product or service they provide and proper with customers (Santisteban & Mauricio³⁰). As such, the startup business with capability entrepreneurs and quality startup team will be able to offer competitive products or services. The entrepreneurs need is the specific assistance or support from professional services such as a financial consultant to support the business management succeed (Gnyawali & Fogel¹⁶). There are several ways to do that such as short-term consultancy, long-term support to meet ongoing needs for general business advices and training programs for entrepreneurs (Deakins¹¹). The financial factor also the key factor causing business failure, such as the lack of money to run the early stage business (Erin¹²) such as Singapore's government sectors offered financial support in different forms to startups (Hemmert et al.¹⁸). Thus, it should be offered at the appropriate time (Smith & Miner³¹).

For the University criteria, instruction is important in building entrepreneurship. It was necessary to universities so as to promote students to practice their entrepreneurial experiences through courses as well as activities as interdisciplinary. This conformed with the study of Wandhwani (2012), who stated that instruction and courses were substantial to make students interested in entrepreneurship. According to the research by Timmons and Spinelli (2007), they pointed out that entrepreneurship is a way of thinking, reasoning, and acting which is opportunity obsessed, holistic in approach, and leadership balanced for the purpose of value creation and capture. Besides, the government sector established "Entrepreneurial universities" so that they could develop

entrepreneurial courses and instructor competencies as the archetypes of entrepreneurial instruction management to other universities across the country (STI Office³³). Educational institution (universities) was a key part to help shaping and promoting entrepreneurship to students through instruction process such as Singapore (Cheah et al.⁹). Furthermore, businesses started by alumni are actually much more significant (Roberts & Eesley²⁹; Åsterbro & Bazzazian³).

CONCLUSION

Research Conclusion: In the past two years, the government clearly stated that Thailand would use the startup business as the main strategy to build a sustainable business in order to improve nation's economics and achieve key goals for being sturdy, with prosperity and sustainability. The study found that most of the experts think that the entrepreneur capability, innovation, and startup team are the first important factors for the successful startup business. Moreover, the next factors that both government and related sectors should facilitate are providing financial support from the government, professional service (such as financial consultant), product, and instruction from the educational sector or university to strengthen the business and make it competitive.

Suggestions for Further Research: Further in-depth studies on Thailand's startup groups with growth and competitive abilities at the international level are suggested. Moreover, studies on startup failure factors should also be conducted to produce useful data for new entrepreneurs of markets. Work cultures among entrepreneurs can be explored. In addition, other analytical tools (e.g. analytic hierarchical process (AHP), analytic network process (ANP)) can be used to prioritize the CSFs of startup screened by the current study.

ABSTRACT

The study investigates the effect of personality domains, namely, neuroticism, extraversion, openness, agreeableness and Conscientiousness on life satisfaction. The sample was pensionable middle-age other ranks army veterans (n=464). Stratified random sampling technique was employed in sample selection. A cross sectional survey design, was employed for the study. A structural equation modelling using Smart PLS 3.2.5 was employed for the analysis. The results indicate that conscientiousness, extraversion and neuroticism contribute to the life satisfaction of army veterans. Meanwhile, openness and agreeableness do not significantly contribute to life satisfaction. The result assists in providing insights on the type of personality influencing life satisfaction of the Malaysian Armed Forces other ranks army veterans. This understanding can further assist in designing measures to help the retiring army personnel during resettlement program in dealing with their personality profile that influence to their life satisfaction at middle-age retirement.

Keywords: *Personality, Life satisfaction, Army veterans, Malaysia, Structural equation modelling, Partial Least Squares (PLS)*

INTRODUCTION

Increasing life satisfaction at retirement is contingent upon beneficial resources Hobfoll¹⁹ within the veterans. According to Hobfoll¹⁹, resources can be defined as the total capability of an individual to fulfil the required valued needs. Among the personal resources is personality, which is an antecedent Reis & Gold²⁷ and resource Wang, Henkens, & Van Solinge³² to veterans in achieving life satisfaction. Veterans, during their active duty were exposed to the regimented training of armed forces environment Jackson, Thoemmes, Jonkmann, Lütke, & Trautwein²⁰ of high discipline and routine structured duty. Thus, various exposures to the regimented environment is believed to influence the personality type of the retired veterans Jackson, Thoemmes, Jonkmann, Lütke, & Trautwein²⁰, which

eventually could also relate to their satisfaction with life at retirement Reis & Gold²⁷. Bleidorn, Hopwood and Lucas³ also suggest that more fine-grained research examination need to be conducted pertaining to the changes of personality traits as a function of retirement.

PROBLEM STATEMENT

Approximately 6,756 pensionable other-ranks (Ors) army personnel retired mandatorily from the active service from 2010 to 2012 (Dept. of Record and Salary, Ministry of Defense, 2012). Pensionable other-ranks army retire when they completed as minimum as 21 years of service Armed forces Act¹. If he begins his career at the age of 19, therefore the retirement age is 40.

Many veterans who mandatorily retire at middle age experience difficulties in managing life affairs

with mostly lacking the ability to secure a second career after retired (Normah Zakaria, 2013), although job matching and placement are provided (“Veterans Affairs Department of socioeconomic and welfare,” 2018). Most of them have high financial commitment on family matters and children’s educational expenses (Nur Zahidah Hassanuddin, 2015).

Normah Zakaria (2013) found that only 2% of veterans are able to secure their second career after retirement, indicating that veterans may not be satisfied with their retirement without a job while remaining physically fit and healthy at middle age as civilian. Thus, reflecting dissatisfaction of life at retirement. In this regards, studies on comprehending the aspect of personality relating to veterans’ life satisfaction is crucial as each veterans may possess different types of personality that may benefit them as resources Wang, Henkens, & van Solinge³²; Hobfoll¹⁹ in dealing with difficulties and dissatisfaction at their retirement. Investigating personality is of paramount following suggestion by Leszko et al (2016) that would promisingly bring a novelty of understanding on the role of it as a predictor to any outcome variables such as well-being and cognitive functioning. Though McCrae & Costa²⁴ posit that personality is genetically stable at adulthood, the social investment theory (Helson, Kwan, John, & Jones¹⁵; Bleidorn et al⁴; Roberts, Wood & Smith²⁸ argue that personality could change due to the environmental influences, and life event during adulthood. Taking into account the two contrasting views, this study was conducted to address the effect of personality factors as resources of the veterans on life satisfaction.

Research Objective: The objective of the study is to investigate the effect of personality factors on life satisfaction.

Research Questions: What are the significant effects of personality factors of conscientiousness, extraversion, openness, agreeableness and neuroticism on life satisfaction?

LITERATURE REVIEW AND HYPOTHESES

Personality and life satisfaction: McCrae and Costa²⁴ regards personality as individual differences in characteristics that indicate the patterns of behaving, feeling and thinking, which is stable across time. In this study, personality with regards to conscientiousness, extraversion, openness, agreeableness and neuroticism refers to a veteran’s personal resource of his own characteristics patterns of behaving, feeling and thinking

that relate to his life satisfaction at retirement. Although McCrae and Costa²⁴ defined personality as biologically stable across time at adulthood, but social investment theory argue that the environment where one is exposed to might influence the development of his personality. In this conditions, personality of veterans would be influenced by the regimented training (Jackson, Thoemmes, Jonkmann, Lüdtke, & Trautwein²⁰ that a personnel received during his active duty, whereby the traits were carried out within the veterans’ characteristics even after retired.

In this study, veterans’ self-reporting on their life satisfaction was recorded according to their own overall cognitive judgment on experiences during their early stage of retirement. Reis and Gold²⁷ in their model of life satisfaction at retirement suggest that traits components of the big five personality theory may relate directly or indirectly to life satisfaction of the retirees at their retirement. All hypotheses in this study were developed based on the model of Five Factor Personality trait influence on life satisfaction in retirement Reis & Gold²⁷. In the previous study, Robinson, Demetre, and Corney²⁹ found conscientiousness, agreeableness and low neuroticism were the predictors of life satisfaction to those who had already retired. Thus, the first hypothesis is (H1): There is a significant effect of conscientiousness on life satisfaction.

Mroczek and Spiro²⁵ found that extraversion predicted various changes with life satisfaction, those who possess high level of extraversion is associated with a high and a flat life satisfaction trajectory. Therefore, the second hypothesis is (H2): Extraversion significantly affects life satisfaction among army veterans.

Stephan³⁰ reported that openness to experience has an incremental small variance to predict life satisfaction among 235 sample of retired adult with age between 58-85 years old. Therefore, the third hypothesis is (H3): Openness significantly affects life satisfaction.

Henning, Hansson, Berg, Lindwall and Johansson¹⁶, found that agreeableness moderates the well-being after one year retired with Swedish older sample between age 60-66. Those who possess high score in agreeableness, showed an increase in well-being at retirement. Thus, the fourth hypothesis is (H4): There is a significant effect of agreeableness on life satisfaction.

Boyce, Wood, Delaney and Ferguson⁵ found that changes in neuroticism have the strongest relationship with changes in life satisfaction. Lockenhoff, Terracciano and Costa²² reported that those who possess low in neuroticism and high in extraversion showed higher retirement

satisfaction with cross sectional study on (n=144) sample. Therefore, the fifth hypothesis is (H5): There is a significant effect of neuroticism on life satisfaction.

Based on the arguments above, the framework of the study is depicted in Figure 1.

Figure 1: Research framework

METHOD

Design: A cross-sectional mailed survey design was employed for the study.

Sample: 464 respondents out of 6,756 population of pensionable other ranks army veterans, ranging from warrant officer 1 to private, at middle age between 40 to 50 years old and had attended the resettlement training prior to their retirement, responded to the study.

Measures: A 20-item questionnaire was employed to measure personality and life satisfaction constructs. All scales were adopted from the existing measures of Neo Personality AppiKA UKM Fatimah wati Halim et al⁹, to measure personality, and Satisfaction with Life Scale Diener, Emmons, Larsen, & Griffin⁸, to measure life satisfaction (table 1). Analyses were conducted descriptively and quantitatively using SPSS version 22 and Structural Equation Modelling using Partial Least Square (Smart PLS 3.2.5 software) Hair et. al¹².

Table 1: Instruments

Construct	Source of instruments	Number of items
Conscientiousness	NEO AppiKA UKM, Fatimah wati Halim et al (2013)	5
Extraversion		3
Openness		2
Agreeableness		2
Neuroticism		4
Life Satisfaction	Satisfaction with Life Scale, Diener (1985)	4
	Total no. of items	20

Data collection: Four hundred and sixty four out of seven hundred and forty one data were obtained after data cleaning. Sample size was calculated using G-Power statistical analysis, indicating that 464 respondents were sufficient. Researchers had selected the respondents throughout Malaysia using stratified random sampling technique.

RESULTS

Partial least squares structural equation modelling (PLS SEM) was employed to test the research hypotheses due to a reason on exploring the prediction of personality on life satisfaction. Demographically, the respondents comprised of 93.8 percent male and 6.3 percent female counterparts. The majority of respondents were from 40 to 45 years old (72.4%), SPM holders (69.4%) and Sergeant (24.6%) with 2 years length of retirement (33.2%).

Assessment of the Measurement model: Hair et al¹², suggest that the measurement model in SEM-PLS must be evaluated systematically on its convergent validity, discriminant validity and reliability. Hair et al¹³, suggested the approach of using factor loadings, composite reliability (CR) and Average Variance Extracted (AVE) scores Fornell & Larcker¹¹, in assessing convergent validity. Table 2 shows the results of the convergent validity in that the loadings for all items used range from 0.49 to 0.88, with the cut-off value for the loadings being 0.40 Henseler, Ringle, & Sinkovics¹⁷; Fornell & Larcker¹¹ a powerful structural equation modeling technique for research on international marketing. While a significant body of research provides guidance for the use of covariance-based structural equation modeling (CBSEM. Meanwhile, Table 2 shows the Average Variance Extracted (AVE), of all constructs range from 0.520 to 0.760, exceeding the recommended value of at least 0.5 or more than 0.5 Hair et al¹³; Henseler, Ringle, & Sinkovics¹⁷ a powerful structural equation modeling technique for research on international marketing. While a significant body of research provides guidance for the use of covariance-based structural equation modeling (CBSEM. In this regard, the value of AVE shown for this measurement model indicates the sufficient convergent validity.

In this study, the composite reliability values are between 0.772 and 0.881, with cut-off value above 0.7 Henseler, Ringle and Sinkovics¹⁷ a powerful structural equation modeling technique for research on international marketing. While a significant body of research provides guidance for the use of covariance-based structural equation modeling (CBSEM, in that it is satisfactory.

Table 2: The Measurement Model on convergent validity and composite reliability

Construct	Items	Loadings	AVE	CR
Conscientiousness	Bitem9	0.690	0.533	0.851

	GSwls 3:	0.813		
	GSwls4:	0.781		

Note: AVE= Average variance extracted; CR = Composite reliability

Secondly, validity of measurement model requires the assessment of discriminant validity Fornell & Larcker¹¹; Henseler, Ringle, & Sinkovics¹⁷ a powerful structural equation modeling technique for research on international marketing. While a significant body of research provides guidance for the use of covariance-based structural equation modeling (CBSEM. In this study, the square root of the AVE is greater than the correlation with other constructs indicating that discriminant validity is adequate.

Apart from Fornell-Larcker criterion on AVE, the cross loadings also have to be fulfilled for assessing the discriminant validity of the measurement model Henseler, Ringle, & Sinkovics¹⁷; Chin, 1998; Chin, 1998) a powerful structural equation modeling technique for research on international marketing. While a significant body of research provides guidance for the use of covariance-based structural equation modeling (CBSEM. In this study, the loadings of the measurement indicators on their respective latent construct are significantly different from zero. Table 3 shows that the square root of the AVE by each of the latent variables is higher than the correlations between the latent variable, and all the other variables.

Table 3: The Discriminant validity of the constructs

	Mean	SD	Consc	Extrav	Open	Agree	Neurotic	Life satis
Conscientiousness	4.19	.403	0.730					
Extraversion	3.93	.554	0.491	0.744				
Openness	3.37	.687	0.358	0.354	0.872			
Agreeableness	3.39	.766	0.269	0.281	0.169	0.796		
Neuroticism	2.05	.649	-0.237	-0.199	-0.189	-0.129	0.721	
Life Satisfaction	5.32	.923	0.289	0.303	0.153	0.175	-0.257	0.807

Note: Diagonals (in bold) presents the square root of the Average Variance Extracted (AVE) while the other entries represent the correlations.

According to Henseler, Ringle and Sarstedt¹⁸ such as partial least squares, the Fornell-Larcker criterion and the examination of cross-loadings are the dominant approaches for evaluating discriminant validity. By means of a simulation study, we show that these approaches do not reliably detect the lack of discriminant validity in common research situations. We therefore propose an alternative approach, based on the multitrait-multimethod matrix, to assess discriminant validity: the heterotrait-monotrait ratio of correlations. We demonstrate its superior performance by means of a Monte Carlo simulation study, in which we compare the new approach to the Fornell-Larcker criterion and the assessment of (partial, cross loadings and Fornell-Larcker criterion are two examinations that are always used in order to evaluate the discriminant validity of the measurement model, yet these cross loadings and Fornell-Larcker criterion failed to uncover the lack of discriminant validity. In this regard, Henseler, Ringle

and Sarstedt¹⁸ such as partial least squares, the Fornell-Larcker criterion and the examination of cross-loadings are the dominant approaches for evaluating discriminant validity. By means of a simulation study, we show that these approaches do not reliably detect the lack of discriminant validity in common research situations. We therefore propose an alternative approach, based on the multitrait-multimethod matrix, to assess discriminant validity: the heterotrait-monotrait ratio of correlations. We demonstrate its superior performance by means of a Monte Carlo simulation study, in which we compare the new approach to the Fornell-Larcker criterion and the assessment of (partial suggest the Heterotrait-monotrait ratio of correlations (HTMT) as an alternative to assess discriminant validity of the measurement model. It was found that the HTMT for the study in Table 4 is less than 0.85 ratio, which indicates that the discriminant validity for the measurement model has been established.

Table 4: The Heterotrait-Monotrait (HTMT) ratio of correlations for discriminant validity

	Consc	Extrav	Openn	Agreeable	Neurotic	Life satis
Conscientiousness						
Extraversion	0.711					
Openness	0.491	0.567				
Agreeableness	0.480	0.609	0.330			
Neuroticism	0.324	0.311	0.272	0.228		
Life satisfaction	0.340	0.416	0.202	0.267	0.336	

The assessment of structural model will then can be carried out once the measurement model is valid and reliable Nunnally, Bernstein²⁶; Hair et. al¹²; Henseler, Ringle, & Sinkovics¹⁷; Chin, 1998.

Assessment of the Structural Model: A non-parametric bootstrapping with 5000 replications Hair, Ringle, & Sarstedt¹³, was applied to obtain the standard errors of the estimates and the t-statistics to evaluate on the statistical significance of the path coefficients. In this study, the level of significance p value of 0.05 is used, which means 95% level of confidence to accept the hypothesis Hair et. al¹². The observed t value must be

greater than 1.96 in order to conclude that the hypothesis is supported Hair et. al¹².

The findings showed that Conscientiousness ($\beta = 0.142, t = 2.722, p < 0.05$), implying that the hypothesis (H1) is supported. Extraversion ($\beta = 0.182, t = 3.336, p < 0.05$), the hypothesis (H2) is supported. Openness ($\beta = -0.007, t = 0.142, p < 0.05$), the hypothesis (H3) is not supported. Agreeableness ($\beta = 0.064, t = 1.496, p < 0.05$) the hypothesis (H4) is also not supported. Result for Neuroticism ($\beta = -0.180, t = 3.931, p < 0.05$), indicates that the hypothesis (H5) is supported. Table 5 shows the result of path coefficient and the hypotheses testing for the study.

Table 5: The Path Coefficient and Hypotheses Testing

Hypothesis	Construct	Beta	Standard Error	T value	Decision
H1	Conscientiousness→Life satisfaction	0.142	0.052	2.722	Supported
H2	Extraversion→ Life satisfaction	0.182	0.054	3.336	Supported
H3	Openness→Life satisfaction	-0.007	0.052	0.142	Not supported
H4	Agreeableness→Life satisfaction	0.064	0.043	1.496	Not supported
H5	Neuroticism→Life satisfaction	-0.180	0.046	3.931	Supported

Note: Significant at *t-value >1.96 ($p < 0.05$)

The R² for the model was 0.152, indicating that 15.2% of the variance in the life satisfaction variable can be explained by the latent variables of conscientiousness, extraversion, openness, agreeableness and neuroticism. The R² in table 6 refers to the explanatory power of the predictors on the respective construct.

Further, the blindfolding procedure was employed in testing the predictive relevance (Q²) of the model. Hair et. al¹², explain the Q² as a measure on how well the observed values are constructed by the model and its parameter estimates. This model has Q² value of 0.087, which is higher than 0 Fornell and Cha¹⁰, in that cross validated redundancy measure showed the structural model had its predictive relevance.

The effect size (f²) analysis is carried out in order to measure the changes in R square, in that to perceive whether the impact of exogenous latent variables to endogenous variable have a substantive impact or not Hair et. al¹². Table 6 indicated that Conscientiousness, Extraversion and Neuroticism have a small effect on life satisfaction.

Table 6: The effect size

Construct R ²	f ²	Decision
Conscientiousness	0.017	Small
Extraversion	0.027	Small
Openness	0.000	
Agreeableness	0.004	
Neuroticism	0.035	Small
Life satisfaction	0.152	

f² 0.02, small, 0.15 medium, 0.35 large (Cohen, 1988; Henseler et al., 2009; Hair et al., 2014)

DISCUSSION

The study aimed at investigating the effect of Conscientiousness, Extraversion, Openness, Agreeableness and Neuroticism as personal profile and resource of veterans on life satisfaction. Changes in life satisfaction at retirement were considered as the functions of conscientiousness, extraversion and neuroticism. The results showed that veterans with types of personality on conscientiousness were predicted at 0.017 effect size in contributing to the life satisfaction. A conscientious veteran was perceived to be more careful

on his health related behaviour, and would focus more on his retirement preparation Reis & Gold²⁷. An extrovert veteran would tend to possess more warmth and sociable characteristics in dealing with people around him and more energetic to lead the life Reis & Gold²⁷. Extraversion had an effect size of 0.027, indicating a small contribution to life satisfaction.

Result has shown that Neuroticism has a negative significant effect ($\beta = -0.180, t= 3.931, p< 0.05$), on life satisfaction. In this regard, veterans with neurotic personality would tend to have less satisfaction in his life at retirement. The more the veteran is neurotic, the least he would be satisfied with his retirement life. A veteran with neurotic personality type may have a tendency to possess vulnerable, hostile, impulsive, depressed and anxious Reis & Gold²⁷, traits towards his retirement situation.

Although three personality factors on conscientiousness, extraversion and neuroticism were found significantly affected on life satisfaction at retirement, conversely, the other two personality factors on openness and agreeableness were did not significantly affected on life satisfaction among them.

Implications: Theoretically, this study contributed to the body of knowledge by strengthening the empirical understanding that conscientiousness, extraversion and neuroticism factors did contribute to the life satisfaction of army veterans.

Limitations: Finding of the study cannot be generalised to ranks officers army veterans, neither to navy nor to Air force veterans. Besides, cross sectional design is limited to know the process of retirement took place among the veterans.

Directions for future research: Future research should conduct a qualitative study to better understand both positive and negative personal experience of the other ranks army veterans at retirement.

CONCLUSION

In conclusion, conscientiousness, extraversion and neuroticism had found contributed to life satisfaction of other-ranks army veterans, though the effects size were small. The results revealed that the effect of openness to experience and agreeableness on life satisfaction, were not supported respectively.

ACKNOWLEDGEMENT

A special gratitude is extended to Captain Nizam Ibrahim from Imbalanbaik Samudera Sdn. Bhd. in assisting the data collection of the current study.

The Influence of Electronic Word of Mouth on Theory of Reasoned Action and the Visit Intention to the World Monument Fund Site

Abdul Hafaz Ngah¹, Mohd Rahimi Abdul Halim¹, Norzalita Abd Aziz²

¹Universiti Malaysia Terengganu; ²Universiti Kebangsaan Malaysia

ABSTRACT

The traditional Chinese shop houses in Kampung Cina, Kuala Terengganu have been awarded a grant of USD 50,000 by the World Monument Fund (WMF) to improve and preserve the building structures in this area. In line with the changes, the community and the state administrator have conducted many activities in this area and promoted Kampung Cina which WMF deemed as a major tourist attraction in this area. This study was conducted to understand the electronic word-of-mouth (eWOM) and to close the gap for the lack of literature regarding the intention to visit the WMF site. This exploratory study focused on modelling the influence of eWOM on the attitude, subjective norm, and the visit intention to this world monument site. A survey based on the theory of reasoned action was distributed to 155 tourists at the WMF site, and only 123 responses can be used for the analysis purposes. This study has used a quantitative approach of self-administered questionnaire. The results showed that eWOM has a positive relationship with attitude and subjective norm. Besides that, the study also found that attitude, subjective norm, and benefits have a positive relationship with the visit intention. The findings of this study could help the government and private sector to develop better planning to enhance this WMF site as a major tourist attraction. It is hoped that this study could attract the interest of others to conduct more studies on tourism in Terengganu and also other WMF sites around the world.

Keywords: *Theory of Reasoned Action, Electronic Word-of-Mouth, Second-Order Construct, Intention to Visit, Smart PLS*

INTRODUCTION

As a non-profit organisation (NGO), the World Monuments Fund (WMF) was founded to preserve important artistic treasures worldwide. Currently, WMF has sponsored over 600 conservation projects in 90 countries throughout the world. The preservation activities aimed to identify imperilled cultural heritage sites and provide direct financial and technical support for the conservation activities. As a result, WMF has provided a grant of USD 50,000 to develop a plan to improve the shop structures in Kampung Cina, Kuala Terengganu (<https://www.wmf.org/>). Kampung Cina has been on the watch list in the following years: 1998, 2000, and 2002.

The advancement in networking technology has fostered the development of a new style of changing and sharing information among the world population

especially for tourists. Tourists will look for the information about the destinations, especially from their relatives or friends. However, tourists did not only rely on their relatives and friends but from the worldwide via online, which is known as electronic word of mouth (eWOM). eWOM has become a vital source of meaningful information by the potential customers because it could be either in negative or positive forms (Mayzlin, 2006).

There are many studies that have been conducted to model the intention to visit, however, it is quite impossible to rely on a single model to explain the tourist preferences for different types of destinations Shen et al.²⁶. The intention to visit or travel to certain places can be influenced by various factors. Attitude, subjective norm, and benefits of the visit could be the significant factors that can influence the intention to visit a destination

There are many studies on eWOM have been conducted all over the world such as; on the west Martin & Lueg²¹, Jalilvand et al¹⁸ and Fan et al¹⁰. However, very little research on the topic has been conducted in Malaysia Zainal et al³⁰, especially on the WMF sites.

This study intended to close the gap in the literature by identifying the effect of eWOM on the variables in the theory of reasoned action (TRA) and the theory towards the intention to visit the WMF Site in Kampung Cina, Terengganu. Most of the studies in tourism focused on world heritage sites.

LITERATURE REVIEW

Electronic Word of Mouth: Word of mouth (WOM) has been claimed to have an important function in forming the consumers' attitude and behavioural intentions Xia & Bechwati²⁸. According to Smith et al²⁷, eWOM has become a significant source of information for the consumers to decide on their purchase. The impact of eWOM should be stronger than the traditional WOM Abu Bakar and Ilkan¹. Fakharyan et al. (2013) found that eWOM has a positive relationship with the tourists' attitude towards the Islamic destination choice. It was discovered that eWOM has a positive relationship with attitude and subjective norm Jalilvand & Samiei¹⁸. Hence, the hypotheses are formulated as follows:

H1. eWOM has a positive relationship with the attitude to visit World Monument Funded site.

H2. eWOM has a positive relationship with the subjective norm to visit World Monument Funded site.

Benefits: Tourists will gain certain benefits for their visits to each destination. One of the factors that influence the intention to visit is benefits because each tourist will gain different benefits. This study adopted the benefit factor that was used by Nowacki²³. According to Nowacki²³, benefits can be measured by three dimensions which are recreational, educational, and social. Those three dimensions act as a first-order construct to measure the overall benefits as a second-order construct. Becker et al⁵ proposed that the second-order construct should be in a formative form. Nowacki²³ found that the overall benefits can be positively related to the intention to visit the destination. Hence, the hypothesis is as follows:

H3. Benefits has a positive relationship with the intention to visit the World Monument Funded site.

Theory of Reasoned Action (TRA): Theory of reasoned action (TRA) was developed by Fishbein and Ajzen³ to predict the customers' behaviour. According to Guo et al⁴, TRA used attitude and subjective norm to express the impacts of cognitive components for the individual decision-making process. Even though TRA was formed in year 1975, the theory is still being used to predict the individual's behaviour in many areas of study, including health adoption Xiaofei et al²⁹; social media Kim et al¹⁹; and green purchasing Paul et al²⁴.

Attitude: Attitudes has been classified as an important psychological construct that can influence and predict many behaviours Huh et al¹⁷. According to Ajzen and Fishbein³, attitude refers to the evaluation of the performances of a behaviour. Jalilvand et al¹⁸ found that attitude has a positive relationship with the visiting intention to Isfahan. Han et al¹⁶ also found that attitude is positively related to intention. As a result, we hypothesised the following:

H4. Attitude has a positive relationship with the intention to visit the World Monument Funded site.

Subjective Norm: Ajzen² defined subjective norm as perceived pressure from an important person in someone's life whether to perform or not perform the behaviour. Subjective norm is positively related to the intention to visit Isfahan Jalilvand et al¹⁸. In a recent study, Han et al¹⁶ found that subjective norm is positively related to intention. Thus, we hypothesised the following:

H5. Subjective norm has a positive relationship with the intention to visit the World Monument Funded site.

Intention to visit: Referring to TRA, the two variables that can explain the behaviour are attitude and subjective norm. According to Ajzen², the behavioural intention will explain the individual's intention whether to perform or not perform a specific behaviour. In tourism study, the intention to visit refers to the willingness of a potential visitor to visit the destination (Chen et al. 2014). It is believed that the intention will lead them to the real intention.

METHODOLOGY

Using purposive sampling method, with self-administered approach, data were collected from international tourists during the mid of March until the mid of April 2017. Out of the 155 tourists, only 123 of them were willing to participate in this study. After

sorting the questionnaires, only 117 questionnaires can be used for the data analysis purposes. The unit of analysis for the study is at an individual level. Based on G*power 3.1 software Faul et al¹¹, with four predictors, medium effect size, and power were set at 80% Gefen et al¹², the minimum sample size required to test this model was 85. The 117 responses are adequate to test the research model by referring to the requirement of G*power. All the items in the variables were adopted from Jalilvand and Samiei¹⁸ except for the benefits as the second-order variable which was adopted from Nowacki²³.

This study used partial least squares (PLS) technique using Smart PLS 3.2.6 software (Ringle, Wende, & Becker²⁵ to test the hypotheses in the research model. Anderson and Gerbing⁴ proposed a two-stage analytical procedure that tested the measurement model and the structural model. The structural model tested the hypothesised relationships using the bootstrapping procedure with 500 resamples as proposed by Chin⁷.

Sample Profile: The majority of the respondents are from a European country with the percentage of 53.8%. Overall, 53% of them were female, 58.1% of them aged between 20 to 29 years old, and the majority of them have a degree or above for their education level.

ANALYSIS AND RESULTS

The multivariate skewness and kurtosis were tested by the software available at: <https://webpower.psychstat.org/models/kurtosis/results.php?url=e9bb3e5270e63dd2feb659f8b9c6d168> as proposed by Hair et al¹⁵. The Mardia’s multivariate skewness with $\beta = 7.374$, $p < 0.01$ and Mardia’s multivariate Kurtosis ($\beta = 46.201, p < 0.01$) showed that the data were not normal multivariate. Thus, it is confirmed that the data suited perfectly with the Smart PLS which is a nonparametric analysis software.

Measurement Model: Two types of validity will be examined to confirm the measurement model which are convergent validity and the discriminant validity.

Convergent Validity: The convergent validity is used to confirm that the multiple items measure the same concept in agreement Hair et al¹⁵, Ngah et al²² by evaluating the factor loadings, composite reliability (CR), and the average variance extracted (AVE). The loadings and the AVE should exceed 0.5, and the CR should be greater

than 0.7 Hair et al¹⁵, to establish the convergent validity. Table 1 shows all the constructs achieve the minimum threshold value to meet the requirement to establish the convergent validity.

Table 1: Measurement Model of First Order Construct (Reflective)

Construct	Item	Loadings	CR	AVE
Attitude	ATT1	0.909	0.948	0.858
	ATT2	0.932		
	ATT3	0.937		
Electronic Word of Mouth	EWOM1	0.827	0.907	0.621
	EWOM2	0.871		
	EWOM3	0.788		
	EWOM4	0.798		
	EWOM5	0.649		
	EWOM6	0.777		
Intention	INT1	0.904	0.910	0.719
	INT2	0.736		
	INT3	0.862		
	INT4	0.879		
Educational Benefits	EB1	0.776	0.866	0.683
	EB2	0.845		
	EB3	0.856		
Recreational Benefits	RB1	0.936	0.915	0.844
	RB2	0.900		
Social Benefits	SB1	0.910	0.901	0.820
	SB2	0.901		
Subjective Norm	SN1	0.903	0.925	0.803
	SN2	0.877		
	SN3	0.908		

Table 2: Measurement Model for Second Order Construct (Formative)

Construct	Weight (Beta value)	VIF	T-value
Educational Benefit	0.598	1.537	14.522**
Social Benefits	0.427	1.424	9.491**
Recreational Benefits	0.271	1.096	3.049**

**p < 0.01

The overall benefit was measured using the formative second-order construct; Hair et al¹⁵ proposed that the measurement should focus on weights, t value, and collinearity. Diamntopoupus and Siguaw⁸ claimed that if the variance inflator factor (VIF) values are higher

than 3.33, it is a sign of a multicollinearity problem which does not occur in this study. The weights and associated t-values which assess the level of each item's contribution to the overall factors were good. These results confirmed that the measurement model for the second-order construct is not a problematic issue for this study. Table 2 illustrated the result for the measurement model for second order construct.

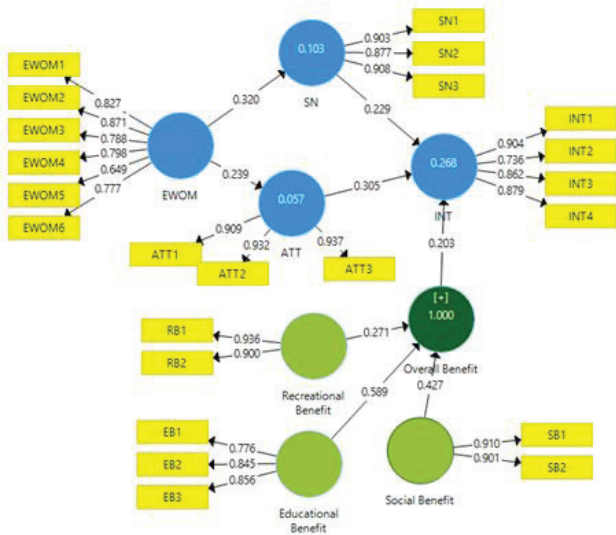

Figure 1: Measurement model

Discriminant Validity: The discriminant validity is the extent to which a construct can truly distinct from the other construct and to measure how much indicators represent only a single construct Gholami et al¹³. Table 4 shows the results of the discriminant validity based on the HTMT ratio. If the HTMT value is greater than HTMT_{0.85} Kline²⁰, it indicates that there is a serious issue in the discriminant validity. Table 3 shows that the discriminant validity was established as all values for HTMT were lower than the cut-off value mentioned by Kline²⁰.

Table 3: HTMT Criterion

	1	2	3	4	5
1. Attitude					
2. EWOM	0.258				
3. Intention	0.498	0.253			
Overall Benefit	0.201	0.286	0.295		
SN	0.493	0.345	0.405	0.155	

Note: HTMT established at 0.85

Structural Model Analysis: It is vital to confirm that there is no collinearity issue before assessing the structural model. Table 4 shows the results of the collinearity test. Since the VIF values were lower than 3.3 Diamantopoulos & Sigua⁸, it is confirmed that collinearity is not an issue for this study.

Table 4: Collinearity Assessment

Construct	INT	SN	ATT
ATT	1.327		
Overall Benefit	1.049		
SN	1.291		
EWOM		1.000	1.000

Table 5 illustrates the results of the hypothesis testing based on the hypotheses in the research model. All of the proposed model were found significant with three of them were significant at 99% confidence interval (EWOM → SN, β = 0.320, t = 2.793, ATT → INT, β = 0.305, t = 2.706. Benefits → INT. β = 0.203, t = 2.652). Other were statically significant at 95% (EWOM → ATT, β = 0.238, t = 2.108, SN → INT, β = 0.229, t = 2.309). The results confirmed that all of the exogenous constructs have a positive relationship with the endogenous constructs.

Table 5: Path Coefficient Assessment

Hypothesis	Relationship	Beta	Se	T-Value	LL	UL	Decision
H1	EWOM -> ATT	0.238	0.113	2.108*	0.020	0.443	Supported
H2	EWOM -> SN	0.320	0.115	2.793**	0.078	0.527	Supported
H3	ATT -> INT	0.305	0.113	2.706**	0.065	0.522	Supported
H4	SN -> INT	0.229	0.099	2.309*	0.036	0.427	Supported
H5	Benefits -> INT	0.203	0.077	2.652**	0.060	0.352	Supported

Note: * p < 0.05, ** p < 0.01., LL = Lower Level, UL = Upper Level

DISCUSSION AND CONTRIBUTION

This study found that all of the hypotheses were supported; thus, indicating that the TRA and the

variables representing the benefits factor is useful in understanding the intention to visit the WMF site which is Kampung Cina in Kuala Terengganu. The results

were similar to Jalilvand and Samiei¹⁸ and Han et al¹⁶ that attitude and the subjective norm were significantly related to the intention to visit Isfahan. The government or organisation which promoted this site should be aware that attitude and subjective norm are important to attract more tourists to visit this site. The promotion should be broader and also ensure that it will reach not only for specific potential individuals but also the important person in their life.

On top of that, eWOM has also been found to have a positive relationship with the attitude and the subjective norm. Hence, eWOM is capable of explaining the attitude and subjective norm among tourists who visited the world monument funded site. This result is similar to Jalilvand and Samiei¹⁸ who found that eWOM has a positive relationship with the attitude and subjective norm of the tourists who visited Isfahan. This study also confirmed the capability of the eWOM to influence the attitude and the subjective norm of the potential visitors to Kampung Cina. Since online information is easily accessed nowadays, the promoters should include more online information through blogs, Facebook, or any other social media channels. The community of Kampung Cina should also provide more online information to the potential visitors since they know the place more than others.

Benefits also has a positive relationship with the intention to visit this area. This result supported the findings by Nowacki²³ who found that benefits was positively related to the intention to visit. Hence, the local body such as Terengganu State Tourism should promote the benefits of visiting this site. Besides promotion, the obligation bodies for this area should create many events to increase the attractiveness and offer a meaningful moment for the potential visitors.

Using Expectation and Confirmation Theory to Determine Customer Loyalty among Postpaid Users

Syukrina Alini Mat Ali¹, Wan Jamaliah Wan Jusoh², Abideen Adeyemi Adawale³

¹Faculty of Business Management, Universiti Teknologi MARA; ²Assoc. Prof. Kulliyah of Economics and Management Sciences, ³Assoc. Prof. Institute of Islamic Banking and Finance, International Islamic University Malaysia

ABSTRACT

In developing countries, the rate of mobile network subscription is slowing down due to market saturation. Thus, acquiring new customers is a challenge for the service provider. Hence, it is vital to raise customer loyalty in mobile service providers for the purpose of maintaining customers. This paper aims to determine the factors which explain customer loyalty and satisfaction among users of mobile postpaid services. Building from the expectations and confirmation theory using the survey method of positivist research, data was collected from 338 subscribers of Digi, Maxis and Celcom located in Klang Valley, Malaysia. The data was analysed using SEM_PLS Version 3 and the result has generally revealed the significant relationship between all variables. Further analysis revealed that service expectation and performance, for example network quality (i.e. first time dial, no cut on line, etc.) were significant customer expectations when subscribing to a service provider. The finding provides further input and understanding for service providers to offer better services to their subscribers in order to satisfy and retain customers longer.

Keywords: customer expectation, service performance, customer satisfaction, customer loyalty, telecommunication industry

INTRODUCTION

Maintaining customer satisfaction is vital for the mobile service industry as the competition is getting intense. Many researchers agree on the importance of customer satisfaction in retaining customers longer (Arokiasamy & Abdullah²; Kunupakan²⁵; Loke, Taiwo, Salim, & Downe³⁰). For example, the loyal customer will engage with word of mouth advertising by promoting the product and services to family and friends, which can subsequently reduce marketing cost and increase profit (Kursunluoglu²⁶). Many organizations concentrate on their resources to enhance their services in order to attract their customers longer. The literature has identified various determinants of customer loyalty, for instance satisfaction, trust, and service quality (Ahmad, Hussain, & Rajput¹; Mosahab, Mahamad, & Ramayah³⁵; Srivastava & Kaul⁵⁴).

A study on consumer satisfaction based on the Consumer Satisfaction Index (CSI) was conducted by Malaysia Communication and Multimedia Commission (MCMC) in 2015. The study involved five mobile service providers, which were Maxis, Digi, Celcom,

Umobile, and Tunetalk. The result showed an increased rate of consumer satisfaction index from 2006 to 2015. However, Maxis and Celcom lost a significant number of their customers to other service providers in the same year. This leads to the question why even though customers are satisfied with their service providers, they still turn away to other competitors. The present study is thus duly motivated to understand this phenomenon and to identify ways in which companies can retain their customers longer in the current market.

Previous studies in Malaysia's telecommunication industry mostly concentrated on prepaid users as target group (Haque, Khatibi, Raquib, & Al Mahmed²⁰; Moneruzzaman³³; Nikbin, Tabavar, & Jalalkamali³⁸; Shamsudin⁵¹). In addition, most of the consumer behaviour frameworks used were those developed in western countries. Therefore, this paper focuses on postpaid users' expectation and perceived service performance in the Malaysian setting. Maxis, Celcom, and Digi were selected as these service providers recorded the highest number of users in Malaysia. The purpose of this paper is to bridge the gap in the literature by examining the roles of expectation and confirmation towards customer satisfaction and loyalty.

LITERATURE REVIEW

Many service providers expend their resources to improve services in order to achieve their goal of lengthier customer retention. Past studies have disclosed various factors that contribute towards customer loyalty such as satisfaction, switching cost, trust, and service quality. It is pertinent to highlight that even though studies on customer loyalty have been an interest for the past decade, it is nevertheless still a challenge to understand the context of customer loyalty in the service industry due to the significant changes in measurement (Ladhari, Souiden, & Ladhari²⁷). Defining customer loyalty is a particularly difficult task as to date, consensus on the meaning of the concept has yet to exist (Bennett & Rundle-Thiele⁵; Bowen, Chen, & Duffy⁷; Dickinson¹⁴; Gecti & Gumus¹⁸; Khan²³; McMullan & Gilmore³²; Ogba & Tan³⁹; Pan, Sheng, & Xie⁴²; Reichheld & Sasser⁴⁷; Saleem, Zahrah, Ahmad, & Hina⁵⁰; Wymer & Rundle-Thiele⁵⁸). The present study conceptualizes 'loyalty' in terms of customer behavior and attitude related to the service or the company, for example the likelihood of future renewal of service contracts, how likely it is that the customer changes patronage, how likely the customer is to provide positive word-of-mouth, and the likelihood of customers providing voice.

Expectation and Confirmation Theory: This study applies the expectation confirmation theory (ECT) by Oliver⁴⁰ which is commonly used to define and predict satisfaction. This theory posits three variables, namely service expectation, service performance, and confirmation, which are measured towards satisfaction and loyalty (Figure 1). According to Oliver, satisfaction is based on previous experience. He further elaborated that satisfaction is acquired from confirmation which is obtained from expectation towards the services or products (Oliver⁴⁰). Confirmation is defined as the differences between two ideas, respectively referring to the differences between a pre-purchase expectation and the actual performance received (Spreng & Page⁵³). Usually, customers will develop expectations toward the product and services before they engage in the buying process. Customers will explore the use of the product or service and develop perceptions about its performance after the buying process. Expectation refers to the "customer's anticipations about performance of products and services" (Churchill & Surprenant¹²). ECT has the ability to define multiple manners of customers in the

purchase process (Elkhani & Bakri¹⁷). The framework is extended by adding perceived performance as a predictor of satisfaction, and further views that both expectation and perceived performance have an influence on confirmation (Churchill & Surprenant¹²). The services literature considers expectations to be reference points of comparison in the service evaluation process (Parasuraman et al⁴³).

Previous Research on ECT: Previous studies have examined the relationship between service expectation and service confirmation in various industries (Baharum & Jaafar⁴; Bhattacharjee⁶; Chang et al⁹; Lin et al²⁹). A research conducted among the students in a beauty salon measured service expectation in pre-purchase setting. The result revealed the relationship between service expectation and service confirmation (Lin et al²⁹). Service expectation links to satisfaction as it roles an anchor in the satisfaction evaluation process (Oliver⁴⁰). Past literatures have examined the association between service expectation and satisfaction in various industries (Baharum & Jaafar⁴; Bhattacharjee⁶; Chang et al⁹; Nasser, Md. Salleh, & Gelaidan³⁷). A review of past literature suggests that customers may consume multiple types of expectation in the evaluation process of satisfaction (Tse & Wilton⁵⁵). These expectations are frequently used as standards of service against which the judgement of satisfaction is made (Churchill & Surprenant¹²). An early study conducted by Helson (1964) in adaptation level theory discovered the association between service expectation and satisfaction. Bhattacharjee's⁶ study supports this hypothesis, revealing a significant relationship between expectation and satisfaction when the customers' expectation was lesser. Furthermore, a study conducted to seek mobile users post-adaptation behaviour emphasizes that meeting users' expectation is a main way to enhance their satisfaction (Zhou⁶⁰).

Performance can influence satisfaction both directly and through confirmation. The relation between performance and disconfirmation is predicted to be positive (Lankton & McKnight²⁸). Tse and Wilton⁵⁵ found that performance had a significant direct effect on satisfaction as well as an indirect effect through confirmation. A more recent study conducted in the service industry also confirms the relationship between perceived service performance and service confirmation (Lin et al²⁹). Moreover, Tse and Wilton⁵⁵ found that performance had a significant direct effect on satisfaction. This discovery was made when the

role of perceived performance in customer satisfaction formation was examined with a tape recorder. In addition, another research in service industry in the UK supports the relationship between service performance and satisfaction (Johnson, Nader, & Fornell²²). The result is in line with the study conducted by Burton et al⁸ in vehicles transport market by measuring the damage rate and vehicle delivery time in Australia. When performance and expectation are equal, confirmation occurs. Both performance and confirmation have been found at times to be significant predictors of customer satisfaction (Churchill & Surprenant¹²; Tse & Wilton⁵⁵).

The research conducted by Bhattacharjee⁶ shows that a higher level of positive confirmation means higher satisfaction. Spreng and Page⁵³ developed a modified satisfaction composition model with the help of ECT model. Their model indicates that confirmation has a significant influence upon property satisfaction or information satisfaction, and upon overall satisfaction. Bhattacharjee also points out that there is a positive correlation between confirmation and satisfaction. In addition, another study using online on internet self-efficacy found that confirmation has a significant influence upon product satisfaction and information satisfaction, as well as overall satisfaction (Chen, Huang, Huang, & Sung¹¹). Based on the discussion, six hypotheses were formulated, as listed below:

H₁: There is a positive relationship between service expectation and service confirmation.

H₂: There is a positive relationship between service expectation and satisfaction.

H₃: There is a positive relationship between perceived service performance and service confirmation

H₄: There is a positive relationship between perceived service performance and satisfaction.

H₅: Service confirmation has a positive effect on satisfaction.

H₆: Satisfaction has a positive effect on loyalty.

Figure 1: Expectation Confirmation Theory

METHOD

The research was conducted based on the quantitative method to examine the relationship between satisfaction and loyalty and to determine the factors that influence customer satisfaction and loyalty. In this study, multiple items were adapted and modified accordingly. Items for service expectation and service performance were adapted from Shamsudin⁵¹, Sirapraha and Tocquer⁵², and Zhang and Feng⁵⁹; items for service confirmation from Bhattacharjee⁶, Lin, Wu, and Tsai (2005), Liu (2012), and Oghuma et al. (2015); customer satisfaction from Quoquab, Abdullah, and Mohammad⁴⁴, Shamsudin⁵¹, and Valvi and West⁵⁶; and customer loyalty from Dimitriades¹⁵, Ruyter and Wetzels⁴⁸, and Shamsudin⁵¹. A reliability test was conducted prior to the actual data collection to ensure consistency of measure. Based on the pilot test of 30 respondents, the internal consistency value for all constructs met the minimum requirement of 0.700. To determine the minimum sample, G*Power software was employed. Based on the effect size set at 0.15, alpha level of 0.05, and four predictors, a sample of 143 respondents was considered appropriate. However, taking into consideration Hair, Black, Babin and Anderson's (2014) suggestion that a larger sample improves precision and reliability of PLS-SEM results, the total number of 400 questionnaires were distributed to Maxis, Digi and Celcom postpaid subscribers at the respective service centers in Klang Valley. Using purposive sampling, the survey return rate was 344 (86%). However, six of the questionnaires were excluded due to missing value exceeding more than 15% and therefore, only 338 (84%) were useable. The Statistical Package for Social Science (SPSS) was used for data cleaning and preliminary analysis, followed by the Partial Least Square-Structural Equation Modelling (PLS-SEM) for analysis since the result failed to meet the normality test procedure.

RESULTS

A total of 338 useful data was used in this study. The respondents' profiles are depicted in Table 1. The data shows a majority of the respondents were female (n=180, 53.3%) and aged between 19 to 30 years old (n=150, 44.4%). More than half of the respondents were Malay (n=186, 55%) with an income level of RM 2001 to RM 4000 (n=144, 42.6%). Almost half of the respondents were subscribers of the RM 101 to RM200 postpaid plans (49.7% n=168). In terms of service

provider subscription, majority of the respondents were Celcom users (n=135, 39.9% and had subscribed to the service provider for almost 1-5 years (n=139, 41.1%). The final data of the study were examined for common method variance. Accordingly, Harman's single test was performed by entering all the measurement items

into SPSS and the results revealed the absence of any common factor loading on all measures, in which the total variance for a single factor was 33.09% which was less than the suggested cut off point of 50% (Podsakoff & Organ, 1986). Therefore, it can be concluded that common method bias was not a threat in this research.

Table 1: Demographic Profiles

Variable	Frequency	%	Variable	Frequency	%
Gender			Income		
Male	158	46.7	Below RM2000	63	18.6
Female	180	53.3	RM2001-RM4000	144	42.6
Age			RM4001-RM6000	98	29.0
18 years old and below	19	5.6	RM6001-RM 8000	30	8.9
19 to 30 years old	150	44.4	RM8001 and above	3	0.9
31 to 40 years old	136	40.4	Monthly Bill		
41 to 50 years old	30	8.9	Below RM 100	116	34.3
51 years old and above	3	0.9	RM 101-200	168	49.7
Race			RM 201-300	41	12.1
Malay	186	55.0	RM 301-400	8	2.4
Chinese	86	25.4	RM 401 and above	5	1.5
Indian	59	17.5	Years of using		
Others	7	2.1	Less than 1 year	52	15.4
Main service provider			Between 1-5 years	139	41.1
Maxis	92	27.2	Between 6-10 years	102	30.2
Digi	111	32.8	Between 11-15 years	33	9.8
Celcom	135	39.9	16 years and above	12	3.6

Measurement Model: Next, the conceptual model was analyzed using PLS-SEM version 3.0. The analysis was divided into two parts which were the measurement model and the structural model. In assessing the measurement model, three criteria were examined. They were the internal consistent reliability; convergence validity, and discriminant validity. Service expectations and service performance were further divided into second order item for each technical and functional constructs in order to reduce the number of indicators in the structural model. Such allows a more parsimonious and easier to grasp analysis (Asyraf & Afthanorhan³). The results are presented in Table 2.

Table 2: Internal Consistency and Convergent Validity

Construct		Loading	AVE	CR
Service Expectation			0.738	0.942
Service Expectation (Technical)			0.672	0.910
SET1	I expect that I can rely on my current service provider to serve me well.	0.769		
SET2	I expect that the network coverage is good in terms of line clarity.	0.866		
SET3	I expect that originated calls can be completed without experiencing premature calls termination (e.g. dropped calls or line got cut).	0.837		
SET4	I expect that my service provider provides customers with good network quality in terms of line clarity, e.g. no disruption, noises or cross lines.	0.837		
SET5	I expect that the service provider will provide good geographical coverage including in-street and in-building.	0.784		

Conted...

Service Expectation (Functional)			0.738	0.942
SEF8	I expect that the service provider will communicate the latest information in a way that is easy to understand, e.g., special offers, rates, discount, helpline numbers, etc. through their websites, brochures, bills and advertisements.	0.709	0.591	0.905
SEF9	I expect that the service packages will give me many choices of postpaid plan.	0.686		
SEF12	I expect that the service provider will offer a very attractive promotion.	0.717		
SEF13	I expect that this service provider will take effective ways to help me know its pricing policies of products and services.	0.806		
SEF14	I expect that this service provider will be offering flexible pricing for various services that meet my needs.	0.838		
SEF15	I expect that the call rate offered by this service provider will be reasonable.	0.795		
SEF16	I expect that the pricing policies of product and services from this service provider will be attractive.	0.817		
Service Performance			0.778	0.913
Service Performance (Technical)			0.672	0.908
S_per1-T	I can rely on my current service provider to serve me well.	0.768		
S_per2-T	The network coverage is good in terms of line clarity.	0.848		
S_per3-T	Originated calls could be completed without experiencing premature call termination (e.g. dropped calls or line got cut).	0.749		
S_per4-T	Provides customers with good network quality in terms of line clarity e.g. no disruption, noises or crosslines.	0.847		
S_per5-T	The service provider provides good geographical coverage including in street and in-building.	0.856		
Service Performance (Functional)			0.569	0.902
S_per8	The service provider provides easy to understand communication of latest information e.g., special offers, rates, discount, helpline numbers, etc. through their websites, brochures, bills and advertisements.	0.706		
S_per9	The service packages offered by this service provider give me many choices of postpaid plan.	0.746		
S_per12	The service provider offers a very attractive promotion.	0.704		
S_per13	This service provider takes effective ways to help me know its pricing policies of products and services. [SEP]	0.754		
S_per14	The pricing policies of products and services from this service provider are attractive.	0.812		
S_per15	The call rate offered by this service provider is reasonable.	0.775		
S_per16	I expect that the service provider is offering flexible pricing for various services that meet my needs.	0.775		
Service Confirmation			0.838	0.939
Con1	My experiences of using the services are better than I expected.	0.913		
Con2	The service level provided by service provider is better than I expected.	0.915		
Con3	Overall, most of my expectations from using this service provider are confirmed.	0.918		

Conted...

Satisfaction			0.702	0.942
CS1	My decision to use this service provider is a wise one.	0.870		
CS2	At times, when I have experienced unforeseen or critical situations, my service provider managed these situations in a satisfactory manner. I think I did the right thing by using this service provider.	0.690		
CS3	My service provider meets my purchase expectations.	0.856		
CS4	I am happy with the effort my service provider is making towards regular consumers like me.	0.761		
CS5	I think I did the right thing by choosing this service provider.	0.881		
CS6	Using this service provider has been a good experience.	0.883		
CS7	Overall, I am satisfied with this service provider.	0.903		
Loyalty			0.677	0.924
CL1	I would definitely recommend my current service provider to someone who seeks my advice.	0.899		
CL2	I encourage relatives and friends to use the services offered by my current service provider.	0.889		
CL3	I intend to use more services offered by my current service provider for the next few years.	0.824		
CL4	I say positive things about my current service provider to others.	0.871		
CL5	I consider my current service provider as my first choice to use the services that I need.	0.891		
CL7	I would pay more than what other competitors charge with the benefits I currently receive.	0.484		

The results provide evidences for composite reliability which meet the minimum requirement of 0.7 and above to achieve internal consistency reliability (see Ramayah, Cheah, Chua, Ting, & Memon⁴⁵). Moreover, all indicator loadings adequately reached the minimum requirement of 0.4 with the average variance extracted (AVE) established more than 0.5 to accomplish the convergence validity requirement. Next, a discriminant validity procedure was conducted to observe how a particular construct was different from the other construct in the study (see Lowry & Gaskin³¹). Using the heterotrait-monotrait ratio (HTMT) techniques, the results shown in Table 3 indicate all values fulfilled the criterion of HTMT_{0.85} as suggested by Kline²⁴ which established discriminant validity. Furthermore, the result of HTMT inference also revealed that the confidence interval did not show a value of 1 on any of the construct, which further confirmed discriminant validity (see Henseler, Ringle, & Sarstedt²¹; Ramayah et al⁴⁵). In addition, based on the Confident Interval Bias value, the columns labeled 2.5% and 97.5% showed that the lower and upper bounds of the 95% (bias-corrected and accelerated) confidence interval did not include the value of 1. In conclusion, the measurement model has established its discriminant validity. Prior to the structural model development, a procedure to address the issue of collinearity was conducted, as the existence of multicollinearity does not contribute to a good regression model.

Table 3: HTMT Criterion

	1	2	3	4	5	VIF
1. Confirmation						1.000
2. Customer Loyalty	0.693 CI.85(0.613, 0.751)					-
3. Satisfaction	0.822 CI.85(0.788, 0.85)	0.792 CI.85(0.713, 0.843)				1.951
4. Service Expectation	0.191 CI.85(0.101, 0.277)	0.042 CI.85(0.002, 0.116)	0.102 CI.85(0.018, 0.193)			1.031
5. Service Performance	0.744 CI.85(0.698, 0.781)	0.663 CI.85(0.567, 0.733)	0.756 CI.85(0.707, 0.8)	0.143 CI.85(0.06, 0.227)		1.031

Next, the structural model analysis was performed through a number of steps. Prior to the hypothesis testing, there was the issue of multicollinearity which needed to be addressed in order to avoid a problematic regression model, requiring below 5.0 variance inflation indicator (VIF). As illustrated in Table 3, values for all constructs met the requirement of VIF which was below 5.00 (see Hair, Hult, Ringle, & Sarstedt¹⁹; Wong⁵⁷), thus confirming the absence of multicollinearity. This was proceeded with the structural model and followed by PLS algorithm which was used to test the hypotheses. In order to ensure the accuracy of PLS estimates, bootstrapping technique with 5000 subsamples was performed and the results are presented in Table 4.

Table 4: Path Coefficient Assessment and Determination of Coefficient (R2)

Relationship	R ²	Path Coefficient	SE	LL	UL	T value	Decision
H1: SE -> Con	0.560	0.087	0.055	0.024	0.147	2.276	supported
H3: SP -> Con		0.731	0.026	0.68	0.772	26.265	supported
H2: SE -> Sat	0.726	-0.058	0.054	-0.109	-0.109	1.899	not supported
H4: SP -> Sat		0.324	0.029	0.517	0.68	7.117	supported
H5: Con->Sat		0.592	0.019	0.517	0.66	13.907	supported
H6: Sat-> Loyalty	0.627	0.792	0.039	0.708	0.842	19.809	supported

t > 1.645 *(p < 0.05), t > 2.33** (< 0.01)

Based on the results, with the exception of the relationship between service expectation and satisfaction, all path coefficients were found to be significant at 99% confidence interval (Service Expectation -> Confirmation $\beta = 0.087$, $p < 0.011$; Service Expectation -> Satisfaction $\beta = -0.058$, $p < 0.029$; Service Performance -> Confirmation $\beta = 0.731$, $p < 0.000$; Service Performance -> Satisfaction, $\beta = 0.324$, $p < 0.000$; Confirmation -> Satisfaction $\beta = 0.592$, $p < 0.000$; Satisfaction -> Customer Loyalty $\beta = 0.792$, $p < 0.000$). Thus, it can be concluded that the five hypothesized relationships in this study are supported in which there is no zero between the Lower Limit (LL) and Upper Limit (UL) confidence interval which relies on bootstrapping standard error (see Hair et al., 2014). The R² value of 0.560 suggests that service expectation and service performance explain 56.0% of variances in confirmation, 0.726 or 72.6% for customer satisfaction, and 0.627 or 62.7% for loyalty. Therefore, R² in this study is acceptable as R² value of 0.20 is considered high in consumer-related studies (see Hair et al¹⁹).

The blindfolding procedure was conducted next to obtain the predictive capability of the model by using Q² (Hair et al¹⁹). According to Hair et al¹⁹ and Ramayah, Cheah, Chuah, Ting, and Memon⁴⁶, if the Q² value is more than 0, the model has predictive relevance for a certain endogenous construct. Based on Table 5, the Q² for Confirmation was 0.564, Satisfaction was 0.704 and loyalty was 0.634, which suggests that the exogenous

constructs possess predictive relevance as they are above zero as outlined by Hair et al¹⁹. The f² values represent the effect size of a specific exogenous construct on the endogenous construct (Hair et al¹⁹). The effect size of SE-Con, SE-Sat, SP-Con, SP-Sat, Con-Sat, Sat-Loyalty were 0.017 (small), 0.012 (small), 1.190 (large), 0.171 (medium) and 0.562 (large), 1.678 (large) respectively based on the guidelines provided by Cohen (1988).

Table 5: Effect Size (f²) and Predictive Relevance Q²

Relationship	Q ²	f ²	Size of effect
H1: SE -> Con	0.564	0.017	small
H3: SP -> Con		1.190	Large
H2: SE -> Sat	0.704	0.012	small
H4: SP -> Sat		0.171	Medium
H5: Con->Sat		0.562	Large
H6: Sat-> Loyalty	0.635	1.678	Large

DISCUSSION

This study was conducted to determine the relationship between customer satisfaction and customer loyalty and to determine the factors that explain for customer satisfaction. Based on the finding, it can be concluded that satisfaction plays an important role towards customer loyalty. This finding supports the previous study conducted by Morgan and Govender³⁴ which emphasized the importance for

service providers to pay a closer attention on activities aimed at increasing satisfaction in order to retain loyal customers longer. As the telecommunication industry is getting saturated, it is important for service providers to meet the customers' expectation, which can lead to satisfaction. In addition, another empirical finding also revealed that postpaid subscribers had high expectation towards their service providers, especially in terms of technicality such as network quality (i.e. first time dial, no cut on line, and others). This particular finding of the study is consistent with the outcome of a previous study conducted by Duzevic, Delic, and Knezevic¹⁶ which found that the functionality of services was one of the important elements in satisfaction. This study has revealed that the current service performance is not at par as to what customers expect. Therefore, it is vital for service providers to meet customers' expectation by showing a good service performance. The result also revealed that the higher the expectation, the lesser the satisfaction. Hence, service providers should avoid making unrealistic and overarching promises, especially during promotional events or advertising to avoid high level of expectation. Moreover, observed was the minimal impact of the relationship between satisfaction and loyalty among subscribers.

The application of ECT in this research extends the knowledge on satisfaction in the context of service expectation and service performance especially since previous studies had mainly focused more on the factors of service quality (Chen & Cheng¹⁰; Muturi, Wadawi, & Owino³⁶; Özer, Argan, & Argan⁴¹; Sagib & Zapan⁴⁹). The use of ECT has allowed this study to incorporate the variable of loyalty in order to strengthen the existing ECT model. This is essentially crucial in light that the telecommunication industry is facing a serious issue of customer retention at present. This model conceptually distinguishes the different impacts of expectation and service performance in the telecommunication industry, as it makes a sharper distinction between how satisfaction is determined.

CONCLUSION

The present study has shed light on the expectation of postpaid subscribers in Klang Valley, Malaysia. This study has further provided a deeper understanding of customer satisfaction and loyalty among mobile postpaid users. Since this study has employed the ECT theory,

it will be an advantage for future research on customer loyalty to conduct a longitudinal study in which a greater comparison can be achieved in terms of pre- and post-subscription, likely after a few months of subscription. Such study may help validate the conclusion of this study and overcome the issue of single period data collection. In this competitive and saturated market, gaining new customers and maintaining old ones is quite a challenging task. Thus, future researchers can explore more on the value of added services, bundle packages, and the ideal mobile network plan to suit customer preferences. This can at the end be used as part of the strategies to retain and develop loyalty among customers.

The Role of E-Management in Achieving Sustainable Competitive Advantage: Field Study of Zain Telecom in Iraq

Khaled Abdulaah Ibrahim¹, Shatha Aboud Shaker², Waleed Khalid Abduljabbar³

^{1,3}Department of Public Administration, College of Administration and Economy, University of Fallujah, Al-Anbar, Fallujah, Iraq; ²Yemen Secondary School for Boys, Baghdad, Iraq

ABSTRACT

This study aims at the role of the electronic administration in achieving the competitive advantage of Zain Company in Iraq and the extent of the contribution of the administration in reducing the time of completion of tasks and the cost of performance and by contributing to the achievement of financial savings through (minimum cost and time of completion of tasks) The study relied on taking the views of the same staff (40) people were excluded (5) questionnaires for lack of validity for statistical analysis to remain (35) questionnaire and the most prominent findings of the study is the existence of a relationship of statistical significance between the application of electronic management and achieve a sustainable competitive advantage of The most important of the study's findings is the adoption of a more sophisticated and modern approach to qualify the organization in providing distinguished services to customers and achieving a sustainable competitive advantage.

Keywords: *Competitive advantage, Kaizen, accounting, Information technology, Electronic management*

INTRODUCTION

The electronic administration is a means of developing and developing the performance of the employees of the organization in question. The electronic administration is considered the main component of the sustainable competitive advantage after the emergence and development of the Internet and information technology and the conversion of administrative, marketing, accounting and other operations to electronic work by converting the papers into electronic files. All operations are carried out through networks and the Internet. Increase and develop the relationship between government, organization, employees and customers. Electronic management is efficient, fast and able to solve the problem of traditional management.

Research Problem: The problem of research is to clarify the role of electronic management in achieving sustainable competitive advantage through the use of modern and sophisticated means and the problem of research by answering the following questions:

1. What is the role of electronic management in developing the performance of employees and speed of completion of transactions for customers?

2. What is the role of electronic administration in developing the skills of employees in the company being investigated?
3. Does electronic management affect the quality and quality of the services provided by the employees of the company?
4. What is the impact of electronic management on achieving quality in governmental and private organizations?

The increasing interest of the organizations in Iraq in general and Zain Telecom in particular in electronic management due to the evolution and change in the business environment with the role of electronic management in improving the efficiency of the performance of the employees and the need of these organizations for such new administrative methods so that the organization can achieve competitive advantage and compete with other companies and access to markets Global.

RESEARCH OBJECTIVES

To draw attention to the role of electronic management in achieving the competitive advantage of sustainable, which is one of the most important factors

that help in achieving customer satisfaction by satisfying their desires and achieve their goals and achieve and improve their competitive position in the market and provide services of high quality and ability of employees to achieve the spirit of cooperation among them. And speed in the completion of transactions resulting from electronic transactions and move from the use of paper and eliminate the routine through electronic dealing.

Method and sources of information collection:

The researchers adopted the methods of collecting information and data that help in the implementation of the research objectives and access to the results that were adopted by the researchers on the following sources and methods:

(i) **Theoretical side:** The researchers used the theoretical side of what is available in some theoretical books in addition to Arabic and foreign books, books, periodicals and university letters.

(ii) **The practical aspect:** Adopted the questionnaire method as a key tool to collect the required data, which included the first section/the first section personal information, the second section includes the questions of the questionnaire and measured the dimensions of the independent variable (electronic management) through (5) paragraphs and dimensions of the variable adopted (sustainable competitive advantage) Through (5) paragraph

Community and research sample: The study population consists of Zain Telecommunications Company, where the sample of the study was determined by the employees of the company. The questionnaire was distributed to 35 items of the questionnaire. The researchers adopted the Likert scale of the five-order order as follows:

Disagree Completely (1), Disagree (2), Somewhat Agree (3), OK (4), Totally OK (5).

Statistical means: The study was based on the analytical descriptive approach. An applied study was applied to Zain Telecom in Iraq, where the statistical averages and standard deviations were used as well as the explanatory analysis according to the statistical method through the SPSS program.

LITERATURE REVIEW

The two researchers reviewed previous studies that dealt with the subject of electronic management did not address any of the previous studies to the subject of the role of electronic management in achieving competitive advantage sustainable.

The study aims at identifying the contribution of electronic management in improving the management of technical colleges in Saudi Arabia and uncovering the differences between the views of the technical colleges in Saudi Arabia. The members of the educational and training body and the extent of the application of electronic management to detect these differences. One of the main findings of this study is that the technical colleges apply electronic management to a moderate degree and this contributes to improving the performance of the technical colleges

Creativity must therefore be challenged by change, achievement, customer focus, new ideas, and culture. The key to innovation is trust and respect between management and public in¹⁰.

Market resilience: Due to changes in the environment, it is necessary to adapt to environmental changes easily².

Quality refers to identifying customers, analyzing their needs and knowing the quality of services with other competitors, through which we will reach quality targets that will achieve a sustainable competitive advantage¹.

The results of this study showed that there are no differences between the point of view of administrators and faculty members regarding the application of electronic administration in all fields. The study found that there are differences between the diploma, bachelor and graduate studies in the fields of planning, control, evaluation and electronic implementation.

Study¹² (Effect of Adopting the Total Quality Strategy in Improving Competitive Position: A Field Study for Jordanian Pharmaceutical Industry Companies. This study aimed at determining the effect of adopting the comprehensive quality strategy in improving the competitive position of the Jordanian pharmaceutical companies. The study reached the following results:

- (a) A relationship between the overall quality strategy, the competitive position and the ability to access external markets

- (b) B - Quality and continuous improvement of the strongest elements of total quality.

Electronic administration and its role in achieving competitive advantage in industrial organizations This study was conducted in the battery manufacturing plant in Babylon (1) and Babylon (2)⁸. This study dealt with electronic management and its role in achieving competitive advantage. The results of this study were:

- (a) Achieving respiratory advantage by reducing the time to complete tasks and reduce costs
- (b) B - clarity in the strategic vision of the application of electronic management in the senior management in the battery industry.
- (c) The electronic management of the battery manufacturing plant is in its early stages switching from traditional management to electronic management, so there is a need for a legal system to protect the electronic organizations

Charag & Ahmad¹¹, this study dealt with the gap between the citizens and the government through the establishment of an electronic service capable of providing information in a timely manner and that the delivery of services is quick with a motivation to develop the system, which meets the requirements of customers efficiently through electronic information exchange and the study to provide common services to stakeholders

The Concept of Electronic Management:

E-management is a newly emerged term that plays a key role in improving organizations' performance and quality and shortening the time in providing their services to customers. Electronic management is the integration of information and data in guiding the procedures and methods of the organization to achieve its objectives by responding to internal and external variables⁵.

Yunus⁶, defines it as a group of administrative processes through which it can use the electronic means and apply them with high efficiency, thus improving the performance of the electronic devices and enhancing the effectiveness of information exchange to achieve the desired goals.

From the point of view of the researchers, the electronic administration is the technology of data and information and the development of administrative methods using management in the organization of electronic devices to achieve the goals and desires of the customer and this achieves competitive advantage sustainable.

Importance of electronic management: The idea of electronic management goes far beyond the mechanization concept of labor administrations within the organization. To the concept of data and information integration between different departments and the use of such data and information in guiding the actions and policies of the organization to achieve its objectives and provide the necessary flexibility to respond to external or internal variables⁴, where the importance of electronic management through its ability to keep pace with quantitative and qualitative developments in the field Information technology, the so-called ICT revolution, represents a strong response to the challenges of the 21st century, as well as its efficient and effective interaction with the variables of the present⁷. The Company shall be permitted to plan for the scheduling and timely submission of services⁹.

The electronic administration achieves administrative flexibility in delegation and administrative empowerment and thus will have a greater role in achieving the objectives of the organization. Planning, direction, supervision and organization will remain the new functions of electronic management³.

The research community: Zain Telecommunications Company, located in Baghdad Governorate, has been chosen as a field field to test the hypotheses of the research, as it clearly highlights the variables related to the subject, especially the variables (quality, time, cost, creativity and flexibility) and its impact on the use of electronic management among employees of Zain Telecom, And cultural for the employees in this company and its impact on the absorption of the vocabulary of the answer and the accuracy of the answer to them.

Description of the research sample: The research sample, which included the employees of Zain, was identified. A questionnaire was distributed to the employees of this company in the form of direct delivery and receipt. On this basis, the total number of questionnaires analyzed was 30. After analyzing the results, 69.4% of males and 30.6% of females were female. The results showed that 23.2% were aged 30-25 years and 58.1% were between the ages of 35-30. (17.7%) were between 40-35 years of age and 1% were aged 40 years or older, while 74.2% of them had bachelor's degrees while 25.8% The results showed that 50% of those with years of service ranged from (10-1) years, while 50% had years of service (20-11 years). The results of the analysis That n (74.2%) had three or more courses, and 12.9% had two courses and 12.9% had only one training course. Knowledge and knowledge of electronic management.

Test the search resolution: To test the questionnaire, the researcher used the following statistical tests:

1. Instrument Validation (Instrument Validity):

The questionnaire was prepared in final form by conducting a comprehensive review of the most important studies, researches and references related to the subject of the study, through which the first draft of the questionnaire was reached, and the first draft of the questionnaire was presented to a number of arbitrators who made their observations and suggestions.

2. Instrument reliability test: In order to verify the stability of the tool, Cronbach Alpha was extracted in order to reach the stability coefficient of the questionnaire to make sure that the measuring instrument did not receive the wrong data if it was re-studied and using the same instrument and in the same conditions for the first time and using the statistical program (SPSS) The stability coefficient for the variable was 0.983 and the stability coefficient was 0.984. The stability coefficient for the variable was creativity and elasticity (0.985). The results showed that all variables had a stability coefficient of more than 60% To prove the study tool

Description of the results of the search sample variables: Descriptive statistics (mean arithmetic, standard deviation) have been used as an appropriate means to analyse search variables. (3.33 and above) to determine the relative importance of respondents' perceptions of the study questions based on the five-dimensional Likert scale. Table (1) shows the arithmetical averages and standard deviations of the search variables

Table 1: Level of the quality variables

s.t	SMA	Paragraph	Paragraph number
0.731	3.26	the quality	1
0.791	1.92	Time	2
0.693	3.13	Cost	3
0.919	3.22	creativity	4
0.659	2.08	Flexibility	5
0.714	3.17	Electronic management	6

The results of Table (1) indicate that the level of the quality variable is medium, which is confirmed by the general mean of this variable of (3.26) and by standard deviation (0.731). While the mean variable of

the variable was 3.13, which showed that the level of the variable cost was average and with a standard deviation (0.693) The results showed that the elasticity variable achieved an average of 2.08, indicating that the elastic variable level was low and with a standard deviation (0.659). Finally, the electronic administration variable achieved an arithmetic mean of (3.17) and this indicates that the level E was average and reached the standard deviation (0.714).

CONCLUSIONS

This study deals with the main results of the test of hypotheses and conclusions and then the recommendations reached through the data of the research results

There is a significant statistical correlation between quality and electronic management among the employees of Zain Telecommunications Company in Iraq.

Table 2: Correlation coefficient of quality and the use of electronic management

Use of electronic management	the quality	
0.942**	1	the quality
1	0.942**	Use of electronic management

Table (2) shows that there is a positive correlation between the quality variable and the electronic administration, with correlation coefficient (0.942). This means that the more quality is available, the greater the level of use of electronic of Zain Telecom. The hypothesis of the study can therefore be accepted management in the employees

There is a relationship of statistical significance between the time and the use of electronic management among employees of Zain in Iraq.

(0.958 **) with statistical significance between the time variable on the one hand and the use of electronic management, indicating that the greater the time, the more the use of electronic management among employees and therefore can accept the hypothesis of the study. As shown in Table (3)

Table 3: correlation coefficient of time and use of electronic management

Use of electronic management	Time	
0.958**	1	Time
1	0.958**	Use of electronic management

There is a relationship of statistical significance between the cost and the use of electronic management among employees of Zain in Iraq. The correlation between the variable cost and the use of electronic administration shows that the higher the cost, the greater the use of electronic management among the employees. Therefore, the hypothesis of the study can be accepted. As shown in Table (4)

Table 4: Correlation coefficient of cost and use of electronic management

Use of electronic management	Cost	
0.970**	1	Cost
1	0.970**	Use of electronic management

There is a relationship of statistical significance between the creativity and the use of electronic management among the employees of Zain in Iraq.

(0.951 **) with statistical significance between the variable of creativity on the one hand and the use of electronic management. This indicates that the greater the creativity, the greater the use of electronic management among employees and therefore the hypothesis of the study can be accepted. As shown in Table (5)

Table 5: Correlation coefficient of creativity and the use of electronic management

Use of electronic management	Creativity	
0.951**	1	creativity
1	0.951**	Use of electronic management

There is a statistically significant correlation between flexibility and the use of electronic management among Zain employees in Iraq. The correlation between the elasticity variable and the use of electronic management

is statistically significant. This indicates that the more flexible the use of electronic management among workers, the more likely the hypothesis of the study will be accepted. As shown in Table (6)

Table 6: Correlation coefficient of elasticity and the use of electronic management

Use of electronic management	Flexibility	
0.961**	1	Flexibility
1	0.961**	Use of electronic management

There is a significant statistical impact between the quality and the use of electronic management among employees of Zain Telecommunications in Iraq.

(R²) indicates that the quality variable has an effect on the use of electronic management not less than (98%). This means that the percentage indicates that (98%) of the total differences in The use of electronic management is determined by the interest of the employees of Zain for the quality of the company and the remaining (2%) represents the percentage of contribution variables not included in this research, which cannot be controlled. While the value of (F) (244.98), a value of significant statistical significance at the level of indication (sig = 0.460), indicating that the regression curve is not good in interpreting the relationship between quality in the use of electronic management. The value of the estimated effect of quality on the use of electronic management is 0.095 (= β). This effect is statistically significant according to the value of t = 0.751 at the level of sig = 0.460. Accordingly

There is a significant statistical impact between the time and the use of electronic management among employees of Zain Telecommunications in Iraq.

(R²) indicates that the time variable has an effect on the use of electronic management not less than (98%). This means that the percentage indicates that (98%) of the total differences in The use of electronic management is determined by the interest of the employees of Zain for the time it owns and the remaining (2%) represents the percentage of contribution variables not included in this research, which cannot be controlled. While the value of (F) (244.98), a value of significant statistical significance at the level of indication (sig = 0.002) indicating that the

regression curve is good in interpreting the relationship between time in the use of electronic management. The value of the estimated time effect on the use of electronic administration is 0.451 (β). This effect is statistically significant by the value of ($t = 3.531$) at the level of sig (0.002)

There is a statistically significant impact between flexibility and the use of electronic management among employees of Zain Telecommunications in Iraq.

(R^2) indicates that the elasticity variable has an effect on the use of electronic management not less than (98%). This means that the ratio indicates that (98%) of

the total differences in The use of electronic management is determined by the interest of the employees of Zain for the time it owns and the remaining (2%) represents the percentage of contribution variables not included in this research, which cannot be controlled. While the value of (F) (244.98), a value of significant statistical significance at the level of indication (sig = 0.751), indicating that the regression curve is not good in explaining the relationship between flexibility in the use of electronic management. The estimated effect of elasticity on the use of electronic management is 0.044 (β). This effect is statistically significant by the value of ($t = 0.321$) at the level of sig = 0.751.

Table 7: Results of the effect of independent variables on the use of electronic manage

Regression coefficient					DF	F	R ²	R	Dependent variable
Sig**	T	SD	B	Independent variable					
0.460	0.751	0.124	0.095	the quality	14.770	244.98	0.980	0.990	Use of electronic management
0.002	3.531	0.115	0.451	Time					
0.001	3.672	0.164	0.584	Cost					
0.306	1.045	0.118	0.158	creativity					
0.751	0.321	0.147	0.044	Flexibility					

The correlation between the independent variables (quality, time, cost, creativity and flexibility) and the dependent variable (use of electronic management) from the point of view of the research sample was significant and real, reflecting the reality in Zain’s environment in Iraq Some results have been achieved and some have not been achieved.

ACKNOWLEDGMENT

ABSTRACT

Work family conflict issue has received increasing attention by researchers involving the psychometric properties of measurement scale and its factor structures. Thus, the present study evaluated the psychometric properties and confirmed the factor structure of the work family conflict. A survey design using self-administered questionnaire was conducted to collect the data from 487 teachers in East Coast of Malaysia (Kelantan, Terengganu and Pahang) through multistage-random sampling technique. Results of exploratory factor analysis performed using Principal Component Analysis (PCA) yielded two factor structures with the cut off value of loading factor (λ_x) is 0.50 with rotated solution is Varimax. Further, the confirmatory factor analysis (CFA) also confirmed the scale as a two model factor with good fit indices of $p < 0.01$, $\chi^2/df = 2.41$, RMSEA = 0.05, CFI = 0.99, PCFI = 0.63. All items also yielded acceptable factor loading (λ_x) ranging from 0.72 to 0.94. Thus, the work family conflict scale is a valid and reliable instrument among Malay speaking teachers in the East Coast of Malaysia and proved as a two factor models (e.g. work conflict and family conflict) as the best model fit. Benefits of the measure and uses are discussed.

Keyword: *Work Family Conflict, Exploratory Factor, Confirmatory Factor, and Psychometric Measurement Instrument.*

INTRODUCTION

The 10th Malaysia Plan achievement (2010-2015) reported an increase in the number of female labor force from 46.8 per cent in 2010 to 55.0 per cent by 2015 (Department of Statistics Malaysia⁵). Among the impact of career women is the desire to build a family and at the same time want to stay in the career. As Malaysia's workforce encompasses 62.4 per cent of workers who have married 44.0 per cent are from the dual-income group (Department of Statistics Malaysia⁵), the issue of work conflicts as a result of competing claims between homework and employment is inevitable. While working, they are still obliged to fulfill other responsibilities as husbands, wives, fathers, mothers and boys and girls. Concerns about the adverse impact of work family conflict on individual and family wellbeing along with societal impacts have gained increasing attention among researchers in the east and

west as changing demographic patterns and economic globalization have led to increasing numbers of women into the workforce. Work family conflict according to Greenhaus and Beutell⁸ is a form of inter-role conflict which mutually incompatible leading to role pressures. Work family conflict distinguished by two conflict directions namely work to family conflict (WFC) (e.g. entertaining clients' call during family time) and family to work conflict (FWC) (e.g. cancel a meeting due to unavailability of babysitter). Dobreva-Martinova, Villeneuve, Strickland and Matheson⁴ revisited role theory (Davis³; Kahn et al.¹⁴) as a useful framework for understanding how holding different roles affects the wellbeing of individuals and organisational effectiveness.

The current study attempts to validate Netemeyer, Boles and McMurrian¹⁶ work family scale, one of the most cited instruments and measuring both dimensions of WFC and FWC eventhough with lesser number of

items compared to Kelloway, Gottlieb and Barham¹⁵ as well as Carlson, Kacmar & Williams² (Jain & Nair¹²; Shaffer, Janice & Hsu²⁰). In Malaysia, a few studies of work family conflict scale met the psychometric quality (Ismail & Nordin¹¹; R Zirwatul Aida¹⁷), however, none of these studies used the combination of both EFA and CFA to prove the validation of Netemeyer et al.¹⁶ scale. For example, Ismail and Nordin's¹¹ study mainly conducted CFA involving married female teachers which constraints the validation in that particular study, while, the study by R Zirwatul Aida¹⁷ assessed the factor structure underlying work family conflict scale through EFA. Thus, the objective of the study is to evaluate the measurement model fit of work family conflict scale among teachers in East Coast of Malaysia expands the respondents' demography profiles including both genders and all marital status.

The current study expands previous study by conducting EFA and CFA in an attempting to explore and confirm the factor structure of Netemeyer et al.¹⁶ work family conflict scale. Specifically, the main objectives are:

1. to explore the factor structure and psychometric properties of work family conflict scale among school teachers in East Coast of Malaysia.
2. to confirm the reliability and validity of work family conflict scale.
3. to examine the relevancy of work family conflict scale in Malaysian context.

METHODOLOGY

Sample: 487 secondary school teachers from three-state in Malaysia i.e. Terengganu, Kelantan and Pahang were participated representing 22.79% (111) males and 77.21% (376) females and collected using multistage – random sampling techniques. In the initial stage of data collection, the questionnaires were distributed to 600 teachers, however, due to incomplete and missing data, the number has been reduced to 487 (81.17% response rate).

Research Instrument: Netemeyer et.al¹⁶ work family conflict scale was translated from English to Malay language using back to back translation. Example of items for WFC (e.g. “My job produces strain that makes it difficult to fulfill family duties”) and FWC (e.g. “Family-related strain interferes my ability to perform job-related duties”). Ranging from 1 (*strongly*

disagree) to 7 (*strongly agree*) with the reliability $\alpha = 0.93$ and $= 0.94$ respectively. CFA confirmed the scale as a two model factor with good fit indices of $p < 0.001$, $\chi^2/df = 2.41$, RMSEA = 0.05, CFI = 0.99, PCFI = 0.63. All items also yielded acceptable factor loading ranging from 0.72 to 0.94.

Data Analysis: The data were analyzed by using the statistical software namely SPSS -23 and AMOS – 23. Using SPSS 23, we conducted the data screening process, descriptive statistics analysis (percentage and frequency) and principal component analysis utilized to extract the factor structure of the scale. The CFA was tested using few indicators or indices. Overall measurement fit depends on the smaller value of chi-square (χ^2), Goodness of Fit Index (GFI) and Comparative Fit Index (CFI) are greater than 0.90 and Root Mean Square Error of Approximation (RMSEA) is lower than 0.80.

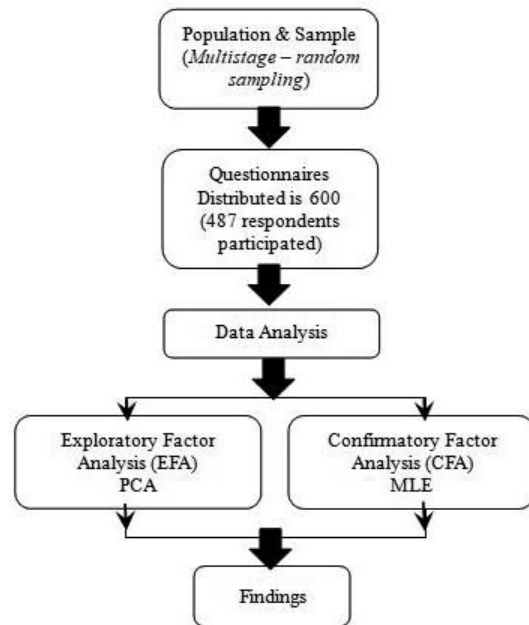

Figure 1: Data analysis flow chart

RESULTS

Demographic Profiling of the Respondents: From a total of 487 respondents, 111 (22.79%) were male and 376 (77.21%) were female. The range of age groups was from 30 years and below (n= 19, 3.9%), 31 to 40 years (n=148, 30.39%), 41 to 50 years (n= 212, 43.53%) and 51 years and above (n=108, 22.18%). Majority of the respondents were ethnic Malay (N= 462, 94.87%), followed by Chinese (n=20, 4.11%) and Indian (n= 5, 1.03%). For marital status, 450 respondents (92.40%) were married, 24 respondents (4.93%) were single, 6 respondents (1.23%)

were divorced and the remainder 7 respondents (1.44%) were widowed. About 158 respondents (32.44%) reported the maximum five children and above, 97 respondents (19.92%) have four children, 86 respondents (17.66%) have three children, 57 respondents (11.70%) have two children and 39 respondents (8.01%) have one child. The remainder of the respondents reported not having any children (n=50, 10.27%).

Exploratory Factor Analysis (EFA): Netemeyer et al.¹⁶ work family scale was examined for its factorability. All the criterion achieved the recommendation values

including; all 10 items inter-correlated items at least 0.30 coefficients, the KMO value of 0.90, the Bartlett’s test of sphericity reached statistical significance, $\chi^2 (45) = 9093.82, p < .001$ as well as the diagonals of the anti-image correlation matrix (over .50). Two distinct factors underlies work family conflict scale after undergoing Varimax rotation, namely WFC (eigenvalue = 5.90) and FWC (eigenvalue = 1.73). All items loaded in a simple structure (WFC: between 0.78 and 0.89; FWC: between 0.73 and 0.88). Both factors explain 76.36% of the variance as shown in Table 1.

Table 1: Factor Structure of WFC Scale

Items	Factors	1	2
WFC items	Q1. The demands of my work interfere with my home and family life.	0.78	
	Q2. The amount of time my job takes up makes it difficult to fulfill my family responsibilities.	0.89	
	Q3. Things I want to do at home do not get done because of the demands my job puts on me.	0.88	
	Q4. My job produces strain that makes it difficult to fulfill family duties.	0.86	
	Q5. Due to work related-duties, I have to make changes to my plans for my family activities.	0.78	
FWC items	Q6. The demands of my family or spouse/partner interfere with work-related activities.	0.73	
	Q7. I have to put off doing things at work because of demands on my time at home.	0.84	
	Q8. Things I want to do at work don’t get done because of the demands of my family or spouse/partner.	0.88	
	Q9. My home life interferes with my responsibilities at work such as getting to work on time, accomplishing daily tasks, and working overtime.	0.85	
	Q10. Family-related strain interferes with my ability to perform job-related duties.	0.86	
Eigenvalue		5.90	1.73
% Variance		59.03	17.36
% Cumulative Variance		76.36	

Fitting–Measurement Model

Confirmatory Factor Analysis (CFA): The value of loading (λ) expresses the relationship of each item to the underlying construct. Thus, using the result of analysis, this study found that the items of Work Conflicts (WC_1 to WC_5) had strongest association to their underlying construct (Work Conflicts) and the items of Family Conflicts (FC_1 to FC_5) had strongest association to their underlying construct (Family Conflicts) with the value of loading factors are greater than 0.60 (Hair et al., 2013).

The values of the Average Variance Extrated (AVE) for both construct namely Work-Family Conflict are 0.70 and above are considered good (Hair et al.⁹). It indicates that the level of variance captured by a construct versus the level due to measurement error is categorized as very good (Fornell-Larcker⁶). Further, the value of composite reliability(CR) is 0.70 and above which means the variance of indicator is not accounted by measurement error or it is commonly represented by the square standardized multiple correlation which range 0 to 1 (Bollen¹; Joreskog & Sorbom¹³).

Table 2: The Value of Loading Factor, Construct Validity, and Reliability

Item		Construct	Estimate (Loading)	AVE	CR
WC 1	<---	Work Conflict	0.786	0.701	0.921
WC 2	<---	Work Conflict	0.879		
WC 3	<---	Work Conflict	0.900		
WC 4	<---	Work Conflict	0.887		
WC 5	<---	Work Conflict	0.718		

Cont'd...

FC_2	<---	Family Conflict	0.876	0.749	0.923
FC_3	<---	Family Conflict	0.941		
FC_4	<---	Family Conflict	0.839		
FC_5	<---	Family Conflict	0.800		

This study obtained that the critical values (C.R) are greater than 1.96 and 2.57 (0.05 & 0.01 - two tail) or all indicators have significant reflecting for each of constructs (Refer Table 3).

Table 3: The Work and Family Conflicts

Item		Construct	Estimate	S.E.	C.R.	P	Label
WC_1	<---	Work Conflict	1.000				
WC_2	<---	Work Conflict	1.110	0.043	25.634	***	par_1
WC_3	<---	Work Conflict	1.127	0.051	22.064	***	par_2
WC_4	<---	Work Conflict	1.117	0.051	21.724	***	par_3
WC_5	<---	Work Conflict	0.852	0.048	17.902	***	par_4
FC_2	<---	Family Conflict	1.000				
FC_3	<---	Family Conflict	1.016	0.035	29.336	***	par_5
FC_4	<---	Family Conflict	0.922	0.038	24.482	***	par_6
FC_5	<---	Family Conflict	0.842	0.038	22.436	***	par_7

Using the result of analysis, we found that all-covariance matrix is significant relationship with each other (Refer Table 4).

Table 4: Covariance Test

Item		Construct	Estimate	S. E.	C. R.	P	Label
Work Conflict	<-->	Family Conflict	0.965	0.11	8.772	***	par_8

e1	<-->	e5	0.149	0.057	2.614	0.009	par_11

Table 5: Fit Indices CFA - 2 Factors

Category	Index	Threshold	First-Modification	Second-Modification
Absolute Fit Indices	Chi-Square/df	< 3.00	4.214	2.411
	RMSEA	< 0.08	0.081	0.054
	GFI	> 0.95	0.954	0.976
	PCLOSE	> 0.05	0.000	0.337
Incremental Fit Indices	AGFI	> 0.80	0.915	0.954
	CFI	> 0.95	0.977	0.991
	TLI	> 0.90	0.965	0.986
	NFI	> 0.90	0.970	0.985
Parsimonious Fit Indices	PNFI	> 0.50	0.647	0.629
	PCFI	> 0.50	0.651	0.633

Sources: Hair et al., 2010

As shown in Table 5, the First-Modification refers to the measurement model has been fitting and some thresholds are not achieved. For instance, the value of Chi-Square/df should be less than 3.00 and the empirical result is 4.214. Further, PCLOSE is 0.000 or significant at the level 1 percent as absolute fit indices. By removing item FC_1 (the Second –Modification), results achieved all the threshold achieved recommended by Hu and Bentler¹⁰ (eg. Chi-Sq/df= 2.411 and PCLOSE =0.337).

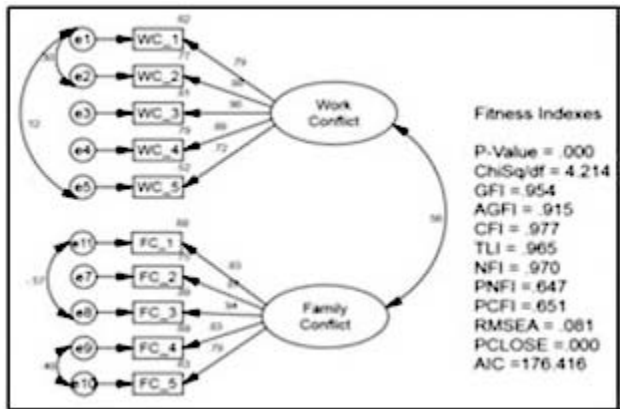

Figure 2: First-Modification (Fitting)

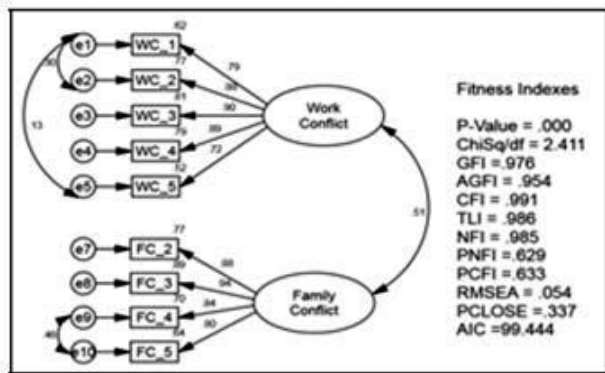

Figure 3: Second-Modification (Fitting)

CONCLUSION

This study evaluated the factor structure and psychometric properties of Netemeyer et al.¹⁶ work family conflict scale. The two extracted factors from EFA found in this study consistent with previous studies by Gudmundson⁷, Netemeyer et al.¹⁶ and Razak, Omar and Yunus (2010). The two factors of 10 items of work family conflict had 76.36 of total variance explained. CFA also confirmed that this scale is a reliable and valid scale explained by two underlying factors measuring dual conflict namely work conflict and family conflict. In other words, the CFA supported the 10-item 2-factor model of Netemeyer et al.’s scale rotated through

varimax rotation of principle component analysis (EFA). This finding was consistent with previous studies in East and Western countries (Jain & Nair¹²; Scott, et al.¹⁹).

This is among a few studies that validate work family conflict scale in the teaching profession focusing all genders and marital status demographic characteristics. The major strength of this study it expanded previous study (Ismail & Nordin¹¹) by including the use of EFA and CFA involving teachers especially in the context of the East Coast of Malaysia. It can be concluded that this study can contribute to a better understanding on work family conflict scale (Netemeyer, et al.¹⁶) in the context of Malaysian study, Malay speaking samples especially among school teachers. This scale appears to be a psychometrically robust measure of work family conflict which can be applied in various industrial and organizational fields and benefitted to the academicians as well to practioner. Most importantly, the current study supports the psychometric property of western adopted work family conflict scale being used among Malaysian respondents that represent different socio cultural background.

Organ Donation Intention: The Influence of Attitude, Altruism and Spiritual Belief in Malaysia

Noor'ain Mohamad Yunus¹, Dilla Syadia Ab Latiff¹, SyukrinaAlini Mat Ali¹, Noor Azzah Said¹, Sri Fatiany Abdul Kader Jailani¹

¹Faculty of Business Management, Universiti Teknologi MARA, Shah Alam Selangor. Malaysia

ABSTRACT

Organ shortage is widely discussed in many countries despite the growing acceptance of organ transplantation procedure worldwide. In Malaysia itself, only 420,601 pledgers which only represent 1.3 percent of the total population of Malaysia. This is not sufficient to meet the demand from patients in the organ waiting list. Literature reported that the level of awareness in Malaysia is still low with respects to organ donation. Malaysia as a multi-cultural nation, organ donation becomes very complex due to personal belief, emotions, rituals and practices. Religious views are thought to be one of the major barriers to organ transplantation. Though, no major religion strictly prohibits it, although there are differences in opinion within some religions. Therefore, the primary focus of this study is to identify the factors that influence the society towards organ donation intention. A quantitative approach was used to explore the relationship among the variables. A survey was conducted among 200 respondents using validated questionnaire. The data was analysed using Partial Least Square Structural Equation Modelling (PLS-SEM) approach. The result revealed that spiritual belief and altruism significantly influenced intention regarding organ donations. The outcome of this study aims to inform future health campaigns as there will be a better insight on the role that these elements play in the population's decision to be an organ donor. It is suggested that future studies should look into the possibility of positioning education level as moderator to affect the relationship between the factors that influence the society to pledge for organ donation and organ donation intention. Future studies should also look into the possibility investigating the effect of gender, age and religion on the relationship between factors that influence society to donate dimensions and organ donation intention dimensions.

Keywords: *Organ donation; attitude; altruism; spiritual belief; intention*

INTRODUCTION

Transplantation has become a possible treatment for patients with end-stage organ failure Siminoff et al⁴⁶. In 1954 when the first kidney transplant was successfully performed, the demand for organs has escalated Ehrle¹¹. Hyde²¹ stated that the rising demand for organ donation is due to increase awareness of the benefits from this procedure such as improvement in quality of life. Nevertheless, with 60 years of progress in organ transplantation, the supply of donor organs is still insufficient. This has than lead to the waiting lists getting longer and the figure is alarming all over the world.

The scarcity of organ is an unresolved global problem although various methods have been introduced worldwide to combat this Jingwei, Yu-Hung & Ching²⁴. World Health Organization⁵² reported that

most developing countries are left behind in number of potential donors in per million populations (p.m.p). Statistics by International Registry on Organ Donation and Transplant IRODAT²² revealed that potential deceased organ donors who have pledge in developing countries like Philippines and Malaysia with only 0.2 and 0.7 p.m.p respectively. These figures are among the lowest in developing countries and it is worst compared to the highest donation rate country, Spain (35.1 p.m.p.) Malaysia National Transplant³² & IRODAT²².

Low organ donation rates have been linked to a lack of public awareness and knowledge about organ donation in general Siminoff & Mercer⁴⁶, misleading interpretation of religious fatwas in relation to organ donation Wakefield et al⁵¹, cultural concerns about how dead body is treated Ashkenazi et al¹, and mistrust of the healthcare system (Anwar Naqvi et al., 2014). There

are many reasons why Malaysians are less likely to agree to organ donations and both social and religious issues play an important role and this reflects a multi-ethnic, multicultural, and multireligious community like Malaysia Robson, Razack & Dublin⁴¹. A consistent finding from studies investigating barriers to increasing the number of organs available for transplantation is the rejection of the option to donate organs by the potential donors' next of kin. The shortage of organs for transplantation makes it important to understand why majority of Malaysians do not accept organ donation. Therefore, this quantitative research focused toward examining the factors associated with intention to become an organ donor in Malaysia.

Organ Donation and Transplant in Malaysia: Organ donation and transplantation in Malaysia started in 1970's where the first kidney transplant was carried out in December 1975 and the first deceased donation in 1977 Kassim²⁵. Since then, the Ministry of Health (MOH) has taken number of initiatives to improve the organ donation and transplantation issues in Malaysia. In 2007, the government has strengthened its existing transplantation policy by introducing the National Organ Tissue and Cell Transplantation Policy which serve as a guideline for the future expansion and development of transplantation services.

National Transplant Resource Centre (NTRC) was set in 1997 up to monitor the progress of the organ, tissue and cell transplantation programme in the country. NTRC is responsible to conduct campaign to improve awareness of the importance of organ donation to the public. In 1999, Organ Donor Card was launched as an indication of a person's registration as an organ donor. In an attempt to boost the organ donation rate, NTRC has started the Organ Donation Awareness Week since 2014 which is held throughout the country.

There are various activities run by NTRC such as campaign, talk, organ donation run to make people aware of the importance of organ donation. Most of the talk were conducted in government agencies, universities and events. Currently NTRC is active in promoting organ donation through 'Organ Donation Drive' which is being held in malls and mosque throughout Klang Valley. Despite the number of activities provided, the number of current pledgers in Malaysia are 420, 610 representing only 1.3 per cent of the population. This is considered low compared to the total population of Malaysia.

LITERATURE REVIEW

Organ donation is defined as a surgical procedure for the removal of organs from a donor for the purpose of transplantation with the intention to save and improves lives Malaysia National Transplant³². Up to February 2018, there were only 2023 organ and tissue donations took place in Malaysia (NTRC, 2018). Malaysia National Transplant identified two types of organ donation;(i) deceased organ donation – the donor is someone who has died where an organ is removed after death and (ii) living organ donation – the donor is still alive and chooses to donate one of their kidney or part of their live.

Determinants of Intention towards Organ Donation

Attitude towards Organ Donation: Regardless of race or ethnicity, individuals appear to support organ donation due to positive attitudes toward donation (Morgan & Miller & Arasaratnam, 2003). According to the Institute of Medicine of the National Academies (2006), individual's attitudes towards organ donation depends on awareness and knowledge, which suggest educating people and providing the right information could shape positive attitude towards organ donation. Empirical research found that a favourable attitude toward organ donation especially from health professionals can positively influence a potential donor Schaeffner, Windisch, Freidel, Breitenfeldt, & Winkelmayr⁴⁵. Therefore, the following hypothesis was formulated:

H₁: Individuals who have positive attitude are more likely to have a positive intention regarding organ donation.

Altruism towards Organ Donation: Altruistic deeds were most influenced by the desire to voluntarily saves life and help to improve organ donation intention (Hyde & White, 2011). Altruism is one of behaviour that have been successful in identifying certain psychological variables that appear to be associated with organ donor willingness Morgan & Miller³⁶. Sanner⁴⁴ found that altruism influenced non-donors to change their intention towards organ donation. However, Kopfman and Smith's²⁸, found in their studies, that those who have already registered as a donor are knowledgeable and altruistic. Thus, the following hypothesis was offered.

H₂: An altruistic individual is more likely to have a positive intention regarding organ donation.

Spiritual Belief: Spirituality is defined as the broad personal search for meaning, purpose, and value in life Baumsteiger, Chenneville, & McGuire⁴; Ellor & McGregor¹². Spiritual beliefs relate to perspective on life, death, and the nature of reality Holland, Kash, Passik, Gronert, Sison, Lederberg, & Fox¹⁸. Spirituality span a wide range, and one of the components is religion Hill & Pargament¹⁷ though the use of the term's religion and spirituality as synonymous Gorsuch & Walker¹⁴. Furthermore, the sense of purpose is linking to the importance of volunteer activity to a person's well-being Thoits⁴⁷. Therefore, the following hypothesis was formulated:

H₃: The spiritual belief of an individual influence the intention regarding organ donation.

The development of the conceptual model of this study was guided by A Model of Willingness to Become a Potential Organ Donor developed by Horton and Horton¹⁹ and review of previous literature related to organ donation and transplantation. The conceptual model is illustrated in the conceptual model in Figure 1.

Figure 1: Conceptual model

METHODOLOGY

This study employed quantitative approach and convenience sampling technique was utilised to select respondents who can provide the desired information. A survey was conducted among adults aged 18 years old and above. G*Power software was employed to calculate the sample size and it suggested 79 samples. However, researchers decided to distribute 200 questionnaires as the precision and reliability of PLS-SEM results can be increased with larger sample size Hair et al¹⁶. However, 149 questionnaires were returned, yielding 74.5% of the response rate.

The respondents were asked to respond to a five-point Likert scales that gauge their perception towards the organ donation. The questionnaire was divided into two sections; (i) Section A relates to demographic background, and (ii) Section B enquires about the factors that influence the respondents' intention to donate organ. The study adapted measurement items from several

studies; (i) a total of four items from Kopfman and Smith²⁸ and five items from Rumsey, Hurford and Cole (2003) to operationalize attitude, (ii) five items from Kopfman and Smith²⁸ and to operationalize altruism (iii) five items from Kopfman and Smith²⁸ to operationalize organ donation intention. PLS-SEM 3.0 was used to evaluate the outcome of the study.

RESULTS AND FINDINGS

Harman's single-factor test (Podsakoff & Organ, 1986) in which all items are loaded into one common factor was employed to address the issue of common method bias. An exploratory factor analysis (EFA) was conducted and the result revealed that there was no common factor loading on all measures, where the total variance for a single factor was 27.13% which is less than the suggested cut off point of 50% (Podsakoff & Organ, 1986). Therefore, common method bias was not a threat in this research. A descriptive analysis was conducted to describe the demographic profile of the respondents. Based on the analysis, most of the respondents were female aged between 25-34 years old and Islam.

Measurement Model: Smart PLS 3.0 was used to empirically analyse the conceptual model. In order to confirm the validity and reliability of the data in the study, the assessment of measurement model needs to be conducted. Table 1 shows the outer loadings, Cronbach's alpha, composite reliability (CR), and average variance extracted (AVE) examine the measurement model reflectively. All the loadings exceeded the minimum threshold value of 0.60 for the exploratory study (Ramayah, Cheah, Franchis Chua, Hiram Ting, & Memon, 2016). The measurement of internal consistency reliability of the Cronbach's Alpha also exceeded the minimum threshold level of 0.70. Based on the CR values, all the constructs possessed high levels of internal consistency reliability. Furthermore, the AVE values (convergent validity) were greater than the recommendations value of 0.50 and above; hence, they constituted convergent validity for all constructs. Due to low loading and to increase the AVE value respectively, items A1, A2, A4, SB 1, SB 3, SB 5 were deleted. All constructs comprising altruism, attitude, spiritual belief and organ donation intention met the minimum value of the threshold requirement by which after the deletion process, the CR < 0.7 and AVEs were greater than 0.5 Hair¹⁶.

Table 1: Internal Consistency and Convergent Validity

Construct	Items	Outer Loading	Cronbach's alpha	AVE	CR
Altruism	If I could help save somebody's life, I would do everything possible.	0.758	0.790	0.539	0.854
	I enjoy doing small favours every day for the people I care about.	0.680			
	I think helping others are one of the most important aspects of life.	0.757			
	I enjoy working for the welfare of others.	0.729			
	My family and I tend to do what we can, to help those less fortunate than ourselves.	0.743			
Attitude	I support the idea of organ donation for transplantation purposes.	0.846	0.808	0.636	0.874
	I believe that organ donation is an act of compassion.	0.816			
	I believe that organ donation is an unselfish act.	0.733			
	I view organ donation as a benefit to humanity.	0.790			
Spiritual Belief	I don't have religious objections to organ donation.	0.642	0.840	0.559	0.883
	I think that organ donation is safe and effective practice.	0.725			
	I trust that doctors and hospitals use donated organ as they are intended to be used.	0.714			
	I think that doctors would try just as hard to save my life whether I plan to be an organ donor.	0.735			
	In general, I think organ donation is a good thing.	0.789			
	Organ donation is consistent with my moral values and beliefs.	0.864			
Organ donation intention	I will register as an organ donor in the future.	0.917	0.942	0.813	0.956
	I will give my organ to a person who needs it.	0.921			
	I will donate my organ to another person after my death.	0.925			
	I will donate my organ to my next of kin after my death.	0.882			
	I would donate my bone marrow to a stranger who needs it.	0.862			

Discriminant validity was conducted to discover the difference between a particular construct and the other construct in the study Lowry & Gaskin³⁰, which resulted from the adoption of different theories in this study Hair¹⁶. HTMT result reveals that all values met the criterion of HTMT, which denoted that discriminant validity has been established. In sum, the sufficiency of both convergent and discriminant validity exists as suggested through the evaluation of the measurement model; hence, the researchers found it appropriate to proceed with the evaluation of the structural model.

Structural Model: Structural model measurement was conducted after all the requirement of measurement model was fulfilled. It is important to address collinearity issue as the existence of multicollinearity does not contribute to a good regression model Pallant³⁸. By using PLS algorithm,

the value of all the construct meet the requirement (Variance inflation factor not more than 5), ranging from 1.244 to 1.425. Therefore, it can be concluded that there is no issue of multicollinearity in this study.

Hypothesis testing was conducted using bootstrapping resampling technique with 1000 sub-samples were used to ensure the accuracy of the PLS estimates Hair et al¹⁶. The result was revealed in the Table 2 which are two construct which are altruism and spiritual belief were found to be significant at 99% confidence interval (Altruism → Organ donation intention $\beta = 0.253$, $p < 0.001$; Attitude → Organ donation intention, $\beta = 0.126$, $p < 0.238$; spiritual belief → Organ donation intention, $\beta = 0.467$, $p < 0.000$;). Thus, it can be concluded that only two hypothesized relationships in this study are supported.

Table 2: Path Coefficient Assessment

	Relationship	Path Coefficient	Std error	LL	UL	T value	Decision
H ₁	Altruism -> Intention	0.253	0.079	0.076	0.401	3.209**	Supported
H ₂	Attitude -> Intention	0.126	0.106	-0.075	0.321	1.182	Not supported
H ₃	Spiritual belief -> Intention	0.476	0.08	0.309	0.626	5.923**	Supported

**p < 0.01, *p < 0.05

After disclosing the significant relationship between independent and dependents variable, the result for the values of coefficient of determination (R²), predictive relevance (Q²), and effect size (f²) were revealed and presented in Table 3. The R²-values showed the amount of variance in the endogenous (organ donation intention) construct that can be explained by all the exogenous constructs (altruism, attitude and spiritual belief) linking to it Astrachan, Patel, & Wanzenried² such as family harmony or family cohesion. Its capability to evaluate complex measurement models and structural paths involving a multitude of variables and levels of constructs has enabled family business researchers to investigate complex and intricate relationships that previously could not be easily untangled and examined. In many cases, however, researchers struggle to meet some of the challenging requirements of covariance-based SEM (CB-

SEM. Therefore, the result of the R²-values of 0.518 suggest that the exogenous constructs in this study moderately explain 51.8% of variances in organ donation intention as recommended by Chin, Peterson, and Brown⁹ Then, the blindfolding procedure was conducted to obtain the predictive capability of the model by using Q²Hair, Hult, Ringle, & Sarstedt¹⁵. Based on the results, the Q²-values for organ donation intention was 0.387. Thus, it can be concluded that the altruism, attitude and spiritual belief possess predictive relevance over the organ donation intention as the Q²-values were all above zero as outlined by Hair et al¹⁵. The f² values represent the effect size of altruism, attitude and spiritual belief on organ donation intention. According to the results in Table 4, the effect size of altruism, attitude, and spiritual belief were 0.101 (small), 0.016 (small) and 0.244 (medium) respectively based on the guidelines provided by Cohen (1988).

Table 3: Determination of Coefficient (R²), Predictive relevance (Q²) and Effect Size (f²)

Construct	R ²	Q ²	f ²	Size of effect	VIF
Altruism	0.518	0.387	0.101	Small	1.316
Attitude			0.016	Small	2.047
Spiritual Belief			0.244	Medium	1.922

DISCUSSION, LIMITATIONS AND CONCLUSIONS

The overall aim of this study was to investigate the factors predicting organ donation intention. The findings revealed that attitude, altruism and spiritual belief accounting for a significant 50.8% of the variance in the intention to register. Spiritual belief and altruism emerged as significant predictors of intention. Looking at the relative importance of the exogenous constructs in predicting intention regarding organ donation, it is evident that spiritual belief is the most important predictors followed by altruism. The result of this study is in line with those of previous studies which found that spiritual belief is the key factor influencing organ donation intention Lam & McCullough²⁹; Bresnahan, Guan, Smith,

Wang & Edmundson⁷; Bortz, Ashkenazi & Melnikov⁶; Hvidt, Mayr, Paal, Frick, Forsberg & Büssing²⁰. As majority of the respondents were Malay, thus their religious belief would be the driver towards intention. Religious belief is closely related to spiritual belief Hill & Pargament¹⁷; Gorsuch & Walker¹⁴ it is not surprising that spiritual belief significantly influenced their organ donation intention. Spiritual belief is closely related on an individual perspective on life Holland, Kash, Passik, Gronert, Sison, Lederberg, & Fox¹⁸ and sense of purpose of life Thoits⁴⁷ and this was found to be a key mechanism linking the importance of helping others. However, this driver is only one part of individual belief system.

There is another key driver to organ donation intention as the findings of this study discloses that there

is a significant relationship between altruism and organ donation intention. This finding is supported by results from previous studies on organ donation Richardson & Hurwitz⁴⁰; Kopfman & Smith²⁸; Morgan & Miller³⁶; Bolt, et al.⁵; Nuffield Council on Bioethics³⁷; Moorlock, Ives, & Draper³⁵. This can be explained by the fact that the majority of the respondents of this study were women, and based on previous literature, women are more empathetic and altruistic than men Chaplin & Aldao⁸; Auyeung, Allison, Wheelwright, & Baron-Cohen³; Christov-Moore, Simpson, Coudé, Grigaityte, Iacoboni, & Ferrari¹⁰ and women express a greater willingness and a more favourable attitude toward organ donation Thomson, Robinson & Kenny, 2002; Sanil⁴³; UNOS⁵⁰. Moreover, it can be explained by the fact that individuals are urged to donate partly to fulfil their motivation to help others and they believed that this will promote the kind of community where others would do the same for them. This is due to the increased feelings of empathy experienced by altruistic individuals.

The present study has several limitations. One of the limitations of the study is the lack of generalizability of most of the respondents were female and Muslim. Another limitation is that, the constructs, namely altruism, attitude and spiritual belief only took account of about 50.8% variation in intention regarding organ donation. Possibly there are other factors that could influence the organ donation intention among Malaysians. Further research should be conducted to identify other variables influencing intention regarding organ donation such as the gender, education level, religious view, knowledge and subjective norms.

In summary, the findings suggest for the development of the content for future campaign and programs in to induce awareness and persuade individuals to register as an organ donor. The results may provide insight into how organ donation registration rate may be improved. The healthcare providers and policy makers must be aware on the significant influence of spiritual beliefs on the intention regarding organ donation. They must acknowledge and respect the beliefs and values of our multicultural society and recognizing our diverse spiritual beliefs. Therefore, involvement of spiritual leaders and the medical community is imperative to increase the organ donation rate. Re-evaluation and enhancement of the current national program and policies on organ donation are crucial to enhance public awareness and acceptance towards organ donation to address the problem of organ shortage in Malaysia.

Measuring the Effectiveness of Hydroponics Technology Knowledge Transfer Program from Universiti Utara Malaysia-Coconut Island Resources on Rural Community: A Case Study in Jitra, Kedah

Shri-Dewi Applanaidu¹, Roslina Kamaruddin¹, Rozana Samah¹

¹*Department of Economics & Agribusiness, School of Economics, Finance and Banking, Universiti Utara Malaysia, 06010 Sintok, Kedah*

ABSTRACT

Transfer of knowledge about innovation in agriculture is essential in improving the living standard of the rural community. This study focus on the collaboration of Universiti Utara Malaysia-Coconut Island Resources (UUM-CIR) hydroponics knowledge transfer to local communities of four villages namely Kampung Pulau Nyior, Kampung Alor Batu, Kampung Gelong, and Kampung Bemban, Jitra in the district of Kubang Pasu, Kedah. The objective of the study is to measure the effectiveness of the hydroponics technology knowledge transfer program by UUM-CIR to Mukim Gelong villagers. A total of 40 respondents was selected from the four villages and have been exposed to the hydroponics technology. The findings showed about 42.5% of the respondents were above 40 years old. In terms of gender, 57.5% of the respondents were female. Majority (70%) of the respondents are aware of hydroponics technology while most (32.5%) of them heard through the media such as newspaper, television and radio. More than half (55%) of the respondents have knowledge about hydroponics technology while 77.5% of respondents never used hydroponics technology. However, 37.5% of the respondents do not know how to set up the hydroponics kit before the workshop. Interestingly, after the workshop almost all (97.5%) the respondents could set up the hydroponics kit on their own and enjoyed using hydroponics technology. Based on this, knowledge transfer of hydroponics technology workshop was found to be effective to the local community with the collaboration of university and industry. The willingness to adapt the hydroponics technology will lead to reduction in household spending on purchase of vegetables, enhance food security and increase their intake of nutritious food which will create a healthy community.

Keywords: *Effectiveness, Hydroponics technology, Knowledge transfer, Rural community.*

INTRODUCTION

The important tool for sustainable growth, poverty alleviation and ensuring food security in developing countries is through agriculture. In agriculture, hydroponics technology is probably the most intensive method for food production which involves less capital and increase profit realised by the farmers' (Jensen¹⁴; Obisesan et al²⁰). According to Sinsinwar and Teja²⁸, hydroponics is the technology of growing plants without the use of soil but through nutrient solution. Similarly, Beibel⁴ stated that hydroponics was derived from Greek words hydro meaning water and ponos meaning work.

Hydroponics technology has been used for several years in United States of America (U.S) and Australia while

Latin America just adopting its use (Kartasi¹⁷). The U.S. Army used hydroponics for vegetable production during world war for civilians and soldiers (Jones¹⁵; Sawas²⁶). Equally, Hussain et al¹³. studies show the successful use of hydroponic technology for vegetable production for passengers in Wake Island. For decade, hydroponics methods have been used to assess development and growth of fruits, vegetables and flowers. Likewise in Asia, there has been high interest in the use of hydroponics to appraise development and growth of crops such as rice and wheat. This system makes it easier for proper monitoring of nutrient uptake, physiological growth status, morphology of the root and yield (Onanuga²¹).

Hydroponics technology can be used to solve the problem of food insecurity due to its cost effectiveness

and contains all the nutrients required for plant growth (Buwalda et al⁷). Hydroponics technology can also be used where arable land is limited and in tropical countries with plentiful land. It also offers products of high quality, high level of production, reduce use of pesticides and free from soil conditions (Corrêa et al⁹). According to Fahey¹¹, hydroponics technique has been used in the urban areas to enhance fresh food accessibility and reduce poverty level in the area. In New York and Montreal, advanced entrepreneurs have applied hydroponics to grow produce on urban rooftops. The hydroponic industry is anticipated to grow more rapidly as soil state becomes difficult. This system should be adopted to increase the quality and yield of produce in order to ensure food security (Ayele et al²).

Food security occurs when people have access to sufficient and nutritious food that meets their dietary needs for a healthy life and it is measured through four scopes which include accessibility, availability, sustainability and utilization. The quality of life and well-being of people plays an important role in a country (Osseweijer et al²³). However, food prices are one of the major factors contributing to food insecurity. High cost of food can lead to food insecurity as a result of low ability of people to manage with high food costs. In Malaysia, there is significant increase in the cost of living due to increase in the price which effects the quality of life of people especially the low income households (Gustafson¹²). The major factors influencing food security household is their monthly income. Hence, these households switch to cheaper food or forgoing some important food items which is important for their health especially vegetables. High prices in vegetables are due to uncertain climate and increase in other inputs such as land, labour, chemicals, fertilizers and machinery. Hence, this contributes to shortage of fresh vegetables and created a situation of supply less than demand. Eventually, the prices of vegetables increase. In order to improve the standard of living of low income households and to ensure food security, hydroponics technology can be introduced to these households. Hence, UUM with collaboration of CIR has conducted hydroponics technology transfer workshop. Four lecturers and 12 facilitators (UUM Agribusiness Management students) and two staffs from CIR were involved in this workshop. The objective of this workshop is to transfer the hydroponics technology knowledge to selected villagers to encourage them to grow their own vegetables using the transferred technology.

Knowledge about hydroponics technology can help in improving production, reduce production costs, increase households' profits and reduce expenses for vegetable expenditure among the local community. The main objective of the study is to measure the effectiveness of the hydroponics technology knowledge transfer program by UUM facilitators and Coconut Island Resources company to the rural communities namely villagers from Mukim Gelong, Jitra, Kedah. The specific objectives of the study are: (i) to profile the demographic information of the respondents, (ii) to examine the awareness level towards hydroponics technology, and (iii) to assess the effectiveness of the knowledge transfer workshop.

THEORETICAL AND EMPIRICAL REVIEW

Hydroponics technology has helped the growers to reduce their cost of operation by setting up under safeguarded structure such as use of plastics or green house (Bradley & Marulanda⁶). This technique does not make vegetables vulnerable to weeds, insects and diseases but reduces costs for planting and harvesting of crops (Banez & Manipon³). This study used the theoretical approach drawn from diffusion on innovation (DOI) by Rogers²⁴. According to Rogers²⁵, adoption decision is a procedure that does not take place suddenly but happens gradually. The farmer needs to try different technologies in order to identify a suitable one that works perfectly well on their farm with resources available before deciding to incorporate the technology into practice. Process of decision on innovation involves seeking and processing of information activity, where an individual is inspired to lessen in decision about an innovation. Individual have to pass through five steps of decision innovation process before adoption of technology which involves knowledge, persuasion, decision, implementation and confirmation. Straub²⁹ opine that understanding of adoption was based on behavioural change. This indicates that adoption occurs gradually and after acceptance it can be used and integrated into the farmer's system. Adoption level of hydroponics technology is based on farmer's choice. According to Bhattarai⁵, various factors determine decision of adoption such as demographic characteristics, awareness, features of technology and policy. Benefit to be derived from the use of hydroponics technology inspires farmer's level of adoption. Meanwhile, Rogers²⁴ opine that early adopters of theory of diffusion of innovation have more

educational years than late adopters. This implies that formal education and training will have positive impact on level of adoption of innovations.

Hydroponics method reduces pesticides application, other agrochemicals, limit cost of production and increases profitability (Sawas²⁶). However, due to economic crises in the country like Thailand, expansion of hydroponics technology has taken place throughout the country and has increased number of hydroponics farmers rapidly for commercial purpose (Mortri & Wattanapreechanon¹⁹; Department of Agriculture¹⁰). Likewise, Sheikh²⁷ opine that hydroponics system has been used for only 40 years on commercial basis and it is a technique that can be used for agriculture sustainability, rural development, poverty alleviation and safeguard food security. The hydroponics technology reduces production cost and increase income level. Farmers were encouraged to embrace the use of hydroponics technology which involves less stress and good yield of produce (Orsini et al²²; Wattanapreechanon & Sukprasert³²)

Reviewed literatures revealed that demographic characteristics are one of the factors that determine decision level towards adoption of hydroponics technology (Bhattarai⁵; Kartasi¹⁷; Awotide et al¹). It is expected that young people will adapt new technology compared to older people who are likely to show unwillingness attitude towards adapting new technology. Similarly, individuals with high level of education are expected to embrace the use of hydroponics technology compared to people with low level of education specifically below secondary education. Educated people are more exposed and have high flexibility level to adoption of technology. Based on gender level, females participate in farming activities more than the males and the possibility to adapt hydroponics technology is higher among the females. Also, income level determines level of technology adoption. People who earn more will have the capacity to meet with the expenses of materials to be used for setting up of the hydroponics kit (Kartasi¹⁷; Velandia et al³⁰; Joy¹⁶). Furthermore, Joy¹⁶ revealed that cost of technology reduced level at which people adapt hydroponics technology.

Moreover, level of awareness is another major factor that create acceptance of new technology. Studies from Kartasi¹⁷ indicated that dissemination of information regarding benefit attached to hydroponics technology, knowledge and trained expertise on the

use of hydroponics technology are limited and has contributed to low level of awareness of hydroponics technology. People with knowledge of hydroponics technology have high possibility to adapt hydroponics technology. Moreover, Velandia et al³⁰ opine that knowledge derived from extension services and other sources of information plays significant role towards adoption of technology. Information of hydroponics technology provides adequate knowledge, costs and benefits to be derived from the use of the technology. Access to information on hydroponics technology is very essential and increase adoption level (Awotide et al¹; Kibiti & Gitnga¹⁸). Technology awareness is very important because it makes people to embrace and adopt it. It can be practiced at the backyard with little stress, disease free, no soil and less water for culture. Similarly, it can be used to provide intensive food production in a limited space in developing countries and could serve as source of livelihood through vegetable production on a limited scale in a given local environment (Mortri & Wattanapreechanon¹⁹). In order to ensure that hydroponics technology is successful, research effort should concentrate on the production aspect and adequate knowledge to operate the system effectively is required by the farmers (Buwalda et al⁷; Wattanapreechanon & Sukprasert³²; Kibiti & Gitonga¹⁸). Adoption level of hydroponics technology can be enhanced through design of suitable policy and capacity development (Joy¹⁶).

Based on our limited readings, there are no studies that measure the impact of hydroponics technology knowledge transfer program involving the collaboration of public university and industry to rural community. Hence, this study will measure the effectiveness of knowledge transfer of hydroponics technology program to selected community with the help of UUM-Coconut Island Resources towards development of rural community.

METHODOLOGY

The objective of the study is to measure the effectiveness of hydroponics technology knowledge transfer program which was carried out by UUM-CIR to four villages namely; Kampung Pulau Nyior, Kampung Alor Batu, Kampung Gelong, and Kampung Bemban, Jitra, in the district of Kubang Pasu, Kedah. The villages were chosen because of the location near to the CIR (the industry partner with UUM). Majority of the respondents were chosen based on their interest in agriculture. Non-probability sampling technique was used to select 10

people per village based on their interest in agriculture and this gives a total of 40 participants for this study. The workshop was carried out by UUM facilitators and CIR in implementing the knowledge transfer in which the company carried out its social responsibility by providing training, equipment and venue for the project.

Structured questionnaires were used for data collection from the respondents and administered with the help of trained research assistants. The design of the questionnaire was based on perceptions towards the hydroponic technology among the villagers. The questionnaire was divided into four parts; demographic factors, awareness towards hydroponic technology, behaviour before adapting hydroponics technology and behaviour after adapting hydroponics technology. The questionnaire and interview were administered using *Bahasa Melayu*. After training, the respondents were given a questionnaire to gauge the effectiveness of this workshop (post testing). The time period between pre-testing and post-testing was within a day; before the start of the workshop and after the end of the workshop which took a day (two sessions).

The effectiveness of knowledge transfer during the one day workshop among the people involved can be seen through their ability to perform their own hydroponics kit set up by their own. Data were analyzed using descriptive statistics (frequency, percentage, mean, standard deviation), mean value for 4-point likert scale and cross tabulation analysis. Mean is simply the average score and the formula is: $\mu = (\sum x_i) / n$ where μ stands for the sample mean, \sum means summation, x_i represents all of the x -values and n means the number of items in the sample. Standard deviation is a measure of variability (spreads out) around the mean. The formula of standard deviation is: $\sigma = \sqrt{\sum (x - \mu)^2 / (n-1)}$ where σ means standard deviation, \sum means summation, x represents individual values in the data set, μ stands for the sample mean and n means the number of items in the sample. Cross tabulation is a two-dimensional table that shows the relationship between two variables in a row and column.

RESULTS

Demographic factors of respondents: The results indicate that almost half (45%) of the respondents were above 40 years old, 22.5% were between 21–30 years old, 17.5% were less than and equal to 20 years while 15% were between 31–40 years old respectively.

Majority (57.5%) of the respondents were females while 42.5% were males respectively. Based on occupation level, most (35%) of the respondents were students followed by retirees (17.5%) and housewife (15%) respectively. Fifty five percent (55%) of the respondents have within 6–10 people as their total family members while about 43% have within 1–5 people in their family members respectively. Majority (57.5%) of the respondents were married while 42.5% were single. In terms of educational level, findings showed that 47.5% of respondents had *Sijil Pelajaran Malaysia* (SPM) qualification, 30% diploma, 7.5% *Sijil Tinggi Pelajaran Malaysia* (STPM) qualification, 5.0% Degree, 2.5% Master while 7.5% had other educational level such as certificates and *Penilaian Menengah Rendah* (PMR). Findings revealed that most (40.0%) of the respondents earned less than RM 1000, 27.5% earned between RM 1001 to RM 2000 as their monthly salary, 12.5% of the respondents earned more than RM 2001 while 20% of the respondents do not have income. Basically, all of the respondents were considered as low income group.

Awareness towards hydroponics technology: In terms of awareness towards hydroponics technology, majority (70%) of the respondents have heard about hydroponics technology while 30% of them have never heard about it. The sources of information on hydroponics technology shows that about 32.5% of the respondents received information through media such as newspaper, television and radio; 17.5% from family and friends, 12.5% from government and non-governmental organization, 5.0% through their agriculture teacher while 2.5% from other source. More than half (55%) of the respondents have same knowledge about hydroponics technology while 45% of them do not have any knowledge about hydroponics technology. In terms of usage, 22.5% of the respondents revealed that they have used hydroponic kit before. Meanwhile 12.5% of them have used it for a period of more than 1 year, 7.5% of the respondents have used it for a period of less than 3 months while 2.5% have used it for a period of 3 to 6 months respectively. Most (20%) of the respondents adapted hydroponics technology because it is a simple method while 2.5% adopted because of its worthy results.

Behaviour before and after the workshop on transfer of knowledge on adapting hydroponics technology

Descriptive statistics behaviour of respondents before the workshop shows majority (62.5%) of the

respondent does not know how to set up hydroponics kit but after the workshop about 97.5% know how to set up hydroponics kit. Around 72.5% of the respondents think cost of applying hydroponics kit between RM150 – RM200 per set worth it before the workshop while after the workshop 100% of the respondents think cost of applying hydroponics kit worth it. Furthermore, about 85% of the respondents enjoyed using hydroponics kit before the workshop while 100% of the respondents enjoyed using hydroponics kit after the workshop respectively. This implies that after the workshop, more respondents enjoyed using hydroponics kit for vegetable cultivation. More than half (60%) of the respondents were willing to carry out hydroponics activities at their home if the cost is borne by their party while after the workshop 87.5% of respondents showed willingness to carry out hydroponic activities at their home if the cost is borne by their party.

Out of all the respondents, 60% of them are willing to pay for the cost of the hydroponic equipment before the workshop. However, after the workshop, all of the respondents (100%) were willing to pay for the cost of the hydroponic equipment. Meanwhile, majority (97.5%) of the respondents were willing to pay between RM150 – RM200 for the cost of the equipment while 2.5% were willing to pay between RM201-RM250 respectively. About 87.5% of the respondents showed willingness to join hydroponics workshop before attending this workshop. However, after attending this workshop, the percentage increased to 92.5%. Moreover, about 92.5% of the respondents showed interest in conducting vegetable farming using hydroponic kit well after workshop respectively. Based on these results, it is revealed that hydroponics technology knowledge transfer one day program by UUM-CIR was found to be effective.

Perception and rating of respondents regarding the hydroponics technology after the workshop: The extent to which respondents agree or disagree regarding the use of hydroponics technology in the agriculture based on the 4-point likert scale shows the mean values (3.73, 3.62, 3.58, 3.65). This has indicated that use of hydroponic technology will help respondents to learn new things, generate income, increase their skills and they believe it is an effective technology respectively while respondents disagree with some statements based on the mean values (1.80, 1.85, 2.20) which says they will avoid using hydroponics technology, technology used too much time and too costly in terms of resources, time

and effort respectively. Descriptive statistics of rating the hydroponics technology after the workshop based on the 4-point likert scale used to rate the hydroponics technology after the workshop, the mean value (3.85) shows that majority of the respondents rated the project a good and excellent one.

DISCUSSIONS

Hydroponics technology is a method which does not require huge land but small parcel of land and a few employees for execution. Results showed that females were more aware of the hydroponics technology compared to males in the study area. Out of 57.5% of the female respondents, 50% of them had positive behaviour towards adapting hydroponic technology after the workshop. According to Kartasi¹⁷, female are involved in farming activities and are more likely to adapt new technology but their decision is highly affected by male being the household heads. Almost half (45%) of the respondents are above 40 years of age which is in accordance with Joy¹⁶ findings. According to Velandia et al³⁰ and Walton³¹ studies, it was revealed that age influenced level of adoption of technology among farmers. From the study, more than half (57.5%) of the respondents have SPM educational level while 30% had diploma respectively. Study by Caswell⁸ shows that education affects the adoption level of technology and increase productivity levels. It was stated further that level of education creates a mental attitude psychologically towards efficient and effective acceptance of new technologies. Results indicated that most (37.5%) of the respondents income falls within RM1000 – RM2000 and this implies that people that earn higher income level will be able to afford the production cost and set up expenses of the hydroponic kit.

Results showed that a larger percentage of respondents have heard about hydroponics technology before. The major source of information on hydroponics technology is through media such as newspaper, television and radio followed by family, friends and government/ non-governmental organization. Findings are in line with Awotide¹ which stated that access to adequate information about agricultural technologies was essential to increase adoption level. Adoption of technology in a local community depends on the willingness of the people. Results showed that more than half (60%) of the respondents are willing to carry

out hydroponic activities at their home if the cost is borne by their party. Also, 60% of them were willing to pay for the cost of the hydroponic equipment. However, majority (92.5%) of the respondents showed interest in cultivating vegetables using hydroponics methods after the workshop. The effectiveness of hydroponics technology knowledge transfer workshop was measured through the pre and post-testing of the workshop and findings showed that almost all (97.5%) the respondents were able to set up the hydroponic kit, harvest vegetables well and enjoy using hydroponic technology after the workshop. Furthermore, findings showed that knowledge transfer of hydroponic vegetable cultivation methods was effective because the number of respondents towards positive behaviour to adapt the hydroponics technology increased after the workshop. Kartasi¹⁷ opine that inadequate dissemination of information on the benefits attached to the use of the technology has made hydroponics technology not to be widely known in the local communities and encounters faced in locating experts with adequate knowledge of hydroponic technology. Furthermore, Kartasi¹⁷ observed that hydroponics will go a long way in improving food security due to its lower cost of production.

CONCLUSIONS AND POLICY RECOMMENDATIONS

Adoption of hydroponics technology by the local community has to do with awareness, adequate knowledge and effective training on good management practices to ensure continuity of the technology. Innovations of technology will help to improve production, reduce production costs, increase farmers' profits, reduce household expenses for vegetable food component among the local community and enhance food security. Findings revealed that 32.5% of the respondents above the age of 40 years old were aware of hydroponics technology. Awareness level was high among the female respondents (37.5%) compared to male respondents (32.5%). Likewise, 40% of the married respondents were more aware of hydroponics technology when compared with 30% of the single respondents that were aware respectively. Results from pre and post-testing of the knowledge transfer of hydroponics technology indicated that after the one day workshop, about 97.5% of the respondents could set up the hydroponic kit, harvest vegetable well, were willing to pay for the cost of the equipment, think cost of applying hydroponic worth it and enjoyed using hydroponics technology respectively.

The results also showed that, 92.5% of the respondents were willing to join hydroponic knowledge transfer project and were interested in conducting vegetable farming using hydroponic methods after the workshop respectively. Meanwhile, 87.5% of the respondents were willing to carry out hydroponics activities at their home after the workshop. At the end of the workshop, respondents rated it has a good one while most of them participated in order to get more knowledge, due to interest in vegetables and simple method. However, economic prospects of adoption of hydroponics technology will improve if public policies support subsidies for production systems is designed by the governments.

This study recommends that knowledge transfer of hydroponics technology should not only concentrate on the older people but also encourage young people to participate in the local community. Similarly, females should be trained on the use of hydroponics technology irrespective of their marital status and educational level. In addition, local community should be enlightened more about the benefit attached to the usage of hydroponics technology and proper training should be given to them.

ACKNOWLEDGEMENTS

The authors wish to thank Universiti Utara Malaysia in funding this study under the Social Innovation Grant Scheme (SIGS), S/O code 13972, Research and Innovation Management Centre and Innovation & Commercialization Centre Universiti Utara Malaysia, Kedah for the administration of this study.

ABSTRACT

Tax evasion is a crime. Recent estimates registered the loss of tax revenue amounting to USD3.1 trillion or 5.1% of world's GDP. Tax revenue losses have negative consequences to the government ability to fuelled economic growth by providing enough public infrastructure and other services. In this study we have estimated the share of shadow economy to the official economy for five ASEAN economies, namely; Indonesia, Malaysia, the Philippines, Singapore and Thailand for the period 1980-2013 using the MIMIC model. The indexes of the shadow economy from the MIMIC model were then used to calculate the loss in tax revenue as a result of the presence of the shadow economy. We then test the hypothesis that the level of economic development and tax burden play an important role in mitigating tax evasion. Our results indicate that increasing economic development and tax burden in all five ASEAN economies Malaysia increased tax evasion for the period 1980 to 2013.

INTRODUCTION

One of the most common and persistent problem for any nations is tax evasion. Cerqueti and Coppier¹⁰ argue that the tax revenue loss has serious economic consequences to the government. By evading taxes the government are deprived from providing adequate public financing and investment, which results in fewer jobs, hospitals, schools, less infrastructure, and ultimately less development, as well as other facilities that would benefit the society (Johnson et al.³³). Furthermore, large tax evasion signifies that the country having large shadow economy compared to the developed world (Fuest and Riedel²²). Franzoni²¹ asserts that the loss of tax revenue may result in slow economic growth, upsetting the proper functioning of the government as the ability to finance its basic expenses is threatened. Thus, fighting tax evasion should be an important agenda for any government.

The Tax Justice Network⁵³ has reported that the estimated total tax evasion is in the excess of USD3.1 trillion or about 5.1% of world's GDP. Europe experienced tax losses of USD1.5 trillion, followed by

Asia USD666 billion, North America USD453 billion, South America USD376 billion, Africa USD79 billion while the Oceania USD46 billion. Among the ASEAN-5 economies Malaysia ranked fourth with total tax evaded of USD11.2 billion; after Thailand USD25.8 billion, Indonesia USD17.8 billion and the Philippines USD11.7 billion. On the other hand, Singapore experience tax losses of USD4.1 billion.

The report further point out that the loss from tax evading activity occurs as a result of shadow economic activities existed in all economies. Nevertheless, tax evasion can also due to tax haven activity, trade mispricing and trade misinvoicing. Tax haven countries are those countries characterize of having low or non-existent tax rates on some types of income, lack of transparency, bank secrecy, lack of information sharing, and requiring no economic activity for an entity to obtain legal status (Gravelle²⁶). Zucman⁵⁶ estimates that bank deposits in Switzerland constitute about one third of the global stock of household offshore wealth and it is believed that a fraction of this wealth escapes home country taxation

(offshore tax evasion). Johannesen³² reports that most of this wealth is owned by the very richest households and that it is largely escapes taxation. In tax haven countries with strict bank secrecy rules, banks do not generally report the investment income earned by their clients to the tax authorities, and therefore escape paying taxes. Henry³⁰ reports that it is estimated that the accumulated offshore wealth stock owned by developing country residents was worth at least USD6.2 trillion by 2007. This implies that developing countries might be losing as much as USD120-160 billion per year in lost tax revenue on the interest and other income generated by all this unreported anonymous wealth. Henry³⁰: p.20 further contends that “developing countries as a whole didn’t really face a “debt” problem, but huge “offshore tax evasion” problem”.

On one hand, trade misinvoicing occurs when trading partners write their own trade documents through export under-invoicing and import over-invoicing. Corrupt government officials, criminals and commercial tax evaders are able to easily move assets out of the countries and into tax havens, anonymous companies, and secret bank accounts (Kar and Spanjers³⁶). In 2012, the Asian region recorded the highest among the developing countries experiencing trade misinvoicing outflows accounted for USD354 billion of funds “flight” out of the country. Among the ASEAN-5 economies, Malaysia ranked 1st with fund outflows of USD39 billion, followed by Thailand USD28 billion, Indonesia USD20 billion and the Philippines USD5 billion. On the other hand, trade mispricing due to activities through which profits of companies (MNCs) are shifted from developing countries to developed country banks and tax havens. Trade mispricing can occur when the underlying trade involves transactions between related parties, such as trade transactions between international subsidiaries of a large parent corporation (Hollingshead³¹). It is reported that as a result of trade mispricing, the yearly average tax revenue loss incurred by Malaysia, average 2002-2006 is about USD4.9 billion, followed by the Philippines USD4.3 billion, Indonesia USD3.1 billion and Thailand USD1.4 billion.

Interestingly, Martinez-Vazquez⁴¹ found that a significant feature of the tax system in Asia is that tax burdens at the regional scale are among the lowest in the world. The average tax-GDP ratio in Asia has been approximately half that of the European Union, and it is also below the ratio for Africa and the Middle East,

and for the Americas. However, there are disparities among the ASEAN-5 countries in the tax-GDP ratio with Thailand being the highest (16.3%), followed by Malaysia (15.8%), Singapore (14.1%), the Philippines (13.8%) and Indonesia (13.6%). Nevertheless, the daunting question that is relevant to tax evasion is: why people evade tax? According to Hanousek and Palda²⁸, people did not just evade taxes in order to enrich themselves but as a means of signalling their discontent with the quality of government services they received. Their study on the transition economies found some evidence that when people believe the quality of government services to be poor, they will evade taxes in response.

In fact, earlier Feige¹⁹ contends that a rising public dissatisfaction with the performance of government and/or a growing public distrust and resentment may potentially contribute to the size of the shadow economy, and economic activities in the shadow economy will be tax evading (Tax Justice Network⁵³). In another study, Torgler⁵⁴ analyses tax morale in seven Asian countries and found that tax morale is very low in the Philippines and relatively high in Japan, China and Bangladesh. Further analyses assert that Philippines having the lowest tax morale among the evaluated Asian countries are also having the biggest size of the shadow economy; while countries like Japan and China having higher tax morale but also having a lower size of shadow economy. Generally, the study suggests that trust in the government and the legal systems have a positive effect on tax morale.

The purpose of the present paper is to determine factors affecting tax evasion in the ASEAN-5 economies. According to Schneider⁴⁹ activities in the shadow economy in most cases imply the evasion of direct or indirect taxes, such that the factors affecting tax evasion will most certainly also affect the shadow economy. In this study we employ the MIMIC model to estimate the index of the shadow economy for each of the ASEAN-5 country. From this index we can calculate the amount of tax evasion and thereafter, we employ the cointegration approach to determine the long-run relationship between tax evasion and its determinants – tax burden and economic development.

The paper is organized as follows. In the next section we discuss the MIMIC model used to estimate shadow economy; section 3 presents the tax evasion model; and in section 4 we discuss the estimated tax evasion model. The last section contains our conclusion.

ESTIMATING THE SIZE OF SHADOW ECONOMY

To estimate the revenue from tax losses it is imperative to estimate the extent of the shadow economy. In this study we follow the approach popularize by Schneider and his associates (Schneider and Enste^{50,51}; Schneider⁴⁷; Bajada and Schneider⁴⁷; Dell’Anno et al.¹⁴; Buehn⁵) by using the multiple indicators multiple causes (MIMIC) method to estimate the shadow economy which is consider a latent variable (unobservable). In our study the causal variables (in logarithm) are government consumption (), inflation rate (), tax burden (), and unemployment rate (). It is expected that increase government consumption in the official economy will instigate crowding-out effect and also introduces distortions to competition in the market, and encourage individual and firm towards shadow economy. Similarly higher tax burden will push people to participate in the shadow economy and evade taxes. Unemployment and inflation indicate peoples’ misery as a result of recession or economic downturn. In such condition individual or firm will move towards shadow economy to find alternative source of income and cheaper goods and services. For the indicators variables we used currency to money supply (M1) ratio, (), and real GDP per capita, (). The increase in the official GDP as well as currency will indicate increasing in the shadow economy. The data for currency, money supply M1, tax burden, inflation, unemployment rate and real GDP per capita were collected from World Development Indicators at the World Bank database. The data used in the study span from 1980 to 2013.

The MIMIC model used in the study is formulated as follows:

$$y_t = \lambda \eta_t + \varepsilon_t \quad \dots(1)$$

$$\eta_t = \gamma' x_t + \xi_t \quad \dots(2)$$

where η_t is an unobserved latent variable, shadow economy;

$y' = (y_1, y_2) = (\lgdppc_t, \text{lcurrency}_t)$ is a vector of indicators for the latent variable η_t ; and $x' = (x_1, x_2, \dots, x_4) = (\lgovtconsp_t, \text{linflation}_t, \text{ltaxburden}_t, \text{luemployment}_t)$ is the vector of the causes of η_t ; λ and γ are $(p \times 1)$ and (4×1) vectors of parameters; and ε and ξ are $(p \times 1)$ and are scalar

random errors. Giles²⁴ shows that Equations (1) and (2) can be viewed as a multivariate regression model,

$$y_t = \Pi x_t + z_t \quad \dots(3)$$

where $\Pi = \lambda \gamma'$ and $z_t = \lambda \xi_t + \varepsilon_t$.

Equation (1) is the measurement model while Equation (2) is the structural model. The consistent and asymptotically efficient estimates for the parameters λ and γ (the elements of Π) can be obtained using the restricted maximum likelihood estimation method. However, the estimation of Equations (1) and (2) requires a normalization of Equation (1), which is generally achieved by constraining one element of λ to a pre-assigned value (e.g. $\lambda_1 = +1$ or -1). Once the estimate for γ is obtained, the latent variable η_t can be predicted at each observed sample point x_t , and the size of the shadow economy can be evaluated. Figure 1 shows the path diagram where potential causes of the shadow economy are shown on the left and the indicators on the right.

Figure 1: MIMIC Model

To make estimation feasible we set the coefficient of one of the measurement model’s indicator variables to non-zero. In this study we fix the coefficient of the variable real GDP per capita, \lgdppc_t , equal to +1, and Table 1 present the results of the estimated MIMIC model for each of the ASEAN-5 country. The result of the MIMIC models is quite encouraging as some of the variables are significant and show correct signs. The shadow economy show positive relationship with real GDP per capita and negative relationship with currency holdings. The result implies that the increase in real GDP per capita (income) increases shadow economy, while the increase in currency holdings in the shadow economy suggest a reduction in the used of currency holdings in the official economy. For the causal variables majority of the variables are statistically significant at least at the 10% level.

RMR [≤ 0.08]	0.027	0.023	0.006	0.016	0.007

Notes: Asterisks (***), (**), (*) denote statistically significant at 1%, 5% and 10% level respectively. The source for the criteria for the test statistics for the MIMIC model are from Joreskog and Sorbom³⁴ for chi-square; Chau and Hu¹¹ for GFI and AGFI; Browne and Cudek (1999) for RMSEA and RMR. Figures in square brackets are favourable test statistics for good fit.

As for the overall goodness of fit of the MIMIC model, we report the chi-square (χ²) with degree of freedom (df), normed chi-square (χ²/df), goodness of fit index (GFI), adjusted goodness of fit (AGFI), root mean squared error of approximation (RMSEA), and root mean square residual (RMR). Generally the results for the goodness of fit of the MIMIC models are not encouraging. This is not surprising as the data do not fit the model well is attributed to the time series and the small sample size used in the analysis (see Klaric³⁸; Dell’Anno et al., 2007). Further Dell’Anno et al.¹⁴ note that the reliability of the MIMIC estimates is a controversial matter and the scientific debate is in progress. Nevertheless, our main purpose estimating the

MIMIC model is to compute the index of the shadow economy. The ordinal shadow economy (SE) index is calculated from Table 1 as follows,

$$\text{Indonesia: } \hat{\eta}_{Ind,t} = 0.193* \text{lgovtconsp}_t - 1.202* \text{linflation}_t - 0.424* \text{ltaxburden} + 0.421* \text{luemployment}_t$$

$$\text{Malaysia: } \hat{\eta}_{Mal,t} = 0.245* \text{lgovtconsp}_t - 1.067* \text{linflation}_t - 1.241* \text{ltaxburden} - 0.783* \text{luemployment}_t$$

$$\text{Philippine: } \hat{\eta}_{Phi,t} = 0.018* \text{lgovtconsp}_t - 1.179* \text{linflation}_t - 0.016* \text{ltaxburden} + 0.049* \text{luemployment}_t$$

$$\text{Singapore: } \hat{\eta}_{Sin,t} = -0.858* \text{lgovtconsp}_t - 7.360* \text{linflation}_t - 1.636* \text{ltaxburden} - 0.337* \text{luemployment}_t$$

$$\text{Thailand: } \hat{\eta}_{Tha,t} = 0.146* \text{lgovtconsp}_t - 5.461* \text{linflation}_t + 1.348* \text{ltaxburden} - 0.428* \text{luemployment}_t$$

These indexes, $\hat{\eta}_{j,t}$ (j=Indonesia, Malaysia, Philippines, Singapore, Thailand) are then transformed into a cardinal series using the benchmark estimates for each country from Schneider⁴⁸ which is 19.4% of official GDP in

2000 for Indonesia; 31.1% for Malaysia, 43.3% for the Philippines, 52.6% for Thailand, and 12.7% for Singapore from Elgin and Oztunali¹⁶. Accordingly, following the steps in Dell'Anno and Schneider¹⁵ and Buehn and Schneider⁶ we compute the ratio of shadow economy to the official GDP (%) equals $(\hat{\eta}_{j,t} / \hat{\eta}_{j,2000}) \tilde{\eta}_{j,2000}$ with $\hat{\eta}_t$ notes the value of the MIMIC index at time, t according to Equation (2), $\hat{\eta}_{2000}$ is the value of this index in the base year 2000, and $\tilde{\eta}_{2000}$ is the exogenous estimate (benchmark) of the shadow economy in 2000. For example, for the case of Indonesia, shadow economy, SE equals $[(\hat{\eta}_{Ind,t} / \hat{\eta}_{Ind,2000}) * 19.4\%]$. In this study we plot our estimates of the shadow economy for each of the ASEAN-5 country with three other estimates by Alm and Embaye¹, Elgin and Oztunali¹⁶ and Schneider⁴⁸, as presented in Figure 2. Generally our estimates of the shadow economy showing similar declining trend, however, our estimates seem to be averaging the other three estimates.

9

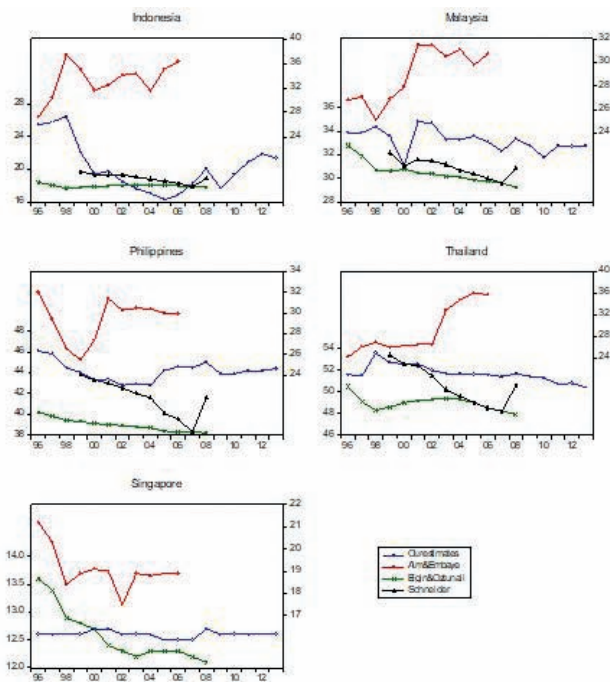

Figure 2: Ratio of shadow economy to GDP in ASEAN-5 economies, 1996-2013

Estimating Tax Evasion: The estimates of the tax evasion are calculated as tax revenue multiply with the ratio of shadow economy to the official GDP. Figure 3 clearly demonstrates that the share of tax evasion to GDP has been on a declining trend for all five ASEAN economies.

Figure 3: Tax evasion to GDP ratio in ASEAN-5 economies

Next we specify the determinants of tax evasion for the ASEAN-5 economies. Numerous studies have indicated that among others, age structure, income, education, financial development can affect people to evade taxes. For example, a cross-country study by Richardson⁴⁶, posit that age, education, employment in the services sector, fairness and tax morale affect tax evasion in 45 countries investigated. Study by Crane and Nourzad¹² revealed that inflation, marginal tax rate, probability of detection, penalty rate, proportion of wages to income and real income influence tax evading behavior in the U.S. The role of inflation in stimulating tax evasion is further supported by Caballe and Panades⁷.

In two studies on tax evasion in Switzerland, Feld and Frey²⁰ and Kirchgassner³⁷, contend that the probability of detection, penalty rate, marginal tax rate, tax procedures, democracy, income, age distribution, type of employment, language, and population are important determinants of tax compliance. For the OECD countries, Kafkalas et al.³⁵, found that apart from income and tax rate, government effectiveness (quality of government) and tax monitoring expenses influence tax evasion. On the other hand, studies by Cebula⁸ and Cebula and Foley⁹ indicate that income tax rate, unemployment, interest rate, audit and penalty rate affect tax compliance in the U.S.

On another strand of study, researchers have investigated the role of financial sector as determinant of tax evasion. According to Bose et al.³, in developed economies characterized by high level of financial development, individual or firm have easy access to the credit market. However, borrowers have to declare their income and/or assets and this can be used as collateral

or to gauge their creditworthiness but in doing so they will subject to tax liability. Since the value provided by the financial intermediation is considerable (Gordon and Li²⁵), there is less incentive to evade tax and the need to participate in the shadow economy is minimal.

On the contrary, for developing economies with low level of financial development, there is limited access to the credit market due to shortage of loanable funds, asymmetric information and high cost of borrowings; borrowers have less incentive to declare income and/or assets. In such environment, tax evasion is substantial and shadow economy is also larger. Their cross-sectional and panel analyses indicate that improvement in the development of the banking sector as well as the depth and the efficiency of the banking sector contribute to smaller shadow economy. The contention that more tax compliance is associated with more access to the credit market is also supported by the finding in Gatti and Honorati²³.

However, in this study we specify the determinants of tax evasion as follows,

$$Itaxevasion_t = \theta_0 + \theta_1 Itaxburden_t + \theta_2 lgdppc_t + \theta_3 lgdppc_t^2 + \omega_t \dots(4)$$

where $Itaxevasion_t$ is measured by the ratio of tax evasion to GDP, $Itaxburden_t$ is the ratio of tax revenue to GDP, and $lgdppc_t$ is real GDP per capita to the measure economic development or income. All data except tax evasion were collected from the World Development Indicators published and accessible at the World Bank database. It is expected that $\theta_1 > 0$ and $\theta_2, \theta_3 > \text{or} < 0$. l denotes variables in logarithm. The expected sign for θ_2 and θ_3 is ambiguous. However, as Figure 4 suggest, we would expect that there is a non-linear relationship between tax evasion and economic development. This relationship implies that at lower stages of economic development tax evasion are low while at higher level of economic development tax evasion tends to increase.

To estimate Equation (4) we first test the order of integration of all variables in the equation. The unit root test results using ADF-GLS proposed by Elliot et al.¹⁷ which is more robust to both the augmented Dickey-Fuller and Phillips-Perron tests are presented in Table 2. Results in Table 2 clearly indicate that all variables are I(1), that is the series achieved stationarity after first-differencing. These results clearly suggest that all variables are non-stationary in levels. Thus, estimating Equation (4) using OLS is subject to spurious regression results unless the variables are cointegrated. A cointegrating regression implies a long-run model.

Table 2: Results of unit root tests

Notes: Asterisks (***) , (**), (*) denote statistically significant at 1%, 5% and 10% level, respectively. The calculated statistics are those computed in MacKinnon⁴⁰. The optimal lag length in round brackets was chosen based on SC criterion throughout the analysis.

Since all variables are of the same order of integration we can proceed to test for cointegration. The conventional method to test for cointegration is the Engle and Granger¹⁸ two-step procedure (*E-G*). However, this method has been criticized for the low power of using the ADF unit root test. The problems associated with the OLS approach have led to the development of alternative procedures which is more recent and more robust, particularly in small samples. To test for cointegration in small sample, Pesaran et al.⁴⁴ suggest using the bounds *F*-test by estimating the following equation. For ARDL(1,1,1,1) we can estimate the following ARDL-UECM (unrestricted error-correction) model using OLS,

$$\Delta \text{taxevasion}_t = \varphi_0 + \varphi_1 \Delta \text{taxburden}_t + \varphi_2 \Delta \text{lgdppc}_t + \varphi_3 \Delta \text{lgdppc}_t^2 + \varphi_1 \text{taxevasion}_{t-1} + \varphi_2 \text{taxburden}_{t-1} + \varphi_3 \text{lgdppc}_{t-1} + \varphi_4 \text{lgdppc}_{t-1}^2 + \epsilon_t \quad \dots(5)$$

where φ_0 is a constant term and ϵ_t is the disturbance term. According to Pesaran et al.⁴⁴, an *F*-test for the joint significance of the coefficients of the lagged levels in the above Equation (5), that is the null hypothesis for no cointegration amongst variables in the equation, is $H_0 : \phi_1 = \phi_2 = \phi_3 = \phi_4 = 0$ against the alternative $H_a : \phi_1 \neq \phi_2 \neq \phi_3 \neq \phi_4 \neq 0$; are employed to bounds test for cointegration or the existence of a long-run relationship between tax evasion and its determinants. Rejection of the null hypothesis suggests cointegration between tax evasion and its determinants. The asymptotic distribution of critical values is obtained for cases in which all regressors are purely *I*(1) as well as when the regressors are purely *I*(0) or mutually cointegrated. Because the critical value of the test depends on the order of integration of the variables, *I*(*d*), where $0 \leq d \leq 1$, the test utilizes a critical range such that values exceeding the range are evidence of rejection, values less than the range are evidence of non-rejection, and values within the range are inconclusive. In other words, if the *F*-statistics exceed their respective upper critical values; we can conclude that a long-run relationship exists, without a need to know the order of integration of the regressors. If the *F*-statistics fall below the lower critical values, we cannot reject the null hypothesis of no cointegration and estimation can continue assuming no

long-run relationship. If the *F*-statistics falls between the two bounds, the result is inconclusive. As such one needs to know the order of the integration of the underlying variables to proceed further. For small sample size as in our case we used the critical values tabulated by Narayan⁴².

Once cointegration is established, next we can proceed to estimate the long-run model for tax evasion - Equation (4). Using the ARDL method, assuming ARDL (1, 1, 1, 1) we can specify the following model,

$$\text{taxevasion}_t = \alpha_0 + \beta_1 \text{taxburden}_t + \beta_2 \text{taxburden}_{t-1} + \beta_3 \text{lgdppc}_t + \beta_4 \text{lgdppc}_{t-1} + \beta_5 \text{lgdppc}_t^2 + \beta_6 \text{lgdppc}_{t-1}^2 + \beta_7 \text{taxevasion}_{t-1} + \epsilon_t \quad \dots(6)$$

In the long-run, from Equation (6) we can derive the long-run tax evasion model as specify in Equation (4): $\text{taxevasion}_t = \theta_0 + \theta_1 \text{taxburden}_t + \theta_2 \text{lgdppc}_t + \theta_3 \text{lgdppc}_t^2 + \omega_t$ where $\theta_0 = \alpha_0 / (1 - \beta_7)$, $\theta_1 = (\beta_1 + \beta_2) / (1 - \beta_7)$, $\theta_2 = (\beta_3 + \beta_4) / (1 - \beta_7)$, $\theta_3 = (\beta_5 + \beta_6) / (1 - \beta_7)$.

For estimating the long-run model and besides using ARDL, other procedures for small sample include Dynamic OLS (DOLS), Fully Modified OLS (FMOLS), and canonical cointegrating regression (CCR). Stock and Watson⁵² propose the dynamic OLS; Park⁴³ introduces the canonical cointegrating regression); while Phillips and Hansen⁴⁵ suggest the fully-modified OLS. DOLS procedure corrects for possible simultaneity bias and small sample bias amongst the regressors by regressing one of the *I*(1) variables on other *I*(1) variables, the *I*(0) variables, and lags and leads of the first difference of the variables. Incorporating the first difference variables and the associated lags and leads will eliminate simultaneity bias and small sample bias inherent among regressors. On the other hand, the FMOLS procedure correct for endogeneity and serial correlation effects as well as eliminates the small sample bias. The CCR is closely related to FMOLS, but instead employs stationary transformation of the time series data to obtain least squares estimates to remove the long-run dependence between the cointegrating equation and stochastic regressors innovations. Park⁴³ shows that the CCR transformations asymptotically eliminate the endogeneity caused by the long-run correlation of the cointegrating equation errors and stochastic regressors innovations, and simultaneously correct for asymptotic bias resulting from the contemporaneous correlation between the regression and stochastic regressor errors.

RESULTS OF THE LONG-RUN MODELS

In Tables 3 to 7, we present the results of the cointegration tests as well the estimated long-run models for Indonesia, Malaysia, the Philippines, Singapore and Thailand, respectively. For OLS we used the conventional Engle and Granger two-step procedure for testing the null hypothesis of non-cointegration or the present of unit root on the residuals. On the other hand, we also report both the L_c - and χ^2 -statistics, the test for the null hypothesis of cointegration for FMOLS, DOLS and CCR; while the bounds F -test using ARDL that tests the null hypothesis of non-cointegration.

For the long-run model, figures in round brackets are *t*-statistics. For the cointegration tests; the *E-G* test denotes the DF *t*-statistic on the cointegrating regression’s residual. Critical values at 5% level for bound test (*F*-statistics) are I(0) = 3.272 and I(1) = 4.306 for *k* = 3 are taken from Narayan⁴². Breusch-Godfrey LMχ²(4) and Ljung-Box Q(4) are the tests for non-serial correlation. L_C-statistic measures Hansen (1996) parameter instability test for cointegration. The Bound tests and *E-G* tests with null hypothesis of no cointegration while the Hansen test the null hypothesis of cointegration.

Generally, cointegration is detected for all ASEAN countries. For Indonesia cointegration is detected from using ARDL, OLS and DOLS; Malaysia and Singapore from all estimators; while for Thailand cointegration is shown using OLS, DOLS and CCR. All the long-run models associated with the cointegration tests pass the no-serial correlation tests at the 5% significant level. Moreover, all variables are significant and show correct sign. The results suggest that tax burden increases tax evasion by at least 0.3% for every 10% increases in tax rates in Singapore and Thailand. The highest response to tax burden is Malaysia where for every 10% increase in tax burden, tax evasion will increase by 26%.

An interesting result emerge from this study is the non-linear relationship shown between tax evasion and economic development for all ASEAN-5 country. The *U*-shape curves suggest that as economic development progress in all ASEAN-5 economies from low to higher level, tax evasion at first decreases and then tax evasion increases. It is observe that the decrease in tax evasion is more responsive than the increase in tax evasion when economic development increases. For example in Malaysia, a 10% increase in economic development will lead to a fall in tax evasion by 9% and then an increase in tax evasion by 0.5%.

The *U*-shape relationship between tax evasion and economic development can be explained according to the public choice argument. Studies by Hanousek and Palda^{27,28}, D'Hernoncourt and Meon¹³, Lassen³⁹, and Torgler⁵⁵ posit that trust and tax evasion is negatively related. At low level of economic development there is high level of trust – trust between economic agents as well as trust to the government. Trust is related to tax morale. Torgler⁵⁵ argue that people will be more prone to pay taxes if they trust their fellow tax-payers to do the same, and if they trust the government to use tax revenues to finance public goods. In this situation high level of trust lead to high tax morale and consequently tax evasion will be low. However, as income increases and economic development progress further, the level of trust eroded and tax morale deteriorate among the society. This situation becomes more complex when an economy consisted of various ethnicity and heterogeneity. Lassen³⁹ point out those countries with more heterogenous society, the trust level is low and therefore tax compliance will be lower too.

CONCLUSION

Revenue from taxation is important for the elected government of all nations. The supply of adequate

government services to the society will be met if the government able to collect enough finances to finance the required expenses – public infrastructures and services. However, it is recognized that the universal problem faced by any nation is the leakage or loss of tax revenue through tax evasion. Tax evasion is a crime – crime to the society as well as to a country; and since tax loss may result in slow economic growth, upsetting the proper functioning of the government as the ability to finance its basic expenses is threatened; therefore, fighting tax evasion should be an important agenda for any government.

The purpose of the present study is to relate tax evasion with tax burden and economic development for five ASEAN countries. In this study using time series data for the period 1980 to 2013, we have estimated the fraction of shadow economy to the official economy for all ASEAN-5 countries using the MIMIC model. Based on this estimate we have computed the amount of tax losses for the period 1980 to 2013. Our estimated long-run models suggest that tax burden and the level economic development are important determinants influencing peoples' behavior to evade tax in all five ASEAN economies. The relationship between tax evasion and economic development is *U*-shape: tax evasion is low at lower level of economic development but as economic development increases, tax evasion also increase. In relation to this non-linear relationship we offer an explanation that at low level of economic development when trust to the government is stronger, there will be less people to evade tax, but as economy grows, government effectiveness become questionable, and when people believe that government is dishonest and the quality of services to the public is poor; the states' misled the peoples' trust and people will evade taxes in response.

ABSTRACT

Campus crime is a serious issue and the first anxiety of the entire campus community as a whole. This criminal activity that occurs on campus not only affects the quality of the learning process but also gives a sense of fear and discomfort to using university facilities. This paper intends to determine the critical contribute factors of crime incidents on the university facilities. This research employs a quantitative method as methods to gather data. This study involved 173 respondents from students of Universiti Sains Malaysia, Pulau Pinang, Malaysia. The analysis of this study used descriptive analysis. The findings have shown that five factors contribute to crime, the first factor is security that contributed to the incident on campus, the second factor is an environment, the third factor is student behaviour, the fourth factor is activity and lifestyle, and the last element design. Entirely the crime contributes factors need to be envisaged in university policies towards reducing the offence incidence on the university facilities.

Keywords: *campus crime, crime contribute factors, and crime incidence*

INTRODUCTION

University campus is an environment that placed thousands number of students to fulfil academic activities. According to Castaldi¹⁰, the organised learning environment is crucial to consider as most of the institutions of higher education places their students live on campus. Besides, a campus doesn't only consist of students, but it also accommodates various parties such as staff, visitors, temporary workers and so on. Therefore, a safe, peaceful, harmonious and free from crime must be created so that all the activities on campus can be conducted without any interruption. The ambience of peace and harmony in the campus can affect the lives of male and female students who are in college. If the campus is in a safe environment, students can gain knowledge through comfortably, but otherwise, the learning process will be interrupted. Its can be linked to the issue of security on the campus.

Crime on campus turned out to be a problem of concern. If the offence often occurs on a campus, it does not immediately raise issues about the safety of the students who are on campus. The question of security is not a new problem, but it is the primary concern of parents when their

children attend college and university. In a study about the goal of parents to students, "health and safety" have higher frequencies than "preparation for citizenship," "improve social skills" or "explore the values and beliefs" Turrentine et al⁴³. Although safety on campus entrusted to the Security Department, in reality, is a collective responsibility of all citizens of the campus either staff or students. Individuals who have an attitude of indifference to the things that could jeopardise safety is part of the primary threats to security. Therefore, close cooperation and mutual understanding of each that will determine the assurance of peace and happiness in this campus.

The crime caused losses arising from damage to the property, resulting in increased property insurance claims, high-value employment compensation, life and health insurance claims were high and also involve the loss to the victim because the need to bear the cost to move to another place Soh³⁹. Reducing or preventing crime to occur is necessary to provide safety and comfort to the people and surroundings. Place-based crime prevention method aims to prevent or reduce crime before they occur. The design of the physical environment plays an important role in preventing crimes from occurring by reducing the opportunities or facilities for their criminal

activities Hedayati et al²¹. It promotes people the ability to feel safe and comfortable outdoors. This different method of approach in deterring crime focus on using structural and environmental design in crime prevention.

Support activity encompasses any activity that increases the presence of community activities in public space and concurrently will reduce potential crime. All the activities that encourage communities to involved in certain areas will provide natural surveillance and a sense of ownership. For example, a futsal court may provide the youngster with a recreational space for them for this sport while on the other hand making strangers to be visible to be identified. This paper attempt to determine the crime contribute factors in university campus.

LITERATURE REVIEW

Issues in University Campus: Nowadays people believe that a university prioritises their image, rather than the safety of students. The argument regarding a crime report will give impact on the money generated by the registrar and alumni donations Burd⁹. This opinion can be viewed on the situation prevailing today, where only minor crime report will be disseminated to the public as is the case of theft. While there are certain cases that confidentiality and the closed case with the reasons to protect the image of the university and avoid students' anxiety.

There are various types of studies have been carried out to safety and campus crime. For example, Gordon¹⁹ has studied the variation between technology and campus safety. Wickes et al⁴⁵, has conducted research on ethnic diversity and campus security. It turns out researchers concerned the issue of campus safety crime aspects, although statistics show that university studies have not experienced crime critical Rund³⁵. The awareness of students regarding factors that lead to crime events can be known. Besides, through this study, campus security weaknesses or deficiencies can be identified based on the views of the students, as well as steps that can be done to improve campus safety and reduce crime.

What are Crimes?: According to Andresen and Jenion (2008), defined crime as a complex phenomenon and can give the cumulative effects of the financial, psychological aspects through the loss of property, insurance, litigation, victimisation and safety. Crime consist of individual or group of people acts become threats to society and that action is an offence in the lawful (Alise, 1990). Crimes

can threaten the safety of individuals and society if it is not kerbed (Bloch and Geis, 1962). Crime is seen to resemble the other crimes carefully, it may be different from the angle of incentives or in the process of etiological. In reality, crime is an acts that will threats the society and influences the life of the community.

THEORY OF CRIMES

Rational choice theory: This theory believes that people are naturally egoistic nature and the law educate people through punishment to ensure individual fear to breaking the legal Devine¹⁴. Besides, the theory also argues that to protected offenders, the punishment should be proportional to the fault Siegel³⁷. There are two concepts in this theory. First theory is an offence particular and the second theory is offenders specific crime. According to Philip and Votey³³, before the criminal commit to do the crime, they will measure the opportunity, space, security exist and they also study the value and risk will expected if they under arrest. Whereas, offenders-specific crime is the criminal commit the crime based on the motive. Temporal, the criminal will think their ability to commit crimes, the intention of doing, they also study about the security of placed. The criminal law is definitely capable of causing a feeling of trepidation to criminals, and it might also cause offenders to cancel their intention.

The theory of rational choice has found there are some criteria cause of crime. According to Siegel³⁷, the causes of crime from economic issues, experience and know-how to commit a crime. In the financial aspect, the criminal is viewed from the point of returns earned from the act of having committed an offence. According to Siegel³⁷, a criminal act will be more interesting if it allows the offenders to earn a second profit within overnight. However, criminals will stop committing the same offence in the future if they find that the benefits they received of the crime are decreasing Pezzin³². In summary, the theory of rational choice considers that opportunity from an economic point is also a contributor to the occurrence of the crime problem. Also, the rational choice approach stated that the skills and knowledge of the offence also plays a significant role in the process of influencing a person commits a crime.

Routines activities theory: In this theory, criminals will see victim's action in their daily lives, which influence the crime to occur. It's the key criteria for the crime happen because of their act Anastasia and John¹. According to Mannon²⁸ in the reality the crimes happened because of

two main things, there are; the criminal will evaluate the risk. In this type of crime, the criminal already understands the characteristics of their target victim and the time constraint during the crime was considered. The criminal understand very well their victim daily activities and also know how to commit without arrest by police. The criminals know very well the environment and behaved the inhabitants of target area

The list of factors that influence success of criminal behaviour Sue⁴⁰:

- (a) The existence of appropriate targets such as houses that have valuable belongings
- (b) The absence of a capable guardian such as the police, homeowner, neighbour, friends and relatives.
- (c) Offenders who acted as criminals as a group of teenagers who do not work, the unemployed and the population of drug addicts.

All these factors will influence the crime exist in certain area and gives tremendous opening of criminals to act Jensen and Anderson²². This theory emphasises on characteristics of the target and any opportunity occur of crime exist will be avoid by guardian of friends, relatives, neighbours and so on.

Trait theory: Trait theory was introduced by Lambroso, where the physical characteristics of criminals as one of the factors that cause crime. This theory was published by observation of the physical characteristics of prisoners and compare them with the physical features of the Italy's armies at that time. At the end of the remark, Lambroso found that there are different physical characteristics between the prisoners and the troops and this lead Lambroso concluded that biological factors as causes of criminal behaviour Siegel³⁷.

Trait theory also described the physical characteristics of the body that can classify a person as a criminal. Among the physical characteristics is the unusual shape of the face or head, large ears, thick lips, broad chin, long arms, wrinkled skin and extraordinary finger's length. A man will be labelled as a criminal if he has five characteristics as mentioned above, whereas for women only have three features of the above, it will be labelled as criminals McCrae and Costa²⁹.

Labelling theory: Kendell²³ found that the Labeling theory states that behaviours are begun with deviant

labelling by social control agents against a small number of individuals involved in acts deviant. Graven and Lerman²⁰ agreed that formal social agencies such as court, police, mental health treatment centres, and prisons are the cause of the terms, labelling as a "madman", "sick people", and "prisoners" existed among the community. Terms and names make the individual charged with the call have a bad record in the eyes of the society. Bad record given by the community to them will cause them to feel alienated. This segregation cause they are motivated to return to their world of crimes.

Contribute Factors: In crimes have many contribute factors that influence the crime occurred. Under this part will discuss that crime contributes elements based on university campus. In this paper will focus on five crime contribute factors as below:

Building Design: According to Clarke¹¹, the opportunities that exist based on the design of a building and the physical environment of an area could invite crime events to occur. A building may encourage crime when it provides an opportunity for criminals to enter into it quickly. Most of the crimes that took place in an area are driven by the availability of possibilities in implementing it. For example, crime is easier to happen when there is an opportunity for the offenders from getting caught or seen by the public such as a building with many routes can help an offender to escape. The building space that does not encourage good neighbouring can cause crime events like the burglary because the residents do not know each other. Through perception of residents, neighbourhoods are those who live next door or those who live near to us Taylor and Harrel⁴¹.

Activity and Lifestyle: The lifestyle and daily campus routine activities require the student to travels to and from the campus, walking to the library at night, parking in public lots, and socialised inside and outside campus area create opportunities to be a victim of criminalization. These lifestyle exposed students to criminal behaviour. Crimes are ignited by mainly three factors that present simultaneously at the same time. Those factors are the victim, the person that is motivated to commit the offence, and open opportunities to carry out crime. The daily student routine would able to provide the victim, and opportunities factor for a crime to happen.

Studies of crime in the campus stating that student has lower percentage compare to non-student within the same age to be crime victimisation, including overall

level of violence Becker et al⁴. Another study shows that thievery related to student properties has been the most famous crime that occurs in campus life Clarke¹¹. As victims know these offenders, many of them had not taken any precaution steps as they trust the offenders to watch and cares of their properties.

Environment: Many researchers have examined how and why crime occurs, especially as it relates to the physical environment. Medieval and classical cities found refuge in defensible space, long before the term was even coined, which can be observed in the way they walked their communities and places few entry gates. Cities in 18th and 19th century modified their built surroundings as part of major crime control efforts Dhiman¹⁵. In London and Paris, street lighting was introduced to reduce crime on the streets Brangtiham and Brangtiham⁷.

Adequate lighting in an area plays an important role; this is because proper lighting enables the environment clearly visible and can also help individuals to detect a crime happens more easily. Also, the researcher has proved that lighting has a close link with the fear of crime, this is due to poor lighting does not offer adequate lighting to allow conditions or hazardous environments such as being attacked by criminals detected earlier before the offence occurred. Poor lighting in some areas such as parking areas is more prone to crime to occur due to parking areas usually located away from the crowd, and the fear of crime is higher than in public places such as sidewalk where the lighting is poor Brownlow⁸.

Most findings showed consistent results where low light intensity level caused heightened fear. According to Kirk²⁴, there are two factors chosen by most of the respondents that expressed the environment was not safe when an area is dark (poor lighting), and there are also places that allow an attacker to hide. Also, there is also a study made by Loewen et al²⁷, where the study asked students to list the characteristics of the environment that they think are safe, that can avoid becoming a victim of criminals. Most listed features to ensure a safe environment is light followed by open spaces as well as access to real protection.

Security: Installation of CCTV system is intended to prevent crime and disorder where it can prevent crime through surveillance. According to Bennett and Gelsthorpe⁵, CCTV can give assurance to the people about their safety while in public areas and reduce the fear of crime and at the same time can increase the use

of public space. Through an evaluation program that has been made about the effectiveness of CCTV installations in particular areas such as residential areas, parking, elevators, shopping malls and other results obtained is crime rates decreasing compared with areas without CCTV installation.

Security also can be enhanced by placing a security guard in the student hostel. According to Fischer et al¹⁸, the placement of safety guard nearby to the student hostel can reduce crime where offenders or the students themselves are afraid to commit crime or immorality as they worried their actions being seen and the risk of being caught is high. Furthermore, the offences in student dormitories such as burglary, fights, bring in an outsider, property theft and so on are easier to known and can be resolved fast when there are security guards in charge or control near the hostel Brownlow⁸.

Security checks should be enhanced at the female hostel due to female students are more likely to become victims of crime Schreck and Miller³⁶. Usually, offenders prefer their victims to commit crimes are women compared to men, it is because women are weak and they are unable to defend their self to fight criminals. Women who are victims of crime usually prefer to remain silent or concealing the crimes on them instead of reporting to the police Weiss⁴⁴.

Resident's Behaviour: The behaviour of the population is among the contributing factors of crime on campus. According to Narawian and Syawal³¹, students are subjected to the Universities Act and University College Act, so students should know what can they do and what they cannot do on campus. It is an offence to be in the lecture hall after class time and is prohibited together with a partner (couple) in the dark area.

Students should think wisely before taking any actions or decisions. They should be more sensitive to the Universities Act and University College Act so that cases like theft and aggression can be overcome. To prevent crime and avoid becoming a victim, students must be more vigilant and careful with the environment and do not go out alone at night.

Table 1 present crime contribute factors based on the previous research. Most of the researcher discuss five crime contribute factors namely design, activity and lifestyle, environment, security and resident's behaviour. This finding will be used in the study of real crime factors in the university campus.

METHODOLOGY

This study applied a quantitative method. Therefore, a set of the questionnaire had been developed as a research instrument. The question has been designed based on the literature findings. In developing the survey, the question that is made must be straightforward, short, simple, easy to understand and avoid any sensitive issues. The most important thing is, the question that had been developed must not take a much time for respondents to answer. A total population of student Universiti Sains Malaysia is about 30 000 and the sample size is about 390 students. The sample size based on the determination of sample size by Krejcie and Morgan²⁵. After the data collection and data cleansing, the whole data that were used in this research is 173. Besides, this study used probability sampling. According to Archer et al³, probability sampling is a sampling technique in which every member of the population has a chance to be selected as respondent. Therefore, its reason this study used this kind of technique sampling.

RESULTS AND DISCUSSION

Based on the descriptive analysis that has been carried out, Table 2 shows the factors that contribute to crime incidents in USM Main Campus in descending order. From studies carried out, its indicate that the security factor as the key element to the crime incidents with the highest mean value (m=4.2890, std=0.47709).

The weak security controls induced the crime due to the opportunities obtained by the criminals to carry out their activities. Lack of patrols by security guards at night, especially in areas that are quiet, located far from the public, may cause it to become the target of criminals. This finding clearly shows that its equivalent with finding by Brownlow⁸ which the placement of security guard nearby to the student hostel can reduce crime where offenders or the students themselves are afraid to commit crime or immorality as they worried their actions being seen and the risk of being caught is high.

Followed by the environment factor as the second critical factor lead to crime occurrence with the mean value (m=4.0684, std=0.51462). This factor becomes main factor during at night which people difficult to control after their eye. Before the crime is carried out, the criminals will evaluate first the potential risks and rewards they get by performing illegal activities. This finding in link with Day (1994) and Sloan et al.(2000).

The third factor could encourage to crime incidents is resident's behaviour with the mean value (m=4.0048, std=0.60185). While, the fourth factor is activity lifestyle with the mean value (m=3.8116, std=0.55099). The last factor that is believed only contributes a small percentage to crimes is design element with the mean value (m=3. 6262, std=0.60705).

All the crime contribute factors namely security, environment, resident's behaviour, activity lifestyle and

design should be the main agenda in making of crime policy in the university campus. Its will support the system of education because the students will develop their life without prejudice with safety system in the university.

Table 2: Crime Contribute Factors in Campus of Universiti Sains Malaysia

Factors	N	Mean	Standard Deviation
Security	173	4.2890	0.47709
Environment	173	4.0684	0.51462
Resident’s Behavior	173	4.0048	0.60185
Activity and Lifestyle	173	3.8116	0.55099
Design	173	3.6262	0.60705

CONCLUSION

The crime contributes factors will influence students in choosing the right university for their four years study life. In this found that five crime contribute factors namely security, environment, resident’s behaviour, activity and lifestyle and design. The first factor based on this research finding is security, this factor related with the system that implements in university to take care of students in their campus. The university should rethink about their security system because it become the important elements in providing the first class education environment. This finding also related to the university policy, how they plan to make their student live in comfortable and feel safe. This finding could aid universities to improve their facilities towards students safety.

ABSTRACT

The purpose of this study was conducted to assess the validity and reliability of this research instrument using the Rasch Measurement Model (RMM). This instrument will be used to measure the factors that influences young consumers towards sustainable clothing disposal behaviour. The respondents consisted of 45 students of Fashion and Textile Design Course (SRFT) and there were 43 likert scale items with five sub-constructs which are attitude, awareness of environmental issues, controlled behaviour, social norms, and social action. Therefore, Winsteps 3.73.0 software was used to analyse the reliability of the items and respondents, the separation index of items and respondents, polarity of items, items suitability, difficulty level of items and item mapping. The findings showed that the reliability index of item is 0.89 and respondent is 0.99. The results also indicate that 9 out of the 43 items were misfit due to unfulfilled the conditional value of PTMEA CORR and Infit/Outfit MNSQ and these items need to be improved after consulting with the experts. Based on the research findings, it was evident that the items are quite good, acceptable and valid to be used. Apart from this, this research also intended to create awareness among the community regarding the importance ways to dispose clothing products.

Keywords: *Clothing disposal behavior, young consumer, rasch measurement model, validity and reliability.*

INTRODUCTION

Nowadays, clothing product is the most important asset of consumers (Lang, Armstrong & Brannon²⁷) especially for the younger generation consumers that are more interested to keep up with the latest fashion trend (Wai Yee, Siti Hasnah, & Ramayah⁴⁵; Saeid, Asghar, Asadollah, & Parviz⁴⁰). However, the rapid growth of the fashion and textile industry contributed towards alarming wastage of clothings and environmental pollution (Najdah, Marhana, Khatijah, & Shafiek³⁴; Arasinah, Suriani, & Zaliza¹). In western countries, the issue that is related to disposal of second-hand clothing is one of the serious issues. This problem has been discussed in some previous studies by Cruz-Cardenas, Gonza'lez, and Gasco¹⁶; Xu, Chen, Burman, and Zhao⁴⁷; Lang et al²⁷; Bianchi and Birtwistle⁹ and others. Not only that, Malaysia is also experiencing the similar problem (Lee, Ghozali, & Zulkifli²⁸; Wai Yee et al⁴⁵). However, in Malaysia this issue has not been taken seriously yet. This can be proven by the statistics issued by the

National Solid Waste Management Department in which Malaysia has produced approximately 8.4 million tonnes of solid waste per year and 4% of solid waste is made up of clothing and textiles (Wai Yee et al⁴⁵).

The unlimited production and usage of clothes also raises questions regarding how Malaysians practice sustainable clothing disposal behaviour in order to reduce the environmental pollution (Najdah, Marhana, Khatijah, & Shafiek³⁴). Some consumers threw their clothing directly into waste bins without thinking about the consequences of their action. This is because they have no clear understanding that this irresponsible behavior could bring negative impacts toward their daily lives (Wai Yee et al⁴⁵; Farah, Arasinah, Rahimah, Asliza, Rodia, & Baity²⁰). Thus, it is really crucial to create awareness among the public especially young fashion designer regarding the importance of disposing second-hand clothing in environmentally sound manner. Students of fashion majors are students who are more susceptible to the development of the fashion world. According to

Bianchi & Birtwistle⁹, fashion students are also known as young fashion designers. Therefore, they are said to be more susceptible in having the latest fashion and will dispose of clothes in a short period of time.

Other than that, second-hand clothing can be recycle or redesign to make a new product. This process will need some human labour. Thus, not only this method can solved the issue of increasing clothing wasted, but it also gives opportunities for citizen to create a new job. Based on the International Labor Organization's report, 200 million people in the world are unemployed and 75 million are made up of young people aged between 15-24 (Zanariah⁴⁸). Therefore, to help achieve the government's target of creating 60% of new jobs to meet the needs of TVET skills (Zanariah⁴⁸), this study was able to open the minds of young fashion designers that second-hand clothes not only can be donated (Laitala²⁶), but can even be recycled (Ekstrom & Salomonson¹⁹), redesigned into a new exclusive costume (Rahman & Gong³⁷), and this redesigned clothing can be sold (Bianchi & Birtwistle¹⁰) at high prices. Indirectly, these behaviors can help to create jobs opportunities and generate their daily income as well as generating highly skilled human beings, in line with the aspirations to be achieved in 2020 (Eleventh Malaysia Plan¹⁸, RMKe-11). Therefore, in order to ensure that the items adapted from literature reviews are able to measure accurately the factors that influences young consumers towards sustainable clothing disposal behaviour, RMM that was founded by Rasch³⁸ was used to provide empirical evidences regarding the validity and reliability of this instrument, so that it can be used in the real study.

Validity defines the level to which an instrument used in a research is able to measure what it is supposed to measure and maintain the accuracy of the instrument by protecting it from flaws (Hair, Black, Babin, & Anderson²³). According to Arasinah, Suriani, Zaliza, Che Ghani, & Rahimah² and Fraenkal and Wallen²², a researcher must validate the instrument so that the items are defensibility, accuracy, appropriateness, meaningfulness, and usefulness. In this research, the researcher chose content validity and construct validity in order to determine the accuracy and validity of this instrument.

Content validity is the measurement of the items in the instrument to ensure that those items indeed measure the intended construct. According to Creswell¹⁵, high content validity is based on the ability of the items that

have been developed, modified, or adapted to measure the intended construct precisely. Content validity is assessed by expert review. In this research, a total of three expert panels from the fashion field were appointed to determine the content validity and evaluate the items present in the questionnaire. The research selected the expert panels based on their expertise and experience in the fashion field. They were tasked to check the research objectives and provide comments on whether the adapted and modified items in the instrument are parallel with the research objectives and suit the Asian culture. As for the construct validity, the researcher utilised RMM to measure whether the adapted and modified items are suitable and fit to measure the intended construct. The analyses used to determine the construct validity were items' polarity, misfit of items, and items' map.

Reliability is the consistency that measures the variables of the research instrument and provides the degree of consistency and accuracy of the research instrument (Arasinah, Rahimah, Ab. Rahim, & Zaliza³). An instrument that has high reliability level produces the same result every time the instrument is used. There are three types of measurement and ways that are normally used to determine the reliability of an instrument which are sequential measurement, simultaneous measurement and internal consistency measurement (Cooper & Schindler¹⁴). In this research, the researcher determined the reliability by using internal consistency measurement utilising Cronbach's Alpha (α) coefficient.

Marnburg and Luo³² stated that α coefficient can be used to determine the reliability of a research instrument with multiple scales such as Likert, Thurstone, Guttman atau Semantic Differential, and Kuder-Richardson (instruments which has dichotomy). The reliability coefficient value must be between 0 and 1.0. When the coefficient value nears 1.0, the instrument is said to have high reliability (Arasinah et al⁵). In relation to that, this research was carried out to determine whether the items of this instrument measure the constructs of factors that influence clothing disposal behaviour. RMM also was used to produce empirical evidences regarding the validity and reliability of this instrument because this model is able to measure the consistency of a construct.

THE AIM OF RESEARCH

Generally, this research intended to measure the validity and reliability of items in this factors that influence

clothing disposal among SRFT students questionnaire. Sub-constructs involved in this research are attitude, awareness of environmental issues, controlled behaviour, social norms, and social behaviours. In this research, RMM was used to measure the reliability and separation index of items and respondents, the separation rate of items and respondents, polarity of items, item suitability, difficulty level of items and ability of the respondents.

METHOD OF RESEARCH

This research was carried out in Faculty of Art & Design, Universiti Teknologi Mara, Shah Alam. Cooper and Schindler¹³ stated that the need number of samples are around 25 to 100, meanwhile Johanson and Brooks²⁴ opined that there needs to be at least a minimum of 30 samples for a research. Thus, the researcher determined that the number of samples needed for this research was 45 students from UiTM Shah Alam using the simple random sampling technique. The questionnaires were distributed to 45 research samples by meeting them face-to-face. All the questionnaires were collected and all were completely answered.

This research used the instrument with Likert scale which were from 1 (Strongly Disagree) to 5 (Strongly Agree). A total of 43 items were modified and adapted from past researches by (Wai Yee et al⁴⁵); Zala Zurga et al⁴⁹; Taljaard⁴¹; Bianchi & Birtwistle⁹; Thompson & Tong⁴⁴; Azah³⁵; Chen & Chai¹²; Awuni et al⁷; and Lang et al²⁷. The main construct of this research was factors that influence clothing disposal behaviour and sub-constructs were attitude (5 items), awareness of environment (23 items), controlled behaviour (6 items), social norms (6 items), and social action (3 items). The number of items was deemed sufficient to measure the validity and reliability of the items because in the study of Khotimah and Sri²⁵, the researcher tested validity and reliability of items using RMM for only 20 items.

ANALYSIS AND DISCUSSION

In order to test the quality of the items in this instrument, the instrument’s validity and reliability were measure using the RMM with Winsteps 3.73.0 software. The RMM was used to (i) test the reliability and separation index of items and respondents, (ii) detect the polarity of items, (iii) determine the items’ suitability, and (iv) determine the difficulty level of items and ability of the respondents.

Reliability and Separation Index of Items and Respondents: Reliability refers to how far an instrument is able to produce the same or similar score when it used repeatedly (Arasinah et al²). When an instrument used on same samples but at different times produces same or similar scores, that particular instrument is said to have high reliability value and if the scores produced are different, the instrument is said to have low reliability value. Fisher²¹ classified the value of reliability when used RMM between 0.81 and 0.90 as good, 0.91-0.94 as very good, and best is 0.94. Devellis¹⁷ and Pallant and Tennant³⁶ stated that the minimum reliability value that can be accepted is 0.70. According to Bond and Fox¹¹, good reliability value when using RMM is between 0.70 and 0.89 and very good is between 0.90 and 1.0. Separation refers to the level of respondents’ consent distribution and good value of separation is between 3 and 4, very good is between 4 and 5 and best is 5 (Fisher²¹). However, (Linarc²⁹) suggested that good separation value is 2 and above.

Table 1 shows the reliability and separation value of items and respondents. The pilot test data analyses showed that the respondent reliability value based was 0.88 and separation value was 2.75 while the item reliability value was 0.93 and separation value was 3.59. The showed reliability values proved that the items of factors that influence clothing disposal behaviour among young fashion designers were good, acceptable, and can be trusted to be used in real research. Once the values were rounded, the respondent separation value showed that there were three levels of respondent agreeableness while item separation value showed that there were four levels of agreeableness and according to Fisher²¹, separation value between 3 and 4 can be considered good.

Table 1: Reliability and separation index of items and respondents

	Person	Item
Reliability	0.88	0.93
Separation	2.75	3.59

Detect the Polarity of Item: Point Measure Correlation (PTMEA CORR) can be used to detect item polarity (Mad Noor³¹). The purpose of detecting item polarity is to ensure that the items are parallel in measuring the intended construct (Arasinah, Rahim, Ramlah, & Soaib⁶; Linarc³⁰). On the contrary, if the PTMEA CORR value

is negative (-), the items do not fulfil the criteria of the measured construct and it is deemed that the items or individuals provided responses conflicting with the sub-constructs. Thus, those items and individuals need to be eliminated or modified (Ruhizan, Faizal, Ridzwan, Azmi, & Mohd Bekri³⁹).

Based on the Table 2, there were two items that showed negative PTMEA CORR values which were N6 and TLK1 while other items showed positive PTMEA

CORR values. Item N6 and TLK1 that produced negative PTMEA CORR values were repaired because did not fulfil the construct criteria. Apart from that, there were three items that had positive PTMEA CORR value but the values were too low which were K19, K7, and S2. It may mean that these items were hard to comprehend by the respondents and it lead to conflicting responses. The item that had the highest PTMEA CORR value was TLK2 and according to Linacre³⁰, this value showed the ability of an individual to distinguish the said item.

Table 2: Item polarity based on the PTMEA CORR values

Entry Number	PTMEA CORR	ITEM	Entry Number	PTMEA CORR	ITEM

(PTMEA CORR = Point Measure Correlation)

Detecting Misfit Items: Infit Mean Square (MNSQ) is used to detect mismatch of items (Arasinah et al³; Ruhizan et al³⁹). The purpose of this is to ensure that the items in the instrument fulfil the construct criteria. According to Arasinah et al⁶, for items with Likert scale, the range of item fit that is acceptable is between 0.6 logits and 1.4 logits while Wright and Linacre⁴⁶, suggested that acceptable item fit range should be between the range

of 0.5 logits and 1.5 logits. A value of 0.6 and lower shows that the item overlaps other items (Linacre²⁹) while 1.4 logits and above shows that the items are not homogenous with other items in one measurement scale (Arasinah et al⁴). According to Bond and Fox¹¹, the value of Infit ZSTD should be between -2 and +2. However, if the value of Infit Mean Square (MNSQ) is acceptable, the Infit ZSTD value can be ignored (Linacre²⁹).

Based on the Infit MNSQ values suggested by Wright and Linacre⁴⁶, Table 3 shows four misfit items out of 43 items that measured factors that influenced clothing disposal behaviour. No items showed Infit MNSQ value

of 0.5 and lower and items that showed Infit MNSQ values of more than 1.5 were TLK1, N6, S2, and K19. The items that did not fulfil the requirements of Infit MNSQ values were repaired after consulting the experts.

Table 3: Item Misfit based on the MNSQ values

Determine the Difficulty Level of Item and Ability of Respondents: The RMM is able to help the researchers to measure the difficulty of the items and ability of the respondents. In order to measure whether the adapted and modified items were parallel with the ability of the respondents, item map is used (Azrilah & Azami⁸). The dotted lines on the left show the position of the respondents involved in this study while the dotted lines on the right showed the items' position.

Upper part of the left map shows the position of respondents with high ability in answering the questionnaire while the upper right of the map shows the highest level of item difficulty. Figure 1 shows the level of item difficulty and ability of respondents towards the 43 items.

Based on Figure 1, most of the respondents were in between the min value of logit 0 and 4.45 for ability of respondents, which is almost nearing the min value of logit 0 determined for the items. This mapping describes that most of the individuals has high ability in answering the questionnaire items. It can be observed that the toughest item (TS1) was positioned at the top of the scale and the easiest item (K14) positioned at the bottom of the scale.

DISCUSSION

In order to achieve the standard validity and reliability of items using RMM, there are a few conditions to be fulfilled during the implementation of item checking. If the item did not fulfil the determined conditions, the researcher must refer back to the experts to determine whether the item needs to be eliminated or maintained (Arasinah et al³).

Based on the analyses, the item reliability value for the constructs of the factors that influence clothing disposal behaviour is 0.93 which is classified as very good while the respondent reliability value was 0.88 deemed good. These findings are parallel with the findings of Fisher²¹ and Bond and Fox¹¹ in which the reliability value between

0.81 and 0.90 considered good while value between 0.91 and 0.94 considered very good.

The item separation value of the 43 items was 3.59 and this is categorised as very good. This finding showed that the items modified and adapted can be divided into four strata. The separation value for the 45 respondents was 2.75 which is good and shows that the ability of the respondents can be divided into three strata. Thus, this research found that the separation values were inlined with Fisher²¹ in which the value between 3 and 4 is considered good and any value between 4 and 5 is very good. The reliability and separation analyses of the items and respondents showed that the items in this instrument can be trusted and able to measure the factors that influence clothing disposal among students.

Apart from that, the research found that there were two items which produces negative PTMEA CORR values while other items produced positive PTMEA CORR values. However, there were three items that produced positive PTMEA CORR values but the values were lower than 0.3, thus needed to be repaired because did not fulfil the criteria of the construct. This is corresponding with Ruhizan et al³⁹ who stated that whichever item that did not fulfil the criteria needs to be eliminated or repaired to ensure that the item able to measure the intended construct. Meanwhile, the Infit/Outfit MNSQ values of the items showed fit values between the range of 0.5 logits and 1.5 logits as suggested by Wright and Linacre⁴⁶. However, there were four items that showed Infit/Outfit MNSQ values of more than 1.5 logits. According to Arasinah et al⁶, these items need to be separated for modification.

Moreover, by using RMM, the researcher was able to identify the level of item difficulty and the ability of the respondents in answering the questionnaire. Based on the item map analysis, it described that there 10 respondents who are highly able to answer the items in the questionnaire and there was no respondents with low

level ability. The easiest item was K14 with a value of -1.48 logits and the hardest item in the instrument was TS1 with a value of 1.59 logits. Table 5.0 shows the summary of the items that did not fulfil the criteria of RMM usage and these items were repaired according to the needs of the research context.

Figure 1: Item map for constructs of factors that influence clothing disposal

CONCLUSION

First of all, the authors wish to acknowledge their gratitude to the anonymous reviewers who gave freely time and effort, constructive recommendations that enhanced the value of this manuscript. The authors also would like to express their deepest thanks and appreciation to all the farmers of Turatea Distric who participated in the interview research. Special thanks go to Jeneponto Government, Bappeda Jeneponto and Hasanuddin University for supporting the studies of the authors that enabled them to conduct this research.

ACKNOWLEDGMENT

The author gratefully acknowledges Universiti Pendidikan Sultan Idris for the funding of the project GPU (University Research Grant). The author also acknowledges the constructive comments received by the anonymous reviewers.

Ethical Clearance: Taken from the committee

Reflection on Teaching ‘Statistics in Education’ for Postgraduates Students

Arsaythamby Veloo¹, Hariharan N Krishnasamy¹, Ruzlan Md. Ali¹

¹*School of Education and Modern Languages, Universiti Utara Malaysia, Malaysia*

ABSTRACT

Many countries are taking efforts to review the way statistics is being taught so that it can be mastered. Malaysia is no exception and recognises that statistics is a challenging subject to teach. Generally postgraduate students perceive it to be a difficult subject. Negative perceptions of statistics involve a complex set of emotional reactions which is likely to cause considerable discomfort and results in unfavourable consequences such as apprehension. The purpose of the study is to explore students’ initial perceptions of statistics and subsequently throughout the class for one semester for the subject “Statistics in Education”. This study uses qualitative methods comprising focus group interviews and individual face-to-face interviews. 24 postgraduate students enrolled in a Masters of Education program for the subject Statistics in Education at a public university participated in this study. Focus group interviews were conducted for duration of one hour per group in two groups of 12 students each. Based on the findings, students felt that knowledge of mathematics was an important prerequisite to perform statistics and to understand statistical concepts. Initial perceptions of statistics are related to calculation, memorizing formula, mastery of additional mathematics and in-depth contents, fear and anxiety, as well as a lack of interest. However, during class, it was felt that although the subject was difficult, the appropriate teaching approach made the students more confident and less burdened because they were asked to recap what had been taught during the previous lesson. The preferred characteristics of teachers and the teaching process in “Statistics in Education” involves the teaching approach, questioning techniques, relevance to daily life, interaction, humour, monitoring, being knowledgeable and patience. The implication of this study is that although statistics is perceived to be a difficult subject, appropriate teaching methods and pedagogical practices that emphasize outcome-based education need to be observed.

Keywords: *Statistics in Education, negative perception, initial perception, class perception, postgraduate students*

INTRODUCTION

Similar to educational trends in many advanced countries, teaching and learning at the Institutions of Higher Learning (IPT) in Malaysia focus on Outcome Based Education (OBE) (Ministry of Higher Education¹³). The alignment of teaching and learning activities, assessment and learning outcomes helps to optimize learning outcomes. In order to achieve this objective, lecturers must first master the learning outcomes of study programs, courses and related subjects. Constructive alignment is done to ensure that teaching and learning activities and assessment tasks are in line with the mastery of learning outcomes in a course. Constructive alignment can be achieved by using the Structure of the Observed Learning Outcomes known as the SOLO taxonomy (Biggs & Tang³).

In general, to accommodate teachers who come from various disciplines and diverse backgrounds, there is a need for teaching strategies that are more specific to a particular domain (Lee & Picanco¹⁵). Thus, Lee and Picanco propose that there are three stages required to plan lessons, namely, (i) the goal or objective of the teaching and learning be aligned with the different phases of learning, (ii) different teaching methods that are suitable depending on the learning phase, and (iii) focused assessment on different types of measurement depending on the contents of the subject being taught at each phase of learning. The learning phases include acquisition, proficiency, maintenance, and generalization. Hall, Meyer, & Rose¹¹ believe that all students learn the same concepts or skills but with different levels of preparation according to the learning phase.

Based on the OBE approach, there is a set of beliefs and assumptions about learning and teaching in which learning can occur in depth (Arter&Chappuis¹; Carey&Gregory⁴). An important assumption in the OBE approach is the belief that all students are capable of learning. However, teaching institutions determine performance expectations and results at the end of the learning experience. Teachers can be empowered to make changes to learning approaches from being confined to a teacher-centred activity to one that combines the teacher and learner centred approach to optimize the learning experience.

Within the broader fields of knowledge, the knowledge of statistics is widely used in academia. However, statistics' teachers or lecturers often face the challenges on how to reduce anxiety and enhance the learning of statistics among their students (Chiou, Wang, & Lee⁵). Furthermore, according to Onwuegbuzie and Leech²¹, the anxiety related to statistics could lead to a negative perception of statistics among students, and also be considered as a major obstacle to obtaining a 'degree'. The findings of Onwuegbuzie²⁰ provide evidence that statistics anxiety involves a complex set of emotional reactions which is likely to cause considerable discomfort or discomfort at a high level and results in severe consequences such as apprehension, fear, nervousness, and panic that hinder learning

The literature review suggests that fear, anxiety or apprehension about statistics is inversely connected with learning (Teman²⁵). In related studies to determine students' expectations and learning experiences on statistics, Ruggeri, Dempster, Hanna, and Cleary²⁴ found that poor communication with course instructors as well as concerns over failure in the course were the main reasons for statistics' anxiety. Onwuegbuzie²⁰ had categorized statistics' anxiety as "state anxiety". This refers to a temporary state of anxiety because of a particular situation. Since 'state of anxiety' is a reaction to an external situation, the situation can be improved. Such anxieties can be overcome and removed (Richardson & Suinn²²).

Statistics is a challenging subject to teach at any level of education. It can be seen that many students enter statistics courses with negative attitudes (Tremblay, Gardner, & Heipel²⁶) and uncomfortable levels of statistics anxiety (Onwuegbuzie, Slate, Paterson, Watson, & Schwartz¹⁹). However, research has also been conducted to investigate how stress, anxiety and other apprehension can be reduced so that students are able to engage positively with statistics in a meaningful manner (Morgan¹⁷; Morris, Joiner, & Scanlon¹⁸). Zeedyk²⁸

provides an example of an empirical study in which second and third year undergraduate psychology students were given a class exercise on statistical reasoning that was based on the analogy of police detective work. A handout was used that was written in a humorous style. The initiative was shown to improve performance on an assignment for students who were given the handout in comparison to students who did not have access to the handout. Another example of an empirical investigation is provided by a study by Berk and Nanda² in a graduate biostatistics course. Using a pretest-posttest control group design, the researchers examined the effects of humor in an examination on exam performance which yielded positive results.

Finally, it can be said that various countries are taking efforts to review the way statistics is being taught so that it can be mastered. For example, in New Zealand, educators consider statistics as at a critical juncture and call for new approaches to teaching statistics to reach new groups of learners and facilitate statistical understanding in fundamentally new ways (Wild, Pfannkuch, Regan, & Horton²⁷). The American Statistical Association (GAISE K-12 Report⁸; GAISE College Report⁹) and leading statistics educators (Cobb⁶; Rossman²³) emphasise the need for reforms in the way statistics is conceived and taught. Studies that have focused on revising traditional methods of teaching statistics, suggest changes which should be implemented to enable students to receive training which is both up-to-date and relevant to society's needs. The major directions of the statistics education reform movement involve (a) pedagogical reforms toward development of conceptual understanding and teaching to statistical thinking and reasoning; (b) changes in the content of statistics courses, especially introductory level courses; (c) improving the instructional techniques used in statistics courses; and (d) integration of technology and computer-based methods into teaching statistics as an important tool for effective delivery of teaching and essential part of effective pedagogy (Garfield & Ben-Zvi¹⁰).

An important aspect of effective pedagogy is active learning. Enquiry-Based Learning (EBL) is an active form of learning that arises out of a structured process of enquiry within a supportive environment, and which is designed to promote collaborative and active engagement with problems and issues (Lancaster¹⁴). EBL is an empowering, predominantly student-centred approach to learning and teaching with benefits for subject learning (Deignan⁷; Metz¹⁶). The flexibility of the method allows for the development of a range of student abilities and skills in areas including initiative, critical judgment, openness, creativity and independence of mind (Kahn, & O'Rourke¹²).

Researcher's own experience on teaching and learning in the Statistics in Education course: The Statistics in Education course is a core course for students enrolled in the Masters of Science in Management, Masters in Education, Masters in Applied Linguistics and Masters of Arts in the School of Education and Modern Languages. This course was introduced to equip Masters' students with data analysis techniques using the SPSS software. This course has been offered since 1998. However, until now, there is an irrational fear coming close to being a phobia and also uneasiness among students taking this course. In fact, some of these students suffered high levels of anxiety when they attended this course.

Students who attend this course come from different academic backgrounds and areas of specialization at the undergraduate level such as English, Linguistics, Literature, History, Islamic Studies, Mathematics, and Science. Thus, the course must accommodate students from various disciplinary backgrounds. In addition, this course is very valuable and meaningful because it introduces the study of statistics which provides the knowledge for students to apply in their research work. Nevertheless, there are several reasons for Masters' students to enrol for this course. Among the main reasons is that it is compulsory and they need a minimum pass. This shows that the enrolment in the statistics course cannot be based on the assumption that students are motivated to appreciate the science of statistics or it can be used in the research that they undertake. In other words, statistics is not seen beyond a compulsory course in the curriculum.

The researcher's own observations provide insights regarding students in the teaching and learning of Statistics in Education. Upon reflection, the researcher has noted that there are students who are still unable to successfully apply theories learned in real life contexts. There are sections of the statistics students who have a poor conceptual understanding of important statistical concepts and hence unable to apply these concepts in real life situations. There are also students who make the misguided assumption that this course requires a high level of mastery in the field of Mathematics and requires high levels of computational skills to solve complex problems.

Researchers' feedback (who is an instructor himself) received from those who have been appointed as supervisors for the research project under the Master's program indicate that there remain many unresolved challenges. For example, supervisors feel that there are students who are less familiar with the concepts and technical terms in statistics, such as the meaning of "relationship"; "difference"; "effectiveness"; and

"impact". Supervisors also receive complaints from students that they still cannot perform the quantitative data analysis. In relation to data analysis, some students are able to frame research questions correctly but unable to choose appropriate methods of analysis. Furthermore, interpretation of results based on their findings poses many challenges for the students. Students are also not able to make connections between the statistical knowledge and real life applications or see the relevance of statistical concepts beyond the classroom. Finally, there is still a gap between the results of the analysis and writing it in the form of a final report based on academic conventions in the discipline. Even those students who are able to understand lessons taught during class are not able to translate this knowledge towards the completion of the report.

METHOD

This study uses a qualitative design involving data acquisition through individual interviews and focused group interviews. Data collection will be conducted in the first semester of 2015/2016 session. This study focuses on teaching and learning approaches as well as strategies (based on student-centred learning (SCL) conducted in the Computer Lab room. 24 students from one class in a public university participated in this study. They had enrolled in a master's program under the field of education and took the course on Statistics in Education. Students who enrolled for this course comprised Masters of Education students who specialised in English Language Teaching and Learning (4 students), Psychology in Education (2), Curriculum and Instruction (16), Instruction in Technology (2). The 24 students comprised 14 students who had taught in secondary schools and 10 students who had taught in elementary schools. Their areas of specialization included different fields such as English, Tamil, and arts.

This study used qualitative methods which included face-to-face interviews and focus group interviews. Focus group interviews were conducted in week 13 by a lecturer who specializes in the field of conducting interviews. Focus group interviews were conducted in two groups of 12 students each. These interviews lasted for duration of one hour per group. Focus group interviews were recorded, transcribed and analyzed according to the themes in the study. Video recordings were made during the statistics classes. Two officers from the centre did the video recordings. The recording took two hours per session, each time the classes were conducted. After the video recording, the researchers studied and analysed the videos based on the objectives of the study.

Student's responses and feedback were checked for validity and accuracy. Three students were randomly

chosen and their field notes were checked. Additionally, member checking was used to look through all the documents. Students were given the opportunity to look through the video recording and responses from the focus group interviews. Lecturers asked if they did a pilot study on the questions that they formulated.

FINDINGS

Initial perceptions of postgraduates on the statistics education course: This postgraduate course is compulsory for all masters in education students. The duration of the course is 14 weeks. It is a prerequisite before embarking on the master’s dissertation. The course contents include descriptive and inferential statistics. When the postgraduates initially enrol for the course, most feel that it is a subject they would like to avoid if they were given that option. Most feel that the name of the course suggests that it is highly mathematical involving manipulation of numbers and solving mathematical problems which require high levels of numeracy skills. There is a preconceived notion that only those who are good in mathematics will be able to perform well in the statistics course.

Before attending the statistics class, they shared some initial perceptions on the nature of statistics and what the study of statistics involved. Students felt that statistics was very much based on calculations and highly mathematical. A deeper knowledge of mathematics was seen to be a necessary prerequisite to perform statistics and to understand statistics, complex mathematical operations and abstract notions of mathematical equations. For example, “my impression was that the subject was on calculations and needed to be calculated”.

Additionally, students associated statistics with the ability to memorize formulae. For example, “before enrolling for the course, I understand that this course has calculations and I need to memorize a lot of formulas, need to interpret the data because I have attended this course during my first degree.” Closely related to this aspect were emotions not conducive to the learning of statistics such as fear and doubt. For example, it was stated that “... I was still in a state of fear and doubt because of the ideas that it was a calculation subject that included mathematics.” The calculations associated with statistics also resulted in students’ lack of interest in the subject. For example, it was said that “most students will not be interested in the course because of the calculations which will make them take a qualitative subject”. Nevertheless, students enrolled for the statistics course because it was compulsory.

Statistics was seen to be an equivalent of mathematics as a subject because several concepts are common to both, such as the mean, median, mode, and variance. For example, it was mentioned that “ before I signed up for the course, I understood that this course will teach about the median, mode, mean, variance, standard deviation and will be a continuation about what we have learnt before”. Since there were some terms that appear in mathematics and statistics, students tend to categorize statistics under mathematics and a difficult subject to master.

In summary there are six themes related to students; initial perceptions of statistics, namely (i) the calculation, (ii) memorizing formula (iii) mastery of additional mathematics, (iv) and in-depth contents (v) fear and anxiety, (vi) lack of interest. Table 1 shows a summary of the interview excerpts and explains each theme concerned.

Table 1: Initial perception regarding statistics in education

Bil.	Theme	Excerpts from interviews
1.	Calculation	before I enrolled for this statistics course, my impression was that the subject was on calculations and needed to be calculated
2.	Lack of interest	most students will not be interested in the course because of the calculations which will make them take a qualitative subject
3.	Mastery of additional mathematics	My perception, because I am from the arts, I do not have any experience studying additional mathematics. So, when I heard that the course was called statistics, I thought that this course was a calculation subject that included additional mathematics
4.	Fear and anxiety	When I signed up for the course I was still in a state of fear and doubt because of the ideas that it was a calculation subject that included mathematics.
5.	In-depth content	before I signed up for the course, I understood that this course will teach about the median, mode, mean, variance, standard deviation and will be a continuation about what we have learnt before. When I was in high school I understood that statistics was the graphic base for presenting data for using bar graphs, charts such as pie charts and I had a good understanding of statistics which has become easier for me and I was actually quite excited when registering for the course.

Conted...

6.	Memorizing formula	Before enrolling for the course, I understand that this course has calculations and I need to memorize a lot of formulas, need to interpret the data because I have attended this course during my first degree. So at that time, I felt that statistics was pretty hard and so when I registered for this course at the master's level. I thought that statistics will become more difficult at this stage.
----	--------------------	--

Post graduates perceptions of the class: Students were also asked to give their opinions about the teaching of the “Statistics in Education” course which they had followed during the semester. Upon completion of the course, students reflected on the classes and the lessons they had attended. The major finding was related to the teaching approach and its effect on the learning process and learning outcomes. It was felt that although the subject was difficult, the appropriate teaching approach made the students confident and less burdened because they were asked to recap what had been taught during the previous lesson. This practice was continually observed during the thirteen weeks. For example, it was stated that “... this course is quite difficult, but the approach that Dr. A has made the class confident, class felt confident because in each class Dr. A will begin with a reflection or a recap of what he had taught in class before. We also felt less burdened when throughout the 13 weeks we could follow this course properly although the course was quite difficult.”

In relation to the teaching approach, students felt that the questioning technique had a positive impact as it served as a constant checking mechanism so that students were attentive. Students had to be alert all the time. For example, it was mentioned that “... students cannot sleep or do something else because he loves to ask questions to the students. Therefore, students should always be prepared for any questions he will ask.” Students were also continually monitored during the lesson as “he would not sit in one place but he prefers to walk and observe the activities of students in the class”. This constant monitoring helped to ensure that students needed to be attentive in class. In addition to the fear of statistics, there was also the unwelcoming presence of Dr. A who seemed rather fierce with a big build and a thick moustache which enhanced his ferocious look. Initially, he did not smile and gave a very sober presentation of what was expected in the course. In addition to the fear of statistics, there was also the unwelcoming presence of Dr. A. Initially, he did not smile and gave a very sober presentation of what was expected in the course. Refer to Table 2 which provides a summary of the interview excerpts and explains each theme concerned.

Table 2: Characteristics of teaching the “Statistics in Education” course

No.	Theme	Excerpts of interviews
1.	Teaching approach	<p>Actually, this course is quite difficult, but the approach that Dr. A has made the class confident class, felt confident because in each class Dr. will begin with a reflection or a recap of what he had taught in class before. We also felt less burdened when throughout the 13 weeks we could follow this course properly although the course was quite difficult.</p> <p>Dr. A often repeats or recaps in the class that makes students understand better, for example, on this day he was teaching about ANOVA and in the following class he will start the class by repeating about the ANOVA which will make the students to better understand in greater detail.</p> <p>I prefer the repetitive method because sometimes in our class, we are not able to focus properly. So through this repetitive method, students are able to recall everything that he teaches.</p>
2.	Questioning technique	<p>In addition, in Dr. A's class, students cannot sleep or do something else because he loves to ask questions to the students. Therefore, students should always be prepared for any questions he will ask.</p>
3.	Relevance to daily life	<p>Besides, Dr. A also likes to associate every thing that he has taught with everyday life. So this method makes it easier for us to remember well all that he has taught well.</p>
4.	Interaction	<p>Dr. A also likes ‘two way communications’. If we have any doubts we can ask him and address our doubts immediately.</p>
5.	Humor	<p>Sometimes he will joke using the students answers and relate it to the student content. His jokes are funny and we enjoy it.</p>

Conted...

6.	Monitor	Sometime she would joke and throughout the time in the class he would not sit in one place but he prefers to walk and observe the activities of students in the class.
7.	Knowledgeable	Yes, whatever he wants to deliver is at his fingertips. He will give handouts in each class.
8.	Patience	He always took the time to teach us slowly and this made it easier for us to understand. And when it comes to the application, I can do it myself using SPSS software for final semester project. Through this course, I believe that this course will be of great help for my future projects.

Besides the approach, students felt that the teacher needed to be knowledgeable and supplement it with handouts. For example, it was felt that "... whatever he wants to deliver is at his fingertips. He will give handouts in each class." Additionally, the way the lessons were delivered was also important. For example, "he always took the time to teach us slowly and this made it easier for us to understand. And when it comes to the application, I can do it myself using SPSS software for final semester project. Through this course, I believe that this course will be of great help for my future projects." Thus, students appreciated patience as they were able to understand better and apply the knowledge later.

Students also perceived the interaction between the lecturer and the students to be helpful as they could resolve any problems. For example, "Dr.A also likes 'two way communications'. If we have any doubts we can ask him and address our doubts immediately." Humor was greatly appreciated in the interactions as they were not only funny but also educational. For example "Sometimes he will joke using the students' answers and relate it to the student content."

The relevance of statistics to daily life seemed especially important as students were able to better remember the concepts. The concepts were more easily understood rather than seen to be abstract or not applicable outside the statistics class. For example, "Dr.A also likes to associate everything that he has taught with everyday life. So this method makes it easier for us to remember well all that he has taught well."

DISCUSSION

Initial perceptions of postgraduates on the statistics education course: Most of the postgraduates share the perception that the statistics education course is highly mathematical involving manipulation of numbers and solving mathematical problems. In other words, statistics requires high levels of numeracy skills. The preconceived

notion is that a student must be good in mathematics to perform well in the statistics course. The findings in this study are similar to the findings in Onwuegbuzie and Leech's²¹ study which concur with many researchers that when students are challenged with concepts, questions, cases, teaching or tests on statistics, they are most likely to experience anxiety.

Prior to attending classes, the students shared some initial perceptions on the nature of the statistics course and what it entails. There was a general feeling among students that statistics was driven by mathematics and calculations. A deeper knowledge of mathematics or numeracy skills was perceived to be an important prerequisite to understand statistics and to perform statistical procedures. The way the lessons were delivered was also seen to be important. For example, "he always took the time to teach us slowly and this made it easier for us to understand". The importance of this pedagogical aspect is supported by Hall, Meyer, and Rose¹¹ who believe that all students learn identical concepts or skills but differ in their levels of preparation according to the learning phase. A typical response to the application is; "I can do it myself using SPSS software for final semester project. Through this course, I believe that this course will be of great help for my future projects." In general, there is a need to accommodate teachers who come from various disciplines or diverse backgrounds. Therefore, there is a need to introduce teaching strategies that are more specifically customised to a particular domain as suggested by Lee and Picanco¹⁵.

One quality that students truly appreciated in their lecturer was patience as the students were able to understand better and apply the knowledge they had acquired at a later stage. Students were of the opinion that interaction between them and the lecturers was helpful as problems could be resolved. Any doubts on content, statistical procedures or understanding concepts could be addressed immediately. Humor was greatly appreciated in the interactions with the lecturer as they were not

only funny but also facilitated learning as suggested by constructive alignment. Constructive alignment is observed to ensure that teaching and learning activities together with assessment tasks are in line with them as a way of learning out comes in a course (Biggs & Tang³).

Post graduates perceptions of the class: The major finding upon completion of the course was the pivotal role of the teaching approach and its effect on the learning process together with the learning outcomes. Students recognised that the subject was difficult, but the choice of an appropriate teaching approach made the students more confident, less stressed and less burdened. This is because they had to continuously recap what had been taught during the previous lesson. The importance of reducing stress is supported by Teman²⁵.

Furthermore, the teaching approach which extensively incorporated the questioning technique was well received by the students. Questions had a positive impact on the students' attentiveness as they were constantly on the alert and needed to respond. The questioning technique provided an effective mechanism to ensure that students were continually monitored. Constructive alignment is done to ensure that teaching and learning activities and assessment tasks are in line with the mastery of learning outcomes in a course. Constructive alignment can be done by using the Structure of the Observed Learning Outcomes known as the SOLO taxonomy (Biggs & Tang³).

Students also perceived the interaction between the lecturer and the students to be helpful as they could resolve any problems. If students had any doubts, they could ask him and address their doubts immediately. An important aspect of effective pedagogy is active learning. Enquiry-Based Learning (EBL) is an active form of learning that arises out of a structured process of enquiry within a supportive environment, and which is designed to promote collaborative and active engagement with problems and issues (Lancaster¹⁴). The relevance of statistics to daily life seemed especially important as students were able to better remember the concepts. The concepts were more easily understood rather than seen to be abstract or not applicable outside the statistics class.

IMPLICATION AND SUGGESTIONS

The name of the course, which is "Statistics in Education", could be interpreted by students from the arts stream as a course which is highly focused on statistical

calculations. However, such an understanding could be misleading as the content of the subject focuses on the 'interpretation' of statistical results which is obtained through the use of SPSS software package. Hence it can be likened with a misnomer and the name of the course could be changed to reflect more accurately what the course does. A possible name could be the "Interpretation of Statistical Analysis in Education." Since most of the students were part-time students, there is definitely more need for pedagogical guidance, assistance and support. This need is more evident because the field of statistics is challenging in the sense that students are not familiar with the discipline or inclined to think the way statisticians do. The study shows that students' perceptions has changed through the course as students felt that it was not another mathematics course. It is not really about mathematics and not as difficult as they had thought initially. The change of attitude will help students perform better in the paper. In addition to the fear of statistics, there was also the anxiety and stress induced by the physical presence of Dr. A. His introduction and sober presentation at the initial stage only added to their discomfort. This view changed quickly as the students came to realize that initial impressions could be deceiving. It was a matter of time that they came to appreciate that he meant well and intended to guide them through the course using the most effective methods they were comfortable with in the classroom. Thus, the role of the teacher is very important to bridge the gap between preconceived notions and the actual pedagogical practices.

CONCLUSION

In summing up, it can be said that one major problem faced by students at the early stages of the course was that they were unable to see the connection between the concepts learnt in class and their relevance to the realm of statistics in the world outside the classroom. There was a preconceived notion that statistics is learnt as a separate field of knowledge and has very little application in daily life. It was believed that it would be challenging for students as they are not able to see how the more complex statistical operations can be used in domains outside the classroom or how to benefit from the knowledge of statistics. The study has shown that such initial apprehensions on the subject "Statistics in Education" gave way to a more positive view on statistics and how it could be applied in real life as they progressed during the course.

Scientific Imperatives in Entailing the Legitimacy for Harm Reduction Approach to Drug Use: Reduction of HIV Incidence

Yusramizza Md Isa Yusuff¹, Mazita Mohamed¹

¹*School of Law, Universiti Utara Malaysia, Malaysia*

ABSTRACT

Harm reduction constitutes a significant approach which aims at decreasing the harmful consequences of drug use. The approach involves a range of measures including Methadone Maintenance Therapy (MMT) and Needle and Exchange Programme (NSEP) for lowering drug-related harms, particularly the Human Immunodeficiency Virus (HIV) infection. Considerable debate still exists, particularly in Malaysia on whether the local government should legitimise the harm reduction practice. The vehement criticism for the approach is that it is not actually effective in achieving the outcomes but merely implies an aid and promotion of drug consumption and hence should be banned. This article seeks to address the scientific bases for legitimising harm reduction approach. It examines the effectiveness of MMT and NSEP strategies on the subset of its outcomes, namely the decrease in HIV transmission and its scientific evidence. This article relies on data sourced from materials including published peer-reviewed research articles, books and reports. The analysis provided in this article suggests that the MMT and NSEP practice is justifiable based on its contribution to the control of HIV pathogen transmission. The available national and international evidence compellingly indicates that both interventions are effective in reducing HIV risk behaviours and the viral infection incidence among drug users. The outcome is unaffected by negative empirical data as there is a persuasive expounding explanation for them. The effectiveness of the interventions for reducing the blood-borne virus may be further increased by multi-integrated strategies. Moreover, considering scant local empirical findings, the efficacy of harm reduction interventions, particularly with respect to NSEP, warrants further research. It is critically vital for the scientific bases for harm reduction approach to be firmly sustained and articulated in law and policy discourse.

Keywords: *harm reduction, public health, HIV, drug policy, criminal law and justice*

INTRODUCTION

Harm reduction appears to be an integral approach that seeks to decrease the negative consequences associated with drug use. Public health community believes that individuals who pursue in consuming drugs may nevertheless minimise negative effects of the habit. Accordingly, the harm reduction approach engages various strategies including provision of methadone; a type of substitute drug and distribution of sterile needle and syringe for mitigating drug-related risks, particularly the Human Immunodeficiency Virus (hereinafter referred to as HIV) infection. The long history of the approach might be supported by the opiate prescribing practice in the United Kingdom since the 1920s. Yet, the concept was revitalised during the mid-1980s as a consequence of HIV/AIDS outbreak. The harm reduction approach in drug use context has rapidly developed

across all continents. In 2005, Malaysia started to echo the international initiatives of implementing harm reduction approach. Against the backdrop of high HIV cases driven by drug users, the government underscored the Methadone Maintenance Therapy programme (hereinafter referred to as MMT) and Needle and Syringe Exchange Programme (hereinafter referred to as NSEP) as integral interventions for curbing the spread of HIV among drug using population.

Considerable debate still exists, particularly in Malaysia on whether the local government should legitimise the harm reduction practice. The vehement criticism for the approach is that it is not actually efficacious in achieving the outcomes but merely implies an aid and promotion of drug consumption and hence should be banned. This article is devoted to address the scientific basis for legalising harm reduction approach.

It seeks to examine the efficacy of MMT and NSEP measures on the subset of its outcomes, namely the reduction in HIV transmission and its scientific evidence. This article relies on data sourced from materials including published peer-reviewed research articles, books and reports. The consideration to international and local literature provides clearer insights and basis for the arguments.

EFFECTIVENESS IN MITIGATING HIV RISK BEHAVIOURS

Notably, MMT and NSEP are considered important strategies when seeking to restrain HIV spread through syringe use, by providing substitute drugs and adequate sterile syringes to drug users. The underlying prediction is that, as a consequence, drug users will no longer take part in syringe-related HIV risk behaviours including sharing, lending, borrowing and reusing of syringes and needles, thereby avoiding HIV infection.

An impressive volume of studies from many jurisdictions, including Malaysia, contain evidence regarding the actual efficacy of MMT and NSEP for HIV risk behaviours. There is research available that has discovered the relationship between MMT attendance and reduced HIV vulnerability (Wong and Lee et al⁵⁵; Gill and Sulaiman et al¹⁷; Zhao and Holzemer et al⁵⁸). In a study of long-term outcomes of MMT among 2662 participants in China, Wang and Wei et al⁵¹ found that the MMT attendance had a positive association with reduced illicit drug consumption and related risk behaviours. Findings are also documented by Karki and colleagues' (2015) systematic review and Macarthur and colleagues²⁹ meta-analysis of multiple studies in Asia, Europe and North America. Although it is remarkable that vast studies from various countries reveal similar findings on the beneficial impact of MMT on risk behaviours, opponents still invoke negative or neutral research results to propose a contradictory outcome. A study in a Malaysian hospital found that most of the subjects continued with HIV risk behaviours despite their MMT use (Ramli and Nora et al⁴⁰). A study by Van Ameijden and others⁴⁸ in Amsterdam found negative or no benefit of 'low threshold' MMT in mitigating risk behaviours. Some research has reported no difference between attendees, post-attendees and non-attendees of MMT programmes in needle-borrowing and lending (Baker and Kochan et al³). Arguably, these negative or mixed findings are limited exceptional cases that are

insufficient to exclude conclusive evidence on MMT efficacy from larger positive empirical data sources.

Further, the outcome of risk behaviour reduction is achievable via NSEP use. Theoretically, NSEP may affect diminution in patterns and time of syringe circulation. This is accomplished by adding more new syringes per IDU over a particular time period and increasing the volume of syringes evacuated from circulation through exchanging practice. Thus, the time for risk behaviours, including contaminated syringe sharing and reusing and the presence of used injection items in public settings, are possibly lessened, thereby decreasing HIV spread. The theoretical causality is confirmed by practical data in Malaysia and other countries regarding NSEP effectiveness. Numerous studies demonstrate the decrease of self-reported risky behaviours among NSEP clients (Bluthenthal and Kralc et al⁴; Zamani and Vazirian et al⁵⁷; Kerr and Small et al²⁴; Burt & Thiede⁷). The WHO comprehensive assessment discovers 'detectable impact (of Malaysian NSEP) on reducing needle and syringe sharing among Injecting Drug Users' (hereinafter referred to as IDUs) (World Health Organization (Western Pacific Region) & Ministry of Health Malaysia⁵⁶). The WHO review of NSEP found convincing evidence for the protective effect of NSEP against drug-related risks. The review found that most (23) of the 29 studies located showed results confirming the NSEP efficacy. There was only one piece of research finding negative outcomes and five studies reporting no effect (Wodak & Cooney⁵²). All evidence strongly shows the NSEP's outcome to lower HIV risk behaviours.

Despite evidence of the benefits of NSEP, there is much criticism of it which arises from the negative or mixed research findings. For example, the studies by Valenciano and colleagues⁴⁷ and Hope and colleagues¹⁹ reveal the association of NSEP use to high risk behaviours. Some others discover no significant difference between NSEP attendance and non-attendance in the frequency of needle-sharing (Hartgers and Van Ameijden et al¹⁸). Within this article it is argued that these data sources are inconclusively used to point towards NSEP inefficacy and give less consideration to the other potential factors affecting HIV risk behaviours such as homelessness and depression symptoms (Braine and Des Jarlais et al⁵). Braine and colleagues⁵ noted that the attributes of NSEP clients and environmental factors should be considered in analysing the subsisting risk behaviours. Therefore, the argument for NSEP influence on increased risk behaviours is unpersuasive.

Additionally, some critics raise the methodological issue of self-reporting. They question the accuracy of self-reported data about risk behaviours (Safaeian and Brookmeyer et al⁴²; Sloan and Bodapati et al⁴⁵). As contended, self-reporting potentially results in social desirability, recall or observational bias that affects the accuracy of derived data. Accepting this argument means evidence for risk behaviours reducing efficacy have less strength as they mostly come from studies relying on self-reported data. However, the claim has less merit when considering the sufficient validity and reliability of self-reporting achieved in most research involving using drugs and risk behaviours (Darke⁹). Further, the self-reported behaviour change could be considerably verified by options including comparing HIV seropositivity rates among IDUs obtaining supplied injection items and those who do not (Kaplan²²), conducting computer-assisted self-interviews (Metzger and Koblin et al³²) and corroborated urinalysis (Sherman and Bigelow⁴⁴). Thus, the data derived from self-reporting, with or without verification, is valid and reliable enough to show the efficacy of harm reduction interventions for reducing HIV risk behaviours.

EFFECTIVENESS IN REDUCING HIV SEROCONVERSION AND PREVALENCE

Drawing on evidence regarding MMT and NSEP outcomes of decreased drug-related risk behaviours, it seems plausible to claim their potential to decrease the rate of HIV seroconversion and prevalence. However, opponents argue that the modest risk behavioural change, if any, would not necessarily effectuate into actual reduced HIV infection. As a response to this, there is evidence that sufficiently demonstrates the contrary. The studies in Malaysia and other countries evaluate the impact of MMT on HIV prevention and have found a positive association between the programme admission and decreased HIV infection (Novick and Joseph et al³⁹; Metzger & Navaline³¹; Mohamed & Kasa³⁶; Ahamad and Hayashi et al¹). The results of a study in Tampin Health Clinic, Malaysia, demonstrate that none of the 143 subjects were infected with HIV during the course of the study from November 2006 to March 2009 (Norsiah and Dharmananda et al³⁸). The findings are further confirmed by international research, including by Metzger and others³³ and Duan and others¹² recording a high difference in HIV seroconversion levels between those continuing with MMT compared to those not receiving MMT.

Moreover, the intervention can significantly affect HIV prevalence in many settings. Indeed, in the WHO collaborative study using longitudinal cohort design, the data from opiate substitution treatment programmes, principally MMT, in selected developing countries (China, Indonesia, Thailand, Lithuania, Poland, Ukraine, Iran and Australia) indicates the protective effect of the substitution treatment in decreasing HIV prevalence. The rate of HIV prevalence reduced significantly in almost all the studied countries that provide the service. The report concludes that such positive implication achieved in high-resource countries could also be gained in countries with fewer resources (Lawrinson and Ali et al²⁵). Many systematic reviews of studies confirm this effectiveness (Gibson and Flynn et al¹⁵; Farrell and Gowing et al¹⁴; MacArthur and Minozzi et al²⁹). All positive findings constitute strong data on the impact of MMT on the decrease of HIV infection and prevalence.

Despite the evidence, the opposition to MMT efficacy is based on a few study results showing less favourable outcomes of MMT on HIV seroconversion. The studies involved cocaine and heroin injectors (Chaisson and Bacchetti et al⁸) and 'low threshold' MMT (Van Ameijden and Van Den Hoek et al⁴⁹). This outcome is unsurprising considering the absence of any pharmacotherapeutic treatment for cocaine. The few negative findings should also not be interpreted as overall inefficacy of MMT in HIV prevention as it is outweighed by the amount of research with positive results. Rather, the findings can be treated as a factor to ameliorate the service's quality and intensity. This may cover incorporating MMT with psychosocial facilities including healthcare and rehabilitation, ensuring longer retention in treatment and dispensing of a sufficient dosage of methadone. Such comprehensive strategies would increase MMT's benefits in halting adverse consequences including HIV infection from consumption of drugs including cocaine (Gibson and Flynn et al¹⁵).

Further, despite the limited findings in Malaysia, a handful of international studies using diverse research designs indicate that participation in NSEP is substantially associated with decreased HIV infection (Des Jarlais and Marmor et al¹⁰; Luo and Wu et al²⁶). By contrast, the lack of NSEPs may have resulted in the growth of HIV incidence, as suggested by high seroconversion levels observed in Pakistan and the USA (Lurie & Drucker²⁷; Emmanuel and Archibald et al¹³). This data concerning the reversed situation supports the consistency of efficacy arguments. The accumulated evidence strongly indicates the NSEP's protective effects against HIV seroconversion.

Additionally, there are studies that provide compelling evidence on this intervention's efficacy in reducing HIV prevalence. For instance, Hurley and others²⁰ conduct a large ecological analysis of HIV rates and NSEP use, comparing 81 cities across Asia, Europe, North America, South America and the South Pacific. 52 cities without NSEP had a mean annual growth of 5.9 per cent in HIV prevalence, compared to a mean annual fall of 5.8 per cent for 29 cities with NSEPs. More recently, the study of McDonald and others³⁰ involving 99 cities discloses the difference in HIV prevalence rates in cities with and without NSEPs; there was a decline of 18.6 per cent and an increase of 8.1 per cent respectively. The results lend strong support to the argument that NSEP is effective in minimising HIV prevalence. The capability of NSEP as part of a comprehensive set of measures to decrease HIV prevalence also extends to settings where HIV is already developed, including New York City (Des Jarlais and Perlis et al¹¹). The outcome of NSEP on HIV infection and prevalence is consistently supported by comprehensive reviews (Gibson and Flynn et al¹⁶; Ritter & Cameron⁴¹; Wodak & Cooney⁵⁴; Aspinall and Nambiar, et al²).

On the contrary, several studies did not discover the effect of NSEP attendance against HIV seroconversion. Higher levels of HIV infection substantially connected to NSEP access are observed by prospective cohort research in Montreal and Vancouver (Bruneau and Lamothe et al⁶; Strathdee and Patrick et al⁴⁶). Additionally, Strathdee and others⁴⁶ research reported the outburst of HIV prevalence subsequent to the five-year operation of vast NSEPs in Vancouver. Consistent with the above findings, the results of some studies in Amsterdam indicate no significant link between the presence of NSEPs and decrease in HIV incidence (Van Ameijden and Van Den Hoek et al⁴⁹). These findings are deduced by opponents to attribute the greater HIV incidents to NSEP presence.

As Strathdee and colleagues⁴⁶ suggest, the negative result is considerably affected by the insufficiency of NSEP on its own as a HIV prevention tool. Despite the coherent argument given the complexity of HIV transmission, this article argues that stronger explanation considering selection bias could be provided for mixed or negative results of research that compare NSEP clients and non-clients. The NSEPs attracted IDUs who were significantly associated with higher risk activities, than non-attendees (Gibson and Flynn et al¹⁶; Wodak & Cooney⁵³). This position is supported by studies and

commentaries (Lurie²⁷; Hagan and McGough et al., 2000; Noroozi and Mirzazadeh et al³⁷). Further, there is the possibility of the dilution factor. The Dutch, Canadian and UK studies with counterintuitive results were carried out in settings where lesser risk IDUs might have obtained syringes from alternative sources such as pharmacies, giving NSEP access to relatively individuals of greater risk of HIV seroconversion. This confounded the findings (Vlahov & Junge⁵⁰). All these arguments could give potential explanations for the discouraging data.

CONCLUSION

Overall, there is little doubt that MMT and NSEP do mitigate HIV risk behaviours, incidence and prevalence. Drawing on that point, this article contends that the availability of such strategies possibly becomes the main factor in the gradually declining trend of new HIV infection cases among IDUs in Malaysia in recent years. The cases fell from between 70 to 80 per cent of overall cases in the 1990s to 39 per cent by 2011 (Ministry of Health Malaysia³⁴). The rate further dropped to 19.3 per cent in 2014 (Ministry of Health Malaysia³⁵). This achievement rebuts Shan's⁴³ presumption in 2008 that the HIV rate in Malaysia would not decrease in the following three years despite harm reduction services. Malaysia's successful attainment in HIV prevention is endorsed by international bodies including the Joint United Nations Programme on HIV/AIDS (UNAIDS)²¹ and World Health Organization (Western Pacific Region) and Ministry of Health Malaysia⁵⁶. Thus, the hypothesis that both services do not contribute to halting HIV is invalid. The outcome is unaffected by negative empirical data as there is a compelling expounding explanation for them. Supporting evidence regarding this efficacy absolutely exceeds the contradicting evidence. The effectiveness of the interventions for reducing the blood-borne virus may be further increased by multi-integrated strategies. Additionally, considering scant local empirical results, the effectiveness of harm reduction interventions, particularly with respect to NSEP, warrants further research. It is critically vital for the scientific bases for harm reduction approach to be firmly sustained and articulated in law and policy discourse.

ABSTRACT

The leadership style of the top management can have a significant effect on the innovativeness of the firm. The purpose of this study is to examine the impact of a particular leadership style, transformational leadership, on innovations among logistics companies. Drawing on a sample of 500 logistics companies were randomly selected and given the questionnaire to complete. A total of 86 questionnaires were returned and 84 questionnaires were useable for analysis. Findings revealed transformational leadership has a significant relationship and positive impact on innovativeness of logistics companies. The implication of the study brings new evidence to bear on the notion about the innovativeness in the logistics industry in Malaysia.

Keywords: *Transformational Leadership, Firm Innovativeness, Logistics.*

INTRODUCTION

Innovations are essential since they establish the basis for acquirement and retention of a sustainable competitive advantage and are critical for the economic survival of the firms. Various definitions of the term firm innovativeness have been provided by scholars Jain, Siddiquee, & Singal¹⁷. In this study, firm innovativeness is defined as the propensity or capacity of a firm to adopt innovative methods, processes, concepts, and business systems that are new to the logistics industry; not just for maximizing profits, but also to meet the needs of the customers or end users, taking into consideration sustainability and the environment.

The business environment in which the logistics companies operate is characterized by continuous changes and intense competition. To survive such an intense competitive business environment, companies must leverage their resources and manage both internal and external factors that influence their innovativeness Wahab and Cooper³⁰. Although innovativeness research on logistics companies is limited, empirical research has shown that innovativeness can provide company the ability to achieve lower cost and higher quality services that meet all the requirements of potential customers, introduce new products, services, business, environmental issues and maximum utilization of information technology Sundbo, Orfila-Sintes & Sorensen²⁹.

The need for a better empirical research and evidence about innovativeness in at industry level is documented in the literature Hall and Williams¹²; Hjalager¹⁵. The authors argue that industries should adequately represent during any comprehensive or national or international innovation survey. While there have been attempt to assess the organizational innovativeness in various sectors of the economy across the globe, the debate surrounding the best methodology or scale to use in measuring firm innovativeness has often been the source of considerable controversy. For this reason, Crespell, Knowles, and Hansen⁵; Desphande, and Farley⁷ called for a universally reliable and valid measuring scale for innovativeness which is robust enough, void of the weaknesses associated with existing scales.

Due to these reasons, this study attempts to conceptualize the firm innovativeness as a multi-dimensional approach which consists of product, process, business, and information technology innovativeness. A multidimensional approach to innovativeness research will enable the researcher to identify the innovative firms by examining all aspects of the firm innovativeness such as the propensity to adopt innovative products, concept, business, and practice, as well as new marketing strategies.

As the firm innovativeness is considered as driven-factor for firm sustainability and competitive advantage

as well as the driving force of economic growth at both national and international level Mei, Arcodia & Ruhanen²¹, the factor influencing the innovativeness of logistics companies has to be explored and researched. This study suggests the transformational leadership is highly potential to uplift the level of firm innovativeness among logistics companies. Transformational leadership has been recognized as the most advanced because it encompasses the symbolic, emotional and highly motivating behaviours that produce better results than ordinary leadership. Transformational leader is known for his or her ability to motivate followers (firm employees) to perform more than they are initially expected as they strive for better performance Ergeneli, Gohar, & Termirbekova⁸. Unfortunately, this study unable to learn from any empirical literature on the nature of the relationship between transformational leadership and firm innovativeness. Hence, this study sought to answer the following research question; What is the relationship between transformational leadership and firm innovativeness? The aspiration to assist logistics companies to innovate effectively and efficiently has motivated research on the factor and its relationship with firm innovativeness.

LITERATURE REVIEW

This study is grounded in a Resource-based view (RVB) where it recognizes the organizational resources as the fundamental driver of organizational performance. The firm innovativeness is considered as firm performance and indirectly affects firm value through its effects on market position and financial position Rubera & Kirca²⁶. The antecedent of firm innovativeness is transformational leadership. According to Chen (2016), transformational leadership is organizational resources as they argued that the transformational leadership as human capital resources of the firm.

Firm Innovativeness: Scholars have provided various definitions of firm innovativeness in the literature. While some of these definitions reflect the capacity of a firm to produce innovative products Wang & Ahmed³², others focus on innovative related culture or behaviours that reflect inclination or capacity towards innovation Auh & Mengu¹; Hurley & Hult¹⁶. Scholars such as Knowles, et al¹⁹ provided a definition that reflects a firm's capability in product and behavioural innovativeness. The scholars define innovativeness as "the propensity

to create and/or adopt new products, manufacturing process, and business system" Knowles et al¹⁹, p. 2).

In response to different conceptualizations of firm innovativeness in streams of research that result in difficulties in comparing findings across studies, Wang and Ahmed³², p 304 provided five dimensions of firm innovativeness. The five dimensions consist of product innovativeness, market innovativeness, process innovativeness, behavioural innovativeness, and strategic innovativeness.

Knowles et al¹⁹ conceptualized firm innovativeness as a product, process, and business system. This concept, however fails to capture information technology dimension of firm innovativeness despite the numerous literature that associate information technology adoption with innovation Ferneley & Bell¹⁰; Wang & Swanson³³. Thus, this study then added information technology innovativeness to a product, process, and business system, adapted from Knowles et al¹⁹ innovativeness dimension. The dimensions are a product, process, business system, and information technology innovativeness.

Transformational Leadership: Transformational leadership style is preferred to be examined in this study because empirical studies have shown that it is universally effective across cultures eg., Zagorsek, Marko & Stanley³⁵. It is also identified as one of the major factors that affect innovation. Leaders can improve organizational capacity to innovate by directing resources and energy toward implementing new programs and by lending power and legitimation to innovative activities Hasenfeld¹³. Transformational leader is known for his or her ability to motivate followers (firm employees) to perform more than they are initially expected as they strive for better performance Ergeneli, Gohar, & Termirbekova⁸. More importantly, Transformational leadership behavior has been identified to be representing the most active and effective form of leadership Rubin, Munz, & Bommer²⁷.

Furthermore, it has been identified as a strategic tool to manage a dynamic environment faced by the firms in recent times Nielsen & Cleal²². According to Waldman, Ramirez, House, & Puranam³¹ transformational leadership refers to a leadership style in which the leader uses ideology and values to achieve high end-values through motivating the firm's distant subordinates. They try to find to unite employees and inspire them to make the organization's vision a reality Bryman⁴.

It is unarguable to recognize the importance of transformational leadership in stimulating the ability of a firm to innovate. Studies on its relationship with firm innovativeness by Noruzy, A., Dalfard, V., Azhdari, B., Nazari-Shirkouhi, S., and Rezazadeh, A²³ and Jaskyte, K¹⁸ discovered that the relationship is positive and significant. However, little attention has been given to study the said relationship among logistics companies. Thus, the purpose of this paper is to study the relationship between transformational leadership and firm innovativeness in the context logistics companies. Due to this, we assume the following hypothesis:

H1: There is a significant and positive relationship between transformational leadership and firm innovativeness.

METHODOLOGY

This study is a correlational type of study, which is, examines the relationship between transformational leadership and firm innovativeness among logistics companies in Peninsular Malaysia. Since the collection and analyses of data were done at the firm level, the unit of analysis is the firm. Following Knowles et al¹⁹ innovativeness study in wood industry, top managers are the respondents of the study. This study is cross-sectional in nature such that the data were collected by means of the questionnaire at one point in time Sekaran²⁸.

There was a total 528 companies registered at Federation of Malaysian Freight Forwarders. Hence, according to Krejcie and Morgan²⁰; and Sekaran²⁸, the appropriate sample size to represent the logistics companies in Peninsular Malaysia would be 226. However, Krejcie and Morgan²⁰ has suggested providing for a 5% margin of error, 252 sample size would be required for a population of 528 logistics companies. In an attempt to receive the required sample size of 252 responses, a comparison was made with the return rate of similar innovativeness studies that have been conducted in Malaysia. Thus, to take account of the potential loss rate, 500 logistics companies were sampled. The required number of 500 samples for this study is equivalent to 95% (500/528 x 100) of the total logistics companies under study. A set of questionnaires were mailed to them via postal service.

The firm innovativeness is measured from four dimensions; namely as product, process, business

system, and information technology innovativeness. There are 17 items and were adopted from the Knowles et al¹⁹ and Beatty, Shim and Jones². To ensure these items have a proper degree of internal consistency, the Cronbach Alpha test was performed to all dimensions of firm innovativeness and found to obtain a score of 0.848, 0.788, 0.736 and 0.824 respectively. The transformational leadership is measured using 6 items and were adopted from Garcia-Morales et al. (2006). The Cronbach Alpha was at 0.853.

FINDINGS

A set of questionnaires were mailed to 500 logistics companies and 84 respondents responded. Thus, the response rate of the survey is 15.9% of the total population or 16.8% of the 500 respondents which were contacted by mail. However, one of the questionnaires was eliminated due to the outliers case, making to usable cases were 82. The underlying assumption of correlation regression analysis was that each variable and all linear combinations of the variables were normally distributed. As a general rule, when the sample size is at least 30, the sample distribution of the mean will be assumed as approximately normal Berenson, Levine & Krehbiel³. The normality of the distribution of data was examined thru the skewness and kurtosis values for each variable and in conclusion, all the variables did not deviate the normality test requirement.

The correlation analysis was conducted to test the H1 and the output of the test can be referred to Table 1.

Table 1: Relationship between Transformational Leadership and Firm Innovativeness

Variable	Firm Innovativeness
Transformational Leadership	.758**

Note: ** The mean difference is significant at the 0.01 (2-tailed)

Table 1 exhibits the results of correlations analysis to examine the relationship between transformational leadership and firm innovativeness. The results indicate the positive and significant relationship between transformational leadership and firm innovativeness among logistics companies in Malaysia ($r=0.731$, $p<0.01$). The result of analysis also revealed that the

direction of the association is positive. This indicates that additional efforts to enhance transformational leadership would result in the increase in level of firm innovativeness. Since, the result indicates the strength of association between is strong as suggested by Cohen Pallant²⁵, the possibility of transformational leadership to uplift level of firm innovativeness is high.

Table 2 illustrates the results of regression analysis to examine the effect of organizational resources on firm innovativeness.

Table 2: Effect of Transformational Leadership on Firms Innovativeness

	B	t	Sig.
Transformational Leadership	.699	10.380	.000
R2	0.574		
F	107.00		
Sig.	0.000		

As shown in Table 2, the transformational leadership were strongly explained 57.4 percent of firm innovativeness (R2=0.574, F=107.000, p<0.01). The transformational leadership was also found to have the significant effect on firm innovativeness as follows: Transformational Leadership (B=0.699, t=10.380, p<0.01). The result had successfully supported the H1. Hence, H1 is accepted.

DISCUSSION & CONCLUSION

This study made several contributions to the theory and practice specifically in logistics. Some previous studies had focused on adoption of type of innovation, thereby examining innovativeness from one-dimensional approach, such as product innovativeness Fell et al⁹, process innovativeness Yusof&MohdShafiei³⁴, market innovativeness Hilmi & Ramayah¹⁴, or information technology (Oh, Cruickshank, & Anderson²⁴ is impractical. This one-dimensional concept perhaps has brought about results on innovativeness definitions and research instruments that do not aggregate all the dimensions of firm innovativeness. The firm is a system where it is consisting of various activities and functions that inter-related and dependent to each other. The one-dimensional approach incapable to discover the nature of innovation in the firm. Thus, this study able to fulfil

the gap in the literature and provides definition and measures on innovativeness in logistics companies.

This study discovers that the transformational leadership is one of factor influencing firm innovativeness. According to Hartog (2012), leaders with transformational style can enhance employee proactive behaviour. This phenomenon could encourage employees to express their creative ideas and in turn, these ideas will be translated into innovative products, services or processes. Top managers are encouraged to give autonomy to their employees as it will give ample space to them to think about what and how they should perform their tasks. Better customer service and shorten the time in performing routine tasks could be achieved and will lead to low operating costs and capable to secure customer loyalty. This becomes the utmost importance since logistics is a service sector.

ABSTRACT

The main objective of this study is to develop a life cycle mode for a process-oriented quality assurance in organizational performance of food and beverage companies. As an iterative and dynamic process, quality assurance is interwoven in the production and process of food and beverages in the agro-allied industry. Through the review of literatures in existence, specifically those that focus on procedures, frameworks and methodology, a process oriented framework is developed around non-linear sequential stages presented as: planning (before), design and production (during), post production and delivery (after). The model is approved through an advanced systematic methods employed in collecting, organizing and generating reports about quality assurance for updates or changes. Many studies emphasize that quality assurance needs a friendly environs that take quality as a key factor and a work value for attaining the objectives of an organization. A practical quality assurance model is then proposed by this study that complies with the guide of food and beverage developmental stages. Practical steps are recommended in each stage. There is great potential in the quality assurance model for its transformation from static, the state of after-the-fact to a state of dynamism and iterative state, thereby improving the ongoing self-improvement culture.

Keywords: *Total quality management; quality management; production; continuous improvement; agro-allied industry.*

INTRODUCTION

The concept of quality is associated with a definitional challenge alongside its associated derivatives which include quality assurance, quality control, quality audit, quality enhancement and total quality management, expectations, interest, stems from the juxtaposition of external and internal stakeholder's requirements of a company. Those contradictory expectations and requirements are often contribute and complicated to the imprecision of operation and concept that encapsulate all efforts to get quality explained. However, quality is viewed to be stakeholder-relative. Thus, it is elusive, multi-dimensional and slippery concept rather than unitary idea¹. In this vein, it was pointed out by Van Damme² that no consensual definition of this rather controversial and vague in spite of operational experience for 20 years in improving an organizational quality is accepted universally³. In addition, definition of quality is not universal⁴. Pounder⁵ stated that quality is rather an ambiguous term. However, Harvey and Newton⁶ proposed on of the earlier categorizations

of quality which produce unanimous consensus that fitness of purpose, added value, positive transformation and customer satisfaction can be perceived as quality. According to ISO 9001, a standard describes the requirements of a quality management system that needs to be implemented so that the company can produce the products according to the requirement of customers, achieve continual improvement and customer satisfaction on the effectiveness of their quality management system⁷.

As a subset of the semantic cluster word: quality assurance, quality seems to be clearer. However, quality assurance by the International Organization for Standardization (IOS) is regarded as an approach focusing on processes from the quality management part that focuses on confidence provision while quality goals are being achieved. Quality assurance is also defined as the systematic assessment procedure and management employed to ensure achievement of improved quality or quality outputs. A proposed definition closed to this meaning is from Tran, Cahoon, and Chen⁸ where quality

assurance is defined to be a systematic or planned process of review of an organization or project to find out the acceptable standard of infrastructure, production, and how manufacturing can be enhanced and maintained.

The absence of understanding around the context of quality is majorly prompted by the points of view of the stakeholder from this quick quality review and definitions of quality assurance. In contrast, the absence of clarification attracts a doubled-edged possibility; it is conducive to meet the interests and needs on the other hand of the various external and internal stakeholders. In another word, this renders the quality concept hard to conceptualize due to its impression and vagueness. Quality assurance seems to be both implementable and achievable but it is subjected to various perspectives and narratives as a technique employed to measure the achieved goals and objectives of the organization⁹. The use of pragmatic approach by stakeholders is to foster quality assurance in ongoing improvement and culture particularly within the unpredictable, diverse and dynamic context of agro-allied sector in contrast to the perspective of the tradition that posits quality assurance as a systematic approach used to anticipate and prevent mistakes. Thus, this has led to the next question: 'how to understand the context of the key factors that influence quality assurance?'

Quality assurance based on clarification and comprehensive review is designed from three non-linear sequential phases namely: Planning and Analysis; Design, Production; and Post-production and Delivery [10]. Basically, the maintenance of a desired level of quality in a service and product is called quality assurance especially by means of attention to every phase of the process of delivery or production. It involves assessment procedures and systematic management employed to ensure quality outputs and improved quality improvement. This study employs planning and analysis, design, production, post production and delivery as befitting sub-variables to investigate Quality assurance in Food and Beverage companies of Malaysia^{8,10-11}.

In the planning phase, quality is broadly employed as a scale of distinction and approval in the growing presence of agro-allied industry. Additionally, evaluation is promoted to improve both with steering resources and strategic decisions through the pressure exerted by the constraints of budget. Self-evaluation process and competition awareness is achieved

through benchmarking while indulging in exchanging and sharing of experiences¹². However, accrediting agencies and agro-allied sector institutions to implement proactively transparent and rigorous Quality assurance procedure and guideline have been forced by certain action caused by the above-mentioned contextual factors (competitiveness, accreditation and technology). According to Belawati and Zuhairi¹³, the implementation of the quality assurance framework has been promoted locally and internationally by these agencies with a high level of comparability and similarities focusing on improving the organizational performance.

Koul and Kanwar¹⁴ highlight the introduction of quality culture, enhancing building of capacity to implement and promote the systems of quality assurance while establishing quality focus on planning and production. There is variation in the integration of quality assurance system with the frameworks of the policy which is reflected particularly in the criteria and standards applied in various perspectives of quality control. At companies that take quality as their first priority, predetermined criteria and standard are followed generally. Less prescriptive general guidelines and self-improvement as sacrifice are always imbibed at many companies. From this point of view, there is proposition of process-oriented quality assurance based on development and delivery phase with the belief that integrating quality assurance within this context will probably enhance organizational performance with the provision of enabling conditions.

METHODOLOGY

This paper focuses on the development of quality assurance standards and organizational business models. The study included a literature review and evaluation to determine the mechanisms presently in place with particular emphasis on food and beverages.

Model Development of Quality Assurance: Many studies have developed models on quality and quality assurance in respect to agricultural and rural development¹⁵; food supply chain¹⁶; genetically modified organisms; techno-managerial approach in food quality management¹⁷; and analysis of food products¹⁸. Miguel and Bruce¹⁵ developed a repeated purchase model to explore the fundamental economic factor that lie behind the choice of different systems in quality assurance and their associated degrees of stringency by firms. The study revealed that a close

attention is given to the role of reputations in providing the incentives for firms to deliver high quality goods in an environment of symmetrically imperfect information. The model here is developed to deal with complicating factors where in some circumstances, delivering quality can only be imperfectly learned and/or affected by producers. According to Manning *et al*¹⁶, the standards of quality assurance are considered to be a proven mechanism for delivering quality of product and services. There the result shows that in order to demonstrate to stakeholders and the consumer that quality assurance schemes actually deliver tangible benefits, quality measurements should be included in quality assurance models as these measures can improve intrinsic product quality, supply chain efficiency and compliance with legislative requirements and drive business performance. Caswell *et al*¹⁸ developed a two-unified framework for analyzing quality and quality assurance for food products. The unified quality framework offers a systematic means of analyzing quality and quality assurance as this is important in a trade environment where the dimensionality of the issues is growing rapidly. Decision-making in the managerial functions affects food quality by deciding on variability and conditioning of food and human systems; thus, quality assurance deals with deciding on the design, implementation, and performance of the quality system¹⁷.

This study proposed a model of a process-oriented lifecycle in Quality assurance, where Quality assurance can iteratively and dynamically be intertwined with developmental process of food and beverage. This idea recognizes the most paramount factors that affect the quality of food and beverage companies' experiences. These are informed and purposeful design of adequate learning skills with the addition of materials to support the interaction and development¹⁹. In support of this, the study affirms the assertions of the choice of Ellis *et al*²⁰ for a process oriented approach in the Quality assurance implementation.

During practices by making effort on the production and delivery design, QA is transformed to a state of more iterative and dynamic that promotes ongoing self-improvement culture in contrary to circumstantial compliance from a static, after-the-fact state. From this vein, the model proposed focuses on those practices of 'front-line companies' that are involving in shaping the experience of the industry: quality manager, top manager, instructional technologists and instructional designers. It is hoped ultimately that the model proposed

shall enrich and contribute to issues surrounding the food and beverage companies' quality performance by making a provision for practical model of quality assurance strong enough of eliminating the skepticism in Food and Beverage industry. This paper thereby clarifies the context and concept of Quality assurance and quality in an attempt to articulate these goals. It then examines the literatures concerning Quality assurance framework, methodologies and procedures.

A lifecycle of process-oriented Quality assurance built around non-linear sequential phases based on review and clarification is presented below:

1. **Before:** planning
2. **During:** design and production
3. **After:** post-production and delivery

To propose a systematic and practical model suitable of ensuring agro-allied sector to integrate Quality assurance ideas into development of the sector and to share the lesson learnt from this model's trial and initial implementation is the main objective of this paper. However, there is difficulty in isolating this process from the conceptual factors affecting it although this paper opines that Quality assurance model should be structured around organizational performance of F&B companies. Contextual understanding of Quality assurance is important as it establishes the standards to be used in the process and scopes the process of quality assurance, during the translation of the standards in existence into operational performance in particular. Newton²¹ stated that any quality assurance system, method or model would always be influenced through a situational context or factor. A framework is then proposed to fully understand the contextual factors and its dynamic nature influencing quality assurance. From the figure 1 shown below, it is clear that Quality assurance is a core value.

Figure 1: Proposed situational factors of QA affecting organizational performance

This is seen as an iterative, dynamic and continuous program. Thus, it can be easily incorporated into practices daily of the frontline quality control restructuring the food and beverage industry experience instead of serving

as an approach of after-the-fact. Variables such as planning, design, production, post-production, delivery and organizational performance shape the QA process. The culture of Quality assurance in agro-allied sector is permeated by pressures impacted by the technology burgeon with afterward consequences on the narratives of quality assurance to determine standards in particular and procedures for collaboration and communication on the accessibility and usability design on any of the aspect.

Among the commonest challenges shaping Quality assurance are market forces, employers and transnational industry. The new era of these sector executors consisting profit-oriented firms, financial performance, transnational providers and publishing corporations is encouraging the companies to differentiate themselves by providing quality services and products. Quality assurance is fast turning to a distinction seal as a recruiting and marketing tool in the midst of the growing and competitive market. In accordance with this philosophy, the Quality assurance context is a complicated chain of dynamics and interactions in the mist of numerous variables that are interlinked.

The lack of comprehension and acknowledgment of those forces and dynamic is restructuring the narrative and debate of what quality constitute is possible to inhibit the implementation of quality assurance into the paradigm of Food and Beverage industry.

RESULT AND DISCUSSION RESULT

Mode of Process-oriented Lifecycle for Quality Assurance in the Food and Beverage Companies: The consumers' health is an important problem which calls for better training strategies of the personnel implied in quality control and safety. The multitude of changes encountered in quality and processing technologies in raw material also impose a permanent readjusting of the professional formation²². From the discussion made above, there is a proposition of a process-oriented model developed with the aim of helping organization to apply the process of Quality assurance structured around the fundamental process of food and beverage development and delivery. It is noteworthy to disclose the fact that, the planning, design, production and delivery of products need collaboration and a streamlined workflow of many experts for instructional subject matter and working together in a team environment²³. Therefore,

the proposed quality assurance model portrays a centralized and institutionalized frameworks for planning, designing, producing and delivering Food and Beverage products. Abdous and He²⁴ stated that content, technology and design are combined synergistically from this centralized model by using different template series developed on key concepts of research and practices. Hence, the new model for quality assurance implementation is summarized as:

1. Planning (before)
2. Design and production (during)
3. Post-production and delivery (after)

Starting from the phase of planning, a workflow diagram with a project plan is used as quality assurance tools for the flowchart of the development process and for the clarity of presumptions, expectations and timeline. In the arrangement of the stage for the proposed model of quality assurance, the phase is critical, particularly in updating and refining development templates. The sets of standards of quality underpinning the content collection checklists and production templates are defined by this phase.

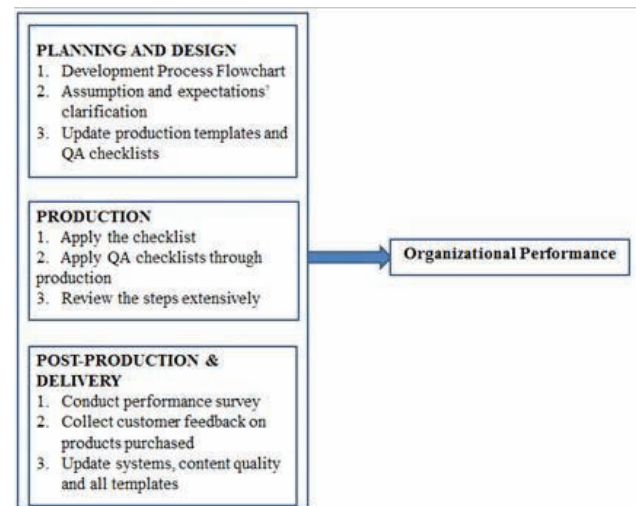

Figure 2: Lifecycle of Process-oriented Model in Food and Beverage Companies

During the phase of design and production, consistency, appropriateness and comprehensiveness of the services are provided by using collection templates of pre-designed content. These templates consist of the crucial factors of an environment that is conducive like the employee-centered developmental programs, content matrix with objective integration, the use of diversified activities of design and engagement, opportunity offer for interaction, collaboration, feedback and meaningful

assessment. Tailored Quality assurance checklists in this phase are employed by a team to enable the implementation of the guidelines and standards as indicated in the first phase²⁵. The adaptation and design of the checklists is done by best practice application of structural design and through proof from research-based standards.

The templates are created by technicians, designers and instructional technologists as improvement tools and self-assessment without affecting freedom and creativity. These systematic practices are applied within the process to make sure there is effectiveness and consistency to embrace the culture of unity. This leads to consistency and uniformity throughout the process of the production by consistently providing features according to the standards indicated from the first phase. A quality assurance checklist in details is used for each production tool during the production phase by team members. There was a development of an advanced system to streamline this process in order to collect, generate and organize reports about quality assurance needed changes and updates.

With the integration of the checklists used for production process, Quality assurance reporting and implementation are facilitated by this system and also reduces the number of tasks related to the process. This system allows the companies to improve the checklists during the production process connect with their roles. The model gives a solid operational framework which enhances quality assurance as a practice done daily by process of production using and mirroring a pre-defined production templates and procedures. Opportunities are provided by this process-oriented model for refinement and continuous improvement which is supported by an advance dynamic system to provide effective organizational performance.

DISCUSSION

Today, the acceleration in knowledge generation, science progression and development of innovative technologies, open up the opportunity for combining new concepts in safety science and corresponding new technologies with good theoretical framework²⁶. For a framework of operational and systemic quality assurance, the proposed model needs a supportive and conducive surrounding that takes quality into consideration as a great value of work and an enhancer for attaining goals within an organization as it provides and documents guidance, in line with continuous improvement and

reinforcement²⁷. The early trial of the model application gives some important lessons in accordance with this valuable enabling condition. Therefore, the findings of this study prompted by the proposed model are enveloped within the following ideas are:

In the stage of planning, there is clarification on expectations of quality supports to execute the implementation path of quality assurance. Provision of a clear view about overall quality requirement, process and expectation is very important. In this regards, keeping in mind the three production consideration is critical.

1. Gain the buy-in of the employees by explaining the importance of each step to be taken and clarifying the overall process of the practices. Frequently, employee resistance is prompted from lack of understanding of the process objectives and from eagerness to accept new methods of practice development.
2. The assurance that workers, both technical employees and the top managers comprehend truly the meaning of the differences in checklist's items.
3. To reach a common understanding of the checklist items, support the members of the production team to ensure that they would be implemented. Quality is contingent upon how it is experienced and used in implementation by the managers.

In the design phase, as well as production, creating additional checklists for the production team is liable to be unproductive except responsibilities and roles are understood and identified clearly. Additionally, implementation of Quality assurance must be supported by a well standardized system to facilitate crucial tasks. Flexibility, efficiency and systematic practices of system are crucial for a successful implementation of quality assurance's model.

In the phase of delivery, there is need for double consideration. From the managerial view of staff, procedure abilities and readiness significantly affect how F&B products are delivered. Therefore, providing both ongoing technical support and development opportunities is highly important for a pleasant experience of F&B companies.

From the manager side, the readiness of the managers, delivery strategies, tactics and technical literacy affect their degree of interaction with the consent. The result from quality assurance does not exclusively

dependent on the process of production but rather on manager enablement and empowerment by providing systematic ongoing support, orientations and collections of feedback. It is very paramount to affirm the fact that the proposed model with these considerations in mind is a kind of roadmap and an operational tool that sustains organization to apply efficient and systematic procedures of quality assurance. However, its implementation success depends on key enabling factors including a common understanding of Quality assurance checklists, the clarification of quality requirements and support of both employees and managers.

CONCLUSION

This study started by highlighting the inefficiency of quality assurance procedures and frameworks in existence by providing justifications for the choice to build a model around development and delivery in food and beverage companies. The study reviewed the existing literatures on quality assurance and its framework and mechanism after shedding light on Quality assurance and quality definitional issues. It is in this regards that a three-phase model that parallels to the process of development is proposed. The model aims to move quality from static state, after-the-fact state to an iterative and dynamic state thereby promoting a culture of continuous self-improvement rather than one of the compliance. Additionally, the model is compatible with daily processes of TQM and it enables a deep penetration to the main activities of the developmental operations. Despite the fact that the model construction is developed from other sector and its application is generic in nature, it is highly recommended for food and beverage companies to employ as it encompasses all the strategic practices and procedures of Quality Assurance. There is potentiality in this approach to increase the overall quality of experience and organizational efficiency in food and beverage products to resolve some of the skepticism that wraps the system of food and beverage production.

ABSTRACT

The aim of this study is to analyze the food security achievement among coastal fishermen in Northern Peninsular Malaysia (Kedah and Perlis,) based on ownership livelihood asset. For this purpose, a structured questionnaire is designed. It consists of livelihood asset (human, physical, finance, natural and social asset), government intervention and livelihood outcome. To achieve the aim of the study, data were collected from a sample of 400 coastal fishermen in Kuala Kedah, TanjungDawai and Yan in Kedah and Kuala Perlis in Perlis Malaysia. The smart PLS-SEM 2.0 was used to evaluate the relationship between the independent and dependent variables. This study discovers that 4 out of the 6 hypotheses were supported by the statistical analysis while 2 hypotheses were not supported. Lastly, a few recommendations were provided with a view to ensuring food security among the coastal fishermen in Northern Peninsular Malaysia.

Keywords: *Sustainability livelihood, livelihood assets, food security, vulnerability group.*

INTRODUCTION

The World Food and Agriculture Organization (FAO) 1998 has defined food security as the ability of every resident to access adequate food for a healthy and active life. Food security can be achieved if the following three elements are met; (1) the guarantee of adequate food, (2) stable food supply and (3) it can be easily accessed by everyone (FAO, 1998). At the same time, food security also emphasizes the ability of every resident to have physical and economic access to sufficient food to meet dietary requirement at all time. Four main components are assessed to determine the achievement of food security, namely food readiness, food access, food consumption, and food stability. The ownership of livelihood assets (human assets, financial assets, natural assets, physical assets and social assets) also has a direct relationship with food security achievement.

Fishermen communities who are mostly relying solely on fishing catchment and fish related products as their sources of income, are easily exposed to economic recession and natural disaster (monsoon rain or tsunami). Hence, they have low-income and lacked of livelihood

asset. Lacked of livelihood assets ownership causes them to trap in poverty which also strongly related to food security achievement. This also causes them to be in the poverty trap and become a vulnerable group for a long time. Lack of material assets reduces their income elasticity and thus affect their purchasing power on food which could result in absence of food and malnutrition (Schoch & Campaign, 2010 and Nnakwe & Yegamina, 2002).

In this regard, it is clear that food security at a household level has a direct relationship with the household's ownership of livelihood assets. The ownership of livelihood asset will determine the capability of a household to have sufficient and nutritious food to meet the dietary requirement as needed. As most studies focus on discussing the ownership of livelihood assets and less emphasis on achieving the food security through the ownership of livelihood assets, the measurement on food security attainment in a household cannot be determined effectively. Therefore, this paper aims to analyze the achievement of food security among the fishermen community through the acquisition of livelihood assets with analytical techniques such as simple regression and structured equation models.

This paper also examines the strategies taken by the fishermen community in facing a vulnerable situation and also develops the sustainable livelihood index (SLI) to determine the ability of the community to deal with vulnerable situation.

LITERATURE REVIEW

Food security exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food which meets their dietary needs and food preferences for active and healthy life. Household food security is the application of this concept at the household level, with individuals within households as the focus of concern. Meanwhile, food insecurity exists when people do not have adequate physical, social or economic access to food as defined above. Food Summit (1996) defines food security concepts in a more complex way, which is when all people, at all times, have sufficient access to safe and nutritious food to meet dietary needs and food reference for active and healthy life. The Food and Agricultural Organization (FAO, 2003) conceives food security as a situation in which all households have both physical and economic access to adequate food for all members and where households are not at risk of losing such access.

Meanwhile, at a household level, Frankenberger et al. (1995) state that food security at an individual level will be achieved when each individual able to access to adequate nutrition and diet for the purpose of physical activity, disease prevention and for sufficient for growth including during pregnancy and breastfeeding. To achieve food security at a household level, livelihood assets are the main factors that contribute to successful food security among households. Thus, Chamber and Conway (1992) proposed a sustainable livelihoods as the combination of capabilities and assets with which a able household to generate its livelihoods to meet the basic needs or physiological needs of the household members. Chamber and Conway (1992) have further identified assets as human, social, financial, physical, and natural resources which households and individuals need to acquire to meet their livelihood objectives.

The Community Nutritionist Council of British Columbia Canada (2004) acknowledged that food security exists when everybody able to obtain safe food and receives nutritious diet through a sustainable food system which maximizes food choices. This definition

also includes: (i). Guarantee access to food; (ii). Food can be obtained without having to compromise human dignity; (iii). Food is secure, adequate and also personally and culturally acceptable; (iv). The quality and quantity of food is sufficient to maintain healthy growth and development as well as able to ward off diseases; and (v). There is no compromise in terms of production, processing and distribution of food in the use of natural resources, land, water and air for the future generations. Food security is the outcome of an efficient food system operation. Efficient food system contributes positively to all dimensions of food security.

These widely accepted definitions point to the following dimensions of food security FAO¹⁵.

- i. Food availability:** The availability of sufficient quantities of food with appropriate quality, supplied through domestic production or imports (including food aid).
- ii. Food access:** Access by individuals to acquire adequate food (entitlements) with suitable nutritious diet. Entitlements are defined as the set of all commodity bundles over which a person can establish command given the legal, political, economic and social arrangements of the community in which they live (including traditional rights such as access to common resources).
- iii. Food Utilization:** Utilization of food through adequate diet, clean water, proper sanitation and health care to attain a state of nutritional well-being where all physiological needs are met. This brings out the importance of non-food inputs in food security.
- iv. Stability:** A population, a household or an individual must have access to adequate food at all times. They should not risk losing access to food as a consequence of sudden shocks (e.g. an economic or climatic crisis) or cyclical events (e.g. seasonal food insecurity). The concept of stability can therefore refer to both dimensions; the availability and access to food.

Previous studies submitted that physical asset is among the main stimulus to attain sustainable livelihoods which secures livelihood outcomes and facilitates achievement of physiological needs. A study by Kamaruddin and Baharuddin²⁴ reveals that ownership of physical asset affects livelihoods outcomes as it

enhances income, thereby improve the well-being of the vulnerable households. The findings affirmed the finding of a study by Seng³⁹ on the ability to access physical asset able to enhance income which help to fulfill the need of food. For instance availability of electricity supply can help to promote economic activities that generate income to a household Lim, & Mansur³⁰; Kamaruddin, & Samsudin²⁵; Ahmed et al².

Meanwhile financial asset enables a vulnerable household or an individual to attain a good life and meet the physiological needs of the household or the individual (Scoones, 1999; DFID¹². Several empirical studies confirmed that financial asset has significance influence in fighting vulnerability and in ensuring well-being of households and individuals. Akudugu³ in a study asserted that financial asset contributes to well-being in terms affording the bills of medical expenses and food consumption which relate to human asset thereby improving the productive capacity of the households and individuals which in the final analysis enhance food security. Similarly, Kamaruddin and Baharuddin²⁴ in their study affirmed that increase in income helps vulnerable households to overcome vulnerability to livelihoods and enhance well-being to which food security is ensured. Furthermore, Seng³⁹ observed that financial asset enhances well-being thereby increasing food security as the vulnerable households and individuals who have financial asset will have sustainable livelihood which empowers them to meet their basic needs.

Human asset connotes capabilities, skills and knowledge, and material health which enable households and individuals to meet livelihoods outcomes Krantz²⁷. Empirical studies suggested the link between human asset and households' well-being, for instance, studies by Seng³⁹, and Kamaruddin, & Samsudin²⁵ observed that human asset has impact on the income of vulnerable households and individuals which affect food consumption thereby ensuring food security. Similarly, Lim and Mansur³⁰ in study confirmed the effect of human asset as it enhances resilience which reduce vulnerability and further safeguard livelihood outcomes of vulnerable households. Consequently, from the results of the previous studies on the impact human asset and livelihood outcomes this study suggests that:

Social asset consists of social resources which empower vulnerable households through social relations and interactions which bring mutual benefit, for instance communal farming, to parties in the social interaction

Coleman¹⁰. Accordingly, Oumer and De Neergaard³⁴ averred that lack of connection to non-governmental organizations and research bodies impedes livelihood outcomes which guarantee food security and well-being of vulnerable households. The finding of the study concurred with the studies of Alfonso et al³; Islam, & Yew²³; Thi et al⁴³.

Government intervention means how government policy-response to address social-economic problems in the society. It implies whatever government does to intervene or support vulnerable households in ensuring relief in the society therefore, government intervention has no definite meaning as it address a myriad of social problems Loewen³¹. Likewise, Ibrahim and Alam²² conceived government intervention as policy action by government in terms of subsidizing agriculture via provision of improved seeds and fertilizer with a view to food production and economic well-being of farming farmer. In summary government intervention symbolizes support from government which usually comes in form of incentives, subsidy of policy action that aims at ensuring relief and well-being of the people. Ibrahim and Alam²² in a study found that subsidies extended by government on fertilizer and improved seedling to paddy farmers enhanced their economic well-being which in turn boost food production and livelihood outcome. Similarly, in a study by Kasim, Ibrahim, & Din²⁶ finding revealed that government support has positive effect on food production and livelihood outcomes. Other studies that advocated the impact of government intervention on livelihoods include Shehu and Abubakar⁴¹, Unmesh and Narayanan⁴⁵, and Kamaruddin and Samsudin²⁵.

Based on discussion with the results of previous empirical studies this study hypothesized that;

H₁: There is significant relationship between physical asset and food security.

H₂: There is significant relationship between financial asset and food security.

H₃: There is significant relationship between human asset and food security.

H₄: There is significant relationship between social asset and food security.

H₅: There is significant relationship between natural asset and food security.

H₆: There is significant relationship between government intervention and food security

METHODOLOGY

The study is based on a descriptive quantitative survey design. Data for the study was collected from the vulnerability group through self-designed and self-administered questionnaire covering the various variables identified in the literature. Non-probability convenience sampling technique was adopted. This study is based on primary data collected from 400 coastal fishermen in Kuala Perlis, Perlis, Kuala Kedah, Yan and TanjungDawai in Kedah Malaysia. The questionnaire consisted of four parts: demographic information; livelihood asset, vulnerability, coping strategies and government intervention intention to contribute food security among the vulnerable group. The data was processed and analyzed by partial least-squares (PLS) path modeling with SmartPLS 2.0 M2 software Ringle et al³⁵. The Smart PLS M2 Version 2.0 and two-step analysis approach was used to analyze the data. PLS is used because it makes minimal demands on the data distributions, sample size and measurement scales and as this study were exploratory in nature; it is a better tool to explain the data. Also a bootstrapping method was

used to determine the significance levels of the loadings, weights, and path coefficients Gholami et al¹⁸.

Measurement Model: This study began with the assessment of the reflective measures using both convergence and discriminant validity analysis. As presented in Table 1 below the measurement models returned Cronbach's alpha values <0.70. Factor loadings, average variance extracted (AVE) and composite reliability (CR) were used to assess convergence validity. The loadings for all reflective items exceeded the recommended value of 0.6. CR values (see Table 1), which showed the degree to which the item captured the latent construct, ranging from 0.616 to 0.877, which exceeded the critical value of 0.4 Hair et al²¹. The AVE was in the range of 0.54 and 0.71 which exceeded the recommended value of 0.5 Fornell and Lacker¹⁷. Next, the discriminant validity was examined by comparing the correlations between constructs and the square root of the AVE for that construct. As shown in Table2, the square root of the AVE is greater than the correlation with other constructs indicating adequate discriminant validity. Thus the reflective measurement model demonstrated adequate convergent and discriminant validity.

Table 1: The Convergent Validity Assessment Results

Construct	Measurement Item	Loading	Average Variance Extracted	Composite Reliability
Physical Asset	AF1- Transportation	0.83	0.66	0.88
	AF2- Distance to town	0.88		
	AF3- Clean water supply	0.79		
	AF6- Electricity supply	0.74		
Finance asset	AK1- Saving	0.65	0.54	0.82
	AK2- Income	0.76		
	AK3- Part time income	0.84		
	AK4- Subsidies	0.66		
Human Asset	AM1-Education	0.72	0.55	0.83
	AM2- Skill	0.81		
	AM3- Age	0.77		
	AM4- Knowledge	0.67		
Social Asset	AS1-Involve in society	0.84	0.61	0.82
	AS2-Involve in non-government organization	0.62		
	AS3-Involve in community engagement	0.84		
	AS4- Relationship in community	0.78		
Natural Asset	ASJ1-Access food from environment	0.77	0.60	0.85
	ASJ2-Impact climate change	0.91		
	ASJ3- Pollution problem	0.64		

Conted...

Govt. Intervention	G1- Health facilities	0.86	0.71	0.91
	G2- Economic development by government	0.85		
	G3 -Public participation	0.88		
	G4- Subsidies delivery	0.79		
Food Security	HP1- Food Access	0.83	0.64	0.87
	HP2- Food Utilization	0.84		
	HP3- Food Availability	0.86		
	HP4- Food Stability	0.64		

Table 2: Discriminant Validity (Fornell-Lacker Criterion)

Construct	1	2	3	4	5	6	7
Physical asset	0.81						
Financial asset	0.42	0.73					
Human asset	0.64	0.43	0.74				
Social asset	0.53	0.45	0.50	0.78			
Natural asset	0.58	0.47	0.53	0.55	0.77		
Government Intervention	0.39	0.23	0.40	0.25	0.39	0.84	
Food security	0.66	0.31	0.57	0.46	0.51	0.48	0.80

Discriminant validity is used to assess construct validity of a reflective construct. It determines how a construct is totally different from other constructs of the model in terms of empirical measures Duarte &Roposo¹³; Hair et al²¹. Therefore based on Table 2 above the discriminant validity of the study’s constructs is attained

Table 3: Hypothesis Testing (Path Coefficients Estimates)

Path relationship and Direction	Beta	Std. Err	T value	Results
Physical asset -> Food Security	0.16	0.07	2.39	Supported
Financial asset -> Food Security	0.08	0.05	1.48	Not Supported
Human asset -> Food Security	0.11	0.07	1.56	Not Supported
Social asset -> Food Security	0.15	0.06	2.39	Supported
Natural asset -> Food Security	0.11	0.07	1.63	Supported
Government Intervention -> Food security	0.37	0.04	8.52	Supported

Table 3 shows the results of testing the structural model. These show that (physical asset β = 0.16, T value = 2.39; social asset β =0.15, T value= 2.39; natural asset β = 0.11, T value= 1.63; government intervention β = 0.37, T value= 8.52) which means that H₁, H₄, H₅, H₆, are supported positively (see Hair et al²¹, signifying that the concerned assets are related to food security. Furthermore, financial asset (β = 0.08, T value = 0.48); human asset (β = 0.11, T value = 1.56) were found to be non-significant see Hair et al²¹, signifying that the hypothesized relationships (H₂ and H₃) are not supported.

DISCUSSION AND CONCLUSION

Finding of this study shows that H₁ is supported signifying the positive relationship between physical asset and food security. This finding conforms with the finding of Kamaruddin and Baharuddin²⁴, Lim and Mansur³⁰, and Kasim et al²⁶, which all advocated that access to physical asset enhances income and well-being of households and individuals as such has impact on the food security of the households and individual. Therefore this study submits that physical asset correlates positively and significantly with food security.

However, the finding of this study shows that H_2 is not supported signifying that there is no relationship between financial asset and food security. This result is, however, contrary to the findings of previous studies by Lim & Mansur³⁰; Unmesh, & Narayanan⁴⁵; Shehu, & Abubakar⁴¹; Kamaruddin, & Samsudin²⁵; Kasim et al²⁶, which discovered that increases in income enhances livelihoods and well-being of a household or an individual.

The finding of this study also indicates that H_3 is not supported statistically, which is quite contrary to the findings of previous studies that there is no relationship between human asset and food security Chen et al⁹; Samsudin, & Kamaruddin³⁶; Kasim et al²⁶. The mentioned studies indicated that human asset has significant relationship with well-being and income of the household which could be translated to food security of households. In essence, the finding shows that human asset has no effect on food security.

In relation to H_4 , this study indicates that there is a relationship between social asset and food security. The finding of the study conforms with prior empirical studies indicated that there is a relation between social asset and livelihood outcomes through linkage to social connections and non-governmental organization which further secure households' basic needs of food and well being Oumer, & De Neergaard³⁴; Alfonso et al⁴; Islam, & Yew²³; Thi et al⁴³. Similarly, H_5 of this study was supported is consistent with past empirical studies which stressed that natural asset (land for agriculture, water resources for irrigation and fishing) improves income, livelihood outcomes and livelihood security which all have effect on food security Lim, & Mansur³⁰, Kamaruddin, & Samsuddin²⁵; Adunga¹; Oumer, & De Neergard³⁴; Van der Berg⁴⁶, Ansoms, 2010).

H_6 which presumes a relationship between government intervention and food security is found to be statistically supported by the empirical data of this study. The result concurs with the studies of Lim, & Mansur³⁰; Ibrahim, & Alam²²; Kasim et al²⁶, which asserted that government support or intervention in the area of subsidy on agriculture and food production. Accordingly, the finding of the present study confirmed that there is positive relationship between government intervention and food security. In a nutshell the result depicts that support from government has effect on livelihood outcomes of households and individuals which in the end enhances food security.

A Preliminary Insight into the Nature of Street-Level Bureaucracy amongst Front-Line Workers of the Malaysian Social Welfare Department

Ahmad Shukri Abdul Hamid¹, Noor Azizah Ahmad¹, Norruzeyati Che Mohd. Nasir¹

¹*School of Applied Psychology, Social Work and Policy, Universiti Utara Malaysia*

ABSTRACT

This paper presents a preliminary findings of an on-going study on service delivery by front-line workers of the Malaysian Social Welfare Department (SWD) in the area of child welfare services. The study utilises Michael Lipsky's Street-Level Bureaucracy theory as its theoretical basis. The analysis conducted on data derived from a pilot study had produced a preliminary insight which supports the assumptions contained in the Street-Level Bureaucracy theory. The findings suggest that, as far as the front-line workers of the SWD are concerned, the nature of work expected of them by their organization is naturally wide-ranging. Even though their role within the organization seemed to be focused on one service area, namely child welfare services, in reality they have numerous responsibilities tied to their jobs. As front-line workers, they are equipped with various rules, regulations and standard operating procedures, yet when it comes to actually performing their tasks, they still have to depend on the use of discretions in various aspects of their job. Hence this preliminary analysis provides a valuable insight regarding the nature of problem plaguing the service delivery and job performance of the SWD street-level workers, and by inference, the policy process within the area of child welfare services.

INTRODUCTION

The Malaysian Department of Social Welfare is the de facto agency responsible for providing social services in this country. Under its wings are thousands of workers, the majority of whom are responsible in carrying out the task of facing the public and their demand for service. Their jobs constitute the end of a long line of policy directives (Sim⁴). Unlike their higher-up counterparts, the front-line workers have to deal with the public face on which often demand prompt actions on their behalf. The fact that they are also dealing with the disadvantaged or marginalised population adds another set of challenges. At the same time they have to consider the demand from the other end as well. All in all their work often involves juggling between two expectations which could be incompatible at times. This paper presents a preliminary report on a study currently underway which investigates the scope of work that these workers perform on their daily schedule. The study however focuses only on those workers who work with children.

Of pertinent concern regarding the performance of their daily duties are the level of freedom that they are subjected to, especially in carrying out tasks that either do not have clear guidelines or in the case that they are available, the guidelines do not cater for their specific needs. The issue of freedom is of critical importance in this regard because being front-line workers, their tasks often demand a certain degree of discretions particularly when dealing with difficult or uncertain situations—a fairly common circumstance when dealing with children. The street-level bureaucracy theory developed by Michael Lipsky² serves as the framework for this study and current analysis.

STREET-LEVEL BUREAUCRACY THEORY

Michael Lipsky¹ describes the front-line workers such as police officers, teachers and social workers as street-level bureaucrats (SLBs). Lipsky² defines SLBs as 'public service workers who interact directly with citizens in the course of their jobs, and who have

substantial discretion in the execution of their work¹. The term bureaucrats is intentional in the sense that it is reflective of the nature of challenges that these workers have to face in carrying out their duties. Even though their position is at the implementation end of the policy spectrum, they are 'bureaucrats' nonetheless, due to the 'substantial discretion' that they have in deciding how to carry out their policy-related tasks. In a sense this definition alone contains a contradicting interpretation of who exactly the SLBs. Based on their review of different interpretations of SLBs Meyers and Vorsanger³ aptly explains the contradiction as follows: '... (in some interpretations) these workers are portrayed as occupying a powerless position downstream of political and bureaucratic decisions; in others they emerge as loyal public servants who pursue the public good even when it means bending agency regulations; in still others they are described as self-interested bureaucrats whose coping mechanisms frustrate the will of elected officials.

The dilemmas facing the SLBs have been described as coming from two conditions Lipsky². Firstly, their jobs demand substantial exercise of discretion. Their work necessitates them to interact regularly with citizens who demand and expect services in any particular way. Often lacking in resources, time and information they have to devise ways to juggle their way to fulfil both public expectations and the demand of the policies themselves. For many workers, developing ways of coping using unsanctioned practices and to some extent, psychological manoeuvring become a necessary part of their job (Michie, S⁵). Given the enormous mass of the workers involved in such conditions, the outcome of such manoeuvres, in turn, can affect the way public policy is conceived. Secondly, the various professions that involve street-level operators are structurally similar in the sense that a certain expectations have been built into their work process. This follows from the policies themselves that often prescribe certain outcomes to be achieved using prescribed protocols. At the same time however, their work often requires fulfilling the demands from their immediate clients which can vary enormously. What this means is essentially that they have to exercise improvisation in order to create an impression of diligence and quality service. When policies need to be implemented and the public needs to be entertained, both to the best of their abilities, then they will often end up with a dilemma in their hands (Belk, R., Devinney, T., & Eckhardt, G⁶).

In the case of the SWD workers, the same dilemma is conceivable. Public expectations are considerably high in their case bearing the fact that their clientele are mostly from the disadvantaged or marginalised population. The precarious situation of the clients also translates into extraordinary pressure being placed upon the workers to perform. Specifically in the service delivery area that involves children, workers are often burdened with an extra consideration due to the fragile nature of their clients. Emotions may come into play amidst the fact that they have to be vigilantly professional and objective (Fong, C. T⁷). It is within this working conditions that this study tries to explore how the front-line workers manage their tasks of implementing such crucial policies while at the same time deal with the uncertainties of their clients' demands and situations.

THE STUDY

The report of finding on which this paper is based is part of a pilot study. The study, entitled Developing a Typological Framework of Service Delivery in Child Welfare Services from the Perspective of Street-Level Bureaucrats aims to develop a framework which captures the intricate process of policy delivery mechanism based on the perspective of the front-line workers. A data collection instrument was devised based on literature review and consultation with staffs of the SWD. This paper shall report on the preliminary finding based on pilot data collection involving 37 SWD personnel. Because the study is still on-going this report is not meant to provide any conclusion on the topic of study. Rather, it dwells more on the development of data collection instrument and refinement of the scope of research itself. Nonetheless a valuable insight is to be expected from this pilot study regarding the nature of the problem since no research of this kind have been done previously.

The scope of inquiry is limited to those workers who are currently or have been in recent years dealt with children and the provision of child welfare services. The SWD deals with different target groups. They represent different categories of vulnerable or marginalised people, which include children, the elderly, the disabled, the destitute, families and disaster victims. Children, particularly those who are living in institutions under the purview of the SWD is one category of clients which represent an enormous challenge for the SWD workers. Those who deal directly with the children bear the most

brunt as far as the policy process is concerned. As such workers of the SWD in this service area are considered the most suitable for this investigation.

FINDINGS

This discussion on findings shall be focused on several outcomes of the pilot study. These include the demographic analysis of the respondents involved, the scope of work that they perform, the availability of guidelines, rules or protocols concerning their daily tasks, elements of work that are vague or lack clear guidelines, and their views regarding the use of discretion in carrying out their duties.

Demographic Analysis: The pilot study involved 37 respondents who are willing to be involved in the study and picked randomly from amongst SWD workers from various branches of the department all over the country. Originally 39 questionnaires were distributed but two were considered incomplete and therefore discarded. In terms of gender distribution the respondents comprise 62.2 percent males and 37.8 percent females. In terms of age, majority of respondents belong in the 30 to 39 years old age group which represents 59.4 percent of the sample. The rest belong to the 20 to 29 years old age group (4 respondents or 10.8 percent) and 40 and above age group (11 respondents or 29.7 percent). A total of 36 respondents or 97.3 percent were from the Malay ethnic category and only one respondent or 2.7 percent belongs to Sabah indigenous. All respondents are Muslim. As for their academic qualification, 40.5 percent or 15 respondents possess an undergraduate degree, 24.3 percent or 9 respondents have a diploma and 32.2 percent or 12 respondents possess high school qualification. Only one respondent or 2.7 percent possesses a master's degree. As for other forms of qualification, three respondents or 8.1 percent each reported having certification in childhood education, automotive works and social work. Another important demographic characteristic is their position (grade) within the organisation. Majority of the respondents belong to the S17 grade which comprise 32.4 percent or 12 respondents, followed by 9 respondents or 24.3 percent in the S27 grade category and 8 respondents or 21.6 percent in the S41 grade category. A more detailed analysis of the above demographic characteristic is shown in Table 1.

Table 1: Demographic Characteristics

Item	Frequency (Percent)

Scope of Work: When asked regarding their scope of work that they typically perform, the respondents reported a wide range of tasks and responsibilities that they are involved in. An analysis into the data suggests that the tasks that the workers have to perform varied widely and require a lot of interfacing with the public. For example, as shown in Table 2, counter services, case acquisition, prevention program, intervention services, children placement and dealing with the children’s families are amongst the most frequent tasks that many of the respondents (ranging from 18 percent to 24 percent) are tasked to perform.

Table 2: Scope of Work of DSW Personnel

Scope of Work	Frequency (%)
Counter services	24
Case acquisition	29
Prevention program services	18
Intervention services	18
Legal-related services	13
Recruiting and selecting of foster family (adoption)	10
Managing placement of children in institutions	18
Supervising children in child protection and rehabilitation institutions	17
Services related to children’s families	22
Follow-up services (after discharge from institutions)	12
Children adoption services	13
Children counselling and therapy services	10
Others	15

Sources of Rules or Policies Used in Daily Work: When it comes to children welfare services, there are many sources of policies, guidelines and conventions that are available for the workers to refer to in their work. In fact these documents were stated clearly in the SWD website. When asked to cite the sources of rules and regulations that they used in performing their duties, the respondents mentioned most of these documents as their guide. Chief amongst these guidelines are the Child Act 2001, Guidelines and Standard Operating Procedures (SOPs), Child Regulations (Places of Safety) 2007, Child (Fit and Proper Person) Regulations 2009, Child (Forms

and Register set) Regulations 2007 and Child Protection Team (Procedure and Practice) Regulations 1995. Table 3 shows the percentage of respondents who claimed to have utilised these documents and regulations as guide in performing their duties.

Table 3: Types of Guidelines, Rules and Policies Used in Performing Duties

Sources of Guidelines	Frequency (%)
Child Act 2001	32
Guidelines and Standard Operating Procedures (SOP)	28
Child (Forms and Register set) Regulations 2007	15
Child (Fit and Proper Person) Regulations 2009	15
Child (Shelter) Regulations 2007	21
Child Protection Team (Procedure and Practice) Regulations 1995	14
Probation Hostels Regulations 1982	8
Others	5

Usage of Rules and Regulations and Standard Operating Procedures: Further inquiries into the nature of their work respondents also revealed the extent to which they actually use the rules and regulations that are available. Table 4 shows the distribution of responses to the question regarding how much of the available documents were utilised. The responses were categorized based on two major categories of documentation: rules and regulations, and standard operating procedures. The data shows that as far as rules and regulations are concerned, only 35.1 percent of the respondents actually used them 100 percent of the time, 24.3 percent cited 80 percent of usage, 16.2 percent cited 90 percent usage and the rest were scattered in between with 5.4 percent failed to declare. But none of the respondents cited less than 70 percent of usage of the rules and regulations. Similarly in terms of standard operating procedures, 37.8 percent of the respondents declared 100 percent usage of the SOPs in their daily work, 18.9 percent cited 90 percent usage, 16.2 percent mentioned 80 percent of usage and the rest are scattered in between 60 percent and 99 percent of usage, with only 5.4 percent did not declare. All in all the data suggest that for the most part, in performing their duties, the workers still rely heavily on the rules and regulations as well as standard operating procedures.

Table 4: The Extent of Use of Rules and Regulations, and Standard Operating Procedures

Extent of Usage (%)	Percentage of workers who use:	
	Rules and Regulations	Standard Operating Procedures
60	-	5.4
70	2.7	2.7
78	2.7	-
80	24.3	16.2
85	5.4	5.4
90	16.2	18.9
95	5.4	5.4
99	2.7	2.7
100	35.1	37.8
Undeclared	5.4	5.4

Tasks that Require the Use of Discretions: Since an inquiry into the use of discretions involve largely an uncharted territory, partly due to the qualitative nature of the problem itself and partly because lack of available data, this study opens up the query by using a qualitative approach. Respondents were given an opportunity to state which area within their work scope that they often use discretions. The data collected revealed an extensive area of service concerning welfare provision to children that the workers face difficulties in carrying out their duties. A thematic analysis indicates that amongst the tasks that the workers deemed necessary to use discretions include those that cater for the children’s subjective needs, those that demands special skills on behalf of the workers and those that involve extraneous circumstances.

With regard to the subjective needs of the children, some of the issues cited by the respondents are disciplinary problems, providing personalised support and assistance to the children, communication, supervising activities, taking care of the children’s hygiene and handling specialised needs. At times, the workers also face difficulties when their tasks demand specialised skills for which they are not adequately trained. These include interviewing and extracting reliable information, handling the children’s emotional episodes, consoling, interacting with families and finding fit person. Also when special circumstances present themselves, the workers find it very tempting to use discretions. This is largely due to the unanticipated nature of the situation and therefore require solutions that are both unique and creative (for which there are no clear or formal guidelines available). Examples include dealing

with children with special needs, dealing with situations that require extensive coordination with multiple agencies and provide advisement to clients and families.

This list is by no means exhaustive. There are myriad of issues that the respondents listed out as indicative of the need for discretion. In addition, the fact that many of the respondents cited multiple instances in their task performance that require the use of discretion indicates the available guidelines failed to provide adequate support for the workers to perform their duties properly.

CONCLUSION

Policy implementation is a complex process with influences coming from multiple interacting factors which calls for the need to develop sophisticated theoretical models in order to understand how the SLBs actually negotiate their working situations (Meyers and Vorsanger³). The preceding discussions highlight some of the issues plaguing the nature of work amongst front-line workers in the area of child welfare service delivery. Being at the forefront of the policy implementation process, these workers face difficult challenges in performing their duties. On the outset, their jobs can be said to have been designed with proper rules, guidelines and instructions on how to deliver services and translate policies into productive outcomes. Yet as this analysis has portrayed, the supposed guidelines are far from adequate. In all likelihood it is perhaps unreasonable to expect that whatever protocols that the organisations were able to concoct for their workers will be able to cover all circumstances that may arise in the course of performing their duties. Still this is the issue at hand – that front-line workers will always be faced with such challenges that require them to constantly adapt to their dynamic working conditions. Research into how these challenges present themselves will definitely be useful so that organizations can take measures to improve the working conditions of their most valuable yet often underappreciated assets.

Correctional Rehabilitation of Inmates: A Solution to Reduce Recidivism in Oke Kura Prison Kwara State, Nigeria

Jamaludin Mustaffa¹, Kehinde Adekunle Aliyu¹

¹*School of Applied Psychology, Social Work and Policy, Universiti Utara Malaysia, 06010 UUM Sintok, Kedah, Malaysia*

ABSTRACT

Education supports security, public safety, rehabilitation that is the entire range of correctional services. There have always been good reasons to provide correctional rehabilitation to inmates. In any case, more ex-offenders still return to the prison. The dissatisfaction of restorative programme to decrease crime should be given due attention. Recovery of prisoners by means of subjective and professional empowerment is fundamental. This researched on the impression of community members, prison staffs and the social workers on the impact of rehabilitation training on prisoners as a remedy for their restoration and coordination into the society. Quantitative research design was adopted for the work. A total of 242 participants were selected as the sample size of this study. The sample of the study was drawn from the prison where rehabilitation activity is to be carried out. The sample size comprises both male and female inmates, Instructors/facilitators and the staff of the Prison and social workers, from the Oke Kura Prison, Kwara State, Nigeria. The outcome demonstrated that the respondents concurred that subjective and individual training for prisoners were deficient. There was no connection between detainees' restoration and formal learning. In view of the discovering, it was suggested that prisoners ought to be given subjective and professional training for restoration and settlement back to the society.

INTRODUCTION

The issue of helping the distressed has been a noteworthy worry to educationists. However detainees who have a place in this classification are not given the consideration they merit as far as instruction and directing, recovery and incorporation. There is generally a high applause to the legitimate establishment every year when reprieve is allowed to detainees and guilty parties remanded in police guardianship. This generosity, in any case, has not decreased the high rate of guilty parties and re-wrongdoers in our detainment facilities. The reason is not implausible. The issue of instruction, advising, restoration and the incorporation of this gathering has not been given the important consideration it merits. Detainees' recovery, as indicated by Souleimanov and Aliyev¹⁵, is a politically disagreeable reason. Ex-detainees have the solid motivator to perpetrate violations to survive and are dangers to the tranquility of the general public. He additionally states that concerned individuals have abundant chances to attempt an assortment of rehabilitative systems, for example,

guiding, work preparing and assisting ex-detainees with receiving support. The scientists have been included in jail religious service and found the abnormal state of the savagery of man to man in some of these detainment facilities. It is qualified to take note of that a portion of the detainees were guiltless of the wrongdoing they were blamed for Dichter⁸. Denying them the chance to carry on with an ordinary life in the wake of serving is another level of brutality.

With more detainment facilities being revamped and new ones raised to suit guilty parties, the solid part of jail training now turns out to be exceptionally basic. Jail training has the essential errand of expanding the possibility of work for ex-convicts. This will help in diminishing wrongdoing rates in the nation. As such, ex-convicts will keep on re-insult unless they are given more professional preparing and formal instruction Foucault⁹. A large portion of the crooks met admitted that they had no instructive capability and no occupations. A significant number of them showed low levels of proficiency and numeracy and have been in and out of the jails severally.

There is a shortage of preparing projects, research and writing in the region of restorative guiding for detainees. Employment preparing would give chances to the sound improvement of the positive possibilities in the detainees Beaudoin⁴. The motivation behind this examination, along these lines, was to analyze the degree to which jail prisoners have been presented to professional preparing, formal instruction and advising administrations. This is with a view to enhancing their recovery and joining into the general public. This initial part will talk about the accompanying terms all the more expressly.

Prison Education System: Education can be considered as the transfer of the values and gathered information of a general public. In this regards, it can be compared to socialization or enculturation as regarded by the social scientists. As social orders develop more perplexing, be that as it may, the amount of information to be gone on starting with one era then onto the next turns out to be more than any one individual can know; and consequently there must advance more particular and productive method for social transmission Pearce, Weller, Scanlon, & Kinsley¹³. The result is formal instruction the school and the pro called the teacher. Schools become more institutionalized as there increased in the complexity of the society. Prison correctional education is part of the prison reform movement. It is a window through which one can observe and encourage human progress. Simply put, it is the education given to prisoners to enable them leave the prison with more skills and be in a position to find meaningful and long-term employment Baron, Draine and Salzer².

Correctional education movement began in 1789 by William Rogers to prevent a riot at the Philadelphia's Walnut Street prison Gray¹⁰. The correctional educators operate on the principles that attitude, ideas and behaviour can be corrected and that humans are capable of progressing to higher thresholds of awareness. For ex-offenders to redirect their lives away from crimes, they need one to three years of transitional services such as life skills, anger management, basic education, job training and placement. Meek¹¹. Stated that the prison must be a centre for information and not for punishment. The primary task of prison education is to increase the chances of employment by ex-offenders and hence reduce recidivism. It can only be done through education resulting in better communication and vocational training.

However, there increases the indirect relationship between educational experience and the daily life

phenomenon. As such, there is a reduced evidenced of learning in the daily life activities and vague practices with more out of context learning. Prison education also known as correctional education are a type of professional training provided to prisoners while they are imprisoned. Usually, this education is a part of programmes organized for the rehabilitation of the inmates and which is useful in helping to prepare the inmates to be useful in the societies. Prison education can be provided from various sources; such as within the prison or from the outside sources such as professional schools, colleges and/or universities. Researches have shown that, apart from helping the prisoners, an entire societies can as well benefit from the prison education Clear⁶. In addition to the vocational and academic training given to the prisoners, moral training are also provided Christian and Islamic scholars. This is aimed at inculcating the virtue and the knowledge of God into the inmates. All these put together help the inmates to fit back into the societies.

Rehabilitation of Inmate: Zastrow¹⁶ stated that, rehabilitation may be regarded as the transfer of values and knowledge gathered from the society. As such, social scientists regards to education as socialization or enculturation. As the complexity of a society increases, the amount of knowledge to be passed from generation to the other becomes more than what an individual can know. Therefore, a more efficient and effective means of transmitting knowledge must be developed. Partridge¹² affirm that, society becomes more perpetually intricate and schools becomes standardized, instructive experience turns out to be less specifically identified with day by day life, less a matter of appearing and learning with regards to the workaday world, and, increasingly a matter of refining, telling, and learning things outside the realm of relevance.

Rehabilitation is a transitional or after-care service rendered to ex-prisoners to avoid revolving-door re-arrests. According to Partridge¹², prisons should be run in a progressive and more human spirit that will ensure ultimate reformation, social rehabilitation, and conducive psychological climate. Incarcerating criminals is a costly endeavor. Without effective treatment programmed to help and reform prisoners, such an exercise would just be a lot of waste. This study/research attempted to find out if prison education could help in fostering ex-prisoners' rehabilitation into the mainstream of the society.

Prison correctional rehabilitation programme provided to prisoners while imprisoned might be in the form of vocational or academic instruction. These programmes can be provided to inmates as a rehabilitation programme or from the outside sources by vocational schools, colleges and universities. The programme is schedule to help the prisoners and I was shown by previous studies that the program can as well benefit the entire community as a whole Partridge¹². Besides the vocational training provided to the inmates, moral training through preaching from both the Christian and Muslim scholars are also benefited by the inmates. The reason for the moral training is to inculcate the knowledge and virtue of God into the inmates to enhance their acceptance back into the societies after release.

A prison is the building designated by law or used by the sheriff for the confinement or detention of persons who are judicially ordered to be kept in custody. According to Cunneen, Baldry, Brown, Brown, Schwartz, and Steel⁷, a prison is a place where persons are confined or restrained from personal liberty. It can also be regarded as a correctional, detention or penal faculty. Hence the prison is often referred to as a correctional institution where offenders are confined or punished. The prison, like vampires, drains its wards of all that makes for maturity. Bright⁵ claims that the prison robs inmates of all independence of thought and action and that all vestiges of autism in the individual succumb to the disintegrating process. In other words, there is a gradual decay of those traits in the personality leading to psychological degradation. The researchers are of the view that only proper education and counseling can help rehabilitate the integrity of such persons.

Statement of Problem: There is a general agreement by good natured Nigerians that the prison establishment needs redesigning. The present prison framework should be in a more dynamic and compassionate way, to empower prisoners to have extreme reconstruction and professional aptitudes. This comes full circle in legitimate coordination into the general public. Along these lines, the prison staff are the ones in coordinate contact with the detainees and know the genuine condition of the undertakings in the prison this investigation endeavored to address this inquiry: ‘Would subjective training in the prison assist ex-detainees with being restored and incorporated into the standard of society, as indicated by prison staff’s perspective?

Hypotheses: The following research hypotheses were adopted to guide the study:

Ho1: There is a positive significant relationship between experiences of re-offenders and correctional rehabilitation programs.

Ho2: There is a positive significant relationship between Empowered (inmates and ex-offenders), and inmates recidivism.

Significance of the Study: The discoveries of this investigation will be of colossal advantages to educationists, jail directors, instructors, educational programs organizers and the administration. In particular, it will enable them to set out plans on the most proficient method to teach, restore and incorporate ex-detainees into the general public. It will similarly enhance the parcel of the detainees who will now have positive methods for employment subsequent to serving their correctional facility terms. Ultimately, the investigation will enable jail chairmen to discover better methods for redressing prisoners to change decidedly to existence without getting to be dangers to their kindred natives.

METHODOLOGY

Research Design: It is a descriptive study employing the survey method to stimulate information from the subjects.

Population of the Study: The target population of Oke Kura prisoners is 651 inmates (NPS, 2017) the prison staff in Oke Kura prison 50 and 50 ex-offenders

Table 1: The summary of the population of the study

Population type	Number	Source	Selected population
Inmates	651	NPS	180
ex-offenders	N/A	N/A	50
Prison officials	50	NPS	12
Total stratified random sampled number			242

Note: there is no adequate data on the ex-offender, the researcher decide to take 50 of Ex-offender to represent them.

Sample: A total of 180 inmates were used 12 prison staff and 50 ex-offenders were randomly selected from Oke

Kura prison. The choice of the three settings was found appropriate for the simple reason that they involve of people from varied backgrounds and exposure. There is, therefore, a wide variety of opinions. The stratified random sampling technique was used.

Instrument: Semi structure questionnaire, interview schedule and focus group discussion guide were used without the need to contact the counselors unless the need emerges based on literature relating to prison education and rehabilitation. Consequently, a panel of twelve experts who are familiar with the constructs carried out a review of the original draft of the survey questionnaire for this study. The panel of experts' composition. The instrument was divided into two sections. Section A requested subjects to give information on biodata of respondents. Section B consists of twenty-five items in relation to respondents' opinions to issues on prison rehabilitation programme, vocational training and empowerment. A 5-point Likert Scale ranging from To a Very Large Extent to Not at All and Strongly Agree to Strongly Disagree was used to score responses of subjects.

Validity and Reliability of Instrument: The instrument was found to have both face and content validity by panel of twelve experts who are familiar with the constructs carried out a review of the original draft of the survey questionnaire for this study in the field of rehabilitation and criminal justice. It had are liability coefficient the results that all measures attained satisfactory reliability coefficient ranging from 0.70 to 0.90 for indicators or items internal consistency reliability index of 0.87 using the Cronbach Alpha Statistics.

Method of Data Analysis: The data collected was analyzed using the descriptive and inferential statistics as methods of data analysis. Specifically, this study used Statistical Packages for Social Sciences (IBM SPSS) for Windows Version 20.0 and PLS-SEM (SmartPLS) software Version 2.0 3M in addition to PLS-Graph in the analysis of the data Correlation Statistics for hypothesis 1 while the t-test statistic was used for hypothesis 2.

RESULT

The results of the data analyses are presented below:

Hypothesis 1: There is no positive significant relationship between experiences of re-offenders and correctional rehabilitation programs

Hypothesis 2: There is positive significant relationship between Empowered (inmates and ex-offenders), and inmates recidivism

Table 2: Direct relationship effects of Rehabilitation (RR), Empowerment (ER) and Economy (EIR) on Inmate Empowerment Problem of Recidivism Assessment (IER) and Preventive or Incapacitation Related Problem (PRP)

	Beta	Standard Error	T-value	P-value
EIR -> RR	0.193	0.076	2.538**	0.011
ER -> RR	0.617	0.067	9.125***	0.000
IER -> RR	0.048	0.090	0.469	0.639
PRP -> RR	-0.036	0.101	0.352	0.725

Note: ***Shows the item is significant at the $p < 0.01$ p 0.05(1% level)

This table of direct relationships between rehabilitation (RR), empowerment (ER), economy (EIR), inmate empowerment problem of recidivism (IER) and preventive or incapacitation related problem (PRP) assessment portends four scenarios.

Firstly, the result shows that rehabilitation, as an attribute, maintained no significant relationship with inmate empowerment problem of recidivism assessment (competency). In essence, inmate empowerment problem of recidivism assessment (IER) in the prison requires specialised rehabilitation expert of social worker (beta = 0.048; t = 0.469; p = 0.639).

Secondly, inmate and ex-offender empowerment (ER) recorded significant relationship with rehabilitation programme (RR). This indicates that empowerment, as an attribute are held by individuals, which enable both inmate and ex-offender to perform their roles competently in the prison is relevant to empower the inmate to reduce recidivism, most especially in the Oku Kura and Kwara state (beta = 0.617; t = 9.125; p = 0.000).

Thirdly, economy of the inmates and ex-offenders (EIR) as an attitude enhances the behaviour and reasoning of both inmates and ex-offender towards the discharge of their roles with specific emphasises on prevention and incapacitation assessment. The results from the PLS-SEM indicates a very strong relationship between economy and rehabilitation programme (RR). (beta = 0.193; t = 2.538. p = 0.011).

Fourthly, the result shows that rehabilitation, as an attribute, maintained no significant relationship with preventive or incapacitation related problem assessment (IER)(competency). In essence, preventive or incapacitation related problem assessment (IER)in the prison requires specialised rehabilitation expert of social worker (beta = 0.036; t = 0.352; p = 0.725).

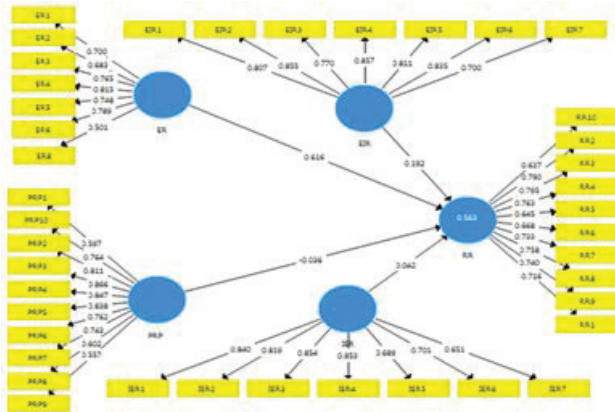

Figure 1: Results of the PLS-SEM Algorithm Direct Effects: RR, ER, EIR, PRP and IER

Most specifically, the results highlights that among the three predictors of IER, Economy (EIR) requirement of inmates and ex-offender recorded the highest significant path coefficient (beta = 0.511). Thus, it indicates the significant contribution of RR as the most important predictor of task performance prevention or incapacitation assessment by social worker in the Oke Kura, Prison Kwara State and Nigerian prison service.

Similarly, RR recorded the lowest path coefficient (beta = 0.129) among the three predictors of IER. Although, significant at p = 0.000), the results of the relationship between inmates and social worker skills and prevention or incapacitation assessment is somehow surprising. This is more so when considering the influence of enhanced empowerment to the inmate and ex-offender in assessing prevention or incapacitation in the era of globalisation that is characterised with information technology as a behaviour enabler or encourager, and coupled with new and complex legislation, thereby creating opportunities to perpetrate unlawful behaviour and high demand for worker. The results achieved on the significant direct relationships between rehabilitation, empowerment and economy (inmates and ex-offender) and inmate empowerment to problem of recidivism assessment are reliable and valid.

DISCUSSION AND FINDINGS

It is clear from the discoveries of this examination that human experience response to certain wonder is a result of a certain factorial transaction in their lives. The finding in theory 1 demonstrates that the subjects trust that detainees’ recovery is not identified with formal and professional instruction. It is amazing to take note of that the finding demonstrated that there is no connection between detainees’ recovery and instruction.

It uncovers to the analysts the indifferent mentality of individuals towards detainees’ welfare. It additionally affirms the perspective of Skocpol¹⁴, who attests that mechanical arrangement in the jail was constantly implausible and that the gathered restoration was nothing not as much as de-habilitation. He additionally clarifies that jail offices were not appropriate for recovery. In all actuality, individuals feel that detainees needn’t bother with instruction. Zastrow¹⁶, detailed that not as much as 33% of detainees approach instruction, and the individuals who do, spend just nine hours every week in formal learning exercises.

Detainees’ regaining is a politically detested reason. Dichter⁸, claims that New York State spent just six for every penny of its redress spending plan on instruction. He advocates that a portion of the reserve funds must go to what is called transitional administrations or aftercare. Numerous detainment facilities do get ready prisoners for life after discharge. Despite the fact that the scientists discovered from the penitentiaries that administration has been making arrangement for the training of the detainees, very little have been done to help the detainees. The prison staff’s declaration that a large number of the detainees have composed senior school authentication examination and other professional courses are at change with their reactions to the survey on restoration and prison programme. This likewise demonstrates the standard of instruction in prison is insufficient and unsuitable.

The discoveries demonstrate that the two gatherings concur that detainees require professional and formal training. The first part of hypothesis testing relates to the relationship between the rehabilitation, empowerment, and economy (inmate and ex-offender) and. inmate empowerment problem of recidivism assessment In addition, the relationship between rehabilitation, empowerment, and economy (social worker and prison staff) and preventive or incapacitation related problem representation and finally, the relationship between preventive or incapacitation related problem

representation and inmate empowerment problem of recidivism assessment. As per Antonovskaya¹, trust that gets ready detainees for discharge is a vital component to guaranteeing open well-being. An examination survey demonstrated that 90% of the 800 respondents upheld that detainment facilities ought to give preparing, training, and genuine occupation encounter and in addition medication and liquor treatment for prisoners. He additionally reports that 75% felt that most previous detainees will keep on needing help after discharge so as to have profitable existences. On the off chance that penitentiaries are to be habitats for renewal as attested by Dichter⁸, at that point the issue of professional and formal training can't be overemphasized.

The outcome additionally concurs with the feeling by Beach, Thein, and Webb³, that remedial teachers are expected to help recognize, illuminate and resolve the issues going up against the prisoners. He additionally clarifies that there was have to assemble and re-establish the person's abilities including his or her professional capacity. Imprisoning offenders is an exorbitant attempt, without viable treatment projects to help change detainees; such an action would simply be an insignificant goliath squander. Recovery programs cost far less.

Recovery pathways can prompt any of the strengthening of the prisoners since they are the extra-ordinarily helpless stratum of society; they are significantly more inclined to have malingered or been overlooked from school because of one reason or the other and more are probably going to have left school without any capabilities as the case possibly. Frequently they need to utilize time helpfully, however, can't take part in classroom condition and the standard instruction in jail (where it exists) concentrates on fundamental and fundamental abilities and may not be suitable for their level or what they coveted to be. This will enable them to build up the confidence and attitudes to increase important work upon discharge and to open entryways which they never knew existed they were detained. Detainment facilities are assembled basically as an establishment to help control the rate of wrongdoing in the general public and furthermore change the detainees.

CONCLUSION

Convicts are assembly of troubled people who have been dehumanized, underestimated and prevented from securing different rights including instruction,

professional preparing, recovery, and reconciliation. Jail directors, educators, and the Legislature have given careful consideration to their correction and restoration. Training is said to be the bedrock of any human attempt in accomplishing improvement and profitability. It will help keep ex-detainees from finding their way back to the penitentiaries. Medicinal directing, professional preparing, formal training and their securing of fundamental abilities have been prescribed. Government and jail executives ought to give an empowering situation to these detainees. Adjustment ought not to be by discipline but rather by reconstruction. This is an assignment for guides and instructors.

RECOMMENDATION

The circumstance in Nigerian detainment facilities falls underneath human models and is not helpful for recovery and treatment. Instruction prompts correspondence and professional capabilities. Detainees need to leave the correctional facility with more abilities and be in a position to discover important and long haul work. Recovery and coordination of detainees are fundamental. In this way:

Prison programme could be supported that would be the free stream of correspondence between the detainees and the staff. Extreme renewal, social restoration, and a more favorable mental atmosphere ought to be given to help mend the officially battered detainees.

The government ought to be urged to finance the detainment facilities in the range of professional and formal instruction. At the end of the day, the instruction of detainees ought to get nearer government's consideration monetarily. Reoffenders are costing the citizens more cash. Instruction assumes a key part in restoring detainees and coordinating them into the general public. Professional preparing in detainment facilities that can plan prisoners for genuine occupations on their discharge is crucial to lessen their reoffending.

Inmates require top notch showing that is suited to their individual needs. There must be a branch of instruction and aptitudes in our penitentiaries. All around qualified educators ought to be utilized. Instruction in the penitentiaries ought to be upgraded to guarantee that detainees are offered an indistinguishable quality and level of training from students in the group.

The nearness of an instructor gives another mental experience to prisoners. It is along these lines suggested that remedial foundations ought to be given advisors to utilize their authoritative and demonstrative aptitudes in helping detainees. Guides help detainees to manufacture and re-establish their confidence and professional capacities.

Prison heads require preparing and retraining on the most proficient method to emphatically impact the detainees to end up plainly balanced individuals from the general public. They similarly should be prepared in the administration of material, human and money related assets as it influences the prisoners' welfare.

Prisoners require one to three years' transitional administrations to effectively deter their lives far from wrongdoing. Consequently, it is upheld that fundamental abilities, outrage administration, essential instruction, and employment preparing ought to be made accessible to detainees.

UUM Sintok Kedah, Malaysia; ²Ahmad Ibrahim Kulliyah of Laws, International Islamic University Malaysia, 53100 Gombak, Malaysia

ABSTRACT

The existing law in Malaysia authorized an evidence of existence of physical body before the law recognized the end of presumption of life of person. Hence, problem may arise where a person has been missing and his whereabouts is not known to the person close to them as no declaration of dead can be made as there is no body to support the contention. This article seeks to examine the specific law in England & Wales namely Presumption of Death Act 2013 in order to suggest an appropriate legal framework on presumption of death in Malaysia. For this purpose, the discussion adopts the doctrinal analysis by examining the existing primary and secondary materials includes statutory provisions, case law and other legal and non-legal literatures relating to the presumption of death and missing persons. This article concludes that there is a need to propose a specific legislative act to harmonize the uncertainties in the existing legal framework. There must be a statutory recognition of 'specific peril' rules to circumvent the hardship of seven years common law waiting period. The law must have following features which are, the court must have jurisdiction's over the property of the missing person; notice to the presumed missing person must be attempted; the lapse of time before the presumption can be raised must be reasonable and there should be some safeguard for the missing person should he return.

Keywords: *Presumption of death, missing persons, England, Al-Mafqud, Malaysia.*

INTRODUCTION

Proving that a missing person is dead is not an easy task. Such situations in which a presumption of death may be employed may gave rise to different legal problems. At present, there is no specific legislation which deals with presumption of death in Malaysia despite of many cases had occurred in the past. To cater the issue, the judiciary has followed the common law position which has been incorporated in section 107 and section 108 of Malaysian Evidence Act 1950. The common law has developed doctrine of presumption of death rules to handle long-term unexplained absences.

Even though the position has been left in abeyance and acknowledged universally without objection, the traumatic loss of Malaysian Flight MH17 and mysterious disappearance of MH370 has trigger the needs to revisit the doctrine of presumption of death and its application in Malaysia. There exist opinions from the scholars and academician that the common law waiting period of

seven year to be tolerate by the family members before the application of presumption of death can be filed before the High court is absurd and no longer relevant in the modern society. England law has started to move from the common law principle waiting period of seven years to a much shorter period by acknowledging the 'specific peril' such as accident and disaster as justification to make a declaration of presumption of death to missing persons where their physical body cannot be found¹.

PROBLEM STATEMENT AND RESEARCH METHOD

Problem Statement: Despite of many tragedy of missing person such as the missing of pilgrims in Al-Muassim Tunnel tragedy in 1990, the collapse of condominium Highland Tower in 1993 and the disappearance of Malaysian Airlines Flight MH370 in 2014, there is no specific legislation which deals with presumption of death in Malaysia² causing problems in administration of missing persons estate³.

These tragedies are among the many cases where one has to deal with the agony of not knowing whether the missing person is still alive or already died until and unless the death is confirmed or presumed after some lapse of time. The ascertainment of death and the survival of legal heirs in a missing person case is extremely important because it determines whether any rights of inheritance exist or not⁴ and also Muslim women's right to marriage dissolution in the case of missing husband.⁵ Based on that premised, this article is undertaken to formulate an appropriate legal framework relating to presumption of death in circumventing the ambiguities and inconsistencies of existing laws in Malaysia. Hence, this article aims to examine the specific statute in England & Wales namely, Presumption of Death Act 2013 in order to suggest an appropriate legal framework on presumption of death in Malaysia.

RESEARCH METHOD

Aiming to formulate an appropriate legal framework on presumption of death in Malaysia, this article employed a qualitative doctrinal legal research as the article intends to discuss in-depth and detailed on the particular matters. By using qualitative methods many new aspects of problem can be identified and thus once they are identified, suggestion would follow resulting in the research result and findings being more beneficial and practical⁶. For this purpose, the discussion adopts the doctrinal analysis by examining the existing primary and secondary materials gathered from multiple sources especially statutory provisions as provided by Presumption of Death Act 2013 of England, case law and other legal and non-legal literatures relating to the presumption of death and missing persons. An analysis of the statutes is made in order to evaluate the loopholes in the law and suggest necessary improvement to the existing law in Malaysia that there are various law that governed the matters relating to the missing person to be presumed dead.

EXISTING LAW ON PRESUMPTION OF DEATH IN MALAYSIA

In Malaysia, there are various laws that governed the matters relating to the missing person to be presumed dead⁷. At present, there is no specific legislation which deals with presumption of death in Malaysia except the common law doctrine of presumption of death rules

which has been incorporated in the Malaysian Evidence Act 1950. There are also other provisions which discuss on the framework relating to presumption of death which are scattered in several provisions of distinct statutes such as Births and Deaths Registration Act 1957, Criminal Procedure Code, Syariah Court Evidence (Federal Territories) Act 1997 and Islamic Family Law (Federal Territories) Act 1984.

The Presumption of Death based on Common Law

Principle: The presumption of death is an exception to the presumption of life. A "missing person" can be defined as a person who is observed to be missing from his or her normal patterns of life, that those who are likely to have heard from the person are unaware of the person's whereabouts and that the circumstances of the person being missing raises concerns for his or her safety and well-being. The definition invoke that in claiming a presumption of death, two basic facts must be proved, firstly that the person must not have been heard of for seven years; and secondly that he must not have been heard during that time by those who would naturally have heard of him.

The prevailing law in Malaysia relating to the presumption of death are section 107 and section 108 of Malaysian Evidence Act 1950. Both section incorporate the Common law presumption of life up to seven years and presumption of death after seven years. The principle has been explained in *In Re Application of Tay Soon Pang; Ex P* [2009] 9 CLJ 778 where the court held that the mere facts of person not having been heard of affords no inference of his death, for in certain circumstances, it is probable that he could never be heard of again by his relatives. The onus of proving death must rest with the person to whose case that fact is essential. If the circumstances of a man's disappearance are such that it is unlikely that his relatives would have heard of him in any event then the court will not presume his death. The principle has furtherly been discussed in *Lau Suet Wan v Hong Leong Assurance Bhd* [2015] 2 CLJ 681 where the court held that the person who has been missing from 2002 was presumed death as no prove has been adduced to rebut the claim by those who would naturally have heard from that person if he had been alive.

Registration of Births and Deaths: Prior to the latest amendment in 2017 to the Births and Deaths Registration Act 1957, the National Registration Department (NRD) will not register or issue a death certificate for a person

presumed dead. This is based on the fact that a person cannot be declared dead if there is no body to support the claim. The information on person who has been presumed dead by the High Court will only be update in the NRD system. However, by virtue of section 19 of the Births and Deaths Registration (Amendment) Act 2017 (Act A1524), the legislature has inserted two new provisions relating to registration of presumed dead namely Section 24A and 24B, where the Registrar shall now issue a Certificate of Presumed Death to the person forwarding the Court order of presumption of death under any written law. In other words, on receipt of the order, the Registrar shall make an entry in a register containing the name of missing person and such other information as may be necessary in relation to the missing person's presumed death. By this amendment, it shows that the Malaysian legislation had acknowledge two types of death in Malaysia, firstly by an actual death and secondly a presume death declared by the court.

Death based on the Circumstantial Evidence: It is to be noted that section 108 of the Evidence Act 1950 does not prevent the court from finding on circumstantial evidence that the death of a person occurred before the expiry of seven years from the date of disappearance. The stand is entangled with the decision made by Augustine Paul in *Re Osman Bachit* [1997] 4 MLJ 445 where the learned judge held that in cases where circumstantial evidence existed that may prove that the person is dead, the family or interested party cannot be forced to wait for seven agonizing years just for formality. The court has the jurisdiction to decide based on circumstantial evidence to shorten the length of time period. The circumstantial evidence causing the death may be by misadventure causes, such as accident, struck by lightning, drowning, suicide or death caused by person or persons unknown as a result of lawful or unlawful intentional and or unintentional act culminating in unforeseeable death, death caused by act of God or death caused by natural causes (*PP v. Shanmugam & 5 Others* [2002] 1 LNS 160; [2002] 6 MLJ 562) & *Inquest into the death of Azaria Chantel Loren Chamberlain* [2012] NTMC 020)

In the current system, there exist a statutory framework which would provide for the making of a presumption of death order in respect of two categories of missing persons. The first category is where the circumstances of the disappearance indicate that death is virtually certain. The second category is where both the circumstances and the length of the disappearance indicate that it is highly

probable that the missing person has died and will not return, which is where the disappearance occurred in dangerous circumstances or in other circumstances in which loss of life may be presumed.

For the first category, section 329(6) of the Criminal Procedure Code provides a hideaway from the normal inquest proceeding where the body of the dead person could not be found and give the family an opportunity to circumvent the general rule of 7 years waiting period. The court in *Re Inquest into the Death of Lim Chin Aik, Deceased* [2014] 1 CLJ 136 come to the conclusion after determining the evidence presented by the wife of the victim is sufficient, adequate, cogent and exact that at the material time. The decision was made based on the proof that the victim's daily routine was to pick his daughter using the similar road in Penang where on that unfortunate date, a structure fell down from a building known as Menara UMNO and crushed unto the said car creating a big hole in the road and incidentally buried the victim to death.

For the second category, the tragedy of the missing Malaysian Flight MH 370 in 2014 would be the best examples as the disappearance occurred in dangerous circumstances or in other circumstances in which loss of life may be presumed. The length of the disappearance also indicate that it is highly probable that the missing person has died.

Presumption of Death under Islamic Law: Islamic law too recognises the concept of presumption of death but wisely it is not stuck with the common law and Evidence Act notion of not less than seven years⁸. Interestingly to note that Muslim heirs of missing person have the option to apply to civil court or Syariah court to obtain a declaration of presumption of death⁹. For illustration, even though the wording in section 80 of the Syariah Court Evidence (Federal Territories) Act 1997 is similar as provision in section 108 of Evidence Act 1950. The only difference is the waiting period under the former is only four years not seven years as provided by the later legislation. The situation is supported by the law that allow for the purpose of enabling a woman to remarry, she may file for an order of dissolution of marriage or fasakh on the ground that her husband is believed to have died, or has not been heard of for a period of four years or more.

For instance, Section 53(1) of the Islamic Family Law (Federal Territories) Act 1984 provides that if the

husband of any woman has died, or is believed to have died, or has not been heard of for a period of four years or more, and the circumstances are such that he ought, for the purpose of enabling the woman to remarry, to be presumed in accordance with Hukum Syara' to be dead, the Court may, on the application of the woman and after such inquiry as may be proper, issue in the prescribed form a certificate of presumption of death of the husband and the Court may on the application of the woman make an order for the dissolution of marriage or fasakh. This provision is interweaved with the provision in Syariah Court Evidence (Federal Territories) Act 1997 as the law acknowledge four years to be the waiting period before a missing husband is presumed to be dead in allowing a wife to remarry.

In discussing the issue, the court in *Re Ex Parte Application of Ridzwan Ibrahim (Presumption of Death)* [2002] 4 CLJ 502 held that where there is no inconsistency between section 108 as found under the Evidence Act 1950 and section 80 of the Syariah Court Evidence (Federal Territories) Act 1997. The provision in former legislation is regarded as general law and the fact that it provides for a period longer than what is available under the latter legislation justify their consistency to each other. Moreover, the learned judge opined that with the two legislations available in respect of an application for a presumption of death the implementation is to be harmonised rather than to construe that there is any inconsistency as to accommodate the applicant in seeking another jurisdiction of a civil court in order to obtain the letters of administration. The waiting period of seven years should be amended [10] to a shorter period of four years following the provision in Islamic law to give effect of certainty in law¹¹.

LAW ON PRESUMPTION OF DEATH IN ENGLAND AND WALES

Under the law of England and Wales the disappearance of a person does not affect the ownership or control of their property and affairs. In such circumstances, it may be difficult or impossible for those left behind to obtain a death certificate if they believe the missing person must be dead. Without a death certificate, the missing person will for legal purposes generally be assumed to be alive. In these circumstances, there are a number of specific procedures under which the missing person may be presumed dead. In most of these cases the presumption of death is limited to the purposes of the specific procedure in question.

Presumption of Death Act 2013 (PDA) was passed in England to simplify the earlier common law process in presumption of death. The Act broadly follows the form and content of the Presumption of Death (Scotland) Act 1977 and the Presumption of Death Act (Northern Ireland) 2009 and is considered to be consistent with the Council of Europe's 2009 Recommendation on principles concerning missing persons and the presumption of death. The Act allows relevant person to apply to the Court for the declaration of presumption of death on the ground that the missing person is thought to have died or has not been known to be alive for at least seven years¹². At that time the declaration will be conclusive cannot be appealed as to the presumed death and effective for all purposes and against all persons¹³. The missing person's property will pass to others in the same way as if the missing person had died and been certified dead in the normal way and his or her marriage will end as a marriage on death¹⁴. It is recorded on a new Register of Presumed Deaths, and has the same effect as a registration of death. Death is taken to occur on (a) the last day that they could have been alive (if the court is satisfied that they are dead), or (b) the day seven years after the date they were last seen (if death is presumed by the elapse of time).

Section 5 provides that the High Court can order the variation or revocation of a declaration of presumed death (an obvious example of circumstances in which this would be appropriate being where the missing person returns, still alive; or where there is clear evidence of the missing person having been alive at a time later than that declared as the time of death in the original declaration. The variation order however neither of itself affect property acquired as a result of the declaration as to protects those coming into possession of property in good faith, nor reviving any marriage or civil partnership ended by the declaration in ensuring validity of the subsequent marriages or civil partnerships of the missing person's spouse or civil partner¹⁵.

The legislation in England and Wales have inserted a 'specific peril rule' provision in their legislation to circumvent the lengthy seven years waiting period¹⁶ as to the suspended years to wait will prejudicially effect the family members. This principle has been inserted in Section 17 of PDA, enabling the Secretary of State to change the length of the periods specified in the Act that are currently seven years; and the period after which an order under section 7(3) can only be made in exceptional

circumstances and the length of period currently is five years. This power is to be exercised by making regulations by statutory instrument and the regulations will be subject to affirmative resolution procedure¹⁷

The ‘specific peril’ rule was first enunciated in *Burr v. Sim*, 4 Whart 150, 171 (Pa. 1838), where the judge opined that to accelerate the presumption from time, it is necessary to bring the person within the range of a particular and immediate danger. Under the specific peril rule, attempts to fix the time of death within the period are universally successful, when it can be satisfactorily shown that, when last seen, the missing person was confronted with some dangerous, specific peril, calculated presently to destroy his life¹⁸. Some Western scholar has pointed out that the common law waiting period of seven years is arbitrary, impractical, anachronistic, obstructive, harsh and unrealistic¹⁹ and might pose hardships on surviving family. Comparatively, in United States, the post 9/11 amendments represent an important step in the evolution of mass fatality and presumptive death certificates by adding specific peril clauses such as catastrophic event or disaster to existing presumptive death statutes, or creating new statutes exclusively dealt with mass fatalities²⁰.

CONCLUSION

This article concludes that there is a need to establish a specific legislation to harmonise the uncertainties in the existing law in Malaysia. The Presumption of Death Act 2013 of England would be a good model to the Malaysian legal framework subject to several modifications to suit the existing law and the local circumstances by acknowledging the existing of parallel judicial system for Muslim and Non-Muslim. There must be a statutory recognition of ‘specific peril’ rules to circumvent the hardship of seven years common law waiting period. The model law must have the following features which are, the court must have jurisdiction’s over the property of the missing person; notice to the presumed missing person must be attempted; the lapse of time before the presumption can be raised must be reasonable and there should be some safeguard for the missing person should he return.

The Restricted Autonomy of Will: The Disregarded Values in Shariah Based Contract

Hakimah Yaacob¹, Selamah Maamor²

¹Faculty of Islamic Economics and Finance, Universiti Islam Sultan Sharif Ali, Simpang 347, Jalan Pasar Baharu, Gadong BE 1310, Negara Brunei Darussalam; Islamic Business School, Universiti Utara Malaysia, 06010 Sintok, Kedah Darul Aman, Malaysia

ABSTRACT

The disregarded values are the principles in Shariah that are secured by disciplines while contracting. These values are disregarded due to influx of conventional doctrines in contracting. This has resulted in losing of identity. The principles are diluted into the conventional system till the main objectives of Islamic economics and financial systems are losing out grasp of the intended results. This paper is an attempt to analyse the dynamism, sanctity and features of shariah contracts rationale. The paper claims that Shariah based contract offers special characteristics and features that never present in the conventional. In addition, this paper claims that there are restricted autonomy of will in Shariah contract. The paper utilises library research. Several cases referred to for evidence purposes. The finding concludes that shariah based contracts are disciplined under the values prescribed in the quran and al-hadith. The autonomy of will is restricted within the ambit of these lines.

INTRODUCTION

It has been recorded that in the immediate pre Islamic era, the life in Mecca was decadent that reflects the moral and cultural decline. The decadencies can be seen in every transaction and way of life including trade. Being a trade centre, Mecca was a central of attention for trader. The main attention of the prophet was to redress the abusive practices in trade. Being a merchant before his Prophethood, he imposed trade based on Shariah values and principles. As mentioned by Shaikh Taqi Usmani says that Al-Quran in verses 278 and 279 reveal on these as:

“After the conquest of Makkah, the holy Prophet (pbuh) had declared as void all the amounts of Riba that were due at that time. The declaration embodied that nobody could claim any interest on any loan advanced by him. Then the holy Prophet (pbuh) proceeded to Taaif, which could not be conquered, but later on the inhabitants of Taaif, who belonged mostly to the tribe of Thaqif, came to him and after embracing Islam surrendered to the holy Prophet (pbuh) and entered into a treaty with him. One of the proposed clauses of the treaty was that Banu Thaqif would not forego the amounts of interest

due on their debtors but their creditors would forego the amounts of interest. The holy Prophet (pbuh) instead of signing that treaty simply ordered to write a sentence on the proposed draft that Banu Thaqif will have the same rights as other Muslims have. Banu Thaqif, having the impression that their proposed treaty was accepted by the holy Prophet (pbuh), claimed the amount of interest from Banu Amr Ibnal-Mughirah, but they declined to pay interest on the ground that Riba was prohibited after embracing Islam. The matter was placed before Attaab ibn Aseed (God be pleased with him), the Governor of Makkah. Banu Thaqif argued that according to the treaty they were not bound to forego the amounts of interest. Attaab ibn Aseed placed the matter before the holy Prophet (pbuh) on which the following verses of Surah al-Baqarah (278–279) were revealed:”

“O those who believe, fear Allah and give up what still remains of the Riba if you are believers. But if you do not do so, then listen to the declaration of war from Allah and His Messenger. And if you repent, yours is your principal. Neither you wrong, nor be wronged.”

“At that point of time, Banu Thaqif surrendered and said that they had no power to wage war against Allah and

his Messenger.”¹Three cardinal principles introduced as the basis for contractual obligations arising out of the muamalat. S.M. Hasanuz Zaman, an IDB Laureate in Islamic economics, has critically examined definitions by a number of scholars and given his own definition:

“Islamic Economics is the knowledge of application of injunctions and rules of the Sharī‘ah that

stop injustice in the acquisition and disposition of material resources in order to provide satisfaction to individuals and enable them to perform their obligations to Allah and society.”

When conventional economy are based on the “using of the limited resources with unlimited wants, while Islamic economy believes that resources are unlimited with limited wants.” With different doctrinal ideology, the two can never be the same. Mohsin S. Khan, a senior economist at the IMF, says:

“Broadly speaking, the term ‘Islamic Economics’ defines a complete system that prescribes a specific pattern of social and economic behaviour for all individuals. It deals with a wide-ranging

set of issues, such as property rights, incentive system, allocation of resources, types of economic

freedom, system of economic decision-making and proper role of the government. The over-riding

objective of the system is social justice and specific patterns of income and wealth distribution and consequently economic policies are to be designed to achieve these ends.”

THE CONNECTION OF ISLAMIC ECONOMICS AND CONTRACTS

The reflection of Islamic economy is transpired in the contract. To uphold the Islamic economy, the principles on the prohibition of riba, maysir and gharar were introduced. These principles are the basis of Islamic economy to ensure the circulation of economy are free from oppression and injustice. As the vicegerent of God, human is accountable to Him for all his actions on the Day of Judgment. Thus Islam prescribes a strong system of accountability at all levels. Islamic economic teaches human to observe certain limits in the exercise of his freedom. Within these bounds all his acts are worship

of God. As the vicegerent of God man is accountable to Him for all his actions on the Day of Judgment. Thus Islam prescribes a strong system of accountability at all levels. In an Islamic society taqwa (God-consciousness) is considered very highly. The more a person is God-conscious, the more highly he is esteemed in the society. Taqwa comprises a cluster of values like justice (‘ad/), benevolence (ihsan), benevolent spending in the cause of God (infaq), remembering God (zikr), etc. Taqwa is a multi-dimensional value. The values brings towards wasathiyah (moderation). In Islam, money is not the objective of life, it is just means to achieve the objectives.

In Islam, the objectives of Muslims are to pursue the maqasid al-shariah (the objective of shariah), to protect life, intellect, religion, property and Nasab. Surah Al-Baqarah of verse 274 states:

“Those who consume interest cannot stand [on the Day of Resurrection] except as one stands who is being beaten by Satan into insanity. That is because they say, ‘Trade is [just] like interest’. But Allah has permitted trade and has forbidden interest. So whoever has received an admonition from his Lord and desists may have what is past, and his affair rests with Allah . But whoever returns to [dealing in interest or usury] - those are the companions of the Fire; they will abide eternally therein.”

Yusuf Ali has commented the verse explaining that usury is any increase sought through illegal means. These include usury, fraudulent trading and bribery. The prohibition is due to economic selfishness. Islam has prohibited interest on capital and thus has foreclosed the door of accumulating wealth without work or without assuming risk. Imposing any interest or riba on principal is an act of transgression and diverted from the value of Islamic economic. From Usamah ibn Zayd: The Prophet, peace be on him, said:

“There is no riba except in nasi’ah [waiting].” (Bukhari, Kitab al-Buyu, Bab Bay al-dinari bi al-dinar nasa’an; also Muslim and Musnad Ahmad). “There is no riba in hand-to-hand [spot] transactions.” (Muslim, Kitab al-Musaqat, Bab bay’i al-ta’ami mithlan bi mithlin; also in Nasa’i).

From Ibn Mas’ud: The Prophet, peace be on him, said: “Even when riba is much, it is bound to end up into paltriness.” (Ibn Majah, Kitab al-Tijarat, Bab al-taghlizi fi al-riba; also in Musnad Ahmad).

From Anas ibn Malik: The Prophet, peace be on him, said: “When one of you grants a loan [of money] and the borrower offers him a dish, he should not accept it; and if the borrower offers a ride on an animal, he should not ride, unless the two of them have been previously accustomed to exchanging such favours mutually.” (Sunan al-Bayhaqi, Kitab al-Buyu, Bab kulli qardin jarra manfa’atan fa huwa riban).

The general rule is that whoever wants to earn a profit must assume risk. The operating principle is “no risk, no gain”.² There is nothing prohibited except that which God prohibits. According to Ibn Qayyum, to declare something permitted prohibited is like declaring something prohibited permitted. The above verses indicate the clear prohibition of Riba.

The basis of shariah contract are free from riba, gharar, maysir and injustice. As mention in Surah Al-Baqarah, Verse 276, “Allah destroys interest and gives increase for charities. And Allah does not like every sinning disbeliever.”

The second principle is the prohibition of gharar. Gharar means uncertainty or hazard that might lead to destruction or loss. Hanafi scholars have defined Gharar as “something which its consequence is undetermined.” Shafi’i scholars have described it as “something which in its manner and its consequence is hidden. Al-Sarakshi, “anything that the end result is hidden or the risk is equally uncommon, whether it exists or not.”

Imam Ibn Tamiyah “Gharar” is involved in the business that one’s deals with unknown about its existence, Rahman (1979) “Gharar” may be divided into two groups, the first group referred to risk that involved uncertainty and probability is dominant, whereby the second group referred to the element of doubt due to deceit or fraud.

“Eat not your property among yourselves unjustly by falsehood and deception, except it be a trade amongst you by mutual consent.” (Al-Bakarah, 2:188; Al-Nisa, 4:29). The Quran has categorically prohibited gambling (Al-Bakarah, 2:219 and Al-Maidah, 5:93). Many scholars argue that Gharar is one of the branches of gambling (Rahman, 2010; p.71).

Prophet (s.a.w.) on many occasions forbade many transactions which included Gharar. For example, “the Prophet (s.a.w.) has forbidden the purchase of the unborn

animal in the mother’s womb, the sale of the milk in the udder without measurement, the purchase of spoils of war prior to distribution, the purchase of charities prior to their receipt, and the purchase of the catch of a diver.”

Taking advantage as part of elements in maysir (gambling), is mention clearly in the Quran: “O ye who believe, eat not up your property among yourselves in vanities but let there be amongst you traffic and trade by mutual good-will...” (Quran 4:29). Hence, it is understood that to take advantage of another person is denounced by Islam, which is, specifically, the taking advantage of the weakness of a speculator and investor, and taking advantage of real or artificially devised inefficiencies in the market.

Based on the above doctrines and principles, Shariah imposes the principles to be incorporated into the system. Be it economic trade or financial system. The autonomy of will and freedom of contract are therefore subjected to Islamic prohibition. Due to this, Islamic contract need to reflect the objective of Islamic economics. The foundation laid down by the Islamic economics and principles are built within the principles of contract. The objective of Shariah based contract is heading towards wasatiyyah.

In order to avoid invalidity, Islam prohibits any transaction contradicts the above three principles, ie; riba, gharar and maysir. The principles goes beyond prohibition of dealing in any transaction involving mal ghaira mutaqawwim (the asset is not valid in the eyes of syara’), selling Ma’dum (object is not in existence), selling something which does not belong to the seller, selling something which is impossible to be delivered. Abdullah ibn Abbas (Gbpwh) extended the prohibition of Bai’ al Gharar to Bai’al-Gh^{ai}b (the sale of absent or concealed goods). The latter contract is considered as falling within the notion of Gharar, since the object of sale is uncertain and the purchaser has the right of option (Khiy^{ar}) to revoke the contract upon sight.

Examples of Gharar are: ignorance about the species being sold, about the quantity of the object and the price, lack of specification of the item being sold, e.g. saying: “I sell you one of the houses of this project” without specifying that house, sale of debt (assignment without recourse to the seller) is prohibited as realization of the debt in the future is not certain, ignorance of the time of payment in deferred sales, contracting on a nonexistent object and/or the inability to deliver the object, indicating more than one price or option in a contract unless one

is specifically chosen. As this uncertainty may lead to undue benefit to one party at the cost of the other, Gharar sometimes also implies deceit.

According to AyyubM. (2007), Gharar can also mean any deception through the act of juhulah or ignorance by one or more parties to a contract. He proposed “the following to reflect the examples of Gharar:

Selling goods that the seller is unable to deliver, as this involves counterparty or settlement risk. This is why, for goods to be covered under the subject of Salam (which is permitted), it is necessary that the relevant commodity might be available in the market at least at the time when delivery has been stipulated.

Making a contract conditional on an unknown event, such as ‘___when it rains’. Two sales in one transaction in such a way that two different prices are given for one article, one for cash and one for credit, without specifying at which price one buys the item with the understanding that the sale is binding on the buyer at either price; or selling.”

SHARIAH BASED CONTRACT AND PRINCIPLES OF AUTONOMY OF WILL

Shariah does not allow freedom of contract in toto. The principles of autonomy of will is limited to several restrictions being the basis of contracting. Imam Ibn Taymiyah explains the difference between ibadah and Muamalat as follows:

“The acts and deeds of individuals are of two types: Ibadat, whereby their religiousness is improved, and Adat or Muamalat (transactions), which they need in their worldly matters. A n inductive survey of the sources of the Shariah establishes that devotional acts are sanctioned by express injunctions of the Shariah. Thus, what is not commanded cannot be made obligatory. As regards transactions, the principle governing them would be permissibility and absence of prohibition. So nothing can be prohibited unless it is prescribed by Allah (SWT) and His Prophet (pbuh) in the overall framework.” As stated in - Ibn Taymiyah, Fatawa al Kubra, cf, Mansoori, 2005, pp. 3, 4.

DISCIPLINES AND FEATURES OF SHARIAH CONTRACT/AQD

Ibnu Taymiyyah indeed encourage the freedom of exercising ijthadiyyah as long as no transgression against the prohibition. There are splitting views in categorising the types of Shariah contracts.

“Aqd or contract is an implied obligation arising out of a mutual agreement. The term ‘Aqd has an underlying idea of conjunction, as it joins the intention as well as the declaration of two parties. The Holy Qur’an has used the word in this sense: ‘O believers! fulfil your contracts (‘Uqud)’.”(Ibn Taymiyah, Fatawa al Kubra, cf, Mansoori, 2005, 2: 235; 5: 88).

According to Al-mansoori (2005), “Aqd is used in two senses: in the general sense, it is applied to every act which is undertaken in earnestness and with firm determination, regardless of whether it emerges from a unilateral intention such as Waqf, remission of debt, divorce, undertaking an oath, or from a mutual agreement, such as a sale, lease, agency or mortgage. In this sense, ‘Aqd is applicable to an obligation irrespective of the fact that the source of this obligation is unilateral declaration or agreement of the two declarations. In the specific sense, it is a combination of an offer and acceptance, which gives rise to certain legal consequences.”

Contracts are structured on various models such as sole proprietorship, partnership (Shirkah), agency (Wakalah) or labour (Ujrah) or forms like sale and lease. All such activities are subject to the observance of certain rules, making the transactions valid and legally enforceable. These rules together constitute the Islamic law of contracts. Shariah contract is divided into 7 types or known as Table of 7 as follows;

Table 1: Table of 7 type of contracts

No.	Types of contract	Muqtadha al-aqd	Contracts
1.	Sale based contract	To transfer ownership	Murabahah, BBA, Salam, itisna’, etc
2.	Equity based	To share profit and losses	Mudharabah, musharakah
3.	Lease based	To enjoy usufruct	Ijarah thumma al-bai’
4.	Fee based	To get ujrah	Wakalah
5.	Security based	To get collateral security	Kafalah/ dhamanah
6.	Tabarru’ based	To be rewarded and not expected any return	Takaful, sadaqa, waqf, qard
7.	Amanah based	To keep in safe custody and not to use it	Wadiyah yadh amanah

Source: Yaacob et al. (2017)

Based on the above table, every contract executed with specific objectives. Each contract executed with tartib or sequence. This is part of ethics in Islam. The modus operandi in writing shariah contract emphasises the existence of pillars and the execution of sequence. These elements are not a requirement under the Contract Act 1950. The Shariah contract consist of Rukn (Pillars). These pillars determine the validity of a contract executed. All Muslim scholars agreed that the contract is void if the pillars incomplete. Every pillar established its own syuruth or conditions. The breach of these syurut conditions may eventually resulted in void or voidable contract contract depends on the opinion of scholars from different school of thought.

Unlike Contract Act 1950, the shariah contract does not impose conditions for a valid contract. syuruth comes later after the pillars. In order to make a contract valid in the Contract Act 1950, there are conditions that must be fulfilled. Unlike Islamic contract, these conditions are not pre conditioned with pillars. Islam also imposes prohibition on execution of a contract based on time. For example it is not allowed to do sell and trade during jumaah prayer. As mentioned in Surah Al-Jumu'ah (62:9-10);

“O you who believe! When the call is proclaimed for the Salah on Al-Jumu'ah (Friday), then hasten (Fas'aw) to the remembrance of Allah and leave off business. That is better for you if you did but know! 10. Then when the Salah is complete, you may disperse through the land, and seek the bounty of Allah, and remember Allah much, that you may be successful.”

The above ayat shows prohibition of conducting business during jumah prayer. Disciplines while contracting is essential. There is no full freedom of autonomy without observing the principles and disciplines. In brief, the principles are read within the ambit of non free autonomy due to dynamic features of shariah contracts. Shariah contracts featured and translated in tartil or composed. The composition of pillars, and every syuruth/conditions emanates of pillars reflects the sequence in contracting. Shariah contracts never imposed syuruth or conditions precede the pillars. The consequences of breach in each composition may lead to different consequences. The pillars of each contracts can never be the same from one contract to another. For example, bai' bithamin ajil (BBA) is a contract riding on the principles of bai' al-inah.

Therefore, the principles of bai' al-inah applies in the context of BBA. Indeed BBA itself is not a contract but a product riding on the contract or aqd of al-inah. Inah contract is prohibited by all schools of thought except shafie. Hence, strict features imposed to ensure the execution of aqd is free from any prohibited elements. Imam Shafii defines Bai' al-inah as “a credit purchase of an asset which is later sold to the original owner or a third party, whether at a deferred or spot, higher or lower price than the first contract or for an exchange of goods”³. Al Haskafi defines it as “a deferred sale of an asset with a motive to generate profit. The debtor, then, resells the asset to the original seller at a lower price in order to settle his debt”⁴.

Bai' al-inah refers to a contract which involves sale and buy back transactions of an asset by the seller. In these transactions, the seller sells an asset to the buyer on cash basis and then buys back the asset at a deferred price which is higher than the cash sale price. It may also be conducted where the seller sells the asset to the buyer at a deferred price and subsequently buys back the asset on cash basis at a lower price than the deferred sale price.⁵ In a celebrated case “Bank Islam Malaysia Bhd v Lim Kok Hoe & Anor And Other Appeals [2009] 6 CLJ 22”, Raus Sharif JCA (as he then was) defined BBA contract as “a deferred payment sale contract”⁶.

The SAC, in its 16th meeting dated 11 November 2000 and 82nd meeting dated 17 February 2009, has resolved that “a valid bai' `inah contract shall fulfill the following conditions:

1. Consisting of two clear and separate contracts, namely, a purchase contract and a sale contract;
2. No stipulated condition in the contract to repurchase the asset;
3. Both contracts are concluded at different times;
4. The sequence of each contract is correct, whereby, the first sale contract shall be completely executed before the conclusion of the second sale contract; and
5. Transfer of ownership of the asset and a valid possession (qabd) of the asset in accordance with Shariah and current business practice (`urf tijari).”

The above requirements are the pillars for inah contract apart from seller and buyer. If the above sequence and pillars are not followed, it may trigger shariah issues.

For example if the contract executed without sequence, there will be an issue of selling something which is not owned by the seller. Separate contracts are required and non interconditional to each other to avoid riba.

Shariah contracts imposes principles on prohibition of riba, gharar and maysir. These prohibitions are well guarded in the contracts. Indeed this paper submits that 'No riba policy', 'No gharar policy' and 'No maysir policy' clauses should be introduced to be incorporated into the contracts. These elements are the identity of shariah contracts. Conventional contracts do not feature these elements. Shariah contracts mentoring caution in disciplining intention, parties involved and the objective of contracts. These characteristics are not present in the conventional. Another interesting features of Shariah contracts is the imposition of obligations beyond riba, maysir and gharar, indication for Taqwa and obedience of a vicegerant.

With all special features and characteristics, this paper claims that harmonisation of conventional contracts and shariah are misleading. As explained above, the shariah based contracts supported by features that is not present in conventional. Harmonisation may misinterpret the values and gate provisions as urged in Al-Quran and al-Hadith.

CONCLUSION AND RECOMMENDATIONS

In conclusion, shariah contracts develops its own identity, features and characteristics. The above indicates a proper way of contracting in accordance with the muqtadha al-aqd. This is essential in order to avoid mimicking conventional. Lacuna in understanding the absorption of terms and conditions into a product is vital. This can invalidate sharia contracts. Hence, this paper propose the following;

- a. The regulators must strictly adhere to shariah principles and the demand the industry to be strict to the discipline while contracting.
- b. Shariah contracts features beyond prohibition of riba maysir and gharar that requires strict observance.
- c. Shariah offers various types of contracts that requires pillars and syuruth (conditions) that are non presente in the conventional.
- d. The disregarded values are the principles in Shariah that are secured by disiciplines while

contracting. These values are disregarded due to influx of conventional doctrines in contracting. The principles are diluted into the conventional system till the main objectives of Islamic economics and financial systems are losing out grasp of the intended results.

- e. There is no such thing as free autonomy of will in shariah contracting based on restrictions and obedience that requires strict adherence.

The Homeless Life: A Profile Study in Penang

Md Zawawi Abu Bakar¹, Rajwani Md Zain¹, Azlizamani Zubir Salim¹

¹*School of Applied Psychology, Policy and Social Work, College of Arts and Sciences, Universiti Utara Malaysia, 06010 UUM Sintok, Kedah Darul Aman, Malaysia*

ABSTRACT

Living on the streets is a common scenario in the cities including Malaysia. The Malay idiom “Berat Mata Memandang Berat Lagi Bahu Yang Memikulnya”, which means it is difficult to watch but even more difficult to be the one bearing the weight, is a suitable idiom to describe the way of life of these homeless people. There are reasons why they chose this life that is far apart from their own family. Thus, a profile study has been conducted to identify the reasons why the respondents choose the life of being homeless. This qualitative study was conducted in the form of an interview with 11 respondents amongst the Muslim homeless people at the Kapitan Mosque, Lebu Acheh and KOMTAR, in the state of Penang. The data was analysed manually to answer the research questions. The findings show that the response of each respondent has their own reasons for choosing the life of being homeless. They surrendered it all to God and did not regret choosing to live in such a way. Therefore, the study suggests that in order to help the welfare of homelessness, the establishment of “one stop centre” for accommodation, eating, worship and self-management, is better than “rescue” efforts and placing them in institutions, their parents’ homes or in retirement homes.

Keywords: *Homeless, Profile, Religion, Muslim*

INTRODUCTION

Being homeless is the choice or action that some individuals have to take when faced with certain problems including poverty, high cost of living, family crisis and other reasons. Despite recognizing the particular risks that need to be faced such as safety, comfort, the community’s perceptions and health, they were forced to live in a state of deprivation out of the desperations of life. Based on the definition given by the Labor Department, the Ministry of Human Resources, Malaysia’s definition of homeless is an individual who lives in a state of disagreement with the proper norms of living within the local community. They also do not have permanent residences & jobs in certain areas and live wandering in public places. (Labor Department of Peninsular Malaysia, 2017).

In Malaysia, this scenario can be seen in urban places like Kuala Lumpur, Penang, Johor Bharu and so on. It became normal for the townspeople to see the homeless. On the other hand, in the suburbs or villages it is said that this scenario does not happen. Nevertheless, as a concerned society, every member of the community should not be neglected, including homeless people.

Hence, such responsibilities are carried out by the authorities such as the Social Welfare Department as well as non-governmental organizations (NGOs) and individuals. The welfare of the homeless should be given careful attention to because of the increase of homeless people due to the higher demands of life. It not only happens in Malaysia but in developed countries as well.

Hodge¹⁴ has conducted a study on the spirituality and mental health among homeless women. The study was conducted in the United States and took 15 months. Over the last few decades, homeless people have set off a major social issue Fertig & Reingold¹¹. The number of homeless people in the United States has increased dramatically since the 1970’s (Wachholz, 2005). The majority of homeless families are led by single mothers, but amongst the people, women make up the highest number of homeless people in the United States (Arangua, Andersen, & Gelberg, 2006).

Other than the Western countries, neighboring countries in Asia, like Indonesia, is also involved with this issue. Muhadi Zainuddin and Lukman Hakim (2013) conducted a study on religion among the homeless children at Ahmad Dahlan Shelter Home and Diponegoro

Shelter Home. The study reveals how homeless children feel when they have a religion, believe in God and have motivation. Homeless people are defined as individuals who do not have a home, any life direction and social access. Moreover, homeless people are also considered to have no identity. Their lives are free and they spend a lot of time in uncertain life directions. They live with social and religious identities which are not clear that they are often considered bad in social life or religious life.

Religion among homeless people is only considered as merchandise that can be exchanged for a meal and a place to stay. Religious traits among homeless children are still at an early-stage and tend to be more materialistic. Children who live on the streets are sociable beings in terms of social, education, economy and religion. Ahmad Dahlan Shelter Home and Diponegoro Shelter Home accommodate some homeless children by offering various motivational programs towards religious activities. The findings show that homeless children are no exception to religious norms and they still can have a sense of religiousness and conviction, although in another perspective, they are viewed negatively by the people (Muhadi Zainuddin and Lukman Hakim (2013).

Hall (2010) conducted a study on homelessness in the 21st century focusing on the spiritual implications of the Muslim population. According to the Housing and Urban Development Department (HUD), homelessness is defined as an individual who lives in an unsuitable location for human habitation including cars, urban parks, sidewalks, roads, abandoned buildings, public places and transitional housing devoted to homeless individuals. There are also Muslims among the homeless people in the United States. But the authorities carrying out the social work do not recognize the spiritual importance that Muslims very much need. In fact, spirituality has a positive impact on homeless Muslims because it contains mechanisms that enable them to cope and overcome the challenges of daily life especially in relation to public housing. The objective of this study is to provide a brief overview of the Muslim population, provide an early introduction to the Muslim spirituality and to propose an alternative in the provision of shelter protection.

There are some factors in becoming homeless. According to the study of Hodge¹⁴, homelessness can be a result of the social factors and economic conditions that operate at the macro level. It is followed by structural factors that include poverty, disability and lack of social

services assistance that are beyond the control of the individual to overcome them. In addition, the factor of domestic violence, expensive rent, divorce or separation, job loss etc may also result in homelessness. This situation can in turn lead to anxiety, stress, depression and it leads to the potential of having other mental illness. Another factor that causes homelessness is the lack of spiritual elements within oneself. It is acknowledged by oKoenig (2008), who states that, hundreds of studies have found that a higher level of spirituality can lead to psychological well-being Hodge¹⁴.

Moreover, the rising living costs, including places for rent or purchase, are increasingly costly to some individuals who are incapacitated and are forced to make a decision to become homeless. There are two kinds of factors, external and internal, that causes a person to become homeless. External factors include poverty, no employment, very low income and inability to own or rent a home. While internal factors involve having mental health problems (or symptoms), lack of support & social networks, abandonment & abuse in childhood and are involved with substance abuse (Morrell-Bellai et al, 2000). The study by Sharifah Mariam Alhabshi & Alifatul Kamilah¹⁷ also found that among the factors that cause a person to be stuck with being homeless is the absence of employment, poverty, involvement with drug addiction or alcohol, family rejection and mental health problems.

When viewed from a scenario especially in the city, homeless people do not make up of merely men and are not limited to those who are involved with drug abuse but also involve women, and even families. The issue of homeless women living on the pavement along with a male vagabond is feared to cause other social problems such as exploitation, sexual abuse, illegal relationships etc. There are also homeless people involved in snatching, stealing and so on (Harian Metro, August 4, 2011). In regard to this, a study has been conducted to identify the profile of homelessness and the reasons why they choose to be homeless and far away from their family.

RESEARCH METHODOLOGY

Qualitative studies involving face-to-face interviews have been conducted in Penang, focussing on the locations with homeless Malays -Jalan Masjid Kapitan Keling, Lebuh Acheh and Tun Abdul Razak Complex (KOMTAR). A total of 11 homeless people was interviewed by our own researchers using

structured interviews. The respondents' characteristics (homelessness) set out to be involved in this study are:

- i. The individual is homeless.
- ii. The homeless individual is a Muslim.
- iii. The individual agreed to be interviewed.

The data was then analysed manually to answer the research questions.

FINDINGS OF RESEARCH & DISCUSSION

The analysis of the findings tries to explain in relation to the profile of respondents and the factors why they choose to be homeless. The findings are as follows:

Respondents' Profile: Based on the results of the research, the background of the respondents involved is as shown in Table 1.

Table 1: Respondent's Profile

No.	Sex	Age	Marital Status	Education	Job	Income	Place They were Born in	How long they have been homeless
1.	Male	57	Married	SPM	Security guard	RM700	Penang	3 years
2.	Male	60	Married	SRP/LCE	Trishaw driver	RM500 -+	Penang	2 years
3.	Male	66	Married	SPM	-	-	Penang	6 years
4.	Male	50	Divorced	SRP	Construction worker	RM500	Penang	5 years
5.	Male	54	Married	SRP	Dishwasher	RM650	Miri, Sarawak	5 years
6.	Male	70	Widower	SRP	-	-	Kelantan	6 years
7.	Male	57	Single	SPM	Street artist	Not stable	Penang (Bukit Mertajam)	20 years
8.	Male	59	Single	SRP	Security guard	RM1700	Penang (Bukit Mertajam)	20 years
9.	Male	50	Single	SPM	Trishaw driver	RM300	Kuala Lumpur	5 years
10.	Male	53	Single	SRP	Security guard	RM1600	Perak	3 months
11.	Male	57	Widower	None	-	-	Melaka	6 months

Based on the results and observation (which was done in the field) of the research, most of the homeless individuals were male. In terms of age, all the involved respondents were 50 years old and above (eight people who were 50 to 59 years old; two who were 60 to 69 years old; and one who was 70 years old). In terms of marital status, four respondents were married, four were single (never married), three were widowers (two were married to a wife and one divorced). For the three married and Penang-born respondents, they only return home once every few months (not fixed). As for the Sarawakian respondent, he no longer contacts his family and wife ever since he became homeless. Most of the respondents have secondary school level of education (graduated in Form 3 or Form 5) while only one respondent has no formal education. Out of the 11 respondents interviewed, only three respondents did not have a job. Three respondents worked as security guards (having an income from RM700 to RM1700 per month);

two respondents worked as a trishaw driver (having an income from RM300 to RM500 per month); one respondent worked as a construction worker (having an income of RM500 per month); one respondent worked as a dishwasher (having an income of RM650 a month); and one respondent worked as street painter (monthly income is not fixed).

As for where they were born in, six of the respondents came from Penang, one from Melaka, one from Perak, one from Kelantan, one from Kuala Lumpur and one from Miri, Sarawak. For those who were not born from Penang, they migrated to Penang for several factors including the purpose of finding work and following friends. Out of the 11 respondents, it was found that two of them have been homeless for less than a year (three months and six months); two of them have been homeless for two to three years; five of them have been homeless for over five to six years; two of them have been homeless for almost 20 years.

Based on the above findings, most respondents have a job to support their livelihood, despite of their low income. This finding rejects the study done by Sharifah Mariam Alhabshi & Alifatul Kamilah¹⁷ which stated that homeless people do not have a job. Although there are homeless people without jobs, some of them do have jobs. Similarly, the study of Morrell-Bellai et al, (2000) also states that occupational factors are one of the causes of homelessness. The researchers stated that there were other factors that made them choose to be homeless.

In addition, there are two respondents who have chosen to be homeless for 20 years and 20 years is not a short period of time for a human being. Robert E. Hall, (2010) states that there is inner strength or “spirit” among the homeless people. This is because, living in the streets makes them exposed to various threats such as weather, safety, health, welfare and so on. Only the strong ones can survive in such a state of life.

Factors of Leading a Homeless Life: The findings show that all the respondents have their own reasons for choosing to be homeless.

Table 2: Factors individuals lead a homeless life

Respondent	Factors of Leading a Homeless Life	Statement
R1	Expensive cost of living quarters	In the beginning, we had a shuttle from home to work but every day I had to spend money on the ride which was very tiring...it's better if I just sit like this. Even renting a house is also very expensive. Staying like this is easier....
R2	Unstable job	In Penang if we don't have money, we don't have to think about a house. With this low income and thinking about a house. It's better if we think about what job opportunities there are out there....
R3	Family did not show any concern about them	When I go home, nobody cares... when we don't have anything and our children and wife also abandons us....
R4	Inferiority	In the condition I am in (physically handicapped), I think I am much less than everyone else. Moreover, it is the same if I am at home and when I am not at home...I cannot give anything to my mother or siblings. So it's better if I live alone...and work for myself only...
R5	Desperations of life	Previously, we used to rent but the rental became very expensive. After that, my wife went back to Miri and it was easier for me to live like this...I don't need to think about house rental. The money is for things that are more in need...
R6	Does not want to trouble the family	After my wife died, I felt too lonely. I didn't want to trouble my children either. So I made up my mind to wander around....
R7	No life purpose	Isn't it easy to live like this...? You just face what you see....
R8	Likes to live alone	Living like this is easy...no one will disturb you and no one will care....
R9	Likes to choose the easy way of life	While life is good, we should enjoy...life like this is easier
R10	Does not mind	Living anywhere is the same...living like this is easier and more convenient....
R11	Tired of living in institutions	When I was in the old folks' home...it was so boring...I didn't know what to do. Might as well just go out and live alone....

In Table 2, it illustrates the factors and reasons why the respondents lead a homeless life (as obtained through the research interview done in the field). It can be seen that each respondent gives a different answer about why they chose to lead a homeless life. The first respondent or R1 informed that he was unable to buy or rent a place to stay. Therefore, he chose to become a homeless. The

second respondent gave the reason of because he had to do various work in one day, he was always not in time to think of a place to stay for the night. Thus, he chose to become homeless.

Next, the third respondent said that he had been ignored by his children and wife who had caused him

to become homeless. Meanwhile, the fourth respondent said that he felt inferior when he was at home because he did not contribute anything to the household. Eventually, he chose the path of being alone and homeless. The fifth respondent gave the reason that the desperations of life forced him to become homeless while the sixth respondent did not want to trouble his family and that led him to become homeless instead.

The seventh respondent led a homeless life because he had no life purpose while the eighth respondent chose that because he preferred to live alone without being disturbed by anyone. In addition, the seventh, eighth and ninth respondent said the reason why they chose this was because it was an easy way to manage their lives by living so casually like that. The tenth and eleventh respondent gave the reason that it was because they didn't mind living like that and it was boring living in the retirement home (old folks' home) respectively.

Based on the factors discussed above, the study found that these factors can be classified into two categories:

(i) External factor: There are five external factors that caused the respondents to choose to be homeless - the cost of living, unstable work, the absence of their family, the desperations of life and not wanting to trouble the family.

(ii) Internal factor: While the six internal factors that caused the respondents to lead a homeless life were - inferiority, no life purpose, like to be alone, like to choose the easy way of life, the casual attitude of not caring and bored of the life in a retirement home.

Based on the respondents' given factors of why they chose to become homeless, it shows that the internal factors have deeper impact than the external factors. This shows that in order to help the homeless, the psychosocial elements must be improved rather than just materialistic things such as food, clothes and so on. In addition, spiritual elements should also be given to the homeless to build a stronger self. On the contrary, people view the homeless with empathy based on their looks, living environment, welfare, hygiene and health. However, far from the common assumptions, they also have internal struggles that need to be helped. That is why, this research suggests that the aid received from professional helpers should also focus on the aspects of psychosocial and spiritual, especially in handling the problems of being homeless.

CONCLUSION

The results showed that there were multiple profiles among the homeless who were surveyed. In fact, there were respondents who have been homeless for over 20 years. Whereas for the factors that led them to choosing to become homeless, there are two factors, that is - internal factors and external factors. The internal factor dominates the external factor in terms of why the respondents chose to become homeless. Hence, studies suggest that in order to help the homeless, social workers, counsellors, volunteers and others should involve psychosocial and spiritual elements as well as material aspects such as food, clothing and so on. Efforts to help homeless people also need to be focused on internal issues because it dominates over the external issue as for the reason why they are homeless.

The Matrimonial Property: Causes of Claim and Distribution Rate in the Alor Setar Syariah High Court

Mohd Akram Bin Dato' Dahaman Dahlan¹, Khairani BtNawawi¹

¹*Civilization and Philosophy Department, School of Languages, Civilization and Philosophy (SLCP), UUM CAS, Universiti Utara Malaysia, Sintok, Malaysia*

ABSTRACT

Matrimonial property or hartasepencarian is a form of property division that is practiced by the Malaysian Malay Muslim community based on the custom of people in the Nusantara. Terms such as 'carianlakibini' as in the pepatih custom and other states customs in the South-East Asia regions as proposed by Sheikh Ahmed bin Zain al-Fatani are clear evidence of these practices. On this basis, in Kedah there are two issues that need to be examined which are; the reason of matrimonial property and rate of equitable division as it is not the same in other states. A study in the form of content analysis is conducted on cases that were listed and discussed in the Syariah High Court, AlorSetar as the court is empowered to resolve *mal*(financial) issues. Based on the analysis, there are three conditions that lead to matrimonial property claim. The causes are divorce, the death of a spouse and polygamous marriages. Based on the analysis made, it is shown that all three conditions have been given a strong base by the Syariah High Court for a claim to be a case. Whereas in connection with the claim, there are three rates as the solution to a matrimonial property claim which are 1/2: 1/2, 1/3, 2/3 and 3/4: 1/4. These divisions are made by looking at the facts and evidence of contributions of both the husband and wife, directly or indirectly. Based on the analysis made, it is shown that all three of rates have been applied by the Syariah High Court to resolve all cases billed in this Court.

Keywords: *Matrimonial Property, Syariah High Court AlorSetar, Causes of Claim, Distribution Rates.*

INTRODUCTION

Matrimonial property is one of the rights that can be claimed by both husband and wife whether after divorce, death and polygamy. According to Miszairi Sitiris⁶, there is no definition nor explanation of matrimonial property given by the Islamic scholars in their books. This is because of their custom during their time, only the husbands worked for their families, while the wives managed their household. The issue of matrimonial property did not arise. Contrary to the custom of the archipelago such as Indonesia, Brunei, Patani and also Malaysia, the average population was formerly a farmer. Husband and wife worked together to cultivate their farmland. When they divorced, the property or land they worked together will be divided between them. The case judged by Judge Briggs in 1950 became a clear evidence of the position of a matrimonial property in the local community (Hajjah Lijah Bt Jamal against Fatimah Bt Mat Diah³. Therefore, the matrimonial property is more closely related to the customs practiced in society in this country.

MATRIMONIAL PROPERTY IN KEDAH

Generally matrimonial property is a property acquired by husband and wife. According to Suwaid Tapah⁷, the matrimonial property is the property acquired by the husband and wife during the marriage according to the conditions determined by the Syariah Law. Whereas according to Zaleha Kamaruddin⁸ the matrimonial property can be defined as any movable or immovable property acquired by the spouses directly or indirectly during a legitimate marriage.

Matrimonial property has been enacted in the legislation of the Islamic Family Law in the respective states. Variety of definitions have been given and contained in the Islamic Family Enactment which is generally concluded as property acquired jointly by husband and wife during legitimate marriages and both parties directly or indirectly contribute to the acquisition or possession of such property. In Kedah context, the Kedah Islamic Family Law Enactment (EUKI) 1994 has allocated property acquired by both parties during the period of marriage divided between the two, or ordering the assets to be sold and the proceeds of sale are divided between both husband and wife.

Although there is no affirmation through the Sharia law, the matrimonial property is allowed by the customary law. The custom is permitted by the Sharia Law is a matter of common practice and is often done by them in daily life matters either in words or deeds that are not contrary to the Qur'an and as-Sunnah. According to Jasni Sulong⁵, in the context of Islamic society in Malaysia besides the teachings of the Shafi'i sect, the community also adopts the customary practices accepted by syarak (al-'Adah Muhakkamah) such as the distribution of inheritance by consensus. This practice is accepted as long as the elements of tolerance among the heirs are achieved fairly and openly.

REASONS FOR MATRIMONIAL PROPERTY CLAIMS IN THE STATE OF KEDAH

Based on the records of the Alor Setar Syariah High Court which are examined through the files of the matrimonial property from 2011 to 2013, there are 3 main reasons for a claim to be made to acquire the matrimonial property which are divorce, death and polygamy. Claims for matrimonial property are made under the section of (SEK) 122, Distribution of Matrimonial Property under the Kedah Islamic Family Law.

Figure 1: Reasons for Matrimonial Property Claims 2011

Figure 2: Reasons for Matrimonial Property Claims 2012

Figure 3: Reasons for Matrimonial Property Claims 2013

Divorce: Divorce generally involves the dissolution of bond, unbinding, liberation and the like (Kamus Dewan, 1997)². In terminology, the divorce term means the interruption of marriage or the dissolution of ties based on certain reasons (Wahbah al-Zuhaily, 2010)⁹.

Based on the cases of matrimonial property recorded in the Syariah High Court of Alor Setar in 2011-2013, divorce is one of the causes for the demands of a matrimonial property.

Figure 4: Divorce Cases in 2011-2013

Here are some examples of cases recorded by the Alor Setar Syariah High Court around 2011 to 2013 involving the demands of austerity. The first case that proved divorce was the cause of the matrimonial property claim was between Samsiah Bt Otoh and her former husband, Jaafar Bin Ibrahim. They were married on April 12, 1985 and divorced on October 12, 2010. For almost 30 years they lived on a piece of land with a house at No. 185, Lorong Angsana 1, Taman Angsana, No. Lot PT 3792 Mukim Bandar Kulim. Having divorced, the property is divided equally as a matrimonial property.

The next case of divorce is between Habshah Bt Abdullah Sani and Zulkifli B Muhamad Hanafiah. The married couple divorced on May 10, 2010. Throughout their marriage they were awarded 3 children. As a result of the divorce the wife or the plaintiff make a claim on the property of the tenant on land Lot No. 7644 Mukim of Parit Buntar, District of Kerian Perak, Land Lot 105

Mukim of Bandar Baru Kedah and 3 buildings on it. They agreed to divide ½ - ½. In addition, there are 2 rent houses, an Usahajaya Company, the income of the Rumah Mesra Rakyat project, the income of Pertubuhan Peladang, a Pajero car, a Honda Prelude, a Kriss motorcycle, 3 lorries, 2 bulldozers. They are evenly distributed at the rate of ½ - ½. The properties other land are plaintiff's. Case closed on July 31, 2012.

The next case is Haniza Bt Abd Mohsin's case with ex-husband Anizar B Md Nor. They divorced on February 20, 2013, during their marriage with a child. The wife is the plaintiff or the claimant while the husband is the defendant. Plaintiff claimed for land of Lot PT 1429, Mukim Semeling, Sungai Kroh, Kuala Muda Kedah District which was bought in 1999 as the matrimonial property. Their case went on until March 17, 2013.

Through the three chronologically arranged cases have proven clearly divorce is one of the reasons for the demands of matrimonial property.

Death: According to Ibn Manzur⁴, the word death means silence, delusion, calm, immobile. According to Ar-Raghib al-Asfahani¹, death is a form of spirit separation from the body. Allah SWT has explained in the Qur'an: *Every soul will taste death. And We test you with evil and with good as trial; and to Us you will be returned.* al-Anbiya': 35

Death is also a cause for the demands of matrimonial property. The analysis made in the Syariah High Court of Alor Setar on cases of the matrimonial property claims clearly proved the matter. According to cases registered in 2011, 30 cases of matrimonial property claim due to death, 35 cases in 2012 and in 2013, 15 cases.

Figure 5: Death Cases in 2011-2013

Here are some cases that indicate death is one of the causes of matrimonial property claim. The case that occurred in 2011 when Adzma Bt Fadzil, widow of the deceased Abdul Rahim Bin Hasan, was the plaintiff.

Doyah bt Yusuf is the mother of the deceased and in-law to Adzma and her seven sons, Mohd Faaiz, Anis, Adilah, Afizah, Adzni, Azira and Adib are defendants. Adzma was married to Abdul Rahim on July 14, 1985. On April 1, 2001, Abdul Rahim passed away. Throughout the marriage, they have accumulated the following property 1) a semi-detached house at address No. 69, Lorong Semarak 5, Taman Semarak, 08000 Sungai Petani, Kedah. 2) A Proton Saga car with registration number KX 4242. 3) A Toyota Corolla with registration number KBK 3062. 4) A Modenas Kris motorcycle with registration number KBK 3062. 5) A Modenas Kris motorcycle with registration number PFW 2205. 6) A Honda motorcycle with registration number KBE 6519. 7) EPF Fund and Tabung Haji savings. All properties are divided ½ to the matrimonial property and the rest are divided into heirs.

The next case is between Haslinda Bt Ishak, the widow of Mohd Aswandi. They were married on September 09, 2001. Mohd Aswandi died on April 16, 2012. They had a daughter named Nursyafiqah. Mohd Aswandi has a mother named Ara and 6 younger siblings, Md Noor Hisham, Herolnizam, Mohd Suhaimi, Muhammad Taufiq, Mohammad Nur Firdaus and Nurhidayah. Matrimonial property claimed is the deceased compensation money of RM 87,780.04 in the account of Amanah Raya.

In 2013, another case of death was the case of Asah Bt Beram, a widow of Man Bin Said. They were married in 1986. The husband died on January 1, 2013. They had a daughter named Satariah Bt Man. The property that was left is BSN savings money of RM 11,280.75. Matrimonial property is ¾ and the rest to the heirs.

Through these three examples of cases in the current year has shown clearly that death is one reason to matrimonial property.

Polygamy: Polygamy is defined as having more than a wife (Kamus Dewan, 1997)². Islam clearly approves polygamy based on verse 3 of Surah al-Nisa'. In the Islamic family law in Malaysia, polygamy is permitted provided that the husband must obtain written permission from the Syariah Court first. For example, as in the provision in section 23 (1) of the Islamic Family Law (Federal Territories) Act 1984.

Based on the case of a matrimonial property claim in the Syariah High Court throughout 2011-2013, it is clear that polygamy is one of the causes of the claim of matrimonial property. In 2011, 5 cases were recorded, 4 cases in 2012 and 2 cases in 2013.

Figure 6: Polygamy Cases in 2011-2013

Here are some cases of polygamy which are the reasons for the demands of matrimonial property. The first case is between Bt Mek Saad with the three defendants; Hassan Bin Johari, Harfizi Bin Mohamad Hassan and Nor Silah Bt Hassan. Hassan has polygamy with 4 wives. The first wife, Juriah Bt Hanafi, was the mother of Johari Bin Hassan, who died during confinement. Che Kai's second wife, was divorced while still alive. His third wife, Puteh Bt Arshad, was the mother of Nor Silah Bt Hassan, who left her daughter, Nor Silah when she was 7 months old. The fourth wife, Mek Bt Saad, is the mother of Mohamad Harfizi Bin Hassan. The property claimed is land Lot 1847 and Lot 957. The distribution rate is $\frac{1}{2}$ - $\frac{1}{2}$.

Bt Hassan, Mohd Hanif Bin Hassan, Siti Rafiah Bt Hassan, Mohd Salman Bin Hassan and Munirah Bt Hassan. Through mutual agreement on property Lot 6383, 5874 acres (tekai), Lot 7592 an area of 0.8572 hectares tekai, Lot 6033 area of 11,705 square feet tekai, Lot 2992 in an area of 472 jemba has declared as matrimonial property. The rate is $\frac{1}{2}$ to the claimant and $\frac{1}{2}$ to the deceased. For Lot 986, 5 relong 26 jemba, the division is: $\frac{1}{4}$ to the deceased, $\frac{1}{2}$ part to the second wife Norizan Saad Bt Muhd and the remaining $\frac{1}{2}$ is divided (Faraid) to the heirs. For the money in Simpanan Amanah Saham amounting to RM 33,210.50, $\frac{1}{3}$ division rate has been divided to the claimant, $\frac{1}{3}$ to the second wife and the other $\frac{1}{3}$ has been faraid.

Through these examples of cases according to the specific year, it has proven that polygamy is one of the reasons for the claims of matrimonial property.

MATRIMONIAL PROPERTY DISTRIBUTION RATES IN KEDAH

In addressing the problem of division of property rates there are several rules have been made. However, these rules still have not been developed to provide

a well- structured base for solving the division of matrimonial property. SuwaidTapah⁷, states that the concept and division of matrimonial property in Malaysia has been enacted in the Islamic Family law in the respective states. The states Syariah High Court have been granted exclusive jurisdiction to hear and speak of the demands of matrimonial property. The rate of claim under the judgment of the Syariah High Court depends on the extent or proportion of contributions granted by the claimant to the property collected during a marriage. The Syariah High Court takes into account the contribution of the spouses directly or indirectly. This division is based on *Qadhi's* discretion after taking into account the various angles and evidence presented. Rates given under the respective states' Islamic Family Laws. There are some fractional rates often used $\frac{1}{2}$, $\frac{1}{3}$ and $\frac{3}{4}$. There are also cases where the wives will not get anything from the property claimed.

MATRIMONIAL PROPERTY DISTRIBUTION RATE

The proportion of matrimonial property in Malaysia varies from one state to another. In general, the proportion of matrimonial property distribution becomes difficult because there is no specific provision for determining $\frac{1}{2}$: $\frac{1}{2}$, $\frac{1}{3}$: $\frac{2}{3}$, $\frac{3}{4}$: $\frac{1}{4}$ or the like. The study specializes in rates in the Alor Setar Syariah High Court, indicates the difference according to the clear evidence of the property acquired during the marriage between husband and wife. The rate of acquisition of the property is based on the contribution of the husband and wife. The rate is not set because the Court will take into account several aspects before determining the rate setting either $\frac{1}{2}$: $\frac{1}{2}$, $\frac{1}{3}$: $\frac{2}{3}$, $\frac{3}{4}$: $\frac{1}{4}$.

The cases of matrimonial property claims from 2011 to 2013 found in the Syariah High Court of Alor Setar proved that the rate of division of matrimonial property is at the discretion of the Judge or Qadhi by referring to precedence cases. According to Qadhi Besar Syariah High Court Alor Setar, Mohd Roze Bin Abdul Wahab, there is no specific reference to the rate of division of the matrimonial property practiced in the State of Kedah. Most cases are determined by the proof (record) and the level of contribution of the spouses. Most cases are also determined by $\frac{1}{2}$: $\frac{1}{2}$ when the case is settled by mutual agreement. The study on the proportionate share of the matrimonial property clearly proves that most cases ended up with $\frac{1}{2}$ share being the property of the husband and $\frac{1}{2}$ of the remaining belong to the wife. Only a few cases recorded $\frac{3}{4}$: $\frac{1}{4}$ and $\frac{1}{3}$: $\frac{2}{3}$ and the like.

1/2:1/2 Rate

Case Reference Number : 02200-017-0087-2011	
Between	
Remarks	The case is settled by mutual consent
Plaintiff Halimah Binti Awang	Defendant Mohd Azmi Bin Shafie
<p>The claimant Halimah Binti Awang has divorced with the alleged party, Mohd Azmi Bin Shafie. Their divorce took place on 18.10.2006. During the marriage they were awarded a total of 4 children. The properties acquired by them during the marriage are:</p> <ol style="list-style-type: none"> 1) A terrace House No. 30 Taman Aman, Mukim of Guar Kepayang, Pendang, Kedah 2) A Proton Wira car No. KAW Registration 6879 3) A Kancil car No. PFJ Registration 7689 <p>The above property became the matrimonial property and the claimant applied for the Court to divide the property into half of her property and the balance was handed over to the defendant.</p>	

Reason for Claim: The reason for the matrimonial property claim is divorce. Mohd Azi Bin Shafie has pronounced a divorce on Halimah Bt Awang on 18.10.2006. During the marriage they both have 4 children. Claims of matrimonial property is made on 3 properties acquired during their marriage.

Solution Method: The case is dealt with by mutual consent. Based on the case report it is clear that the settlement was made by consensus when there was no dispute between the plaintiff and the defendant.

Matrimonial Property Distribution Rate: The case is resolved by the Court’s decision to show the property to be joint property of both: 1/2. This clearly shows the rate of division of the matrimonial property in the Syariah High Court of Alor Setar is 1/2.

Property Type/Contribution Point: The case also indicates that there is an immovable property and two movable property. Immovable property is a terrace house with address No. 30 Taman Aman, Mukim Guar Kepayang, Pendang, while 2 movable property is a Proton Wira car registration number KAW 6879 and a Kancil car registration number PFJ 7689. The plaintiff’s claim for the Syariah High Court Alor Setar divides the above assets into two parts . Half handed over to the plaintiff or the claimant and the other half to his ex-husband as the defendant. The contribution of both parties to these assets is a direct contribution. This can be proved when they are together trying to acquire the property.

This case is settled at a rate of 1/2 given to both parties and this proves 1/2 is the rate of claim of the matrimonial property applied in the Syariah High Court of Alor Setar.

2/3:1/3 Rate

Case Reference Number : 02200-017-0028-2012	
Between	
Plaintiff Aishah Binti Zakaria	Defendants 1) Nur’izzati 2) Nur’Adlina 3) Muhammad Hasif 4) Muhammad Haziq Iman 5) Mohd Hidzir 6) Nur Hafizah
Remarks	Case resolved Sulh Judge
<p>The case of Aishah Binti Zakaria is a widow to Azhar Bin Pawanteh. They were married on 27.04.1986 and were blessed with 4 children, Nur’izzati, Nur’Adlina, Muhammad Hasif and Muhammad Haziq Iman. There are 2 step-children called Mohd Hidzir and Nur Hafizah. Azhar died on 18.08.2011. The deceased left a mother named Charum Bee Binti Md Ali. During his life, the accumulated assets are as follows, 1 immovable property and 3 movable properties:</p> <ol style="list-style-type: none"> 1) A home addressed No. 122, Lorong KS 2/2, Kulim Square, Lunas, Kulim Kedah. Title No. H.S (M) 800. PT 16551, Mukim Lunas on behalf of Azhar Bin Pawanteh 2) A Toyota Unser 1.8GLI (A) Registration Number PFH 9877 registered under the name of Azhar Bin Pawanteh 3) A Perodua Kancil EX650, Registration Number PEX 9137 registered under the name of Azhar Bin Pawanteh 4) Naza Nando 250 Motorcycle, Registration Number PHP 284 registered under the name of Azhar Bin Pawanteh 	

Cause of Claim: According to the case report, the cause of respective matrimonial property claim case which has been registererd under the 02200-017-0028-2012 reference number, is death. This case of Aishah Binti Zakaria is a widow to Azhar Bin Pawanteh. They were married on 27.04.1986 and were blessed with 4 children, Nur’izzati, Nur’Adlina, Muhammad Hasif and Muhammad Haziq Iman. There are 2 step-children called Mohd Hidzir and Nur Hafizah. Azhar died on 18.08.2011. The deceased left a mother named Charum Bee Binti Md Ali.

Solution Method: This case has been tried under the Sulh Judiciary based on the case report filed. When a case cannot reach a concensus, Sulh will be the mediator for two or more disputed parties.

Matrimonial Property Distribution Rate: The Court has decided all the property involved in the case to be the matrimonial property between the plaintiff, Aishah Binti Zakaria and the deceased, Azhar bin Pawanteh. 2/3 of the parts or value from the buying price of the house RM RM 176,800.00 has been given to the plaintiff and the 1/3 belongs to the deceased has been given to the first defendant, Nur'izzati till the third which is Muhammad Hasif.

Property Type/Contribution Point: While living together, the accumulated assets are as follows, 1 immovable property and 3 movable properties:

Immovable property

1. A home addressed No. 122, Lorong KS 2/2, Kulim Square, Lunas, Kulim Kedah. Title No. H.S (M) 800. PT 16551, Mukim Lunas on behalf of Azhar Bin Pawanteh

Movable Properties

1. A Toyota Unser 1.8GLI (A) Registration Number PFH 9877
2. A Perodua Kancil EX650, Registration Number PEX 9137
3. Naza Nando 250 Motorcycle, Registration Number PHP 284

The Syariah High Court of Alor Setarruled that all the properties in the case to be the matrimonial property between the plaintiff , Aishah Binti Zakaria and the deceased, Azhar bin Pawanteh. 2/3 of the parts or value from the buying price of the house RM RM 176,800.00 has been given to the plaintiff and the 1/3 belongs to the deceased has been given to the defendants.

The verdict is a proof that the rate of division of matrimonial property other than 1/2, 2/3:1/3 has been used in the court to settle the claim of matrimonial property.

3/4:1/4 Rate

Case Reference Number : 02100-017-0057-2013	
Between	
Plaintiff Azizah Bt Ahmad	Defendants 1) Zulkifli Bin Ramli 2) Rohaiza Binti Ramli 3) Rohani Binti Ramli 4) Faridah Binti Chea Abdullah 5) Raihan Marini Binti Ramli 6) Raihani Syamimi Binti Ramli
Remarks	The case is settled by mutual consent

The case is between Azizah Bt Ahmad, a widow to Ramli Bin Md Noh. They were married on 22.03.1962 and has been blessed with 3 children, Zulkifli, Rohaiza and Rohaini. Ramli had married to the second wife, Faridah Chea Bt Abdullah and had 2 daughters which are Raihan Marini dan Raihan Syamimi. On 24.06.2012 Ramli died. Azizah has filed a matrimonial property claim as Azizah and the deceased has acquired the immovable properties together:

- 1) Lot 1725, Property No. 2165, Bt 4 ½ Jalan Changloon, Mukim Kapelu, Kubang Pasu, Kedah
- 2) Lot 14, Property No. 1799, Changkat Jejawi, Mukim Kapelu, Kubang Pasu, Kedah
- 3) Lot 1426, GM 31. Padang Besar, Perlis
- 4) Lot 3956, GM 2110, Kampung Sena, Mukim Kurung Anai, Perlis
- 5) Lot 3957, GM 2111, Kampung Sena, Mukim Kurung Anai, Perlis

Cause of Claim: Case reference number 02100-017-0057-201, is a matrimonial property claim because of death and polygamy. This is shown in the case of Azizah Bt Ahmad which is a widow to Ramli Bin Md Noh.

They were married on 22.03.1962 and has been blessed with 3 children, Zulkifli, Rohaiza and Rohaini. Ramli had married to the second wife, Faridah Chea Bt Abdullah and had 2 daughters which are Raihan Marini dan Raihan Syamimi.

Solution Method: The case is dealt with by mutual consent. Based on the case report it is clear that the settlement was made by consensus when there was no dispute between the plaintiff and the defendant.

Matrimonial Property Distribution Rate: The plaintiff pleaded the Syariah High Court to rule that the disputed properties to be the matrimonial property between the plaintiff and the deceased, Ramli Bin Md Noh and the plaintiff received 3/4 over the properties and the other 1/4 to be divided (*faraid*) to the eligible beneficiaries and the parties concerned.

Property Type / Contribution Point: Azizah has filed a matrimonial property claim as Azizah and the deceased has acquired the immovable properties together:

1. Lot 1725, Property No. 2165, Bt 4 ½ Jalan Changloon, Mukim Kapelu, Kubang Pasu, Kedah
2. Lot 14, Property No. 1799, Changkat Jejawi, Mukim Kapelu, Kubang Pasu, Kedah
3. Lot 1426, GM 31. Padang Besar, Perlis

4. Lot 3956, GM 2110, Kampung Sena, Mukim Kurung Anai, Perlis
5. Lot 3957, GM 2111, Kampung Sena, Mukim Kurung Anai, Perlis

As the whole property claimed was the property acquired between the plaintiff and the deceased, Ramli Bin Md Noh, the Court decided that the plaintiff's rate was 3/4 shares on the property and the remaining 1/4 was divided (*faraid*) to the entitled beneficiary and the parties concerned.

The decision of the Syariah High Court of Alor Setar clearly demonstrates that there is another division rate value of a claim of the matrimonial property of 3/4: 1/4, in addition to 1/2 and 2/3: 1/3.

FINDINGS

Through the analysis of the case files registered at the Syariah High Court Alor Setar from 2011 to 2013, there are three conditions which have been the causes of a claim of matrimonial property. The causes are divorce that occurs in a spouse's relationship, the death of either spouse and a polygamous marriage. An analysis of the contents of each case report found that these three conditions had been given a strong basis by the Syariah High Court of Alor Setar for a claim to be raised.

Whereas in relation to the rate of distribution, based on the case reports and decisions decided by the Judge in the Syariah High Court of Alor Setar, there are three rates which are the solutions to a claim of a matrimonial property which are 1/2: 1/2, 1/3: 2/3 And 3/4: 1/4. This division is made by looking at the evidence and description of the contribution directly or indirectly of both the husband and wife. All three rates have been applied by the Alor Setar Syariah High Court in settling cases throughout the period of study that has been registered in this Court.

CONCLUSION

Matrimonial property is a form of property jointly acquired by a spouse during the duration of the marriage. This type of property has become the custom of society in Malaysia particularly in Kedah. The existence of this matter has become the basis of the Syariah High Court of Alor Setar to decide on the distribution of property between husband and wife when a matrimonial property claim is due to divorce, death and polygamy. This is done

to give and restore the rights between the couple during the marriage period based on the contributions they have given. On this basis, some rates have been decided by the Alor Setar Syariah High Court involving 1/2: 1/2, 1/3: 2/3 and 3/4: 1/4.

The Green and Sustainable Care Facilities of Elderly Care Home: An Exploratory study of Rumah Seri Kenangan Cheras, Selangor

Hasif Rafidee Hasbollah¹, Mohd. Nazaruddin Yusoff², Mohd Nasrun Mohd Nawi³

¹Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan, 16100 Kota Bharu, Kelantan, Malaysia; ²School of Government College of Law, Government and International Studies, Universiti Utara Malaysia, 06010, UUM Sintok, Kedah, Malaysia; ³School of Technology Management and Logistic, Universiti Utara Malaysia, 06010, UUM Sintok, Kedah, Malaysia

ABSTRACT

The terminologies of “Green Building” and “Sustainable Building” explore the practice of creating structures by using processes that are environmentally responsible and resource-efficient. This is done through examining a building’s life-cycle that is related with economy, utility, durability, and comfort of occupants. In Malaysia, “Green Building” and “Sustainable Building” for Care Facilities of Elderly Care Homes are still in its infancy. Elderly Care Home is a long term care facility that provides permanent living space and support for the elderly, with the activities of daily living that offers personal care and support. This research explores the Green and Sustainable Care Facilities of Elderly Care Home– Rumah Seri Kenangan (RSK) in Cheras, Selangor (GSch-RSK). RSK is established to provide care, treatment and shelter to the elderly poor, aged 60 years and above. It provides care and protection services; guidance and counselling; recreational activities; medical treatment; occupational therapy; and physiotherapy for the elderly to live in peace and enjoy a good quality of life. This research adopts observation, interview, and document review methods in gathering data. The findings indicate six characteristics of GSch-RSK which consists of (1) Location and Surrounding area of RSK which is explored and consisted of road, RSK building and green landscape; (2) Integrated Operation of Operations and Maintenance in daily cleaning and monthly elevator maintenance; (3) Healthy Environment of Atmosphere and Well-being that consist of bright colours and ventilation system (modern windows and exhaust fan); (4) Waste Management System that includes garbage removal and designated sewerage; (5) Energy Efficiency characteristic that is the installation of the Energy Efficiency Appliances and Solar Panel System; and (6) Sustainable and Green Management of Green Landscape which has been practiced by setting up Rain Garden and planting Edible Green leaves and flowers. All these characteristics are vital in developing the theoretical framework of Green and Sustainable Care Facilities of Elderly Care Homes in Malaysia. Finally, these characteristics will be used for the development framework of existing buildings of Elderly Care Homes in Malaysia.

Keywords: *Green, Sustainable, Care Facilities, Elderly Care Home, Exploratory.*

INTRODUCTION

The word “Green Building” and “Sustainability Building” are gaining popularity in the building construction development. They are used interchangeably for development projects for residential homes, commercial buildings, schools, institutional buildings, and care facilities (Eichholtz et al.¹⁰; Larsen²²; MohdNazaruddinYusoff et al.³¹).

“Green Building” is designed to reduce the overall impact of the built environment on human health and

the natural environment with the efficient usage of energy, water, materials, and other resources; protecting occupant health by improving employee productivity; reducing waste, pollution and environmental degradation of the building life cycle (Howe¹⁷; EPA¹¹).

“Sustainable Building” is constructed for integral quality of a building which includes economic, social and environment. It is designed to maximise aesthetic quality, life cycle-cost, has a minimum environmental impact, and provides a healthy environment for users (OECD³⁶; Feige et al.¹³; Kibert²⁰).

According to Berardi¹ “Sustainable Building” is a “GreenBuilding” that goes further in making the best adaptive use of the building which provides a sense of community, and increases social equity, cultural heritage, human health, healthy environments, and at the same time maintaining an effective level of operations and maintenance.

“Sustainable Building” incorporates all environmental, social and economic aspects, while “Green Building” refers to the environmental leg of sustainability or the economic leg(Yanarellaet. Al⁴⁸).

The terminologies of “Green Building” and “Sustainable Building” explore the practice of creating structures and using processes that are environmentally responsible and resource-efficient throughout a building’s life-cycle that are concernedwithetheconomy, utility, durability, and comfort of users and occupants.

Therefore, whether it is “Green Building” or “Sustainable Building”, both the terminologies encompass the practice of creating and using healthier and more resource-efficient models of building development constructionin the sustainable world.

Green and Sustainable Care Facilities for Elderly Care Home: The United Kingdom is one of the developed countries that practices “Green and Sustainable Building” for care facilities which has the “Minimum Standard Care Home” (Ministry of Health United Kingdom²⁷).The Green Building Council’s LEED for Existing Buildings: Operations and Maintenance (2008) has released “The Green Guide for Health Care” that practices “Green”. The Green Guide for Health Care¹⁵ provides guidance to integrate enhanced environmental health principles and practices into the planning, design, construction, operations and maintenance of sustainable healthcare facilities. The guide has already played an important role in spurring development of healthier building materials and gives the healthcare industry especially for the Elderly Care Home.

The development of “Green” House Project and Eden Alternative is an example of the new America’s National Model that exercises the “Green” and “Sustainable” Elderly Care Home Programmes. The Model provides a home-like atmosphere, including physical environment and social functions of Elderly Care Home (Rabiqet. Al⁴⁰; Koren²¹; Zimmerman and Cohen⁴⁹). It incorporates environmental aspects of “Green” living with the access

of plenty of sunlight, plants and garden areas; social function of warmth (living situation that consists of a layout, furnishing and decorations that encourages social activities), autonomy (the elderly has their own private room and bathroom) and intimacy (consists of clusters of smaller home care with 6 to 10 elderly).

In Malaysia, “Green Building” and “Sustainable Building” for Care Facilities especially Elderly Care Homes are still in its infancy. Only few researches are done on “Green” and “Sustainable Building” on Care Facilities such as “Opportunities for the Transfer of United Kingdom Best Practices for the Provision of Public Residential Care Facilities for the Elderly in Malaysia” by Noralfishah³⁴ and “The Minimum Standard Facilities at the Nursing Homes in Klang Valley” by Nik Muhammad Faris³³ However, to date there is no substantial findings on the characteristics of “Green Building” and “Sustainable Building” for Care Facilities especially in Malaysia. Therefore, this research attempts to explore the Green and Sustainable Care Facilities of Elderly Care Home in Malaysia.

METHODOLOGY

This research adopts observation, interview, and documents review methods to gather data by exploring the Green and Sustainable Care Facilities of Elderly Care Home–RumahSeri Kenangan(RSK) in Cheras, Selangor. Observation is used in theorising, generating descriptions and explaining the phenomena in the research (Malderez²⁶). The data from observational study can be integrated as auxiliary or confirmatory research (Gray¹⁴). In this study, observation method is used in collecting information that includes the process of “seeing” and theorising the characteristics of Green and Sustainable Care Facilities of Elderly Care Home.

An interview is conducted with the management of RSK to provide information on the characteristics of Green and Sustainable Care Facilities of Elderly Care Home - RSK. The semi-structured interview technique is used to cover a wide range of subject matter; a series of questions are in the general form of an interview schedule but it has the ability to diverge from the sequence of questions should the opportunity arise (Bryman and Bell³).

In this research, the documents of contracts and reports of the development of Green and Sustainable Care

Facilities of RSK are reviewed and analysed. Document analysis is a systematic procedure for reviewing and evaluating documents both printed and electronic material. It requires data to be examined and interpreted in order to elicit meaning, gain understanding, and develop empirical knowledge (Corbin and Strauss⁶; Bowen²).

Elderly Care Home-Rumah Seri Kenangan: Elderly Care Home is perceived as one of the long term care facilities. Long term care facilities are places that provide permanent living space and support for the elderly, with the activities of daily living that offers higher levels of personal care and support to elderly needs (Ministry of Health Care and Long Term Care²⁸). Nursing Homes, Hospitals, Hospices, and Care Homes are referred as long term care facilities (Philips and Chan³⁹; Sulaiman, 2013; Hasifet. Al¹⁶).

In Malaysia, Elderly Care Homes are known as Rumah Seri Kenangan(RSK). There are ten RSK that are supervised and managed by the Department of Social Welfare, Ministry of Women, Family and Community Development which are situated in Cheras, Selangor; Kangar, Perlis; Taiping, Kinta and Seri Iskandar, Perak; Seremban, Negeri Sembilan; Cheng Melaka; Johor Bahru, Johor; Kemumin, Kelantan; and Bedong in Kedah (Department of Social Welfare⁷).

RSK is established to provide care, treatment and shelter to the elderly poor and aged 60 years and above with care and protection services; guidance and counselling; recreational activities; medical treatment; occupational therapy; and physiotherapy for the elderly to live in peace and enjoy a good quality of life (Malaysian Institute of Economic Research²⁵; Selvaratnamet. Al⁴²; Department of Social Welfare⁷).

Theorising the Characteristics of Green and Sustainable Care Facilities for Elderly Care Home:

Most of the researches of the Green and Sustainable Care Facilities of Elderly Care Homes discuss the philosophy of resident care, staff culture and the physical structure of the care facilities (Doty et. Al⁹; Sharkey et. Al⁴³; Bowers and Nolet³; Care Quality Commission⁵). However, the aim of this study attempts to theorise the Characteristics of the Green and Sustainable Care Facilities of Elderly Care Home from the perspective of built environment.

The characteristics of “Green and Sustainable Building” are distinguished by Berardi¹ and Olaniyi³⁷. Table 1 indicates the characteristics of “Green and Sustainable Building”. The characteristics of “Green Building” illuminate the environmental friendly part of a building, while the characteristics of “Sustainable Building” highlight the built environment, social, and economic part of a building.

Table 1: The Characteristics of Green and Sustainable Building

Characteristics	Green Building	Sustainable Building
Consumption of non-renewable resources	/	/
Water consumption	/	/
Materials consumption	/	/
Land use	/	/
Impacts on site ecology	/	/
Urban and planning issues	/	/

Cultural perception and inspiration		/

Source: Adapted from Berardi¹ and Olaniyi³⁷

The characteristics of “Green and Sustainable Building” cover psychological and social functions of Care Facilities of Elderly Care Home with a meaningful building functionality. It caters the holistic concept of well-being which covers the location, design, and resource efficiency towards the healthy environment.

The Green Guide for Health Care (2008) is one of the resources and foundation to characterise the Green and Sustainable Care Facilities for Elderly Care Home. Table 2 shows the Required Green Guide for Health Care Facilities.

Table 2: The Required Green Guide for Health Care Facilities

Characteristics	Sub- Characteristics	Aim
Integrated Operations	Integrated Operations & Maintenance Process	Demonstrate a cross discipline in Operations and Maintenance decision-making and implementation to ensure safe, healthful, environmentally sensitive methods and materials.
Facilities Management	Energy Efficiency Best Practices: Planning, Documentation & Opportunity Assessment	Promote continuity of information to ensure that energy-efficient operating strategies are maintained and provide a foundation for training and system analysis.
	Minimum Building Energy Efficiency Performance	Establish the minimum level of energy efficiency for the building and systems.
	Refrigerant Management– Ozone Protection	Reduce stratospheric ozone depletion.
	Minimum Indoor Plumbing Fixture and Fitting Efficiency	Reduce indoor fixture and fitting water use within buildings to reduce the burdens on potable water supply and wastewater systems.
	Outdoor Air Introduction & Exhaust Systems	Establish minimum Indoor Air Quality (IAQ) performance to enhance indoor air quality in buildings, thus contributing to the health and well-being of occupants.
	Environmental Tobacco Smoke (ETS) Control	Prevent exposure of building, occupants, indoor surfaces, and systems to ETS.
Chemical Management	Polychlorinated Biphenyl (PCB) Removal and Asbestos-Containing Materials (ACM) Management	Reduce the potential exposure of building occupants to PCB and ACM. Prevent associated harmful effects of these hazardous materials in new and existing buildings.
	Chemical Management Policy and Audit	Institute a comprehensive chemical management policy and audit process to establish a framework of policies and procedures to reduce and eliminate the use, emission and improper disposal of chemical hazards and toxic materials within the healthcare facility and to the surrounding community.
	Community Contaminant Reduction: Leaks & Spills	Mitigate leaks, spills and waterborne effluents to prevent releasing waterborne environmental, health and safety burdens to the site neighbours and surrounding community
Waste Management	Waste Management Plan	Institute a waste management plan to establish a framework of policies and procedures with a goal of zero waste.
	Waste Generation Profile and Measurement	Establish baseline generation rates of all waste categories to enhance environmental goal setting and performance tracking.

Source: Adapted from the Green Guide for Health Care¹⁵

Table 2: The Required Green Guide for Health Care Facilities (Continued)

Characteristics	Sub- Characteristics	Aim
Waste Management	Solid Waste Land Disposal	Prevent contamination of the land associated disposal of toxic, hazardous, infectious or radiological substances.
Environmentally Preferable Purchasing	Mercury Reduction	Protect the health of patients, staff, and visitors, reduce disposal costs and liability, by avoiding purchase of mercury-containing equipment, devices and phasing out existing mercury sources.
	Electronic Assets Environmental Management Plan	Reduce the environmental and health burdens associated with the manufacture, use and disposal of electronic products.

Source: Adapted from the Green Guide for Health Care¹⁵

There are five (5) Required Green Guide for Health Care Facilities, which are Integrated Operations, Facilities Management, Chemical Management, Waste Management, and Environmentally Preferable Purchasing. These five Required Characteristics are vital to ensure the standard and continuity of Green and Sustainable Building for existing care facilities.

In Malaysia, there are no guidelines, framework or standard Characteristics of Green and Sustainable Care Facilities of Elderly Care Home to date. However, the issues and phenomenon of “Green and Sustainable Building” have been discussed by MohdNazaruddinYusoff and KamarudinMohdNor (2014) in their book “Sustainable Development of Built Environment and Global Warming”. MohdNazaruddinYusoff (2011) also highlighted the characteristics concept of “Green and Sustainable Building” that include the following characteristics:

- i. Location and surrounding area;
- ii. Energy efficiency;
- iii. Healthy environment;
- iv. Integration design;

- v. Water supply management;
- vi. New development considerations;
- vii. Utilising the usage of resources; and
- viii. Site conservation.

The eight (8) characteristics of “Green and Sustainable Building” that have been mentioned by MohdNazaruddinYusoff (2011) are also adapted in theorising the Characteristics of the Green and Sustainable Care Facilities of Elderly Care Home in Malaysia.

Expoloring the Green and Sustainable Care Facilities of Elderly Care Home–RSK, Cheras, Selangor: In exploring the Green and Sustainable Care Facilities of Elderly Care Home (GSch)-RSK Cheras, Selangor, the underlying theory of Characteristics of Green and Sustainable Building (Berardi, 2013; Olaniyi, 2017); The Required Green Guide for Health Care (Green Guide for Health Care, 2008); and the Characteristic Concepts of Green and Sustainable Building (Mohd Nazaruddin Yusoff, 2011) are adapted. Table 3 indicates the exploration and findings of GSch-RSK.

Table 3: Exploration and Findings of GSch-RSK

Characteristics	Exploration and Findings
Location and surrounding	<ul style="list-style-type: none"> ● Location <ul style="list-style-type: none"> ● RSK Cheras is situated at Kilometre 18, JalanCheras, 43000 Kajang, Selangor and can be accessed by road transportations. ● Surrounding area <ul style="list-style-type: none"> ● The land estimation area is about 15 hectares which consists of road, RSK building (office, dormitory and other facilities) and green landscape (flowers and edible green leaves).

Conted...

<p>Integrated Operations</p>	<ul style="list-style-type: none"> ● Operations & Maintenance <ul style="list-style-type: none"> ● Operations of daily cleaning and disinfection are practiced at dormitory, floor, furnishings, office and bathroom. ● Monthly elevator maintenance is done to ensure the continuation of operation performance. <div data-bbox="774 449 1037 632" style="text-align: center;">  </div> <p style="text-align: center;">Figure 1: Elevators in RSK</p>
<p>Healthy Environment</p>	<ul style="list-style-type: none"> ● Atmosphere well-being <ul style="list-style-type: none"> ● The colour of RSK building is painted white and cream. Bright colours are used for heat absorption reduction. ● RSK has modern transparent windows for ventilation that allows air, light and sound. ● Exhaust fan is used in Store and Kitchen to reduce moisture. <div data-bbox="724 921 1086 1176" style="text-align: center;">  </div> <p style="text-align: center;">Figure 2: Modern windows in RSK</p>

Table 3: Exploration and Findings of GSch-RSK (Continued)

Characteristics	Exploration and Findings
<p>Waste Management</p>	<ul style="list-style-type: none"> ● Waste Management System <ul style="list-style-type: none"> ● Residual and Garbage removal are managed by private company from RSK to disposal plant 3 times a week. ● RSK has designated sewerage that is managed by private company which incorporates the sewers, disposal pipes, and pumping stations. <div data-bbox="667 1593 1134 1898" style="text-align: center;">  </div> <p style="text-align: center;">Figure 3: Designated sewerage in RSK</p>

<p>Energy efficiency</p>	<ul style="list-style-type: none"> ● Energy efficiency appliances <ul style="list-style-type: none"> ● The installation of appropriate electrical equipment such as an air conditioner, refrigerator and fans are according to ENERGY STAR standard benchmark. ● Solar Panel System <ul style="list-style-type: none"> ● The installation of Solar Panel System as a community sustainable project by a private company helps to absorb sunlight as source of energy to generate electricity. <div data-bbox="673 457 1125 793" style="text-align: center;"> </div> <p style="text-align: center;">Figure 4: Solar Panel System in RSK</p>
<p>Sustainable and Green Management</p>	<ul style="list-style-type: none"> ● Green Landscape <ul style="list-style-type: none"> ● RSK has practiced sustainable and green landscape of Rain Garden to conserve water decrease runoff. ● Flowers and Edible Green leaves are planted in the landscape area of RSK. <div data-bbox="705 1031 1093 1304" style="text-align: center;"> </div> <p style="text-align: center;">Figure 5: Rain Garden and Edible Green leaves in RSK</p>

DISCUSSION

The findings indicate six characteristics of GSch-RSK are gathered. The location and surrounding area of RSK is explored and consisted of road, RSK building and green landscape. Mohd Nazaruddin Yusoff and Kamarudin Mohd Nor³⁰. Asserted that the location and surrounding area have a huge impact towards green and sustainable building. The locality of the building surrounded by the green landscape helps to reduce heat and increase the energy efficiency. Retaining and sustaining the green landscape contributes to the local water sources and the surrounding area fertility of the soil.

The Integrated operation characteristic discovers that RSK has practiced Operations and Maintenance (OM)

of daily cleaning and monthly elevator maintenance. The International Facility Management Association or IFMA¹⁸ states that “OM is essential in maintaining the original anticipated useful life and the original intended usage of a fixed asset. OM is the upkeep of property and equipment that includes periodic inspection, adjustment, lubrication, cleaning (non-janitorial), painting, replacement of parts, minor repairs, and other actions to prolong service and prevent unscheduled breakdowns”.

According to the Green Guide for Health Care¹⁵, the objectives of OM for Care Facilities are to ensure safe, healthful, environmentally sensitive methods and materials. The characteristics of OM are also mentioned by Berardi¹ and Olaniyi³⁷ in Sustainable Building criteria.

MohdNazaruddinYusoff²⁹ has highlighted that Healthy Environment as one of the characteristics of “Green and Sustainable Building”. He illustrates that, Healthy Environment of Atmosphere Well-being exists in RSK. Atmosphere Well-being is the basic human rights that includes the rights to breathe clean air, the rights to thermal comfort, the rights to visual health and comfort (WHO^{46,47}). The Atmosphere Well-being consists of bright colours (RSK building) and ventilation system that includes modern windows and exhaust fan. The bright colours help to reflect heat away from the building (LEED²³). The ventilation system improves indoor air quality for enhancement of occupants comfort, productivity, and well-being to reduce the chances of ill health (Paola³⁸; LEED²⁴; Siew⁴⁴).

The findings indicate that RSK has exercised the waste management system that includes garbage removal and designated sewerage. The garbage removal service is operated three times a week transported from RSK to Solid Waste Land Disposal. According to Green Guide for Health Care¹⁵ Solid Waste Land Disposal aims to prevent contamination of the land associated disposal of toxic, hazardous, infectious or radiological substances. The Designated Sewage is a sewerage system that collects and transports sewage to a required level, uses, disposes of or discharges effluent, bio solids, methane or any other products from the sewage treatment process and returning them to the environment (New South Wales Department of Urban Affairs and Planning³²). The Waste Management System is administered by an appointed private company.

RSK has taken up the Energy Efficiency Characteristics by the installation of the Energy Efficiency Appliances and Solar Panel System. The usage of electrical appliances with ENERGY STAR standard and renewable Solar Panel. The Energy Efficiency Characteristics are related to the equipment that helps to do more work with less energy usages whilst providing the same service. It is a strategy for decreasing the usage of energy and has negative impacts on the environment (Joelsson and Gustavsson¹⁹; Rosen⁴¹; Wang et. Al⁴⁵, Olaniyi³⁷).

Sustainable and Green Management of Green Landscape have been practiced by RSK by setting up a Rain Garden. A Rain Garden is a depressed area in the landscape that collects rain water from a roof, driveway or street and allows it to soak into the ground and is used by the plants (Environmental Protection Agency¹²). The Green Landscape of RSK is planted with flowers and Edible Green leaves which are beautiful, cost-effective and reduce water runoff.

CONCLUSION

In conclusion this exploratory study has observed six important characteristics. Firstly, the characteristic of GSch-RSK begins with the Location and Surrounding Area, which is the locality of the building surrounded by the green landscape. Secondly, it is the exploration of Integrated Operation of OM that discusses the Cleaning Operation and Elevator Maintenance in ensuring safe and healthy environment. Then, the Healthy Environment of Atmosphere Well-being is discovered in GSch-RSK. This consists of bright colours and good ventilation system for occupants and productivity. Another characteristic of GSch-RSK is Waste Management System that includes Garbage Removal Service to Solid Waste Land Disposal and Designated Sewage for green environment. Next, is the Energy Efficiency that includes the installation of electrical appliances with ENERGY STAR standard and renewable Solar Panel. Finally, it is the Sustainable and Green Management characteristic that consists of Rain Garden and Edible Green that have been set up.

All these characteristics are vital in developing the theoretical framework of Green and Sustainable Care Facilities of Elderly Care Homes in Malaysia. Eventually, these characteristics will be used for the development framework of existing buildings of Elderly Care Homes in Malaysia.

ACKNOWLEDGMENT

Special thanks are directed to the Ministry of Women, Family and Community Development, Department Social Welfare and Rumah Seri Kenangan, Cheras, Selangor for material support and cooperation given for this research.

ABSTRACT

The segment of youth travel has been considered a niche market and was treated as a branch of the tourism industry. In the past few decades, its market value has begun to increase significantly bringing real benefits to the companies tapping into this segment by developing appropriate strategies and policies. Given its significance, there have been an increasing number of researches in this topic with a focus on university students market, which have been largely neglected in the past. This study in particular, utilized the push and pull analysis in decrypting university students motivation to travel. For that purposes, a total of 500 students from Universiti Utara Malaysia were selected for the self-administered surveys using systematic random sampling approach. The statistical analysis indicates that several push and pull factors were considered very important for the university students in making travel decisions. In addition to that, travel characteristics of university students revealed crucial information for travel suppliers and marketers in delivering specialised services that could satisfy their unique needs and desires.

Keywords: *Travel Motivation, Push and Pull Factors, University Students.*

INTRODUCTION

Youth travel is one of the fastest growing and most dynamic markets of the global tourism sector. According to World Youth, Student and Education Travel Confederation (WYSE), youth traveller businesses generated USD285 billion towards global tourism receipts in 2017, affirming their financial value to the global tourism industry and local economies¹. United Nation World Tourism Organisation (UNWTO) has also projected that by the year 2020, the number of youth travellers will rise to 300 million². The power of youth travel is not solely an economic story. The social and cultural benefits for the young traveller and the communities that host them are far reaching, long-term and measurably more sustainable than other forms of tourism.

In Malaysia, youth is defined as those who belong to the age group of between 15 to 40 years old³. There were about 10.1 million youth within the above age group in 2005, and this number has grown since then⁴. In fact, the majority of university students also belong to this group. Currently, there are about 566,266 university students enrolling in the local public universities, and another 608,378 in private universities as in 2015⁵. This

is a significant volume for a niche market of youth travel that has been largely neglected by the tourism industry. Unfortunately, there is no statistics on local university student travel market reported thus far.

Studies on travel motivation have received considerable attention for the past decades^{6, 7, 8}. It is because, motivation can be considered as one of the most important variables that predict tourist behaviour^{6, 9}. Such information is highly needed by both the practitioners and researchers to make important decision on how to successfully develop and promote a sustainable destination. In marketing, it is also very crucial to understand why a person travel and make decision about where to go and what to do at the destinations.

Currently there have been a growing researches conducted to understand youth travel markets. This growing interest could be attributed to the substantial growth of youth travellers¹⁰. Moreover, the youth market has the potential to be a very lucrative market segment^{11, 12}. WYSE Travel Confederation¹⁰ also reports that young and youth travellers comprise a group of 'loyal repeat consumer', and recommends that travel sectors focus on this market by providing specific products tailored to meet their needs.

Despite ample studies on youth travel motivation, very little focus have been put on understanding university students' travel market in particular^{7, 13, 14}. There are several reasons for the limited studies in this area. First, the existing studies on youth travel market are assumed to be adequate to address university students travel behaviour⁷. This is attributed to the fact that there is a predominant belief that students' travel is homogeneous to youth travel market. Secondly, there are some difficulties in measuring student travel behaviour due to scarcity of related studies.

The research objective for this study was mainly to examine the push and pull factors that influence university students' travel decision. In addition to that, several other information related to the common holiday activities and source of information searched by students in making travel decision were also investigated.

LITERATURE REVIEW

Motivation being an important factor influencing an individual into action, it would be useful to understand how a particular decision is arrived at. Travel motivation is the set of needs and attitudes which predispose a potential tourist to act in a specific goal-directed away^{8, 15}. There are a number of studies on motivation in the tourism industry using different theories the likes of Gray's¹⁶ sunlust and wanderlust typology of tourists, Dann's¹⁷ push and pull model, Iso-Aloha's¹⁸ optimal arousal theory, Pearce and Lee's¹⁹ travel career ladder, and various adapted versions. However, the most widely used approach in understanding travel motivation is push and pull model. Scholars claimed that push factor originates from Maslow's hierarchy of needs in which a motivation arises when there is deficiency in a person's needs²⁰. A study by Uysal and Jurowski²¹ found that many of the push factors were derived from intangible or intrinsic desires of human beings, including the desire for escape, rest and relaxation, adventure seeking, novelty seeking, dream fulfilment, health and fitness, prestige, and socialization. Pull factor on the other hand relates to destination-specific characteristics that may fulfil a person's needs to travel^{18, 22}. For example, people from temperate climate countries often visit tropical tourist destinations that offer sunny weather the likes of Hawaii and Bali which enables them to escape from harsh winter.

Currently researches on student travel motivation are limited but gaining momentum. A study by Perrett²³ for example identified that five main travel motives that

drive youth to travel as intellectual, social, competency, stimulus avoidance, and other generic motives. The findings suggest that the most dominant motive for travel was intellectual motives. These include the activities of learning, exploring, discovering, creating, and imagining. Some travel motives were found to differ significantly with socio-demographic variables such as gender and education level. Meanwhile, travel characteristics such as size of travel group, length of stay, fund available, mode of transportation, and booking method were also found to correlate positively with a number of travel motives.

Bicikova⁷ on the other hand proposed only two dimensions of motivation factors simply as push and pull factors. Under the push factor, three motives were highly rated including discovering new places, good times with friends, and mental relaxation. Meanwhile under pull factor - price, beautiful environment, and climate became the main motives for travel amongst British university students. The study also identified four distinct clusters namely 'the sun-seeker', 'the sightseers', 'the in-betweeners', and 'the clubbers' based upon their holiday activities.

Kim, Oh, and Jogaratnam's¹⁴ research on United State college student travel motivations indicated that there were seven push motives including knowledge, sport, adventure, relax, lifestyle, travel bragging, and family. Three top motives recorded were knowledge, sport and adventure. A study by Paris and Teye²⁴ on backpackers using university students as the survey subjects assigned travel motivation as personal growth, experiential, relaxation, cultural knowledge, budget travel, and being independence. This study however, did not use push and pull factor model as a reference. Instead, they used travel career pattern as the theoretical framework. Further analysis also indicated that all the travel motivations differ significantly according to travel frequencies (or experience) except for cultural knowledge motives.

A recent study by Cavagnaro and Steffieri⁸ on student travel motivations discovered three factors as culture, escapism and relaxation, and vogue. Each factor represents both push and pull motivations. For example, motives such as to know different cultures, feel independent, interact with other people, and study/work can be categorised as 'push' under the cultural factors. Meanwhile, under the same cultural factor, seeing a beautiful place can be considered as 'pull'. The rest of the factors; escapism and relaxation motives are self-explanatory, and vogue on the other hand refers to the influences of fashion trends on travel needs.

A study in Malaysia carried out by Mohamad and Jamil²⁵ identified the travel motives into 11 factors namely escape, self-actualization, rest and relaxation, medical treatment, health and fitness, visiting friends and relatives, meeting new people, novelty seeking, culture exploration, enjoying nightlife and shopping, and lastly adventure seeking. All these internal motives (or push factor) then were categorised under several factors namely, Psychological Factor (i.e. escape and self-actualization), Physical Factor (i.e. rest and relaxation, medical treatment, health and fitness), Social Interaction (i.e. visiting friends and relatives, meeting new people), Seeking or Exploration Factor (i.e. novelty seeking, culture exploration, enjoying nightlife and shopping, and lastly adventure seeking). The above categorization of travel motives in their study was borrowed from Hsu, Tsai and Wu²⁶. However, these travel motives differ from destination to another. Thus, the choosing of destination depends on the push factors that drive tourist to travel in the first place.

METHODOLOGY

In this research, the quantitative research approach was chosen to answer the research objectives. Generally, quantitative research is about asking people for their opinions in a structured way so that the researcher can produce hard fact and statistics as a guidance²⁷. To get reliable statistical results, it is important to survey people in fairly large number and to make sure they are a representative sample of the target market. According to Kumar et al²⁷ quantitative approach is where the researcher decides what to study, ask specific questions, narrow the scope of the question, collect data that can be translated from participants, analyse these numbers using statistics and carry out an inquiry in an objective and unbiased manner.

Sampling Procedures: The population of this study was the students of Universiti Utara Malaysia, one of the largest universities situated in the northern part of Malaysia. Currently, there are 18,000 students staying full-time in the main campus²⁸. This study employed systematic random sampling by targeting university students who are between 18 to 33 years old following Bicikova⁷. The appropriate sample size for this study was 377 based on Krejcie & Morgan²⁹. However, the actual sample selected in this study was 500 respondents in an attempt to increase the accuracy of the data.

Instrumentation: The survey questionnaire was designed consisting of a combination of close-ended and open-minded questions. Both of the motivation variables were developed on the basis of a review of the

related literature and modified to apply to the research site and target population^{7, 22}. A five point Likert-type scale was used as the response format for the motivation variables, with assigned values ranging from 1 being “Not at all important”, to 5 being “Very important”. The respondents were asked to read each statement then tick the box to the right of the statement that best describes their answers. The following table exhibits the detailed instrument used in this study.

Table 1: Research instrument

Items		Measurement
Push Factors		
1.	Discover new places and cultures	1 to 5 point Likert-type scale
2.	Have a good time with friends	
3.	Relax mentally	
4.	Avoid everyday routine	
5.	Develop a closer relationship with others	
6.	Relax physically	
7.	Be indulged	
8.	Meet new people	
9.	Being daring and adventure some	
10.	Finding thrills and excitements	
11.	Clubbing/night club	
12.	Gaining knowledge	
13.	Coursework requirement	
Pull Factors		
1.	Easy access	1 to 5 point Likert-type scale
2.	Affordable	
3.	Safety	
4.	Beautiful natural environment	
5.	Cultural and historical places	
6.	Local food and drink	
7.	Friendly local people	
8.	Authentic/untouched places	
9.	Cold Climate (e.g. highland destinations)	
10.	Famous tourist sites	
11.	Seaside/beaches	
12.	Popularity of the place among young people	
13.	Nightlife and entertainment	
14.	Shopping opportunities	
15.	Adventure activities	
16.	Party reputation of the destination	
17.	Sports facilities	
18.	Attractive events	

Source: adapted from Bicikova⁷, Kim et al²²

Data Collection Procedure: The questionnaires were distributed using systematic random sample of students visiting the library. The library is considered as one of the students’ meeting point within the campus. Thus, every 5th respondents passing through the library were selected for this survey.

Data Analysis: Data analysis was carried out using SPSS (Statistical Package for the Social Sciences) version 20.0 for windows in two major steps. Firstly, descriptive statistics analysed the demographic profiles and travel characteristics of respondents. Secondly, another descriptive analysis was conducted on travel motivations(i.e. push and pull factors) among the university students.

FINDINGS

The total number of respondents in this study was 500 students enrolling in various degree programmes at Universiti Utara Malaysia. The analysis indicates that the majority of respondents were female totalling 66.6 percent. Meanwhile in terms of age group, the majority were between 18-25 years (89.4%). The biggest ethnic group were Malay (59.6%), followed by the Chinese (26.6%), Indian (8.0%), Siamese (0.6%), and others (5.2%). In terms of family’s income, a large proportion earned between RM1001 to 3000 per month (34.6%), and followed closely by the income group of between RM3001 to RM5000 per month (30.8%). The details are depicted in Table 2 below.

Table 2: Respondents’ demographic profiles

Profiles	Frequency	Percentage
Gender		
Male	167	33.4
Female	333	66.6
Age		
18-25	447	89.4
26-30	45	9.0
31-35	8	1.6
Ethnic		
Malay	298	59.6
Chinese	133	26.6
Indian	40	8.0
Siam	3	0.6
Others	26	5.2

Conted...

Nationality		
Malaysian	448	89.6
Non-Malaysian	52	10.4
Family Income		
Below RM 1000	72	14.4
RM 1001-3000	173	34.6
RM3001-5000	154	30.8
RM 5001- 700	48	9.6
Above 7000	49	9.8

Travel Characteristics: The travel behaviour of respondents was also captured in terms of amount of money spent, travel companion, types of tour, type of accommodation, and information source for travel. From the analysis, it was found that the majority of respondents spent below RM500 per trip (70.6%), and tend to travel with friends (73.0%). At the same time, the respondents also have high tendency to travel independently without packaged tour (79.6%).The types of accommodation highly preferred by respondents were budget hotel (26.2%), hotels with rating of 1 to 3 star (23.2%), and homestay (20.6%).

The descriptive result also presents the preferred holiday activities among university students. The analysis suggests that the most preferred activities during travel were trying local foods (85.0%), visiting interesting places (84.2%), sightseeing (64.4%), shopping (62.8%), and water and beach activities (53.8%). Meanwhile, the five top sources of information referred by the students were social media (70.0%), word-of-mouth (49.0%), youtube (42.4%), official destination website (37.4%), and travel booking website (31.4%). The details can be seen in Table 3 below.

Table 3: Travel Characteristics

Factors	Frequency	Percentage
Amount of money spent per trip		
RM1–500	345	70.6
RM501–1000	76	15.5
RM1001–1500	21	4.30
RM1501–2000	22	4.49
RM2001 and above	25	5.11
Travel Companion Last Trip		
With friends	365	73.0
With family	110	22.0

Magazines	53	10.6
Newspaper	43	8.6

Push and Pull Factors Analysis: The following section discusses the results of descriptive analysis of the understudy variables. Table 4 lists the five top push factors that drive students to travel as mental relaxation (m=4.42), having good time with friends (m=4.38), to discover new places and culture (m=4.26), physical relaxation (m=4.17), and gaining knowledge (m=4.16). Meanwhile, the least important push factors were found to be coursework requirement (m=3.79), and clubbing/night club (m=2.92).

Table 4: Push Factor Analysis

Push Factors	Mean Value	Ranking	Standard Deviation
Discover new places and cultures	4.26	3	.641
Have a good time with friends	4.38	2	.632
Relax Mentally	4.42	1	.684
Avoid everyday routine	4.01	8	.959
Develop a closer relationship with others	4.13	6	.905
Relax physically	4.17	4	.930
Be indulged	3.93	10	.906
Meet new people	3.85	11	1.025
Being daring and adventuresome	3.97	9	.924
Finding thrills and excitements	4.08	7	.894
Clubbing/night club	2.92	13	1.501
Gaining knowledge	4.16	5	.835
Coursework requirement	3.79	12	1.025

The following table on the other hand exhibits the results of descriptive analysis for pull factor. The top five factors that drive students to choose travel destinations were affordable (m=4.39), beautiful natural environment (m=4.32), local food and drink (m=4.31), safety(m=4.28), seaside and beaches(m=4.28), and easy access (m=4.26). Meanwhile, the least important factors in choosing holiday destination for students were shopping opportunities (m=3.92), sport facilities (m=3.80), and party reputation of destination (m=3.68).

Table 5: Pull Factor Analysis

Pull Factors	Mean Value	Ranking	Standard Deviation
Easy access	4.26	5	.681
Affordable	4.39	1	.635
Safety	4.28	4 Tied	.931
Beautiful natural environment	4.32	2	.896
Cultural and historical places	4.08	11 Tied	.940
Local food and drink	4.31	3	.841
Friendly local people	4.24	6	.820
Authentic/untouched places	4.08	11 Tied	.881
Cold climate	3.95	12 Tied	.758
Famous tourist sites	4.17	8	.682
Seaside/beaches	4.28	4 Tied	.726
Popularity of the place among young people	4.14	9	.787
Nightlife and entertainment	3.95	12 Tied	.886
Shopping opportunities	3.92	13	.929
Adventure activities	4.09	10	.881

DISCUSSION

The analysis carried out has successfully answered all the research objectives laid out at the beginning of this paper. In particular, this research has able to determine the major push and pull factors sought after by university students when making travel decision.

University students in consensus agreed that mental relaxation, having good time with friends, to discover new places and culture, physical relaxation, and gaining knowledge as their main push motivation to travel. In particular, a mental relaxation from academic pressures at school became the top motivation to travel. In addition, as the majority of students were single, spending time with friends during travel was one of the most sought after experience for them. Meanwhile for pull factor, aspects such as affordability, beautiful natural

environment, local food and drink, safety, seaside and beaches, and easy access became their major motivation in choosing holiday destination. As the students rely heavily on parents or scholarships for sources of income, affordability became one of the most important criteria when choosing travel destination.

In terms of travel characteristics, a number of observations can be made. First, university students in general were found to choose budget hotel compared to higher scale hotel due to economic factor. Secondly, their preferred holiday activities were trying local foods and drink, visiting interesting places, shopping, and beach activities. In the contrary, very few were interested to visit museums and heritage sites. Museums and heritage sites might be perceived as unattractive for students to visit.

University students also in general used social media, word-or-mouth, and youtube as their main source of information when making decision to travel. In fact, very few went to look for information on television, magazines, and newspapers. Thus in conclusion, social media and internet became important medium in disseminating information about travel destinations compared to the traditional methods likes television and newspapers.

The major implications of this study can be explained in terms what the travel suppliers and travel marketers can do to meet the above travel motivations. For example, the main reason that pushes university students to travel was mental relaxation. Therefore, the travel experience offered must portray young people in relaxing mood, and having good times experiencing activities that are different from those in their everyday lives. Another aspect that should be focused on was the fondness of these university students for tasting the local food and drink at the destination visited. This in turn could open a greater opportunity for local entrepreneurs to offer a variety of street foods that not only cheap, but also appetizing.

In addition, the selection of marketing tools especially through social media and youtube should be designed in a way that attracts the attention of the university students. This study indicates that students rely heavily on social media and other internet platforms to access travel information. In addition, the travel service providers need to deliver travel experience in a satisfying manner as this could lead to positive word-of-mouth which was considered as the second most referred source of information among university students.

Development of Malaysian Women Fertility Index

Shamshuritawati Sharif¹, Wan AznieFatihah¹, Adzmel Mahmud²

¹School of Quantitative Sciences, College of Arts and Sciences, Universiti Utara Malaysia, Sintok,, Kedah DarulAman; ²National Population and Family Development Board, Kuala Lumpur, Malaysia

ABSTRACT

A fertility rate is a measure of the average number of children a woman will have during her childbearing years. Malaysia is now facing a population crisis and the fertility rate continues to decline. This situation will have implications for the age structure of the population where percentages of senior citizens are higher than percentages of people aged below 5 years old. Malaysia is expected to reach aging population status by the year 2035. As the aging population has a very long average life expectancy, the government needs to spend a lot on medical costs for senior citizens and need to increase budgets for pensions. The government may be required to increase tax revenues to support the growing older population. The falling fertility rate requires proper control by relevant authorities, especially through planning and implementation of strategic and effective measures. Hence, this paper aims to develop a fertility index using correlation and Shannon's entropy method. The results show that Selangor, Johor, and Sarawak are among the states with the highest values of the fertility index. On the other end of the spectrum, Terengganu, W.P. Labuan, and Perlis are ranked in the last positions according to the fertility index. The information generated from the results in this study can be used as a primary source for the government to design appropriate policies to mitigate dwindling fertility rates among Malaysian women.

Keywords: correlation; entropy; fertility; Malaysia

INTRODUCTION

Women fertility is rated by the mean number of children that a woman will have during her childbearing years. Fertility patterns in the world have changed dramatically over the last few decades. Since the 1970s, a large number of developed countries such as United Kingdom, Canada, Denmark, and Germany have seen their fertility rates below replacement level⁶.

Figure 1: Total fertility rate in Malaysia from 1958-2016

As a developing country, Malaysia had experienced fertility declined over the years. Figure 1 shows the total

fertility (TFR) in Malaysia from 1958 to 2016. Malaysia has recorded a TFR of 6.28 in 1958 and steadily declined to 5.06 in 1969. Afterwards, the TFR had reached 4.09 in 1977 and reduced to 3.13 in 1997. Furthermore, the TFR was at par with the replacement level in 2010 which is only 2.1 children per woman. The lowest TFR ever recorded was in 2016 which is only 1.9 children per woman.

The negative influence of low fertility rate is the main cause to further investigate this topic. In society, low level of fertility rate is one of the economic challenges when the population age structure will be affected. In year 2035, Malaysia is projected to reach the status of aging population where 15 per cent of the total population will be at least 60 years old⁴. This situation presents a major fiscal challenge for the government. Currently, it is a serious problem for governments in terms of what the effects will be on healthcare, care services, and pensions. The increasing age is associated with higher morbidity, higher use of health services i.e. number of visits to doctors and hospitalizations, and greater demand for specialized services. All these factors will lead to an increase in the complexity of

health services required and increased the government expenditure. The government needs to spend a lot on medical costs for senior citizens and also needs to increase budgets for pensions. In order to support the growing older population, the government also required to increase the tax revenue. The falling fertility rate requires proper control by relevant authorities, especially through planning and implementation of strategic and effective measures.

To the best of the authors' knowledge, the official report on the Malaysian women fertility index has not yet been studied. Therefore, in this study, we present the mathematical development for measuring fertility index to discover the ranking of the women population ability to have children. The women fertility index is perform to demonstrate the rank of each state in Malaysia. The fertility index plays an important role to explain the fertility level for each state in Malaysia from "high fertility" to "low fertility", as it may help the government to design appropriate policies aimed at increasing fertility rates among Malaysian women.

For the development of women fertility index, there are several criteria that potentially related to the fertility behavior can be employed in developing the women fertility index based on previous researchers findings. In details, there are seven criteria that were used in this study as a potential determinant in fertility behavior which are place of living (urban or rural), age at first marriage, female tertiary education attainment, number of divorces, female participation in labor force, family planning methods, and female income.

In this study, the total number of children ever born (CEB) per woman was used as a measure of fertility. CEB is regularly used as proxy for fertility in various studies^{12, 3, 11}.

The rest of the paper is structured as follows. The next section defines the methodology which includes the data standardization, weight calculation and index development of the woman fertility for each state. To close the paper, we present the results, and conclusion of the study.

METHODOLOGY

The development of a fertility index requires three main steps; the first involves identification of criteria

related to fertility from comprehensive literature review, the second requires calculation of weighting criteria, which involves application of correlation and Shannon's entropy method, and the final involves building of fertility index using methods of linear combination or weighted arithmetic average⁷.

In this study, the data has been obtained from the Fifth Malaysian Population and Family Survey by the National Population and Family Development Board. The data standardization is performed since the measurement units and scales of seven criteria differ. The standardization is used to transform different scales and units among various criteria into common measurable units to allow for multi criteria comparisons⁵.

Data Standardization: Let and being the elements of data matrix of number of children ever born (CEB) and standardized data matrix, respectively across all criteria. Table 1 provides further information regarding the criteria.

Table 1: Description of the Criteria

No.	Criteria	Description of criteria
1.	URBAN	Number of females living in urban areas by state
2.	AGE	Female age at first marriage (years)
3.	EDU	Number of females tertiary education attainments by state
4.	DIVORCE	Number of divorces by state
5.	EMPLOYED	Number of females employed by state ('000)
6.	PLAN	Number of married couples using family planning methods by state
7.	INCOME	Median monthly female income by state (RM)

In this study, to eliminate anomalies of measurements units and data scales, the data standardization is performed [5] before calculate their weights

$$z_{ij} = \frac{x_{ij}}{\sum_{j=1}^k x_{ij}} \dots(1)$$

Weight Calculation: In Table 2, the structure of the matrix is constructed with *n* number of location (state), *i* against *k* fertility criteria, *j* and *w_j* is the weight of fertility criteria *j*.

Table 2: Structure of the Matrix

	Criteria 1	Criteria 2	...	Criteria k
Location 1	x_{11}	x_{12}	...	x_{1k}
Location 2	x_{21}	x_{22}	...	x_{2k}
⋮	⋮	⋮	⋮	⋮
Location n	x_{n1}	x_{n2}	...	x_{nk}
	w_1	w_2	...	w_k

Since different criteria have different meaning, it is not appropriate to assume that they all have equal weights. Methods for finding weights for each criterion can be classified into two groups which are subjective and objective weights⁵. Subjective weights are determined only according to the preference off decision makers such as rank- based method, pair wise comparison method⁸, Analytic Hierarchy Process (AHP) method, weighted least squares method, and Delphi method¹⁰. The objective methods determine weights for each criterion by solving mathematical models without any consideration of the decision maker’s preferences. The examples of objective weights are correlation method, entropy method, multiple objective programming, and principle element analysis⁵. Subjective weighting may be preferable in the most real problems, since the decision maker’s expertise and judgments are taken into account. However, the use of objective weights is practical when obtaining such reliable subjective weights is difficult⁵. In this study, we proposed to implement correlation and Shannon’s entropy method for determining the criteria weight.

Correlation Method: The weight criteria based on correlation method was introduced by¹³ and is also known as Hellwig method. The method states that the greater the correlation coefficient, the greater the weight for the criteria.

After data standardization, correlation test is performed to test whether the correlations are significant among criteria. If correlations between criteria are significant, the size of correlation between criteria is taken into account in calculating the weights. The weighted value of a criterion, which is estimated by this procedure, is equivalent to the absolute value of the normalized correlation for all criteria, namely

$$w_j = \frac{r_j}{\sum_j r_j}, \quad r_j = \sum_i |r_{ij}| \quad \dots(2)$$

where is the correlation coefficient between the and the criteria.

Entropy Method: The concept of entropy was introduced by in communications theory and the concept is now widely used in many different fields. The concept put forward by Shannon entropy is based on statistical theory. The method of entropy can be used in identifying objective weight which is based on the degree of uncertainty of the information as employed in probability theory^{8, 2}. The entropy measure for the criteria is given by the following formula:

$$E_j = -\frac{1}{\ln n} \sum_{i=1}^n z_{ij} \ln(z_{ij}) \quad \dots(2)$$

Entropy measures the size of uncertainty information contained in a decision characteristics, i.e. the larger the size, the lower the condition. The weight for the criteria is

$$w_j = \frac{1 - E_j}{\sum_{j=1}^k 1 - E_j} \quad \dots(4)$$

Index Development: This step is also known as aggregation method, which involves the process of combining a set of values into a single value. In this study, a linear combination method or weighted arithmetic average is used. Mathematically, the fertility index can be written as follows:

$$FI_i = w_j z_{ij} + w_j z_{ij} + \dots + w_j z_{ij} = \sum_j w_j z_{ij}, \quad \dots(5)$$

$$\sum_j w_j = 1, \quad w_j \geq 0$$

Where,

FI_i = Fertility index for location.

w_j = weight for criteria $j, j = 1, 2, 3, \dots, k$.

z_{ij} = normalized value of location $i, i = 1, 2, 3, \dots, n$, with respect to criteria.

RESULTS AND DISCUSSIONS

Correlations between the factors affecting fertility are presented in Table 3. The correlations indicate that EMPLOYED, PLAN, DIVORCE, URBAN, and EDU have positive relationship with CEB. The relationship between INCOME and CEB are negatively correlated, where high income has less number of children ever born, and vice versa. The increasing in age at first marriage also contributed to low number of children ever born.

Since correlations between variables are significant, the correlation size is taken into account in the weighting criteria, and the weighted value is calculated using Equation 2. The resulted weights are shown in Table 4 and the women fertility index for each state in Malaysia are listed in Table 5.

The criteria of URBAN, EMPLOYED, and PLAN which have highest weight, can be considered as important criteria, followed by DIVORCE, EDU, INCOME, and AGE.

Table 3: Correlation test among variables

	URBAN	AGE	EDU	DIVORCE	EMPLOYED	PLAN	INCOME	CEB
URBAN	1	0.1915	0.8860	0.8259	0.9407	0.8800	-0.2414	0.9068
AGE	0.1915	1	0.4367	-0.1565	0.0014	-0.1043	0.2931	-0.1192
EDU	0.8860	0.4367	1	0.5884	0.7630	0.6448	-0.0789	0.6652
DIVORCE	0.8259	-0.1565	0.5884	1	0.8971	0.9132	-0.1804	0.9228
EMPLOYED	0.9407	0.0014	0.7630	0.8971	1	0.9674	-0.3148	0.9729
PLAN	0.8800	-0.1043	0.6448	0.9132	0.9674	1	-0.3393	0.9689
INCOME	-0.2414	0.2931	-0.0789	-0.1804	-0.3148	-0.3393	1	-0.4077
CEB	0.9068	-0.1192	0.6652	0.9228	0.9729	0.9689	-0.4077	1

Table 4: Initial value, weighted value, and criteria rank for fertility using correlation method

Criteria	Initial value, r_j	Weighted value, w_j	Criteria rank
URBAN	5.8723	0.1766	1
AGE	2.3027	0.0692	7
EDU	5.0631	0.1523	5
DIVORCE	5.4842	0.1649	4
EMPLOYED	5.8573	0.1761	2
PLAN	5.8178	0.1750	3
INCOME	2.8556	0.0859	6
		$\Sigma w_j = 1.0000$	

After the are calculated, the state can be ranked from the highest index to the lowest index. The state with the highest values of index presents better conditions for childbirth and childbearing.

Table 5: Fertility index by state using correlation method

Index	Rank	State
0.1311	1	Selangor
0.1202	2	Johor
0.1035	3	Sarawak
0.0758	4	W.P Kuala Lumpur

Conted...

0.0714	5	Sabah
0.0656	6	Kedah
0.0588	7	Perak
0.0583	8	Pahang

0.0304	14	Terengganu
0.0284	15	W.P Labuan
0.0245	16	Perlis

The results in Table 5 show that the state with the highest fertility index is Selangor, followed by Johor, Sarawak, W.P Kuala Lumpur, and Sabah. On the other end of the spectrum, Pulau Pinang, W.P Putrajaya, Terengganu, W.P. Labuan, and Perlis are ranked in the last positions according to the fertility index. The results in Table 6 show the entropy value, weighted value and rank of each criterion. The criteria of EDU, DIVORCE, and PLAN, which have the highest weight, can be considered as important criteria of fertility, followed by URBAN, EMPLOYED, INCOME, and AGE.

Table 6: Entropy value, weighted value, and criteria rank for fertility using entropy method

Criteria	Entropy value, E_j	Weighted value, w_j	Criteria rank
URBAN	0.9347	0.1802	4
AGE	0.9996	0.0012	7
EDU	0.9156	0.2328	1
DIVORCE	0.9327	0.1857	2
EMPLOYED	0.9401	0.1652	5
PLAN	0.9338	0.1825	3
INCOME	0.9810	0.0524	6
		$\sum w_j = 1.0000$	

The results in Table 7 show that the state with the highest fertility index is Selangor, followed by Johor, Sarawak, W.P Kuala Lumpur, and Sabah. On the contrary, Pulau Pinang, W.P Putrajaya, Terengganu, W.P. Labuan, and Perlis are ranked in the last positions according to the fertility index.

Table 7: Fertility index by state using entropy method

Index	Rank	State
0.1444	1	Selangor
0.1268	2	Johor
0.1051	3	Sarawak
0.0779	4	W.P Kuala Lumpur
0.0701	5	Sabah
0.0651	6	Kedah
0.0587	7	Perak
0.0585	8	Pahang
0.0576	9	Melaka
0.0480	10	Kelantan
0.0476	11	Negeri Sembilan
0.0407	12	Pulau Pinang
0.0297	13	W.P Putrajaya
0.0266	14	Terengganu
0.0235	15	W.P Labuan
0.0197	16	Perlis

For every state in Malaysia, the ranking of fertility index using Shannon’s entropy method is almost similar to the index obtained by the correlation method.

CONCLUSION

The weighted calculation based on the correlation and entropy give different results in terms of rank covariates influencing the fertility. Correlation method listed the number of females living in urban areas, number of females employed, and family planning methods as the three most important criteria that influence fertility in Malaysia. This is very different for the weights obtained through the entropy method in which the weight concentrated on female tertiary education attainments, number of divorces, and family planning methods. We cannot say that one of this weighted calculation methods is the best because it has their own specialty. However, the results of the fertility index based on correlation and entropy method as proposed in this study show that Selangor has the highest fertility index. The reason for the high index in Selangor might be because the state government offer schemes to alleviate lower fertility amongst Selangor women⁹. These schemes includes allocation of RM1500 for newborn babies, parents that are eligible will receive financial help to pay for nursery or daycare centers registered with the Department of Social Welfare amounting to about RM100 every month, and payment aids of RM50 every month for children in pre-school education.

In addressing the problem of low fertility in Malaysia, all parties must play their role. The information generated from the results in this study can be used as a primary source for the government to design appropriate policies to mitigate dwindling fertility rates among Malaysian women. These policies include income supports for families with children, affordable or quality child care and early childhood education, flexible working hours, parental leave, family leave, and reasonable working hours.

The findings from this study make several contributions to the current literature. Based on certain crucial factors that influence the fertility rate in Malaysia, we propose the women fertility index as an indicator for verifying and measuring the degree of ability of the women population in Malaysia to have children. However, we accept that the choice to bear children is personal decision. However, this issue supposed to be taken seriously, with full of responsibility. Thus, it is important for married couples to motivate themselves to have more children with good quality of education as it can enhance the economic productivity in our country.

ABSTRACT

This study aims to analyse the influence of brand love on word of mouth with brand commitment as intervening variable. Brand commitment in this research consists of two aspects i.e. affective commitment and continuance commitment. The subjects of the research were the customers of Wardah cosmetic. The respondents of this research were 150 persons taken by using purposive sampling technique. The Structural Equation Modelling is used as the research analysis tool using AMOS 16.0. The result of the analysis proved that brand love positively affected the two aspects of brand commitment i.e. affective commitment and continuance commitment; Brand love positively affected word of mouth; Affective commitment and continuance commitment had a positive effect on word of mouth. Based on these findings, it can be concluded that customer's love and commitment to a brand play an important role in establishing word of mouth communication.

Keywords: *Word of Mouth, Brand Commitment, Brand Love.*

Jel Classification: M12, M39, Y80

INTRODUCTION

Marketing communication is an important factor that must be noticed when a company plans marketing strategies. An effective communication channel will ease company to market their product and service. One of communication channels that should be well managed is Word of mouth communication. *Word of mouth* communication becomes an effective way in creating company's product image, which then establishes positioning in the public (Hasan, 2016).

The result of the research conducted by *Onbee Marketing Research- Octovate Consulting Group* working together with *Swa* magazine suggests that consumers in Indonesia will say something positive to 7 persons if they feel satisfied. In contrast, when they feel dissatisfied, they tend to give negative information to 11 persons (Hidayat¹¹). It proves that people tend to say *negative word of mouth* more than *positive word of mouth*.

Hawkins *et al*¹⁰ describes *word of mouth* as a process that enables consumers to share information and opinion

that makes prospective buyers directly get close or stay away from certain product or service. The concept of *word of mouth* and its influencing factors have been proven empirically by researchers (Carroll and Ahuvia⁵; Albert and Merunka²; Ismail and Spinelli¹³; Maisam and Mahsa¹⁴; Bachman and Wilkins³; Batra *et al*⁴).

Consumer's commitment is one of antecedent factors of *word of mouth*. Commitment represents consumer's desire to maintain relationship with brand (Fullerton⁷). An empirical study conducted by Tuskej *et al*¹⁵ suggests that *brand commitment* has positive effect on *word of mouth*. Improving consumer's commitment to brand will turn to bigger *positive word of mouth*. (Bachman and Wilkins³) in their research suggest that consumers who have affective commitment to a brand will repurchase the brand and spread positive information about the brand from mouth to mouth to convince other consumers to buy the brand of the product.

Albert and Merunka² suggest that *brand love* is the antecedent of *brand commitment*. Consistent with Carroll and Ahuvia⁵ who say that consumers, who love and have emotional bond to a brand, have more commitment to

maintain long-term relationship with the brand and will spread the benefits of the brand to others.

Study on the correlation of *brand love* and *brand commitment* is still relevant thus far; because this study is still looking for appropriate model how brand love affects brand commitment. Several studies found that *brand love* had positive and significant effect on *brand loyalty* and *brand commitment* which belongs to attitude of *brand loyalty* (Carrol and Ahuvia⁵; Hwang and Kandampully¹²; Albert and Merunka²). Meanwhile, other studies found that *brand love* did not have effect on *brand commitment* (Maisam and Mahsa¹⁴).

The phenomenon of inconsistency of relationship between *brand love* and *brand commitment* needs to be studied. Albert and Merunka² clarify in their research that *brand love* had positive effect on *affective* and *continuance commitment*. From conceptual point of view, the result of this research confirms the significance of the effect of the correlation between consumers and brand and suggests the significance of brand love for long-term relationship. Maisam and Mahsa¹⁴ in their empirical study gives suggestion for the next research to examine variable *brand commitment* from two different aspects; *affective* and *continuance commitment*. The argument then becomes the foundation for developing the model of relationship between brand love and brand commitment. In addition, it is expected to be able to explain the gap phenomenon about brand love and consumer commitment.

Based on the explanation above, the hypothesis can be formulated as follows:

H1: *Brand love* has positive effect on *affective commitment*.

H2: *Brand love* has positive effect on *continuance commitment*.

H3: *Brand love* has positive effect on *word of mouth*.

H4: *Affective commitment* has positive effect on *word of mouth*.

H5: *Continuance commitment* has positive effect on *word of mouth*

Figure 1: Research Model

METHOD OF THE RESEARCH

Population and Sampling Technique: This research belongs to quantitative research with survey method by asking respondents' conception about the roles of *brand love*, *affective commitment* and *continuance commitment* in establishing *word of mouth* communication. The population of this research was the consumers of Wardah Cosmetics in Purwokerto.

The sampling technique used in this research was *purposive sampling* i.e. those who performed repurchase for the last three months. Total samples of this research were 150 consumers of Wardah cosmetics. Data were collected by administering questionnaire directly and read previous researches relevant to the topic of this study.

Operational Definition of Variable: Operational definition of each variable of this research is as follows: (1) *word of mouth* measures consumer attitude indicated by explaining personal experience about the product and giving positive information about the product and recommending it to others; (2) *Continuance commitment* measures consumer bond to a product continuously due to no other choice proportional to the product and expensive switching cost; (3) *Affective commitment* measures consumer's emotional bond to a product indicated by love feeling to the product, emotionally bond to the product, believing that the product is very important and meaningful, feeling to get involved with the product, and having strong relationship with the product; (4) *Brand love* measures consumer's emotional level who is satisfied to the product indicated by the consumer's conviction that the product has good quality and gives benefits needed by consumers, comfortable feeling felt by consumers when using the product, consumers' willing to always use the product, consumers love to the product and consumer bond to the product.

Data Analysis Technique: This research used *Structural Equation Modeling* (SEM) analysis technique with AMOS 16.0 to analyse causal relationship in the proposed structural model between variable exogenous and endogenous and to examine validity and reliability of the research instrument.

RESULT AND DISCUSSION

Structural equation in Figure 2 depicts that the value of *Chi-square* was 161,813 with *degree of freedom* (df) at 114. It shows the model deserved to use.

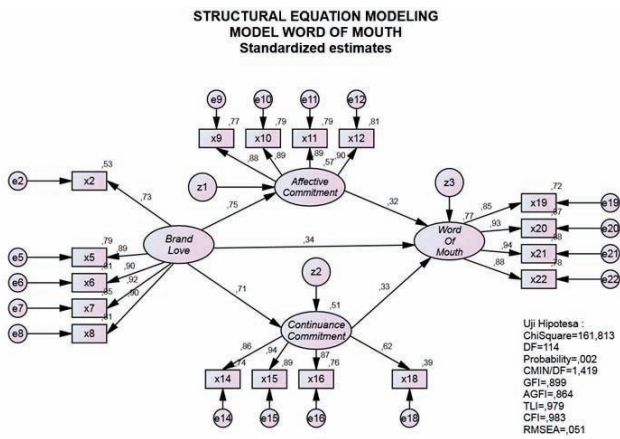

Figure 2: Full Model of SEM

Validity and Reliability Test: Validity test of the questionnaire consisted of convergent and discriminant

validity test. Convergent validity test was carried out in order to know whether or not an indicator could reflect variable by seeing the value of *loading factor* of each indicator higher than 0,5. Meanwhile, discriminant validity test was carried out to know how far an indicator has stronger correlation than the correlation with other variables.

Reliability test was done to know the indicator consistency in measuring a variable. Reliability test could be seen from the value of *construct reliability* and *variance extracted*. Indicator of a variable with the value of *construct reliability* higher than 0,7 and *variance extracted* higher than 0,5 was claimed to be reliable. The result of validity and reliability test can be seen in the following Table 1 and 2:

Table 1: Convergent and Discriminant Validity Test

Construct	Item	Convergent Validity		
		Loading Factor	Construct Reliability	Variance Extracted
Brand Love	x2	0,720	0,940	0,759
	x5	0,893		
	x6	0,902		
	x7	0,923		
Affective Commitment	x8	0,902	0,938	0,791
	x9	0,874		
	x10	0,889		
	x11	0,896		
Continuance Commitment	x12	0,898	0,898	0,692
	x14	0,858		
	x15	0,938		
	x16	0,887		
Word of Mouth	x18	0,604	0,945	0,812
	x19	0,831		
	x20	0,934		
	x21	0,953		
	x22	0,882		

Source: Data processed

Table 2: Correlation between Construct and Variance Extracted

	Brand Love	Continuance Commitment	Affective Commitment	Word of Mouth
Brand_Love	0,759			
Continuance_Commitment	0,510	0,692		
Affective_Commitment	0,635	0,289	0,791	
Word_Of_Mouth	0,619	0,554	0,573	0,812

Source: Data processed

Based on Table 1, it can be seen that *loading factor* of each variable has higher value than 0,5; from 0,720 to 0,953. Thus, it can be concluded that indicator of each variable was valid in convergent. Meanwhile, Table 2 shows the value of *Variance Extracted* 0,692 – 0,812 higher than quadrature value of correlation among variables 0,289 – 0,635. Based on the calculation, it can be concluded that each variable was valid in discriminant.

Reliability test was shown by the calculation result of *construct reliability* which had value higher than 0,7, and *Variance Extracted* was higher than 0,5. Thus, it can be concluded that the indicator was reliable.

Evaluation of Goodness of Fit: A research model is stated to be good, if it can meet minimally five criteria of *goodness of fit* (Ghozali⁸). Overall, the result of goodness of Fit can be seen in the following Table 3:

Table 3: Evaluation of Goodness of Fit Criteria

Goodness of Fit Index	Cut off Value	Analysis Result	Model Evaluation
<i>Chi Square</i> , df = 114		161,813	Good
<i>Significance Probability</i>	≥ 0,05	0,002	Marginal
CMIN/DF	≤ 2,00	1,419	Good
GFI	≥ 0,90	0,899	Marginal
AGFI	≥ 0,90	0,864	Marginal
TLI	≥ 0,95	0,979	Good
CFI	≥ 0,95	0,983	Good
RMSEA	≤ 0,08	0,051	Good

Source: Data processed

Based on Table 3, it can be concluded that the research model can be accepted because it meets more than five criteria of *goodness of fit*. The calculation result of the evaluation model, such as *Chi Square* was 161,813, CMIN/DF was 1,102 smaller than 2,00, TLI was 0,990 and CFI was 0,991 which was both higher than 0,95, and RMSEA was 0,025 which was smaller than 0,08, shows that the model was good and proper to be used. Although, the *probability* value was 0,002 and, GFI and AGFI show marginal value i.e. 0,899 and 0,864, which were smaller than 0,90, it was still in the model under criteria *absolute* and *incremental fit*.

Hypothesis Testing: After meeting criteria *goodness of fit*, the next step was interpreting the research model through hypothesis testing done by analysing the result of the correlation among variables through *regression weights* value.

Table 4: Regression Weights

			Estimate	S.E.	C.R.	P
<i>Affective_Combitment</i>	<---	<i>Brand_Love</i>	,766	,073	10,496	***
<i>Continuance_Combitment</i>	<---	<i>Brand_Love</i>	,488	,068	7,175	***
<i>Word_Of_Mouth</i>	<---	<i>Affective_Combitment</i>	,337	,082	4,125	***
<i>Word_Of_Mouth</i>	<---	<i>Continuance_Combitment</i>	,505	,121	4,180	***
<i>Word_Of_Mouth</i>	<---	<i>Brand_Love</i>	,363	,090	4,026	***

Source: Data processed

Based on Table 4, the *critical ratio* of each variable was higher than t tabel 1,96 and the significance value was smaller than α 0,05. Thus, it can be concluded that the hypothesis, which stated that *brand love* had positive effect on *affective commitment* and *continuance commitment*, was accepted. In addition, the hypothesis, which stated that *brand love* had positive effect on *word of mouth* and *affective commitment* and *continuance commitment* had positive effect on *word of mouth*, was accepted.

DISCUSSION

1. Brand love had positive effect on affective commitment: The result of the research shows that *brand love* had positive and significant effect on *affective commitment*. It indicates that the more consumers love products of Wardah, the higher the consumers' emotional commitment to the product will be. This finding strengthens several previous researches (Albert and Merunka²; Carroll and Ahuvia⁵; Hwang and Kandampully¹²; Drenan et al⁶).

Consumer's love to a brand plays an important role in maintaining relationship with brand, both from functional and affective aspect. Consumers who love a brand will not only use the brand continuously, but also they have emotional bond with the brand (Albert and Merunka²)

2. Brand love had positive effect on continuance commitment: The result of the research shows that *brand love* had positive and significant effect on *continuance commitment*. It indicates that the more consumers love products of Wardah, the higher the consumers' emotional commitment to the product will be. *Continuance commitment* affects consumer attitude to perform continuous purchase, even when the product raises (Aaker¹). Carroll and Ahuvia⁵ prove that consumer love to a brand improves consumer loyalty level. The result of this research is consistent with the previous researches (Albert and Merunka²; Hwang and Kandampully¹²; Drenan et al⁶).

3. Brand love had positive effect on word of mouth: The result of the research shows that *brand love* had positive effect on *word of mouth*. It indicates that the more consumers love products of Wardah, the stronger the consumers' willingness to tell pleasure experience in using the product to their friends and family.

The result of this research was consistent with the previous researches which prove that consumers who love a certain product brand will always tell something positive about the product and recommend it to other people (Carroll and Ahuvia⁵; Batra et al⁴; Ismail and Spinelli¹³; Albert and Merunka²; Maisam and Mahsa¹⁴).

4. Affective commitment had positive effect on word of mouth: The result of the research

shows positive and significant effect of *affective commitment* on *word of mouth*. It proves that the stronger the emotional bond felt by consumers to products of Wardah, the stronger the consumers' willingness to tell something positive about the products and recommend it to other people. This finding also supports several previous researches (Tuskej et al¹⁵; Albert and Merunka²; Bachman and Wilkins³; Maisam and Mahsa¹⁴).

5. Continuance Commitment had positive effect on word of mouth: The result of the research shows positive and significant effect of *continuance commitment* on *word of mouth*. It proves that the bigger the consumers' commitment to maintain long term relationship to product of Wardah, the bigger the consumers' willingness to tell the excellence of the product and recommend it to other people. The result of the research is consistent with several previous researches, which confirm the important role of consumers' commitment in establishing positive communication of *word of mouth* yang positif (Tuskej et al¹⁵; Albert and Merunka²; Bachman and Wilkins³; Maisam and Mahsa¹⁴).

CONCLUSION

Based on the analysis of research data, it can be concluded that: (1) *brand love* had positive effect on *affective commitment*. Consumer's love to brand of Wardah made them bond emotionally to the brand; (2) *brand love* had positive effect on *continuance commitment*. Pleasure feeling felt by consumers when using products of Wardah encourages them to keep using the products; (3) *brand love* had positive effect on *word of mouth*. Consumers of Wardah, who love the benefits of the product, had strong willingness to tell the excellence of product to other people; (4) *affective commitment* had positive effect on *word of mouth*. Emotional bond felt by consumers to products of Wardah made them tell their personal experience with pleasure and gave positive information about the product; (5) *continuance commitment* had positive on *word of mouth*. The stronger the consumers' commitment to maintain relationship with products of Wardah is, the stronger the consumers' willingness to recommend the product to other people will be.

SUGGESTION

The next research should modify the model by adding variable such as personality and repurchase attitude. High consumers' commitment on a brand will increase the intensity of consumers' repurchase. Different personality of consumers can also affect their love to a brand and their willingness to recommend the product to other people.

LIMITEDNESS OF THE RESEARCH

This research has some limitedness. One of them is opened question that was not filled by most of the respondents due to limited time. It is not relevant with the method of collecting data planned by the researchers. Besides that, the researchers could not accompany the respondents one by one in filling the questionnaire so that it enables bias of respondents' answers. The researcher of next study is expected to give more attention to respondents when filling the questionnaire in order to minimize bias.

Screening of *Escherichia Coli* O157:H7 Contamination and Nitrate Content on Butterhead Lettuce from Market Outlets

Siti Fairuz Yusoff^{1,2}, Mahmud Tengku Muda Mohamed², Farah Farhanah Haron³

¹Agricultural Science Department, Faculty of Technical and Vocational, Universiti Pendidikan Sultan Idris, 35900, Muallim, Perak, Malaysia; ²Crop Science Department, Faculty of Agriculture, Universiti Putra Malaysia, 43400 Serdang, Selangor, Malaysia; ³Genebank and Seed Centre, Malaysian Agricultural Research and Development Institute (MARDI), MARDI Headquarters, 43400 Serdang, Selangor, Malaysia

ABSTRACT

Escherichia coli O157:H7 is classified as biological hazard that can produce a bloody diarrhea due to its toxins. While nitrate in vegetables is classified as a chemical hazard if ingested greater than limit and risk getting gastrointestinal cancer and methemoglobinemia. A study was conducted to obtain the information on *E. coli* O157:H7 contamination and nitrate content in Butterhead lettuce from local suppliers. The number of colonies *E. coli* O157:H7 from the lettuce was enumerated using standard plate count and the nitrate content was measured using nitrate meter. From the experiment, it was found that *E. coli* O157:H7 contamination of Butterhead lettuce in Malaysia is still within the safe limit for the consumers while the nitrate content was distributed differently between leaf structures; midrib, outer adult leaf blade and young leaves. Lettuce midrib and outer adult leaf blade had a higher concentration of nitrate compared to the young leaves.

INTRODUCTION

Food safety is monitored through scientific practices during production, processing and storage of food to prevent food poisoning (Satin³⁷). This is to assure that the consumer can eat the food safely when served. Thus, food safety is a discipline responsible to protect consumers from highly dangerous health risks due to biological, chemical and physical hazards (FAO/WHO¹⁹).

Chemical hazards contaminate food through water, air and soil pollutions, for example, dioxins and toxic metals. The hazards also contaminate through the fashion applications of various chemicals, such as fertilizers, pesticides, animal drugs and other agrochemicals (WHO⁴⁵). Nitrate comes from manure, decaying vegetation, fertilizers and other organic waste. According to Chan⁷, high nitrate content in vegetables in the human diet could increase the risk of methemoglobinemia. In another study, ingested high level of nitrate content tend to have a stomach cancer (Bryan et al⁶)

Nitrate in vegetables is classified as a chemical hazard if ingested greater than acceptable daily intake (ADI); however, the exceeding of the ADI limit has occurred frequently in daily human life (Boink and Speijers⁵). European Union (EU) Scientific Committee for Food (SCF)¹⁸ established ADI for nitrate as 0-3.7 mg.kg⁻¹ bodyweight. In order to protect public health in response the SCF's considerations regarding nitrate in food, European Member States agreed a EC Regulation to set limits for nitrate in lettuce (EC Regulation No. 563/2002, 2002).

Maximum Nitrate Limit (MNL) in fresh lettuce harvested on 1 October to 31 March was 4500 and 4000 mg.kg⁻¹ FW for crops grown under cover and open air, respectively. While MNL of the fresh lettuce harvested on 1 April to 30 September was 3500 and 2500 mg.kg⁻¹ FW for crops grown under cover and open air, respectively. However, in the United States, no MNL was fixed but in China, the MNL in vegetables is 3100 mg.kg⁻¹ (Zhou⁴⁸). In Poland, the nitrate limit in tubers was 183 mg.kg⁻¹ FW and Germany was less than 200 mg.kg⁻¹ FW (Cieslik and Sikora¹¹).

De Martin and Restani¹³ stated that leafy vegetables can accumulate nitrate up to 6000 mg.kg⁻¹ FW. Wang et al⁴⁴ reported that nitrate accumulation in lettuce was 123-2678 mg.kg⁻¹ FW, and Santamaria³⁵ classified lettuce as 'very high' in nitrate when the content is greater than 2500 mg.kg⁻¹ FW. This level was exceeded the maximum nitrate limit and harmful to human health.

A biological hazard can be defined as the probability of a biological agent contaminating food during any step of food production, which if ingested by consumer can cause health disorder. Luning²⁸ classified viruses, molds, parasites that produce naturally occurring toxins, yeasts and disease-causing bacteria as biological hazards. Instead of at the field and harvesting stages, microbial contamination is also possible during processing, transportation, distribution, preparation and retail display at market outlet (Gorny²⁰).

The governments all over the world are concerned about this problem and trying to overcome the increasing number of foodborne illnesses intensively by improving food safety management (Codex Alimentarius Commission¹²). *E. coli* O157:H7 is one of the pathogen involved in outbreaks of foodborne illness (Scallan et al³⁸) associated with the lettuce (Islam et al²³).

Sánchez et al³⁴ reported that the greatest natural reservoirs for *E. coli* O157:H7 was from cattle and other ruminants that play a significant role in the epidemiology of human infections. During September and October 2006, United States is a main multi-state disease outbreak related to appearance of *E. coli* O157:H7 in fresh, bagged spinach. *E. coli* O157:H7 on leafy vegetables is a biological hazard if the colonies are more than maximum recommended limit (MRL), 8 log₁₀ CFUg⁻¹ (Debevere¹⁴). The strain *E. coli* O157:H7, a Shiga-toxin producing, is the most predominant in North America, Japan and the United Kingdom (IFT²²). In New Zealand, 2004, 32% cases of serious complications were reported as a consequence of this strain infection. The long term effects of this infection were kidney problems, neurological deficits, haemolytic uremic syndrome (HUS) and in a few cases the disease can be fatal.

The data from overseas, including Greece (Dontorou et al¹⁵), Norway (Johannessen et al²⁵), Spain (Soriano et al⁴¹) and the United Kingdom (Sagoo et al³³) reported no detection of *E. coli* O157:H7 in leafy vegetables. In a review by Beuchat⁴, the environmental factors were the

main differences in microbial loading. This is confirmed by Chigor et al⁹ who studies on the persistence of *E. coli* O157 in irrigation water and Siti Fairuz et al³⁹ who studies on *E. coli* O157:H7 colonies in different production systems of lettuce.

However, information on nitrate and prevalence of serotype O157:H7 in Malaysia, especially lettuce, are still lacking. In addition, awareness among the Malaysians on the food safety aspects is on increased especially on raw eaten vegetables. A meticulous laboratory study should be carried out to determine the nitrate and *E. coli* O157:H7 contaminations in fresh lettuce. Therefore, the objective of this study was to determine the nitrate and *E. coli* O157:H7 contaminations in Butterhead lettuce available in the local market.

MATERIALS AND METHOD

Sample Collection: Butterhead lettuce, from four different producers encompassed three conventional and one organic, were purchased from market outlets in Selangor. The lettuce heads were brought immediately to Postharvest Laboratory, Department of Crop Science, Faculty of Agriculture, Universiti Putra Malaysia (UPM), Serdang, Selangor. The outer damaged leaves of each head were discarded, and uniform sized heads (150-200 g each) were selected. The lettuce heads were washed using running tap water to remove dirt, and other foreign matter, then allowed drying under ambient temperature before further analysis.

Determination of *E. coli* O157:H7 Contamination

a. Preparation of Hicrome EC O157:h7 Selective

Agar: Agar powder (31.85 g) was suspended in 990 ml distilled water. The medium was completely dissolved by boiling gently and cooled to 50 °C. One vial of HiCrome ECO157:H7 Selective Supplement (Fluka 44931, Sigma Aldrich) was added aseptically. The mixture was mixed thoroughly and poured into sterile petri plates. The prepared media was stored below 8 °C and protected from direct light.

HiCrome EC O157:H7 agar was based on the formulation in table 1 described by Rappaport et al³². The medium contains sorbitol and a proprietary chromogenic mixture instead of lactose and indicator dyes, respectively. The chromogenic substrate is specifically and

selectively cleaved by *E. coli* O157:H7 resulting in a dark purple to magenta coloured moiety.

Casein enzymic hydrolysate provides carbonaceous, nitrogenous and growth nutrients. Sodium chloride maintains osmotic equilibrium. Addition of HiCrome EC 0157:H7 selective supplement makes the medium selective (Zadik et al⁴⁷). Potassium tellurite selects the serogroups and inhibits *Aeromonas* species and *Providencia* species. Novobiocin inhibits gram-positive bacteria.

Table 1: Composition of HiCrome EC 0157:H7 Selective agar

Ingredients	Gram/Liter
Casein enzymic hydrolysate	8.0
Sorbitol	7.0
Bile salts mixture	1.5
Sodium lauryl sulfate	0.1
Chromogenic mixture	0.25
Agar	15.0

b. Determining *E. coli* o157:H7 Contamination:

The lettuce head was shredded and only 10 g was weighed and transferred into a sterile conical flask containing 90 mL sterile distilled water. The sample was homogenized using a stomacher bag for two min at 230 rpm. Serial dilutions of 10-fold up to 10⁻⁵ for each homogenized sample, was made and surface spread (100 µlplate⁻¹) in triplicate onto a selective media (Hicrome *E. coli* O157:H7). The plates were incubated at 36 °C for 18 to 24 h (Zadik et al⁴⁷). After incubation, the number of colonies was estimated using the standard plate count method and the data were transformed into log₁₀ before analysis of variance.

Determination of Nitrate Content: Lettuce extract were obtained from three different leaf parts on each lettuce; four young leaves from the inner leaf layers, four adult leaf blades from the outer leaf layers and four midribs from each outer adult leaf blades. Each part was chopped separately and only 20 g from chopping lettuce was weighted and grounded finely using a pestle and mortar. The paste was filtered through cotton wool to get the cell sap.

Nitrate content of the cell sap was determined using a nitrate meter (Cardy Twin Nitrate Meter, Spectrum Technologies Inc., USA) as described by Hochmuth²¹. The

glass electrode of the meter was calibrated with buffers at 2000 and 150 mg.kg⁻¹ NO₃ before use. After calibration, the glass electrode was washed with distilled water and wiped with a soft tissue paper. Three drops filtrate of cell sap was dropped on the electrode of nitrate meter and a stabilized nitrate reading was recorded. The concentration of nitrate was expressed in mg.kg⁻¹ of fresh weight (FW).

Experimental Design And Statistical Analysis: The experimental design was a completely randomized design with four replications. The data were analyzed using analysis of variance and the significant means separated by least significant difference (LSD) test at P≤0.05 (SAS 9.4).

RESULTS AND DISCUSSION

***E. coli* O157:H7 Contamination In Butterhead Lettuce:**

E. coli O157:H7 counts in P2 was significantly higher than P3 and P4 (Figure 1). However, the number of *E. coli* O157:H7 from P1 was not significantly different from P2 and also between P1 and P3. Solomon et al⁴⁰ indicated that *E. coli* O157:H7 can survive on edible portion of harvested lettuce for an extended period. *E. coli* O157:H7 can be present at the point of sale, thus illustrating the importance of understanding the behavior of this pathogen under processing and consumer storage conditions.

Figure 1: *E. coli* O157:H7 contamination on Butterhead lettuce from four producers (P1-P4). Mean values followed by the same letter are not significantly different

MRL = Maximum recommended limit (Debevere¹⁴).

CFU = Colony forming unit.

During mid-1990’s, fresh produce was considered as a significant vehicle for *E. coli* O157:H7. According to Rangel et al³¹, lettuce is the single most implicated

commodity associated with fresh produce outbreaks. In 1998 to 2005, the US Center for Disease Control and Prevention attributes 20 outbreaks and 634 cases of illness to consumption of lettuce contaminated with *E. coli* O157:H7 (Lynch²⁹). *E. coli* O157:H7 is recognized as an important cause of foodborne disease, with outbreaks reported in United States America, Canada and United Kingdom (Doyle and Erickson¹⁶). The illnesses caused by *E. coli* O157:H7 appears to occur throughout much of the world. However, none case regarding severe illness caused by *E. coli* O157:H7 has been reported specifically in Malaysia.

The bacterial colonies on Butterhead lettuce in Malaysia were still in the range indicated by several previous reports where counts in unprocessed and minimally processed lettuce were between 5 to 7 log₁₀ CFUg⁻¹ (Khan et al²⁷; Nguyen-the and Carlin³⁰; Jacques and Morris²⁴; Ahvenainen¹; Babic et al³; Kaneko et al²⁶). Overall, the contamination with *E. coli* O157:H7 of Butterhead lettuce from all producers was still below microbial recommended limit, 8 log₁₀ CFUg⁻¹ or 10⁸ CFUg⁻¹ as proposed by Debevere¹⁴.

Nitrate Content In Butterhead Lettuce: The nitrate content in young leaves of Butterhead lettuce obtained from all producers (P1, P2, P3 and P4) were below the MNL and over 50% lower if compared with nitrate content in the midribs (Figure 2). The nitrate content in midribs of lettuce from P2 was significantly different with those obtained from P3 and P4. The nitrate content in leaf midribs of lettuce, from P1, P3 and P4, were not significantly different. The nitrate content in leaf midribs of lettuce from P2 was significantly higher than those from P3 and P4. The nitrate content in leaf midribs of lettuce from P3 and P4 almost reached the MNL. Leaf midribs of lettuce from P1 and P2 exceeded the MNL. As for the outer adult leaf blades, only lettuce from P1 exceeded the MNL.

Figure 2: The nitrate content of Butterhead lettuce in leaf midribs, outer adult leaf blades and young leaves from four local producers (P1-P4)

Mean values followed by the same letter are not significantly different. MNL = Maximum nitrate limit for the European Commission (2002).

In general, nitrate content in midribs and outer adult leaf blades of Butterhead lettuce sampled showed significant differences with the young leaves. These results indicated that nitrate accumulation was different between the leaf structures. Yosoff et al⁴⁶ also found that the nitrate content was different in various plant structures. The difference in nitrate accumulation within plant organ or structures might be related to their position and nitrate distribution. Normally, in Butterhead lettuce, the adult leaf blade is at the outer layer and young leaves at the inner layer of each head. The plant roots absorbed the nitrate from the growth medium and transported it to the leaves through the xylem.

The nitrate ions should pass the midribs and outer adult leaf blades before being distributed to the young leaves. Therefore, the nitrate content would be higher in leaf midribs and outer adult leaf blades compared with the young leaves. Wang et al⁴³ identified that there is a specific gene in nitrate remobilization from old leaves to the young leaves. Santamaria et al³⁶ also found that heads of chicory and lettuce accumulate lesser nitrate in inner leaves than outer leaves while in parsley and spinach, leaf blades accumulate less nitrate than petioles. In 'Rocket' leaf lettuce, the nitrate content in the leaf petiole was double that of the leaf lamina (Elia et al¹⁷), the difference was as high as 6.6 fold in spinach (Umar et al⁴²). However, the nitrate concentration was lowest in the roots of leafy vegetables such as rape, cabbage and spinach, and the petiole-stem was higher than in the leaves (Chen et al⁸). Besides, nitrate supply has a significant effect on nitrate distribution both in the metabolic and storage pools of leaf blades.

Most of the large lettuce producers in Malaysia grow their lettuce under cover using hydroponic and aeroponic planting systems. Both systems provide luxurious consumption of nitrate. Applying nitrogen fertilizer increases nitrate concentrations in the xylem but has virtually no effect on concentrations in the phloem (EFSA²). Therefore, leafy crops especially lettuce, showed increasing concentration of nitrate in response to nitrogen fertilizer, except in the young leaves, while storage organs of plants that are fed by the

phloem tended to show little effect (Alexander et al²). Thus, the accumulation of the nitrate content depends on the plant organ.

The MNL varied according to season, with higher nitrate levels permitted in crops grown in winter compared with those grown in the summer. However, Malaysia is a tropical region which makes it possible to maintain the same fertilizer practices all over the year. Thus, season does not influence the excessive nitrate accumulation in local lettuce. It was the contrary in Europe where the concentrations of nitrate in vegetables are higher in winter than during other seasons of the year (Alexander²). However, this difference was not observed in a study conducted in Korea. Chung et al¹⁰ suggested that the disparity in data could be due to different environmental conditions and use of fertilizers in summer by Korean farmers.

CONCLUSION

The nitrate content in Butterhead lettuce, in Malaysia, was distributed differently between leaf structures; midrib, outer adult leaf blade and young leaves. Lettuce midrib and outer adult leaf blade had a higher concentration of nitrate compared with young leaves. In this study, the result showed that the nitrate content could be considered as 'high' because it ranged within 1000 - 2500 mg.kg⁻¹ FW. Thus, more studies need to be conducted to get the optimum fertilizing techniques, harvesting stage and storage duration that can reduce the nitrate content.

E. coli O157:H7 contamination of Butterhead lettuce, in Malaysia, is still within the safe limit for the consumers. However, only contamination of *E. coli* O157:H7 from two producers, P1 and P2, 6.95 and 6.65 log₁₀ CFUg⁻¹, respectively, were approaching the MRL. If left unchecked, it could cause out-break of serious diseases associated with this bacteria. Hence, some interventions are necessary in order to reduce this contamination besides hygienic practices, which should be mandatorily applied at every point of the production chain to ensure safe consumption by consumers.

Effect of ESSZONE Establishment on Maritime Security and Economic Activity: A Case Study of Tawau District

Abdul Rahim Anuar¹, RusdiOmar¹, Laila Suriya Ahmad Apandi¹, Dewi Natasha Rasid²

¹*School of International Studies,* ²*School of Government, Universiti Utara Malaysia, Malaysia*

ABSTRACT

Non-traditional security (NTS) threats—trespassing, kidnapping, and smuggling—which repeatedly occur in Sabah (Malaysia) have threatened the country’s sovereignty and security. The National Security Council of Malaysia has declared the east coast of Sabah as Eastern Sabah Security Zone (ESSZONE) to inhibit NTS threats and increase security in the east coast of Sabah. However, the implementation of ESSZONE, such as curfews, may affect the maritime economic activities of the local people. Therefore, this paper examines the impact of ESSZONE toward security and maritime economic activity in Tawau.

Keywords: *Non-traditional security threats, maritime, Tawau, ESSZONE*

INTRODUCTION

Non-traditional security (NTS) threats, such as maritime piracy, kidnapping, smuggling, and human trafficking, often occur along the coastal regions of east of Sabah. The year 2013 marked a tragic event, when Sulu militants invaded Lahad Datu thereby threatening the sovereignty of the country—triggering a host of security concerns to the public in Malaysia, and Sabah in particular. This has brought a negative impact on the tourism and maritime industry in the region because of the ongoing security threats in Sabah’s east coast

In realizing the fact that the frequency of NTS threats were increasing in the eastern part of Sabah, on 7 March 2013, the federal government had declared the region as a Special Security Area (SSA) to safeguard the sovereignty and security of the state’s east coast. During the early establishment, the SSA only covers the districts of Kudat, Tawau, Kunak, Sandakan, and LahadDatu. On 25 March 2013, the federal government established the Eastern Sabah Security Zone (ESSZONE), covering 10 districts in eastern Sabah with an area of 1,734 kilometres from Kudat to Tawau. The associated regions include Kudat, Kota Marudu, Pitas, Beluran, Sandakan, Kinabatangan, LahadDatu, Kunak, Semporna, and Tawau. In the same year, the central government also established the Eastern Sabah Security Command (ESSCOM), which is a new “security enforcement agency” for ESSZONE and created specifically to protect the sovereignty and

security of the east coast, following the intrusion of Sulu terrorist in LahadDatu. Additionally, at the international level, security cooperation protocols with neighbouring countries, particularly Philippines, were implemented to combat terrorism and cross-border crime.

Following the frequency of kidnappings and attacks on tourist areas within the ESSZONE, a curfew had been enforced on 16 July 2014 covering six districts of Sandakan, Tawau, Kunak, LahadDatu, Semporna, and Kinabatangan. However, until today, the curfew still continues to be enforced involving all ESSZONE and territorial waters of the country, following the kidnapping and illegal immigration activities. Accordingly, this paper examines the impact of the establishment of ESSZONE on the east coast of Sabah regarding maritime safety and economic activities in Tawau.

LITERATURE REVIEW

The issue of maritime security at state level in Sabah was studied by Wan and Ramli (2009). They were of the view that the issue of security in Sabah occurs on a large scale and creates a safety concern to the country. Two of the six aspects of NTS threats occur in Sabah, namely cross-border crime and illegal migration. Cross-border crime is often the case occurring in Sabah, such as smuggling, piracy, robbery, and kidnapping, which may not be a new issue in Sabah, but nevertheless, it has become a national issue and requires urgent action

from the government. The continual influx of illegal immigrants (“pendatangtanpaizin” – PATI) into Sabah is due to its geographical location, where it is exposed to two neighbouring countries, the Philippines and Indonesia. NTS issues has increased the national financial allocation to Sabah. Following the incident at Pandananand Sipadan, Malaysia spent nearly RM6 billion to enhance security in the east coast of Sabah. This happened again in 2013 following attack on Sabah by Sulu militants and the government spent more by setting up ESSCOM and improving border defence technology to protect the security of the country’s territorial waters from foreign elements and NTS threats.

Rasid et al¹⁸ stated that social, political, and economic issues are characteristically cross-border in nature and consequently would have a negative impact on the security of neighbouring countries. This is clear with the political, social, and economic disorder in the southern Philippines that has affected the security of Sabah with the influx of illegal immigrants, smuggling of controlled and prohibited goods, piracy in local waters, and kidnapping of tourists. The findings by Rasid et al¹⁸ also showed that the security issue of coastal areas has given an impact on the socio-economic viability of the communities.

In a study by Mak¹¹, it was shown that Malaysia had faced the issue of NTS threats for more than 20 years ago, with the repeated occurrence of piracy, smuggling, and robbery in the Straits of Malacca and the Sulu Archipelago. In particular, Mak¹¹ identified important stakeholders in the local waters from the aspects of economy and safety, namely the fishing trawlers in Peninsular Malaysia, the barter trade between the Philippines-Sabah, and piracy in the Straits of Malacca and Sumatera, Indonesia. Another issue that was highlighted is the problem of differing border water maps between neighbouring countries. This has led to dispute over maritime boundary that is not resolved and complicate control of operations and safety by the authorities of the respective countries.

Meanwhile, some of the issues of NTS illegal migration was discussed by Arvin and Nurfazlina². The illegal immigrant problem in Sabah this decade has given concern to the government and local communities because immigrants have led to high crime rates and threaten security in Sabah. Sabah waters are spacious and very porous, where its openness has led to the existence

of many “backdoors” that have been favourable to outsiders to discretely enter Malaysia.

Ramli and Ahmad¹⁵ studied the main economic activity in Tawau (Sabah), which is barter trade. There is a strong barter trade relationship between traders from Tawau-Kalimantan-Mindanao. They also identified the issue of trade relations between Sabah-Mindanao and Sabah-East Kalimantan, namely smuggling. Ramli and Ahmad¹⁵ also identified other NTS issues such as influx of illegal immigrants from Indonesia and the Philippines, and Malaysia-Indonesia and Malaysia-Philippines conflicts particularly on maritime border. Illegal migration, mainly from the Philippines and Indonesia, has an impact on the socio-economic development of the people in Sabah.

From economic perspective, Abdul Rahim¹ in his study on the development of cross border economy in Tawau (Malaysia) and Nunukan Island (Indonesia) found that the development concept in the border areas of these two countries are characteristically traditional securities. Malaysia and Indonesia consider the issues of defence and security are more pertinent than issues of economic development. Poverty, which is among the NTS issues, is higher in Nunukan Island as compared to Tawau and becomes a push factor for Nunukan residents to find employment in Tawau. In addition, most of the people of Tawau and Sebatik Island depend on maritime economy for their living. Thus, any security threat in the east coast can jeopardise the economy of local residents, including Tawau and Sebatik Island.

Meanwhile, Ramli and MohdZambri¹⁶ discussed the role of ESSCOM in maintaining security of Sabah, especially in the east coast of Sabah. For the locals in Sabah, ESSCOM can be said to have failed in their duties, based on the number of crime incidents, like maritime border kidnappings, which lately have occurred frequently.

In light of improving security, Ruhanas¹⁹ elaborated on the improvement of security cooperation between Malaysia and neighbouring countries: Sabah-Indonesia, Sabah-Philippines, Sabah-Brunei and Peninsular Malaysia-Thailand. However, he did not discuss much regarding the impact and consequences on the lives of local communities in Malaysia because of NTS threats faced by the country. Discussion on security policy implementation was focussed more on efforts

by Malaysia and its neighbours in building defences at national borders, both on land and maritime, with the assumption that this defence itself is a sufficient security measure to protect local communities.

Meanwhile in Peninsular Malaysia, the study by Inderjit¹⁰ also discussed maritime crime occurring in the Straits of Malacca, which is an important maritime route to international traders. However, this maritime route has received many NTS threats, such as piracy and robbery. He found that there is the issue of foreign intervention that tries to increase security in the Straits of Malacca. The Malaysian, Indonesian and Singaporean governments, which are the stakeholders in maintaining the security and sovereignty of these waters, did not agree with the intervention of a third party. The challenge to Malaysia in overcoming maritime crime has gained the attention of the United States, China, and Japan. They wanted to get involved in protecting the Straits of Malacca from NTS threats to keep their respective economic interests, as they are the largest user of those commercial shipping routes. However, Inderjit¹⁰ was in view that security cooperation between the countries that share the waters of the Straits of Malacca is important because interference from foreign countries or third parties would not lead to a complete solution to the issue of security in the Straits of Malacca. In fact, Inderjit¹⁰ purported that allowing third parties to be involve would cause problems and can lead to Malaysia, Singapore, and Indonesia to lose authority in the respective fields of maritime power.

NTS and security issues in Sabah have gained attention among local analysts. This is because the frequency of cross-border crime and the threat of NTS in the east coast of Sabah has risen, even though the government has taken certain safety plans, such as creating ESSZONE and ESSCOM.

RESEARCH FRAMEWORK

This investigation was characteristically a qualitative study using interviews and secondary data. Interviews were based on open-ended questions, conducted on stakeholders to analyse the impact and implementation of ESSZONE the impact on NTS threats related to the security and maritime economic activities in Tawau. Field work and observations were also made on economic activities of the community in that region.

Eight selected respondents were interviewed, namely a barter-trade trader in Tawau, representative from Sebatik Island Fishermen's Association (Tawau), representative from Tawau District Fishermen's Association, Superintendent of District Fisheries Office, General Manager of the Fishermen's Association Tawau (Tawau PKN), the Sabah Secretary of National Security Council, Commissioner of Police Staff, the Consulate of the Republic of Indonesia Tawau, Tawau Vice-Consulate of the Republic of Indonesia. All respondents were selected based on their function and their role in the issue under review.

Primary data sources were obtained from interviews with the National Security Council (NSC), Tawau Royal Malaysian Customs, the Immigration Department of Malaysia (Sabah), Tawau Area Fishermen's Association (PNK), Department of Tawau Fisheries District Office, Consulate of the Republic of Indonesia (Tawau), and barter-trade traders and Tawau fishermen representatives from Tawau and Sebatik Island.

Secondary data related to the maritime economy were also collected for supporting the information obtained from primary sources. Secondary data were obtained from the Department of Statistics, which publishes Annual Statistics of Sabah and Sabah External Trade Statistics. Sources of information about NTS threats to the east coast of Sabah were obtained from mainstream media and websites, especially Eastern Sabah Security Command portal (<https://esscom.gov.my/>, n.d.).

NON-TRADITIONAL SECURITY THREATS IN SABAH

Many NTS threats occur repeatedly along the east coast of Sabah, especially in ESSZONE territory. The ESSZONE establishment on 25 March 2013 was due to the intrusion by Sulu militants in Sabah. ESSZONE covers 10 districts in Sabah's east coast between Kudat and Tawau: Kudat, Kota Marudu, Pitas, Beluran, Sandakan, Kinabatangan, Lahad Datu, Kunak, Semporna and Tawau with a beach area spanning 1,734 kilometres. Regulatory agencies face the challenge of maintaining security in the region as cross-border crimes often occur in the waters off the east coast of Sabah. Even the British government advises its citizens to be careful in Sabah, thus giving a negative impression to international tourists that the level of security in Malaysia is not guaranteed (United Kingdom Government, n.d.).

Figure 1: ESSZONE Area

Sulu Militants: The Sulu militant incident attack is one of the most critical NTS threat to Malaysia in dealing with terrorism at the regional level, in addition to the Malaysia-Indonesia confrontation at the start of the 1960s. Malaysia had to use all military assets to defeat the Sulu militant groups.

The Sulu militant aggression was carried out by the heirs of the sultanate of Sulu, JamalulKiram III, on 11 February 2013 in the Tanduo village in LahadDatu, Sabah. The militant group that performed the intrusion in LahadDatu was headed by AzzimudieKiram, who claimed that they were not militants but they are Royal Security Forces of the Sultanate of Sulu and North Borneo attempting enforce the Sulu people's right to recover Sabah Malaysiakini¹².

This incident led to casualties on both sides. On the Malaysian side, nine members of the Malaysian defence fell in the field of battle, while a total of 68 members of the Sulu militants were killed in clashes with security forces. The Sulu conflict in Sabah ended in March 2013 and was followed by the establishment of the legal basis to establish ESSZONE and ESSCOM Bernama⁷.

Kidnapping: Prior to the terrorist attacks by Sulu militants, maritime security threats that are often found include piracy in the waters off the east coast of Sabah. Piracy or better known as "mundu" by the local people of Sabah is a cross-border crime that often occurs despite increased security efforts in the ESSZONE region. In fact, piracy not only involves assault or armed robbery by pirates on local boats, they can take more aggressive action by attacking police stations and grand scale robbery, such as in the town of Semporna in 2010 Ramli¹⁷. Kidnapping incidents also occurred on 15 November 2013, when there was an ambush by Filipino pirates on BomBom Island that killed Hsu Li Min, a

Taiwanese citizen, and Chang Ai Wei was held hostage and released in December 2013 (The Star²⁴. Then on 2 April 2014, Chinese tourist Gao Hua Yuan and Filipino resort worker Marcy Darawan were kidnapped in Singamata Reef Resort Semporna, and released on 30 May the same year, while a second incident occurred on 6 May of the same year, this time the victim was Yang Zai Lin, a 34-year old Chinese national, kidnapped in PulauBaik, LahadDatu. The victim was rescued after 65 days and found in the forest area of Patikul, in the Jolo archipelago that is also a stronghold of the Abu Sayyaf splinter group UtusanMalaysia²⁵.

On 16 June 2014, this kidnaping incident involved cage fish breeding centre owner, Chan Sai Chiun, 32 years old, and a Filipino worker in his 20s, both of whom were released on 9 December 2014 SinarHarian²². The victims were abducted by two armed men in KampungSapang Air, Kunak. On 12 July 2014, the marine police force in Mabul Island, Semporna were ambushed by kidnapers in the ESSZONE, involving Constable ZakiaAliep as the new kidnaping victim by group.

The victim was then released on 7 March 2015 after a negotiation was conducted by the government and the kidnapers, but not before fellow police officer Corporal Ab. Rajah Jamuan, 32 years old, was shot dead in the incident BeritaHarian⁶.

Repeated kidnappings in Sabah occurred on 14 May 2015 when two local people were abducted by the Abu Sayyaf in Ocean King Restaurant, Sandakan. The victim was a woman who is the manager at the restaurant, ThienNyuk Fun, 50, and a son, Bernard Ghen Ted Fen, 39, who is an electronics consultant in Cambodia (Astro Awani, May 25, 2015). Thien was released 9 November 2015, however, Bernard Ghen was beheaded on 17 November 2015 Sinar²¹. The mastermind behind the kidnapping in ESSZONE and four abduction cases was believed to be by the "Muktadir Brothers" The Star²³.

Smuggling: Sabah's geographical position, which is near Mindanao (Philippines) and Nunukan Island (East Kalimantan, Indonesia), have led to the occurrence of smuggled goods. For example, on 2 October 2015 Malaysian Maritime Enforcement Agency ("AgensiPenguatkuasaMaritim Malaysia" – APMM) foiled an attempt to smuggle gas and oil to neighbouring countries through the waters Tawau (My News Hub, October 2, 2015). Smuggling of subsidised items

from Malaysia to neighbouring countries, particularly Kalimantan (Indonesia), has become more frequent and widespread. Subsidised items such as cooking gas, petrol and diesel, rice, sugar, flour, eggs, and chicken are items that are often smuggled out of the country because in this country these items can be found at a cheaper price Astro Awani³. On 16 January 2015, the Royal Malaysian Customs Department seized 26 kilograms of “syabu” or cocaine worth nearly RM5 million in Tawau airport BeritaHarian⁵. In 2014, a total of 480 cases of smuggled cigarettes and 103 cases of other smuggled goods occurred in the ESSZONE waters during the January-June period, as was recorded by the Sabah Customs Department SinarHarian²⁰.

Illegal Immigrants in Sabah: The number of illegal immigrants in Sabah is not known because there is no official data recorded by the government. However, the data related to the number of illegal immigrants deported from Sabah can be used as an indicator of the number of illegals in Sabah. For the period 2014 to May 2016, 54,941 illegal immigrants in Sabah were deported to their country of origin. ESSCOM also improved the operations of hunting illegal immigrants in the area—Tawau, Semporna, Kunak, LahadDatu, Kinabatangan, Sandakan, and Beluran—and since 2015 until 4 May 2016, it has carried out a total of 1,823 ESSCOM enforcement operations and successfully detained 11,688 illegal immigrants Bernama⁸.

CURFEW IN ESSZONE

The curfew was implemented on 19 July 2014, which is a security policy established by the government especially for the ESSZONE region (Agensi Penguatkuasa Maritim Malaysia Tawau, 2015). The curfew conditions are;

- Individuals, except security personnel and exempted individuals, can be in a predetermined area from 6.00pm to 6.00am.
- Individuals exempted from the curfew include “Yang DiPertuanAgong”, “Raja”, “Yang DiPertuaNegeri”, and any members of the Malaysian Navy, Airforce, and Army who are on duty (according to Section 31(3) Police Act 1967).
- Individuals other than the authorities that want to enter or pass through the curfew region need to obtain a Curfew Exemption Permit from the Head of Police in the respective region.

- Any individual found in areas that have been declared during the established times can be detained without a warrant and can be put on trial in court.
- The enforcement members can obtain a mandate to arrest any individual that do not adhere to the curfew in Section 31 (2) Police Act 1967.
- The enforcement members are allowed to use firearms in accordance to the requirements and provisions of law.

The curfew was extended by the Sabah Polis Commissioner to 17 April 2016 and had entered the 40th phase Harian Metro⁹. The extension was prompted by kidnappings that recently occurred frequently, in addition to maintaining the level of security in the waters that can be guaranteed.

ANALYSIS AND FINDINGS

Analysis of interviews with stakeholders was divided into the community involved in the maritime economic activities, and the government that runs the security policy. The study results are divided into two perspectives, i.e., (i) barter-trade and security measures, and (ii) local and national security.

Barter-Trade and Security Measure Perspective: According to a bartertrade trader with more than 20 years of experience in the industry, the government’s proposal to embargo the barter-trade activities in Sabah-Mindanao and Sabah-Kalimantan to combat repeating cross-border crime should be reevaluated. However, from the government’s perspective, it is a proactive step in addressing smuggling and kidnapping that occur in the ESSZONE.

Bartertrade in Sabah’s east coast is carried out in the port of Sandakan and Tawau, which act as the main entrance for merchants from Mindanao and east Kalimantan. Sabah’s major imports are from Indonesia and the southern Philippines, such as cigarettes, high value marine products, timber, counterfeit brand goods, kitchen utensils, and others because they are relatively cheaper. Bartertrade provides a very high positive impact on socio-economic development of the people in the three countries because it creates economic activity in marginalised and rural areas in the respective countries. Among bartertrade traders, this step has a negative impact on the business of bartertrade in Sabah.

Bartertrade business has improved bilateral relations of Sabah-Mindanao and Sabah-Kalimantan. In fact, the spill-over effects of bartertrade economy is clearly observed in the creation of new jobs and business opportunities related to the maritime industry in Tawau.

Table 1 shows the barter trade business in favour of Sabah with an average trade surplus for the period 2011-2015 of RM124 million (Sabah-Indonesia) and RM25 million (Sabah-Philippines).

Table 1: Sabah Barter-Trade with Indonesia and Philippines through Tawau Port, 2011-2015 (RM million)

Year	Indonesia			Philippines		
	Import	Export	Trade Balance	Import	Export	Trade Balance
2011	26.0	190.0	164.0	0.1	31.0	31.1
2012	31.0	251.0	220.0	20.0	11.0	31.0
2013	2.8	0.0	-2.8	0.0	0.6	0.6
2014	30.7	114.0	83.3	0.0	25.3	25.3

average (2011-2015)	23.9	148.0	124.1	4.0	20.7	24.7

Source: Royal Malaysian Customs Department, Tawau

Cross-border crimes, such as smuggling in Sabah's east coast waters, are done by unscrupulous individuals who intend on earning huge profits without paying taxes to the government of Malaysia. Smuggling is done alone without involving of the actual bartertrade traders.

Bartertrade is controlled by the Royal Malaysian Customs and the exchange of export and import goods is carried out in a special area called the Tawau Goods Exchange Centre adjacent to the Tawau port. If any ships from foreign countries (Indonesia and Philippines), that carry trade products, are not anchored in Tawau Goods Exchange Centre, then they will be charged as smugglers under the Malaysian Trade and Barter Trade laws. However, wet and perishable items such as fish and other marine products are exempted from anchoring at the Tawau Goods Exchange Centre and allowed to berth at the fishery jetties in Tawau.

Increased security measures undertaken by the government in fact does not affect the bartertrade activity. Instead, a bartertrade ban would affect trade and barter activities which is detrimental to Sabah. Therefore, the government should identify the real cause of cross border crime along the east coast of Sabah.

This views by the barter-trade representative with experience of more than 20 years was shared by the representative of TawauSebatik Island Fishermen. Following the implementation of security and curfew, the fishermen are not allowed to enter other regional fishery zones and can only catch fish in their own zones, namely Zone A (Tawau).

NTS threat to the Tawau district is less than in other regions, especially Semporna, Kunak, LahadDatu, and Sandakan, which is often referred to as the Hot Zone. Therefore, the lack of NTS threat does not affect the maritime economic activities in Tawau. Conversely, security measures and curfews imposed on all areas do affect maritime economic activities in Tawau. The curfew from 6am to 6pm was enacted on 16 July 2014 covering six districts of Sandakan, Tawau, Kunak, LahadDatu, Semporna, and Kinabatangan.

There are 1,515 fishermen in Tawau and of that number, 98% are Malays (Persatuan Nelayan Kawasan Tawau, 2016). Curfews have a significant impact on the income of fishermen because they cannot get out during the time of curfew and cannot fish in other zones, except for their own designated zone. Due to the increasing number of complaints from fishermen in ESSZONE, the government has given an allowance of RM300 per month to a small fishing operation and RM250 per month for trawlers, as well as reduce accident insurance with a deduction of RM100 a year. In addition, the Fishermen's Area Association also provides assistance in terms of repairing damaged equipment and improving the infrastructure of fishermen.

Concerns expressed by the representative of Tawau Fishermen's Association were also raised by representative of Sebatik Island Fishermen Association that has 626 members Persatuan Nelayan Pulau Sebatik¹⁸. Curfew security implementation from 6am to 6pm every

day has affected the income of fishermen, who are also low-income earners and can be categorised as poor. They hoped that the government can quickly resolve security problems in the coastal waters of east Sabah to enable them to catch fish as usual.

However, Tawau waters are in a situation that is more secured, especially for the maritime economic activities. This is unlike in Semporna, Kunak, Lahad Datu, and Sandakan, areas which form the Hot Spot of the criminal activities including kidnapping, piracy, robbery, threats of Sulu attacks, weapons and illicit goods smuggling, and other cross-border crimes. Thus, the economic activity in those areas are affected by the emergence of these NTS threats.

In recapitulation, the security policy implemented by the government in Sabah's east coast has a negative impact on maritime economic activities in Tawau. Concerns were raised by bartertrade traders and representative of the Association of Fishermen (Tawau and Sebatik), both of whom are in agreement with representatives of the Tawau Area Fishermen's Association (PNK Tawau) and Superintendent of Tawau District Fisheries Office. Both of the latter agencies also assisted fishermen in the form of financial aid to continue with their daily lives. However, in terms of policy implications, the government must re-evaluate security measures in Tawau waters, and the curfew regulations in particular, because the NTS threat is lower and more manageable than in Sandakan, Tawau, Kunak, Lahad Datu, Semporna, and Kinabatangan, which form the hot spot area.

Local and National Security: The view adopted by the business community involved is in very stark contrast to the government's view. The government would prioritise security and sovereignty. If this can be maintained, then it acts as a platform for developing the economy of the country and people. This is because political stability is closely related to the country's development.

From the government perspective, especially the National Security Council, the abolition of bartertrade is associated with wooden boat carrying goods from Mindanao-Sandakan and East Kalimantan-Tawau to trade, but they also took the opportunity to smuggle prohibited goods such as drugs, firearms, and human trafficking. In other words, irresponsible individuals perform cross-border criminal activities under bartertrade activities.

This has prompted the government to embargo the business of bartertrade with a view of combating cross-border crime. However, bartertrade traders who comply with the law are also affected by the security measures taken by the government. Though, the government is ready to hold dialogue sessions with bartertrade traders to resolve their problems and predicament. At the same time, the agency at the Sabah state level like the State Economic Planning Unit, Sabah Economic Development and Investment Authority (SEDIA), the Fisheries Development Authority, Federal Agricultural Marketing Authority (FAMA), and the Department of Agriculture should collectively take the initiative to assist the target groups affected by the security measures implemented by the government.

From the view point of the government of the Republic of Indonesia (RI), bilateral trade relations of Sabah-East Kalimantan and bartertrade are important from the very beginning, which led to the signing of several important agreements, namely the Border Trade Agreement 1970 and Border Cross Agreement 2006. RI also supports Malaysia in the implementation of measures to improve security in the waters off the east coast of Sabah with the view to combat cross-border crime. This also assists merchants from East Kalimantan to enable them to do bartertrade activities with Tawau dealers formally and without hindrance in the future.

However, RI focuses more on taking care of the welfare of Indonesian workers (TKI) employed in Sabah and Sarawak, when compared to barter-trade activities. This is because Tawau-Nunukan bartertrade traders comply more with the barter-trade rules and regulations, than the Filipino Sandakan-Mindanao traders that take advantage of barter-trade activities to perform cross-border crime.

The Indonesian government consulate in Tawau is also aware that the implementation of security measures in ESSCOM and ESSZONE would affect the Tawau-Nunukan bilateral trade and the revenue from bilateral trade has declined. However, the positive effect is even greater in the long-term, where the trade routes in the east coast of Sabah, including Tawau, can be monitored safely for NTS threats, such as smuggling of illegal goods such as drugs, and weapons, and human trafficking.

In short, for the Malaysia government gave priority to the security over economic interests in view of the

uncertain security environment which could affect the sovereignty and national security in the long term. However, for the communities involved in the maritime economic activities, the economic welfare takes precedence in order to maintain their living standards.

CONCLUSION

On the whole, ESSCOM has managed to increase the level of security in the waters off the east coast of Sabah, especially in Hot Spot areas. Cross-border crime has been reduced significantly. In the long-term this can regenerate economic activity when the level of security in the maritime waters can be fully guaranteed. However, economic activity in Tawau, which is a region that faced less NTS threats, is affected by the security measures implemented by the government, especially the curfew. Income of fishermen in Tawau and Sebatik decreased due to the curfew that controlled the time and fishing zones. However, a plan to help them has been implemented by the agencies concerned with the welfare of the fishermen. The government must prioritise security, while the community give priority to economic activities for their livelihood. Therefore, the government should consider appropriate measures to balance the objectives of security and economic interests, depending on the level of NTS threat zones.

ABSTRACT

Sustainability development is a continuous economic development approach strategy which needs to conserve local surrounding and enhance quality of life. Sustainable development will enable the economic progress and the natural quality achieved the goals of continuous human welfare. If the sustainable development strategies had been practiced seriously, it will able to preserve the environment, saving the resources, increasing the local business growth and making the community less vulnerable to the pollution threats. This paper recommends the need for all parties involved to develop plans and practice in sustainability concept and design in property development in this country as a whole.

Keywords: Sustainability; Construction Industry; Property Management

Jel Classification: L74, L80

INTRODUCTION

Sustainable development is a challenge to mankind as it balances the use of natural resources, industrial products, energy, food, transportation, shelter, and waste management with the obligation of preserving and protecting environmental quality and natural resources for future development. This concept is a long-term need of human being, but will be impossible unless the Earth's natural physical, chemical and biological systems are preserved and conserved UNEP²³.

At present, the world community has begun to take a proactive action by implementing sustainable aspects in the design and construction. This application will ensure the comfort of occupancy, improve energy efficiency thus, saving real estate maintenance costs in the long term. In addition, the greenhouse gas emissions (GHG), concerns with the fact that almost 40% come from the development and operation of real estate's (Kibert, 2005) that has to do with global warming. This initiative is expected to reduce the impact of GHG.

Sustainable development is an ongoing strategy of economic development approach that should make the most of the local environment and quality of life. Sustainable development will enable economic development and environmental quality to achieve the goals of human welfare continuously. Sustainable

development strategies if practised seriously will save the environment, conserve resources, increase local business growth and make people less vulnerable to the threats of pollution.

Sustainable development is a concept that has been adopted since the 1972 Conference on Human Environment in Stockholm. In that conference, the environmental concerns related to the world have been emphasized. These efforts continued until its peak in 1987, in a pilot report entitled World Commission on Environment and Development that was submitted (also known as the Brundtland Report). 'Our Common Future' was another Brundtland Report that has highlighted the definition of sustainable as 'meeting the needs of the present generation without compromising the ability of future generations to meet their own needs'. This report proves that this matter has become a catalyst for the global movement for sustainable development, followed in 1992, in the World Summit in Rio de Janeiro when the governments and members of major sectors in the community are required to sign an effort towards sustainable development which was also known as Agenda 21.

There are three elements in the concept of sustainability (Wiles, 2008):

- Environment - environmental issues like global warming and initiatives to reduce and adaptation to those issues.

- Economy - highlighting the development of policies, strategies, and practice that will allow continued economic growth but at the same time ensuring that resources are not reduced.
- Social - highlighting the world's population growth, lifestyle, use of resources, ecological site carbon, carbon and water.

To date, the world community has begun to take proactive action to implement sustainable aspects in the design and construction. This application will ensure the comfort of occupancy, improve energy efficiency, thus conserving the maintenance cost for real estate in the long run. In addition, greenhouse gas emissions of nearly 40% which came from the development and operation of real estate's (Roaf, 2005) that have been proven to be the cause of global warming are expected to be reduced.

Buildings are said to be the primary cause of urban air quality pollution problems that contribute to climate change. An estimated 49% of the production of sulphur dioxide, 25% nitrous oxide production, and 10% dust production in cities can all damage the air quality. The buildings are producing between 35% and 50% of greenhouse gases, especially CO₂, or carbon dioxide Gray⁶. In practice, conventional building practices have not really considered the aspects of the relationship between a building with other buildings, its components, its surroundings and its inhabitants Reffat¹⁷. Conventional building constructions usually consume more natural resources than needed and produce a lot of waste. This will have a negative impact on the environment, and generate a large amount of waste Reffat¹⁷.

The concept of green buildings which is introduced in real estate development is not only related to the design, but consideration of various aspects in terms of the environment is also necessary to reduce its impact on the environment. Among the benefits of green building include energy saving, controlling the ecosystem, increasing the values of real estate and reducing health problems to occupants (USBGC, 2007). According to Shiers²⁰, energy consumption in buildings has resulted in 50% carbon dioxide gas emissions in the United Kingdom which affect the greenhouse effect, while the process of building materials has resulted in energy consumption of 29% in the construction industry. Thus, for the realization of sustainable real estate development, appropriate assessment must be made from different perspectives such as, the effects of heat, ozone layer depletion, biodiversity, lifetime of usage and recycling.

THE CONCEPT OF SUSTAINABILITY

There are three main problems which are fundamental and which can influence the overall issues of sustainability in the built environment. Firstly, there is the increase in world population. In the 1850's, the world's population was around 1 billion people. However, at present, the world's population has increased, exceeding more than 7 billion people and is estimated to reach about 10 billion people by the year 2050 Williams²⁵. The U.S. Census Bureau projections show that the world population growth will continue into the 21st century, but its growth is slower. The world population is estimated to increase from 6 billion people in 1999 to 9 billion people by the year 2045, which is an expected increase of 50% within 46 years U.S. Census Bureau²². This increase will affect economic activities in developing countries. Malaysia is one of the four most populous countries following China, India and Indonesia, with many of them boasting off population growth around 100,000 people every day Torrance²¹.

The second thing underlying the issue of sustainability is the global economic growth. When the world's population reached 1 billion people in the 19th century, the majority (80% majority) population will live in the city and the rest live in rural areas. After more than a century of industrial activities and urbanization, it is forecasted that the majority of the world's population will see 10 times more people living in urban areas than those living in rural areas. At the same time, the population will increase the quality of life in addition to the increase in the per capita income as well as lifespan Torrance²¹.

Thirdly, the world climate is never really stable. This situation continues since the days of cold and heat up since the last ice age (ice-age). The minimum sea level also shows a significant difference. We now have to be in the middle of the heating period. Human activities are actually accelerating the global warming process Torrance²¹.

The sustainability issues began to be addressed since the early 70's. A group of industrial entrepreneurs who call themselves the Club of Rome, from Massachusetts Institute of Technology (MIT) in the U.S. have created the first computer that can generate simulations and trends related to the influence and change to the world's resources. In 1972 a report known as "Limits to Growth"

was published. Although the content of the report is just a mere approximation, the content of the report is an initial information for the government and relevant agencies on the use of resources. Energy savings forecast and its impact presented in the report have been very surprising.

However, the “Limits to Growth” report was regarded too pessimistic, mainly due to its troublesome calculating system. In the meantime, a pioneering idea has led to the Optimistic Model. It is about a set of boundaries which is more subjective, yet flexible, produced by Herman Kahn and his colleagues in their book ‘The Next 200 Years: A Scenario for America and the world “in 1976. Their conclusion is that technology can solve all problems that arise:

‘200 years ago, almost everywhere human beings were comparatively few, poor and at the mercy of the forces of nature. 200 years from now, we expect, almost everywhere they will be numerous, rich and in control of the forces of nature’.

Continuous warning was made by Meadows et al¹³, in his argument about food shortages caused by climate change and increased pollution and toxins in the soil, which are partly due to the acidity in the atmosphere that causes acid rain around the world. The sequence of this, in March 2005 a comprehensive global study was launched by the Millennium Ecosystem Assessment (MEA). This study is an extreme comprehensive assessment of ecosystem health of the world. This study is the result of four years’ worth of work by 1,300 scientists from 95 countries. This assessment is the first attempt to examine the global health world in 24 different areas of ecosystem services (May and Caron¹².

As a result, the environmental quality of the planet/earth is found to be deteriorating and developing countries are the most affected. Only four of 24 examined ecosystems will be able to enhance their ability to harness the human population in terms of food production May and Caron¹². Food production is a good aspect for the growth of population within 40 years.

From the remaining ecosystem services which are examined, it is found that 15 services record a decrease, whilst another 5 are stable. The declining services include the provision of fresh water, fisheries, air and water purification. Ecosystem changes that occur have an impact on people due to problems such as the emergence of new diseases, the continuous spread of diseases such

as malaria, changes to the water supply and shortages of fishery resources. Not a single country, even the rich ones, is able to combat the declining ecosystem. The interactive relationship between man and nature are inseparable. However, there is good news that we can avoid this problem in the future if we implement the changes from now.

At the global level, coordination between trade and environment occurs via negotiations. At the national level, government policies need to ensure that market prices reflect the value of ecosystem services, such as actual costs for energy, water and land. Results of previous studies show that price is an effective mechanism to force people to change and become more efficient in the use of resources. Furthermore, at the local level, citizens must take responsibility for being active participants in making resource management decisions. Experience has shown that, ecotourism and sustainable harvesting of forest products are more effective when the native citizens are involved in the decision making process.

ISLAMIC PERSPECTIVE ON SUSTAINABILITY

The environment from an Islamic perspective is based on the revelation of the Qur’an, the existence of a close relationship between man and nature and God. Mankind and nature are bounded by a divine nature, that all beings receive sustenance from Him. There is no separation between humans or nature from God (Abubakar, 1997).

Allah said “And to Allah belongs whatever is in the heavens and whatever is on the earth. And ever is Allah, of all things, encompassing...” (4:126)

Islamic ethical attitude towards the environment is due primarily to the fact that Islam is not just a set of beliefs, but is a way of life, manhaj of life (as defined by As SayyidQutub, a leading Islamic scholar of the 20th century). Islam comes to reinforce the belief in one God, and clearly aims to create a new community (ummah) from among individuals who would be better creatures, who submit fully to God and accept the moral code of ethics and behave in compliance with Islam. The Regulations cover all the actions, whether that is expected to be adopted by members of the community or of any regulation that limits it Mawil¹¹. Clearly, the important thing is that this responsibility is generally a part of Islam.

In formulating the development of the country, a designer must be able to plan spiritual values which result from the integration of three relationships that serve as the main basis, which are:

- i. The relationship between human and his Creator
- ii. The relationship between human and other humans
- iii. The relationship between human and the environment.

The resulting relationship is an accurate form of civilization Nor Aishah¹⁵. Human relationship with nature is a form of manifestation in which mankind as an administrator on this earth is responsible to exploit and prosper the earth. Humans have a role as a builder, decorator and saviour to the environment and not bring damage and destruction Nor Aishah¹⁵. This explains human's heavy responsibility, whereby apart from developing the country, they are also responsible to always preserve the earth so that it is not polluted.

THE IMPACT OF THE DEVELOPMENT TO THE ENVIRONMENT

According to Roaf et al. (2005), the building construction activities are the main contributors in the world's carbon cycle, due to the fact that the activities greatly make use of fuel to;

- i. produce construction materials;
- ii. support transportation activities; and
- iii. Generate the energy of buildings.

As much as 50% of carbon dioxide has been processed to generate the energy in buildings Anderson et.al², whereas 25% more is produced from transportation activities. The irony lies in the fact that, the greenhouse effect is the result of gas release, consequently leaving a disastrous impact on the global climate change.

In building constructions, it is estimated that 3 billion tonnes of materials have been used for a year, and they have produced 10% to 30% solid waste remnants thrown into main rivers and other water sources in most countries. Buildings in the world have made use of 40% natural resources/materials and also 30% of energy from them Rees¹⁶. The materials produced in factories are in need of a lot of fossil fuels, and as the result, a lot of raw materials have to be mined.

As an example, for 1 tonne of cement, 2 tonnes of mined raw materials are needed, almost 1 tonne of carbon dioxide and approximately 6kg of nitrous oxide will be produced, further providing an impact to greenhouse gas refilling. This shows that buildings serve as an important contributor towards the affected world ecology and the impact on the greenhouse Graham⁵.

Graham⁵, has further identified the existence of four categories of effects to the buildings and to the environment, which are:

- Resource depletion;
- Physical disturbances;
- Pollution; and
- Social and cultural effects.

RESOURCE DEPLETION

Matters concerning resource depletion refers to the building and the construction operation process. Normally, these resources are fossil materials, mineral materials and wood. It is difficult to replenish these resources as it is simply too time-consuming for these resources to be reproduced. As an example, the timber wood that comes from the fell tree needs to be replaced. To get this back, these trees need to be replanted. These trees may need to be replaced in 40-50 years to come Graham⁵.

The effect of building construction can also be seen on the ecology of systems like the forests, rivers, swamps, clean water and this should be considered as early as at the planning stage. Planning should also take into account this resource depletion at the stage of constructing the building, after the construction and the operations that take place in reused buildings Wood²⁸. The wood, for instance, can be reused and recycled as the resource can be planted, but the felling of forest trees has destroyed a large part of the ecosystem contained in the forests and the replacement would take a long time.

FOREST ERADICATION

The main consequence for forest eradication would be the climate change. The change to the environment resulting from forest eradication happens in many ways. First off, there has been a drastic temperature change in nearby areas. This is because, the functions of the forests lie in their cooling property as air moisture can be maintained Wood²⁷.

Secondly, we have to face a long changing process of the global climate. As aforementioned, forest eradication has contributed to the global heat or its corresponding process when the weather becomes hotter if the sun glare penetrates right into the atmosphere (Kay, 2002).

The ozone layer is a mass of oxygen or the ozone particle (O₃) that acts a shield in the atmosphere against the hazardous ultra-violet rays that originate from the sun. The layers comprise of oxygen particle that reacts with carbon monoxide. This reaction will make use of the oxygen particle. This happens when the gas of carbon monoxide enters the atmosphere, where the ozone will react and the volume of oxygen will be reduced, causing the ozone layers to gradually erode Kay⁸.

The third effect to the environment would be the natural underground springs. The springs is the common resource of drinking water for people who live in areas surrounding the forests. There will be more underground springs when it is raining as the roots of the trees will naturally hold the water. Therefore, water absorption into the ground will add to the already existing seepage water. Imagine what will happen when we run out of forests? When it rains, the water will directly flow right into the soil without it staying on the surface of the soil. This also prevents the water from evaporating. Direct evaporation into the soil will also cause the well to dry up.

PHYSICAL DISTURBANCE

The physical consequences that happen during the construction process are only evident after the building is complete and occupied. Such environmental damage is due to the maintenance, refurbishment and demolition activities, as these processes are consistently carried out throughout the lifespan of the building. Apart from that, Sayce¹⁹ also identifies the three main environmental issues that serve as the outcome from the effects of the construction to the environment namely:

- i. The loss of land productivity:** The land used for the buildings will lose its productivity from various aspects like the loss of habitat for both flora and fauna.
- ii. Disturbance due to building constructions:** As the activity is carried out the environment will be undergoing pollution like land erosion that can pollute the river, also causing flash flood in the surrounding areas.

- iii. Reduced and loss of biodiversity:** Happens when natural resources are explored like the felling of timber, oil mining etc., and this further ruins the ecosystem. This also means that the surrounding will suffer too from pollution.

POLLUTION

Pollution will take place due to the resource productivity and the building operations that not only give an impact to the environment, but also the architecture as a whole. The widespread use of synthetic materials, mechanical ventilation, added with the blunder of selecting the resources will definitely lead to a dangerous internal environment to human health. The internal air quality is integral to our health White et.al²⁴. Internal air pollution due to toxic materials/resources are detrimental to the occupants' health as well as interfering the work environment. This phenomenon is known as the 'building sick syndrome'.

This syndrome is contributive to coughing, asthma and fatigue. One of the factors behind cases of asthma would be the dust or pest easily collected on our carpets, blinds and so on. Interior designers should consider certain specifications to mitigate this problem.

Apart from that, another pollution would be coming from synthetic materials. It is a possibility that the construction sites have already been polluted with chemical substances leading to the construction workers and occupants to contract diseases after they have settled in the building.

EFFECTS TOWARDS SOCIAL AND CULTURE

It is rather difficult to detect the effects of construction to both aspects of social and culture as compared to other factors, especially in surroundings that have already remained strong and stable. Rapid and drastic development will leave a great mark on social and cultural activities of the locals. The development that is to be done should ultimately place great importance on the local people's sentiment and sensitivity.

As an example, constructions that have caused great disturbances to historical buildings and the obtainment of ownership of lands belonging to the locals need to be addressed accordingly. Also, the society also needs

to be informed of the impacts resulted from using toxic materials and matters pertinent to energy use. Buildings can also affect the visual factor, either negatively or positively and the effect to the community is also worth considering. Early planning with a close look at the aspects mentioned will make it easier on the future construction activities planned.

CONCLUSION

Humans are always on the lookout for the best approach to address the issue of natural resource use. Various alternatives have been explored and discussed. A wide array of discussions and initiatives at the global level has often been organised. Developed countries have often pointed fingers at the developing countries for the consequences and factors that contribute to the issue at hand. Nevertheless, an absolute solution is yet to be realised. Thus, the challenge that the world has to rise to is to inculcate the green-building practice as to offer an opportunity to design eco-environment-based buildings using the design integration approach with sustainable requirements. Sustainable building development encourages resource maintenance, including energy efficacy and renewed energy, water conservation characteristics, consideration over the effect to the surrounding and the reduction of waste towards creating a healthy and comfortable environment. Sustainable development also affects the way people live. The existence of development has brought about a significant intervention to the ecosystem of the Earth. Nonetheless, the society has conducted and launched various kinds and approaches of sustainable development for the benefit of mankind.

Effective Leadership as the Mediator between Emotional Quotient and Teachers' Work Performance: A Study in National Secondary School in Northern States of Peninsular Malaysia

Azizi Abu Bakar¹, Siti Nur Zahirah Omar¹

¹Kolej Perniagaan, Universiti Utara Malaysia, Sintok, Kedah

ABSTRACT

This study investigates the direct relationship between emotional quotient (EQ), teachers' work performance and effective leadership. This study follows the quantitative paradigm and used cross sectional research method to identify the factors that influence teachers' work performance. This study's sample comprised of teachers of National Secondary Schools (SMK) in the northern states of peninsular Malaysia. Cluster and random sampling were used to choose the samples from the study's population. The results of this study shows that EQ has a positive and significant relationship with teachers' work performance. In the meantime, the results of the regression analysis show that effective leadership plays a partial mediating role in the relationship between EQ and teachers' work performance.

Keywords: Teachers' work performance, emotional quotient, effective leadership.

INTRODUCTION

Malaysia aspires to become a developed nation by 2020. In this endeavour, one of the key field that has been identified to contribute to a developed nation is education. In this regard, the Government Transformation Programme (GTP) was initialised by the Prime Minister in 2009 and education is one of the main National Key Resource Area (NKRA) (Ministry of Education, 2009). Therefore, increasing the excellence of the national education system is an ongoing process that needs to be undertaken and this requires adaptiveness among teachers so that they can illustrate effective work performance for the best of the students' interests, and in return, improving the status of education in Malaysia. These progressive changes are in line with the Education Development Master Plan (PIPP) (2006-2010) which is aimed to develop a world class education system to fulfil the aspiration for Vision 2020. This calls for teachers' and school administrators' perpetual commitment in executing all of the education development policies and improving their work performances so that the goals of education can accomplish.

PROBLEM STATEMENT

The literature review conducted shows that there a few past researches that focused on the relationship

between emotional quotient (EQ), effective leadership and work performance. First, a review was done to investigate the relationship between EQ and work performance. Past studies shown that there is a positive and significant relationship between EQ and work performance Rahmasari²⁰; Salmiah²¹; Trihandini²³. On the other hand, these researchers were not focused on work performance in the context of education. Therefore, there is still a gap that needs to be fulfilled to look at the extents of the influence of such relationship on work performance among teachers. This statement is supported by Mehmood, Qasim, & Azam¹³ and Nurul Hudani et al¹⁶. In line with Malek Shah & Nor Shah¹² and Nurul Hudani et al¹⁶, which stated that EQ can influence employees' work performance. Besides that, Noriah et al¹⁵, stated that studies on EQ are in abundant in the western world, however, the number is still very limited in Malaysia.

Second, the review of literature indicate that there are a few researches conducted on the relationship between leadership and work performance. Such studies include Pradeep dan Prabhu¹⁹, which focused on the public and private sectors while Thamrin²² focused on the shipping industry. Both findings show that there are link between leadership and work performance. Furthermore, there are various studies which focused on education, including Jay¹⁰; Adejumobi & Ojikutu²; Paracha et al¹⁸;

Adeyemi³ and Duze⁷. All of these studies have shown that there is a relationship between leadership and work performance. Finally, past empirical studies show that effective leadership can play a mediating role in the relationship between emotional quotient and teachers' work performance. Therefore, to measure the role of the mediating variables in the relationship, a systematic and scientific approach need to be taken in this study. In this regard, this study focuses on the relationship between these three variables to thoroughly understand how EQ process influence teachers' work performance.

Research Question

1. Does emotional quotient has a positive and significant relationship with teachers' work performance?
2. Does leadership have a positive and significant relationship with teachers' work performance?
3. Does effective leadership mediate the relationship between emotional quotient and teachers' work performance?

LITERATURE REVIEW

Emotional quotient (EQ) and teachers' work performance: Emotional quotient is an important aspect in cultivating a productive work environment. Past researches show that EQ has a significant relationship with work performance Rahmasari²⁰; Salmiah²¹; Trihandini²³. All of these three researches show that EQ has positive relationship with work performance. However, these studies are not focused on the relationship between EQ and teachers' work performance in the education field. Therefore, there is still a gap in investing the extents of such relationship on teachers' work performance.

Emotional quotient (EQ) and effective leadership: Emotional quotient is a play a significant role in determining an individual's actions and behaviour. Past studies such as Barling et al⁵, Batool⁶, Harms & Crede⁹, Nurul Hudani et al¹⁶, Palmer et al¹⁷, Wang & Huang²⁴, dan Weinberger²⁵ found that emotional quotient is linked to effective leadership. Based on the literature review of past researches, this study posits that effective leadership also influence teachers' work performance. To test the hypothesis that proposes the presence of such relationship, a hypothesis was developed to determine the predicted outcome.

Effective relationship and teachers' work performance: Effective leadership, according to Goetsch (2005) is one's ability to inflict and provide inspiration to other individuals, give commitment voluntarily to fulfil the predetermined organisational objective. Meanwhile, Abdul Ghani Abdullah¹, Nurul Hudani et al¹⁶, Pradeep & Prabhu¹⁹ dan Thamrin²² stated that effective leadership can increase work performance. This is further supported by Akhbar et al⁴ who believe that leadership is the main administration function that can maximise workers' efficiency. Furthermore, researches stated that empirical researches conducted by Abdul Ghani Abdullah¹ in the context of leadership among principals in 151 daily secondary school in three states, Perlis, Kedah and Penang. The finding shows that transformational leadership among principals is capable to improve teachers' work performances. From the literature review and empirical study conducted by past researchers, the researcher believes that efficient leadership also influence teachers' work performance.

RESEARCH METHODOLOGY

Research Design: This study is a quantitative study which adopted the cross sectional survey based on the questionnaire responses from the study's respondents. The study population comprises of teachers in national secondary school (SMK) in the northern states of peninsular Malaysia.

Study Sample: The study's population comprised of teachers of national secondary school (SMK) working in the education sector in the northern states of peninsular Malaysia. The study's locations are the states of Perlis, Kedah, Pulau Pinang dan Perak which consist of 44,028 teachers and the study samples comprise of 380 teachers. This study adopted cluster sampling which divides the population into non-overlapping areas or clusters. These clusters are then divided into a set of new clusters depending on the random selection process. As a result of this procedure, Perlis JPNP, PPD Kota Setar in Kedah, PPD Seberang Perai Utara in Pulau Pinang and PPD Batang Padang in Perak were chosen as the study clusters which comprise of teachers' representatives from every national secondary school in every district under the jurisdiction of the state's education department.

Measurements: To measure teachers' work performance, this study adopted the questionnaire by Muhammad

Amin et al¹⁴, while Goleman⁸ was used for emotional quotient, finally, the questions for effective leadership was adopted from Bass & Avolio (1995)'s (*Multifactor Leadership Questionnaire, MLQ*).

RESULTS AND ANALYSIS

The reliability analysis for the variable teachers' work performance shown an alpha value was $\alpha=.760$, meanwhile for EQ, the alpha value was $\alpha=.709$ and the alpha value for effective leadership was $\alpha=.724$. All of the data obtained were analysed using the *IBM SPSS Statistics Version 22* software.

Variables	Number of Items	Cronbach's Alpha
Teacher's Work Performance	25	.760
Emotional Quotient	27	.709
Effective Leadership	28	.724
<i>Note: N = 324</i>		

Table 1 displays the results of the Cronbach's Alpha for the teacher's work performance, emotional quotient and effective leadership were above the suggested threshold of 0.70, except for participation which was slightly below (Chua, 2012). Table 1 summarizes the reliability coefficients of the measures.

Table 3: Linear regression between emotional quotient (EQ) with teachers' work performance

Dependent Variable	β Coefficient	T value	P value	VIF value	Result
Emotional Quotient	0.850	13.974	0.000***	1.000	Supporting

R²: 0.378

Adj. R²: 0.376

F-statistic: 195.272

Note: *** significant at 0.01

** significant 0.05

- a. Predictor (constant), Emotional quotient (EQ)
- b. Dependent variable: Teachers' work performance

Table 3 illustrates a significant, positive relationship between EQ and teachers' work performance, as shown by the correlation value of $r^2=0.378$ and r^2 adjusted =0.376. R² showed that 37.8% of teachers' work performance are explained by EQ. Meanwhile the remaining (100%-37.8%= 62.2%) are explained by other factors that were

RESEARCH FINDING

The relationship between emotional quotient, effective leadership and teachers' work performance.

Table 2: Result of correlation test

Variable	Effective leadership	Teachers' work performance	P value
Emotional Quotient	0.403**	0.614**	0.000
Effective Leadership	1	0.511**	0.000

**Correlation is significant at 0.01; * Correlation is significant at 0.05;

Dependent variable: Teachers' work performance

Based on Table 2, correlation analyses were conducted to determine the relationship between EQ (emotional quotient), effective leadership and teachers' work performance. The study found that there is a significant and positive link between emotional quotient, effective leadership and teachers' work performance, where the correlation values were ($r=0.614$; $p<.01$) and ($r=.511$; $p<.01$). Meanwhile, there is a mediate relationship between emotional quotient and effective leadership with the correlation value ($r=.403$; $p<.01$).

not investigated in this study. Meanwhile the Anova test found the F statistic (1,322) =195.272, $p<0.01$ was bigger than the F-critical value =6.63. Therefore, EQ is significantly positive ($\beta= 0.850$, $t=13.974$, $p<0.01$) and contributes to teachers' work performance.

Table 4: Linear regression between effective leadership with teachers’ work performance

Dependent Variable	β Coefficient	T value	P value	VIF value	Result
Effective leadership	0.362	10.678	0.000***	1.000	Supporting

R²: 0.261

Adj. R²: 0.259

F-statistic: 114.018

Note:

*** significant at 0.01

** significant 0.05

- a. Predictor (constant), Effective leadership
- b. Dependent variable: Teachers’ work performance

Table 4 shows the significant and positive relationship between effective leadership and teachers’ work performance. This is illustrated through the finding of $r^2=0.261$ and r^2 adjusted =0.259. R²value shows that 26.1% of teachers’ work performance were explained by SQ. Meanwhile, the balance (100%-26.1%=73.9%) were explained by factors that were not discussed in this research. Next, the Anova test found that the value of Fstatistic (1,322) =114.018, $p<0.01$) indicating that the F value is bigger than F-critical = 6.63. Therefore, SQ is significantly positive ($\beta=0.362$, $t=10.678$, $p<0.01$) and contribute to teachers’ work performance.

Table 5: Summary model, Anova and coefficient motional quotient, effective leadership and teachers’ work performance

Dependent Variable	Model 1		Model 2		Model 3		Model 4	
	Coefficient BBBB	t	Coefficient	t	Coefficient	t	Coefficient	t
EQ	0.85	13.974***	0.789	7.910***	0.362	10.678***	0.674	10.880***
EL							0.223	7.025***
R ²	0.378		0.1630		0.261		0.460	
Adj. R ²	0.376		0.1600		0.259		0.457	
F-statistic	195.27		62.565		114.02		136.97	

Note:

*** significant at 0.01

** significant at 0.05

- a. Predictor (constant), emotional quotient(EQ), effective leadership (EL)
- b. Dependent variable: Teachers’ work performance

Table 5 shows the results of the analyses conducted involving the EQ, effective leadership and teachers’ work performance in reference to the model specification table, Anova and coefficient. The first model analysis shows that there is a significant positive relationship between EQ and teachers’ work performance ($\beta=0.850$, $t=13.974$, $p<0.01$). Meanwhile, in testing the second model, which is the relationship between EQ and effective leadership, the finding also showed that there

is a positive, significant relationship ($\beta=0.789$, $t=7.910$, $p<0.01$). Furthermore, the third model analysis showed that effective leadership has a relationship with teachers’ work performance ($\beta=0.362$, $t=10.678$, $p<0.01$).

For the final step, identifying the role of effective leadership as a mediating variable, was conducted simultaneously on teachers’ work performance. The finding from these analysis would indicate that whether the relationship is significant enough to be the basis in

determining the role of effective leadership as the either the partial or complete moderator of the relationship. The results of the analyses conducted found that EQ has a significant relationship ($\beta=0.674$, $t=10.880$, $p<0.01$) with teachers' work performance after the leadership factor was simultaneously tested. However, the strength of this relationship is relatively weak compared to the direct relationship with teachers' work performance ($\beta=0.850$, $t=13.974$, $p<0.01$). Therefore, it can be concluded that effective leadership play a role as a moderating factor as part of the relationship between emotion quotient and teachers' work performance.

DISCUSSION

The study findings in relation to EQ and work performance are parallel to the studies by Rahmasari²⁰, Salmiah²¹ dan Trihandini²³, which in general, found that in general, there is a significant relationship between EQ and work performance among teachers. Besides that, the study findings had proven that effective leadership play a moderating role in the relationship and teachers' work performance. In general, the study's findings show that EQ plays an important role in increasing the work performance among SMK teachers from the northern states of peninsular Malaysia, therefore, EQ and effective leadership is considered as a crucial element that can propel education excellence among teachers.

SUMMARY

In all, emotional quotient play plays an important role in determining teachers' excellence and this can be illustrated through its relationship with teachers' work performance. Besides that, effective leadership also plays a moderating role in the relationship between EQ and teachers' work performance.

ABSTRACT

Healthcare in Least Developed Countries is poor. Telehealth has the potential to improve healthcare. Assessing the readiness is important for a successful adoption of Telehealth. Therefore, the aim of this paper is to develop a framework to assess the readiness of health organizations in least developed countries in regard to the adoption of Telehealth. Due to the difficulty to study all countries Yemen has been chosen as a case study in this study. Therefore, Yemen Telehealth Readiness Assessment Framework (YTRAF) has been developed to assess the readiness. Meanwhile, Yemen Telehealth Readiness Assessment Tool (YTRAT) has been developed for collecting data. YTRAF and YTRAT have been used to assess the readiness of the Ministry of Public Health in regard to adoption of Telehealth in Yemeni health system. A qualitative approach including interview, focus group and observation have been used. The outcomes of the interviews revealed that the Ministry of Public Health is in need for considerable efforts to raise the level of its readiness in several areas to be ready for successful adoption of Telehealth. Furthermore, the interviewees have released the potential of Telehealth to improve the current healthcare in rural areas in Yemen and they have accepted to use Telehealth to do their duties.

Keywords: Health Information Technology, Telehealth, Readiness, Least Developed Countries

INTRODUCTION

Least Developed Countries (LDCs) are the countries with low indicators of socio-economic development in accordance with the United Nations organization and the lowest ranked in accordance with the human development index in the world. A country is classified among the countries with the least development according to three criteria which are per capita income, human resources and economic vulnerability UNCTAD³¹.

In this time, 49 countries are involved in the classification of least developed countries UNCTAD³¹. LDCs, with a total area of 20,818,177.5 sq. km. 34 countries are located in Africa, 8 countries are located in Asia, 5 countries are Islands and one is located in the Caribbean. LDCs have a population around 954 million, representing around of 13% of world populations, spread in urban and rural areas and islands IBRD-IDA¹¹.

LDCs suffer from poor healthcare systems, especially in the rural and underserved areas UNCTAD³². In fact,

these areas represent the most areas of it. Furthermore, a largest share of LDCs people live in these areas (Herrmann et al., 2011).

Despite international efforts to improve the situation of the least developed countries the economic and social situations are deteriorated which in turn increased the gap between them and the developing countries, not to mention developed countries. In addition, the number of LDCs is increased from 24 countries in 1971 to 49 in 2015 UN³⁰. According to report UNCTAD³² the country's health system is important factor to the development of productive capacities, which in turn helps to achieve the economic growth of the country. Consequently, economic development helps to make the next generation better healthier and thus improve the economy and society. Therefore, this is the call to study the potential opportunities to improve the healthcare systems in the LDCs taking into account LDCs setting such as the readiness for new solutions.

Telemedicine has the potential to improve the healthcare system Bashshur et al²; Yellowlees³⁵. The terms of Telemedicine and Telehealth can be used interchangeably Bashshur et al². Therefore, this paper proposed Telehealth as a solution for improving the LDCs' healthcare systems. Reid²⁷ has defined Telehealth as "Telehealth is the use of advanced telecommunication technologies to exchange health information and provide healthcare services across geographic, time, social and cultural barriers".

Yemen is a geographically diverse country located in the southern part of the Arabian Peninsula with total area of 527,970 km² and total population of 24 million Kandeh and Kumar¹⁶.

Yemen is one of the least developed countries UNCTAD³². Therefore, this paper has selected Yemen as a case to conduct this study due to the difficulty of studying all the least developed countries. There is a lack of research in using technology to improve the Yemeni health system. However, this paper is the first study in the adoption of using Telehealth to improve the Yemeni health system, especially in rural and underserved areas. This paper is started with introduction and briefly stated the problem. This study also proposed Telehealth Readiness Assessment Framework (YTRAF) and shows the result followed by the discussion and conclusion.

METHODOLOGY

A qualitative approach including interview, focus group and observation has been used. To assess Telehealth readiness, this study has designed tool that contain four steps, which start by reviewing official documents as well as international reports and assessments related to Yemen. Furthermore, review the existing Telehealth readiness assessment frameworks. The second step used observation method to investigate the current health status. The third step used the focus group method to develop and approve the Yemen Telehealth Readiness Assessment Framework (YTRAF) and Yemen Telehealth Readiness Assessment Tool (YTRAT). As for the final step, interviews are used to assess the readiness of the Ministry of Public Health in regard to the adoption of Telehealth in the Yemeni health system.

A total of forty two semi-structured interviews were conducted among selected key informants who have experience in Telehealth, ten interviews with health

professionals, ten interviews with policy makers and the rest of the interviews with others (i.e., social workers, independent health researchers and health professionals from international health institutions).

Thematic analysis was utilized to analyze the collected data.

Developing a Yemen Telehealth Readiness Assessment Framework (YTRAF): With regard to the adoption of Telehealth in Yemen to enhance the current health status, the Yemeni Ministry of Public Health needs to prepare a set of factors to be ready for the anticipated change brought by the use of Telehealth. Therefore, a framework has been developed to identify these factors. Four sources of information were utilised to develop the framework, which are the same three sources of information utilised by Khoja et al¹⁹, namely literature review, existing scales and expert opinion and this study added observation method.

It is a widely held view that the failure in the implementation of Telehealth would cause great losses in terms of time, money and effort. Therefore, an assessment of Telehealth readiness in rural areas is crucial prior to implementation Jennett et al¹³. Moreover, the failure of Telehealth implementation could be avoided by examining and mitigating the barriers that influence implementation Oak²³. Similarly, Jennett et al¹⁵ indicated that a successful introduction of e-health requires the examination of political, social, organisational and infrastructure factors and revealed that the assessment of e-health readiness can reduce the risk of failure after introduction.

From the foregoing, the introduction of Telehealth in Yemen requires framework and tool capable of assessing Telehealth readiness and appropriate for Yemen, which is one of the least developed countries.

Based on the extant literature review, there are many Telehealth readiness assessment frameworks and tools that focus on developed and developing countries, but not for least developed countries. According to Khoja et al¹⁹ there is a big difference between developed countries and developing countries. Therefore, they developed a framework in assessing e-health readiness to be adapted for developing countries. Furthermore, the result of Al-Huneiti¹, study revealed that there is a gap between developing countries and developed

countries in regard to e-Health. Moreover, Alliance for Building Capacity (2002) report suggested that, when assessing e-health readiness, the constructs that need to be investigated should be relevant and put in the context of the study undertaken. Hence, this calls for developing a new framework in assessing Telehealth readiness to be adapted for the least developed countries.

Telehealth readiness is measured by assessing the status of the government in areas most important to adopt of programmes using ICT Khoja et al¹⁹. However, this paper assessed Telehealth readiness in the Ministry of Public Health because it is responsible for the Yemeni health system. Cultures, health needs and health readiness are different among countries. Therefore, developing a framework for assessing the readiness of the country regarding successful adoption of Telehealth is important.

According to Coleman and Coleman⁷, there are currently six assessment frameworks that are commonly used for assessment which are Campbell et al⁵; Demiris et al⁸; Jennett et al¹⁴; Khoja et al²⁰; Overhage et al²⁵; Wickramasinghe et al³⁴.

Jennett et al¹⁵ utilised a qualitative approach to explore the readiness of the rural community for the implementation of Telehealth services. They conducted 16 semi-structured telephone interviews. In addition, they held two communities' awareness sessions followed by five focus groups. Finally, they conducted two in-depth interviews. However, after the analysis, they suggested four types of community readiness: Core, engagement, structural and non-readiness. The result of this study created a framework that can be used to investigate the rural and remote communities in terms of Telehealth readiness to improve the opportunity of a successful implementation.

Wickramasinghe et al³⁴ developed a preparedness framework to assess a country's preparedness in regard to the adoption of e-health. It consists of grids that are able to assess the preparedness of any e-health system. Low, medium and high are identified as the levels of preparedness. In addition, their framework has four prerequisites, which are ICT infrastructure, standardised policies, governmental regulations and user accessibility. Furthermore, four main impacts of these prerequisites include IT education, global economic standing, cultural impacts and impact of

morbidity or disease load. Finally, their framework uses the prerequisites and their impacts to assess the preparedness.

Khoja et al²⁰ stated that the use of e-health has benefits and also risks. Moreover, to avoid the risks, the governments must assess and prepare themselves before the change and adoption of the system that requires the use of ICT. They added that there is a big difference between developed and developing countries in terms of access to ICT. So, they created a conceptual framework that can be used for developing e-health readiness assessment tools for healthcare institutions in developing countries.

Li et al²¹ developed a framework for e-Health readiness assessment from a pandemic perspective. They noted that the readiness assessment must be carried out so as to understand and mitigate the challenges that are likely to appear during the e-health implementation. Also, they pointed out that the readiness assessment will minimise the chances of failure and maximise the hope among healthcare professionals of achieving the desired goals.

Sharma and Schober²⁹ developed a conceptual framework to assess the organisational readiness for implementing nutrition program. Structural and external factors, staffs attributes and other psychological factors were the constructs of the conceptual model. They have chosen it based on the literature. Finally, they have validated their conceptual framework through data collected in focus groups conducted among ECE centre staff members.

For more clarification, there are many assessment frameworks such as: A framework for assessing ehealth readiness for public and private healthcare institutions in Pakistan Khoja et al¹⁸; a framework for Assessing ICT readiness for Tele-cardiology Chattopadhyay et al⁶; a framework to assess the needs and readiness for ehealth in developing countries Durrani et al⁹; a framework to investigate the readiness of community for Tele-psychiatry Pabst²⁶; a framework for assessing the ehealth readiness in developing countries Oio et al²⁴; a framework for e-health readiness assessment (Kgasi and Kalema¹⁷; a conceptual framework for investigating organizational factors that affect adoption of Telehealth by hospitals Gagnon et al¹⁰; and a framework for assessing ehealth readiness in Iran Rezai-Rad et al²⁸.

During the observation, some important facts to develop the Yemen Telehealth readiness assessment framework have emerged, such as: The seven enablers of COBIT5 are appropriate as factors to cover all aspects of the Ministry of Public Health. Thus, COBIT5 has a great potential to solve problems that may arise from using ICT. Furthermore, this paper takes into account the governance and management levels which are included in COBIT5 principles. Moreover, COBIT5 defines seven enablers to support the implementation of a comprehensive governance and management system for enterprise IT ISACA¹².

An expert committee has been formed. It consists of a group of members from the Ministry of Public Health, the Faculty of medicine, Sana'a university, Al-Qahera hospital, Yemen's National Malaria Control Programme,

International health institutions, ICT experts and independent members. The role of the committee is to guide, provide feedback and supervise the process of developing the framework and then approve the developed framework. There are four ways of contact between the members of the committee such as face to face, e-mail, social media and phone. Purposive sampling technique (based on their knowledge of Telehealth) and snowball technique were utilised to select the members of the committee Morgan²².

From the forgoing, this research has developed a framework to assess the readiness of the Ministry of Public Health in regard to the adoption of Telehealth in the Yemeni health system, namely Yemen Telehealth Readiness Assessment Framework (YTRAF).

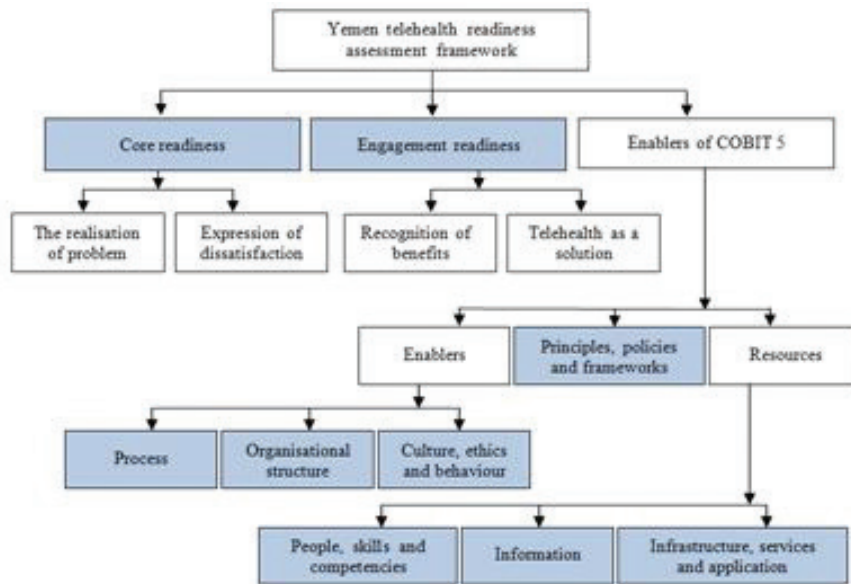

Figure 1: Yemen Telehealth Readiness Assessment Framework (YTRAF)

YTRAF contains nine constructs, which are core readiness, engagement readiness and seven enablers of COBIT5, as shown in the Fig. 1.

Developing a Yemen Telehealth Readiness Assessment Tool (YTRAT): YTRAT is derived from YTRAF. Based on YTRAF constructs, questions were designed to examine the opinions of policy makers and health professionals about the readiness of the Ministry of Public Health's adoption of Telehealth in the Yemeni health system. The questions were tested and validated by an expert committee and then have been translated

into the country's official language, which is Arabic, to be understood by the informants.

RESULT

Data Analysis of the Focus Groups: After several contacts and meetings, one focus group has conducted with expert committee members. The aim of this discussion is to approve the YTRAF and YTRAT. Semi-structured questions were utilized in the discussion. Thematic analysis Braun and Clarke³ was utilized for analyzing the transcription of the focus groups. The

result was that all participants approved the Yemen Telehealth readiness assessment framework and tool.

Table 1: Thematic themes for the Interviews
Thematic Groups and Sub-topics

Thematic Group 1: Core Readiness	
Sub-topic 1	Realization of problem
Sub-topic 2	Expression of dissatisfaction
Thematic Group 2: Engagement Readiness	
Sub-topic 1	Recognition of benefits
Sub-topic 2	Telehealth as a solution
Thematic Group 3: Policies and Framework Readiness	
Sub-topic 1	Existing and new policies
Sub-topic 2	Framework
Thematic Group 4: Organizational Structure Readiness	
Sub-topic 1	Organizational Structure
Thematic Group 5: Processes Readiness	
Sub-topic 1	Internal processes
Sub-topic 2	International process
Thematic Group 6: Information Readiness	
Sub-topic 1	Information
Thematic Group 7: Culture, Ethics and behavior Readiness	
Sub-topic 1	Cultural/social factors
Thematic Group 8: Services, Infrastructure and Application Readiness	
Sub-topic 1	Services
Sub-topic 2	Infrastructure
Sub-topic 3	Applications
Thematic Group 9: People, Skills and Competencies	
Sub-topic 1	People, Skills and Competencies
Sub-topic 2	The well*
Sub-topic 3	Training and Awareness*

* New themes have been explored

Data Analysis of the Observation: Observation has been conducted for investigate the healthcare status in rural areas and to assess the needs of rural health facilities for using Telehealth. Thematic analysis was utilized for analyzing the transcription of the observation. A part of the result supports the use of seven enablers of COBIT5 in the development of YTRAF.

Data Analysis of the Interviews: Thematic analysis was utilized to analyze the interviews data. The researcher has utilized the constructs of the YTRAF as basic

themes. For the purpose of exploration, the informants allowed them to express freely and add new information Buabbas⁴. Consequently, new themes were explored. Results were presented by addressing each of the topics of the table. These explored themes have been added to the basic themes, as shown in Table 1.

Table 1 shows the thematic themes for the Interviews, it presents 9 thematic group and 17 sub-topics.

The Result of the Interviews as Follows

Realization of Problem: All informants agreed that there are serious health problems in Yemeni healthcare system, in particular in rural areas. Some of them said “People are forced to travel a long distance from the village to urban cities to obtain healthcare services sometimes more than 50 kilometers, 10 hours due to bad transportation, also sometimes they could not find the vehicle or there is no road especially in the rainy season, where the roads are destroyed”. Another one said “health facilities are not open 24/7 in our area”. Also, another one added “Rural people can’t easily find a car to travel to urban cities seeking for health services especially at night”. Most of them agreed that beside the healthcare services fees in urban, rural people have to pay other costs like travel fees, transportation fees, food fees and resident/housing fees in urban. Moreover, they agreed that rural residents are in need of life-saving healthcare services. Overall, all informants strongly agreed that there are problems in the current healthcare system in the provision of health care services in particular in rural and underserved areas.

Expression of Dissatisfaction: All informants agreed that there are difficulties for health recipients to obtain good healthcare services. Also, most of informants agreed that there are difficulties for health professionals to consult each other. In addition, it is impossible to continue education and enhance skills. Therefore, all informants are dissatisfied of the current health status. One of them said “Health professionals are forced to travel a long distance for consulting others, or to obtain information and/or upgrade skills”. Overall, all informants are dissatisfied of the current health status.

Recognition of Benefits: Opinions are varied among informants from rejection to approval that Telehealth has the potential to enhance rural health care system. Most of the informants have weighed the benefits of Telehealth because they have recognized the benefits of

Telehealth. It is noticed that approvers are divided into two types, those who have experience in the field of Telehealth and those who have read or/and heard about it before. Meanwhile, most of the rejecters were graduated more than twenty years ago and did not recognize the benefits of Telehealth. On the other hand, the approvers share the same words “We can continue studying and enhance skills while we are working in rural areas. Even that, we can consult and access the internet for learning the newest knowledge related to our field”. The director of communicable disease control program stressed that Telehealth is useful for us. He said “The system can facilitate the control and mitigate the spread of epidemic diseases by sending reports to the Ministry to take the necessary action to control the spread of the disease”. One informant said “There are numerous expected benefits from the use of Telehealth in poor countries especially in their rural areas”. Finally, all informants have weighted the benefits of Telehealth.

Telehealth as a Solution: A few informants disagreed that Telehealth is the best solution for the current rural health problems. Moreover, they asserted that the solution is to increase the number of health facilities and hiring more health professionals. But their proposed solution is not suitable due to economic crisis and limited resources of Yemen. On the other hand, the majority of informants agreed that Telehealth is the best solution due to the potential of Telehealth and limitation of resources in Yemen. Three of informants said “Some of the policy makers did not accept Telehealth as a solution due to limited knowledge about technology, fear to use it and the resistance to change”. The majority of informants said “Telehealth is the best solution in these days due to the current situation in Yemen”. Furthermore, they accept the use of Telehealth to do their duties.

Existing and New Polices: All informants agreed that one of the most critical issues in the Ministry of Public Health is that no policies which organize, control, or even mention the adoption of Telehealth. To confirm the previous sentence, they said that “the Ministry has established two centers of telemedicine at Al-Thawra hospital and Al-Kuwait hospital, but it didn’t work due to lack of plans and policies”. All informants agreed that there are no national Telehealth strategy or policy, interoperability requirements and standards for Telehealth services. Moreover, there is no national coordination mechanism for Telehealth, legislation and regulatory frameworks which exist for sharing health information and data protection. Some informants

pointed that the importance of issuing a policies which regulate the use of ICT and Telehealth prior the adoption of Telehealth. There are no appropriate policies related to health information system. Also, there are available regulations but not enforced. Informants suggested developing a new policy and framework for ICT and Health Information Systems. Overall, most of the informants agreed that Yemen remains in the early stages of using ICT in the delivery of health care services. Moreover, all informants endorsed the need to advocate and develop a national policy and strategy on using ICT and Telehealth.

Framework: From the information gathered, there is an obvious absence of any sort of guidelines, procedures and documents which could be referred to as a Telehealth framework.

Organizational Structure: The Ministry of Public Health has branches and offices across the country. Most informants praised the organizational structure of the Ministry of Public Health and they added that the structure is ready to adopt the system; however, it needs some improvement. Furthermore, they revealed that there are two extant components related to Telehealth in the current organizational structure of the Ministry of Public Health which are Health Policy unit and Health Planning and Development sector. Overall, the majority of informants have emphasized that structure of the Ministry of Public Health will need to be revised before it can manage and organize new technology such a Telehealth.

Internal Processes and International Process: The Ministry deals with two basic types of health processes. Processes which is applied to health facilities and processes that is applied at the national level. At the local level (i.e., inside the health facilities), most of the informants have agreed that the majority of hospitals have utilized processes which fit with the implementation of Telehealth. These processes can be categorized as Administrative processes, Laboratory processes, Radiology processes, Pharmacy processes, Clinical documentation processes and Reporting processes. The Ministry does not enforce hospitals to follow a certain type of categorization of processes but hospitals define its own categorization of processes according to their environment and capacity. Overall, all informants agreed that Telehealth will be appropriate with the health processes mentioned above.

At the international level, there are identified processes which feed the Ministry with health information that needed for the decision makers to create and establish new plans and policies, these processes can be categorized as: Demographic indicators; alerts of diseases; and reports related to the Shortages of health facilities, health professionals and health equipment, the availability and quality of healthcare services and the whole current health status monitoring. Director of the Malaria control program said” We have information system to gather information about the affected areas of malaria and issuing alerts in case of dangerous rates. But, this system is not linked to a unified data base; therefore it is preferred to use Telehealth to link all health facilities in Yemen”. Overall, all informants agreed that Telehealth will facilitate the national processes.

Information: All informants agreed that health information represents a great importance to the Ministry. The analysis of transcripts of the interviews revealed that health and statistical information are needed by the Ministry to complete its activities. The result of interviews pinpointed that there is no unified mechanism that is utilized by health facilities to gather and transmit the data from districts (i.e., rural) to governorates and then to the Ministry. Moreover, there is no tool that measures the credibility of these data after processing and analyzing the received data and then using it to issue the annual report. Overall, Most of the informants agreed that Telehealth will support the Ministry activities.

Cultural, Ethics and Behavior: It is believed that Islam rules are the most important factor that may affect on adopting new thing such as a technology in our country. All informants have emphasized that if the new behavior conflicts with Islam’s rules, it will be rejected by the government and people. Norms play an important role in determining behavior. The following are some of the informants’ opinions: “We will accept to do something new, if does not conflict with our customs and traditions”. “Some basics of Telehealth system must be translated from English into Arabic, such as entries and queries. This is because most nurses and managers who cannot deal with the English language”. “It must hold awareness sessions on Telehealth for both health recipients and health professionals in order to increase their knowledge that Telehealth does not conflict with the teachings of Islam or with customs and traditions”. “It must treat cautiously with some customs and traditions such as confidentiality and privacy”. “It must treat cautiously

with women. In our country, women resist to diagnosis their cases by a man. Moreover, resist taking a picture and using video conferencing. Therefore, it must inform them that it is normal, safe and confidential”. “There is no culture of use of information for decision making among the health professionals”. Overall, Telehealth must not conflict with Islam rules.

Services: Informants placed a large emphasis on improving the health situation in rural areas. Using Telehealth is a must to provide some electronic services by health facilities such as video conferencing, consulting, continuing education and managing health information.

Infrastructure: Analysis of the transcripts of the readiness assessment interviews revealed that, the components required for Telehealth implementation in Yemen are available at the governorates level and at the national level such as hardware, software, network, Internet, etc, but it is not appropriate in term of capacity, speed and modern. Moreover, the infrastructure of the Ministry of Public Health needs to be improved. Furthermore, the Ministry of Public Health has the basic of ICT that was distributed in some of the rural health facilities such as telephone lines and computers. Also, the informants asserted that this ICT infrastructure could be using it to connect the Internet and run the Telehealth as a first step. Furthermore, the interviews revealed that, the electricity problem in Yemen must be taken as a serious matter. Overall, serious steps must be taken to improve the level of Infrastructure.

Applications: Analysis of the transcripts of the readiness assessment interviews revealed that the Ministry does not have unified health information system, unified database, electronic health record and Telehealth system. Also, most of the informants asserted the need of developing unified health system and national data repository with all relevant data and reports. Finally, others suggested developing a national data warehouse and improving a unified health information system and harmonize its data. The Director General of Information and Research Department said “Despite the improvement efforts, the health system remains underdeveloped. That’s due to low allocated budget and poor planning. I think using ICT will solve this problem”. Overall, serious steps must be taken to improve existing systems and develop new applications.

People, Skills and Competencies: The interviews with informants confirmed that the Ministry of Public Health has adequate capacity in ICT such as trained staff with great skills. In addition, the Ministry has distributed ICT trained staff across all governorates and one-third of rural areas. In spite of above information, the Ministry cannot provide technical support to all governorates and rural areas due to financial and logistics constraints. Director General of Information and Research Department said “We have assessed the human resources and we found out that the Ministry of Public Health has health professionals who are having skills and experience in using ICT and health information systems”. The result shows that the health professionals are ready to use Telehealth system to meet their needs. Moreover, they expressed some concerns privacy and confidentiality of their data. Summary of all above, most of the informants agreed that Ministry of Public Health has sufficient human resources to use ICT and Telehealth.

The Will: The interviews revealed that willingness is one of the most important factors that affect in succeeding projects. It is noteworthy that most of the initiatives that have failed because of the lack of willingness by the leadership of the Ministry in order to make it work.

Training and Awareness: Telehealth is a new technology for most of health professionals in Yemen. It requires changing the way of delivering health services from traditional mode to newest mode. So, it can be expected that it will be resisted by those who do not yet understand it. For this reason, it is necessary to give the health professionals and recipients training courses and awareness sessions about Telehealth in order to understand the Telehealth.

DISCUSSION

Readiness is an important predictor of successful change implementation Weiner³³. Moreover, it becomes an essential requirement prior to Telehealth implementation Jennett et al¹³. Therefore, the readiness should be assessed before successful implementation of Telehealth.

This paper proposes a validated Yemen Telehealth Readiness Assessment Framework (YTRAF) to assess the readiness of the Ministry of Public Health to successfully adopt Telehealth in Yemen. In the line to achieve this,

YTRAF framework has been used to develop a validate Yemen Telehealth Readiness Assessment Tool (YTRAT) which is a useful and necessary tool for collecting data to help a country to identify and thus addresses areas require further attention in order to undertake a successful Telehealth initiative Wickramasinghe et al³⁴. Furthermore, it facilitates and used as guidelines for assessing the readiness by the researcher, policy-makers and health professionals.

Much works are required for Yemen to be ready for adopting Telehealth. In addition, more emphasis is needed on identifying the deficiencies which cause unready situations. In fact, Yemen is in need to use Telehealth due to its potential to address diverse problems by increasing the quality, accessibility, deliver health services at a distance and cost reduction Bashshur et al²; Yellowlees³⁵. Therefore, the Ministry of Public Health should be assessed in order to have a clear understanding of what is expected when they are implementing Telehealth.

Discussing the Telehealth readiness assessment result revealed that the Ministry of Public Health is in need great efforts to raise the level of its readiness in several areas to be ready for successful and sustainable adoption of Telehealth. Moreover, to assess the Telehealth readiness there are several factors should be taking into account due to their effect on the adoption of Telehealth such as realization of problem, expression of dissatisfaction, recognitions of benefits, Telehealth as a solution, existing and new policies, framework, organization structure, internal process, international process, information, cultural, ethics and behavior, services, infrastructure, application, the will, people, skills and competencies and awareness and training.

CONCLUSION

Three contributions have been made by this paper which are Yemen Telehealth Readiness Assessment Framework (YTRAF) has been developed to investigate the readiness of health institutions in regard to adoption of Telehealth; Yemen Telehealth Readiness Assessment Tool (YTRAT) has been developed for collecting data to investigate the readiness of health institutions in regard to adoption of Telehealth; and this is the first research that studies adopting Telehealth deeply in order to improve the current healthcare system in Yemen.

The limitations are: The scarcity of studies on Telehealth readiness for Yemen; the researchers have got important official documents, reports and assessments about the current Yemeni health system, but it was not used for research purposes because it is classified as a secret (i.e., not allowed for publishing); and some interviewees had given too much information, while, others have concealed the important information.

Yemen is one of the least developed countries. Due to the great similarities in settings between Yemen and the rest of the least developed countries, findings can be generalized and, YTRAF and YTRAT can be used for the least developed countries.

Does Rural People Socially Mobile? Evidence from Northern Region of Malaysia

Zalina Zainal¹, Mukaramah-Harun¹, Siti Hadijah Che Mat¹

¹*School of Economics, Finance and Banking UUM COB, Universiti Utara Malaysia, 06010 UUM Sintok, Kedah Darul Aman, MALAYSIA*

ABSTRACT

Inspired by the idea of promoting equality opportunities across individuals can enhance economic growth through the allocation of human resource based on their best use, we examine the extent of inter-generational social mobility in Northern region of Malaysia. Using both descriptive and Ordinary Least Square (OLS) estimation, we analyze the possibility of income and occupation change of the poor households in rural areas. The findings demonstrate that both level of education and type of occupation reflect a significant improvement of inter-generational social mobility. Interestingly, the findings also indicate that social mobility in Malaysia is relatively higher than in other countries where more space and equal opportunities are enjoyed by all walks of life in the nation.

Keywords: *Intergenerational social mobility, poverty, income*

INTRODUCTION

Since independence, Malaysia economy has grown rapidly and greatly enriched Malaysians. In merely 57 years, Malaysia has transformed from a backward society rife with poverty into a country with one of the lowest poverty rates in Asia, poverty incidence at about 1.0 percent of population in 2014. However, the significant reduction in poverty is not accompanied with significant reduction in income inequality. Shows by the Gini coefficient which remains high at 0.41 in 2014 (World Bank, 2015). According to Mukaramah, SitiHadijah and Zalina¹⁴, Malaysia Gini coefficient has decreased only slightly from 0.51 in 1970 to 0.41 in 2014. Income disparity ratio between ethnic groups is still high where the income of the Chinese is more than one and a half times the income of the Malays and the income of the Indian is more than one times the income of the Malays in the 2000s. More significantly, rural-urban disparities seem to have risen. Income disparity between rural and urban households deteriorated from 1:1.81 in 1999 to 1:2.11 in 2013. The rural-urban income disparities in 2013 are found to be almost at the same level as in 1989.

Hence, income inequality is still regarded as one of the major problems in Malaysian economy. However, measures of income inequality are like snapshots that

cannot tell anything about lifetime income or mobility. They just reflect differences in income at a specific point in time, but not whether those at the top or bottom of the income distribution are moving up or down or expect to do so.

Therefore, intergenerational social mobility is an issue of concern; from a social justice perspective; a society where the children of the poorest families continue to be among the poorest, and the children of the wealthiest families continue to be the richest, should be undesirable. A branch of economics literature has developed models where initially, a society is divided into a group of rich and a group of poor people. Richer group invests in human capital and therefore has higher labour income within skilled formal sector and bequeaths resources to their descendants' education. With decreasing fertility rates, rich dynasties maintain and perpetuate their status. The second group invests insufficiently in human capital, works in the unskilled sector and generation after generation leaves less inheritance to their children. Greater fertility rates associated with this group helps to uphold poverty conditions. If there is neither intergenerational mobility between the generations nor public policies to promote it, the initial distribution of "rich" and "poor", associated fertility rates and many other variables determine if this society converges to a situation of inequality or more equality.

Within the context of Malaysia, there are many reasons why the issue of intergenerational mobility should be examined. Intergenerational mobility may improve equity by reducing economic inequality, promoting social justice and achieving a more equitable allocation of resources. The extent of intergenerational mobility may thus be seen as a measure of equality of opportunity. Intergenerational mobility may also be an instrument for achieving greater economic efficiency. If inequality is found to arise from lack of social mobility, this may have serious policy implications. A revisit on the educational policy, early childhood investment and health care policy seems very important as these policies could affect the extent to which the social and economic position of individuals in a society is determined and inherited. This to ensure that the social and economic position of individuals in a society is determined by their skills and ambitions rather than by inherited advantage or disadvantage. The ways resources are allocated across generations may influence overall social welfare defined over the entire income distribution of different generations (Atkinson¹). Indeed, in all present actions, past and future generations are inherently represented: past generations, because current actions embody their legacy, and future generations, because current decisions affect their well-being through the various endowments that they will inherit.

In Malaysia, it is crucial to measure the 'equality' of society more along the lines of economic social mobility rather than purely through the income or wealth measures. The idea is to have people begin at more or less the same starting point, then proceed in accordance to their own ability and willingness to work. Economic mobility in this sense means that whatever your personal circumstances, you can reach the top of the social and economic ladder. Therefore, instead of focusing on inequality, economists should examine a more comprehensive measure of social mobility which provides a better measure of changing opportunities than do traditional measures of inequality.

Therefore, in this study, we propose to measure and analyse the existence and the extent of intergenerational social mobility in Malaysia by focusing on the phenomenon of rural people getting out of the poverty circle. The analysis is based on a survey of the rural households in the northern region of Malaysia, comprising the states of Kedah, Perlis, Pulau Pinang and

Perak in 2015. Hence, this paper is organized as follows; in the next part, the literature review and methodologies were discussed. Then the researchers report empirical results and conclusions of the study and discussion of further policy implications are discussed in the last part of the paper.

LITERATURE REVIEW

The issue of social change and transformation of rural communities in Malaysia has been the subject of study in earlier landmark works by Ungku Aziz in the 1960s and Ishak Shaari in the 1980s. However, specific studies in the intergenerational social mobility are very few in Malaysia. Among them are (Lillard and Willis¹²; Lillard & Kilburn¹¹; Solon¹⁶).

Lillard and Willis¹² explored evidence concerning the relationship between parents' and children's education using the Second Malaysian Family Life Survey (MFLS-2), which contains information on the education of as many as four generations within a given family. These data allow the authors to study the spread of education in Malaysia over much of this century by examining the educational attainment of birth cohorts from 1910 to 1980. More significantly, the authors used these data to study the effects of parental education on the progress of their children through elementary, secondary, and post-secondary school within a sequential discrete-time hazard model, which allows for correlations among unmeasured family and individual-specific components. For a subset of the cohorts, the authors were able to introduce time-varying covariates to measure a family's economic circumstances, the quality of its environment, and the composition of the subset at the time a given decision is made. Lillard & Kilburn¹¹ estimated a value of 0.26 for Malaysia's elasticity, meaning that, one percent increase in parent education affects 26 percent increase in the education of children. In other words, an increase of approximately one level of parent education will lead to education of children increased by two levels. Based on this study it was found, that educational upgrading between generations was a core influence for improving mobility.

A burgeoning literature has estimated the extent of intergenerational earnings mobility for other countries. Blanden⁴ used data for Britain, the United States, West Germany, Canada, Sweden, Norway, Finland, and

Denmark, and concluded that “America and Britain have the highest intergenerational persistence (lowest mobility)”. Conversely, the Nordic countries and Canada are the most mobile. Moreover, Jänttiet *al*^P compared mobility in Finland, Denmark, Norway, Sweden, the United States and United Kingdom using mean regression procedures and transition matrices. The results show that Denmark is the most mobile country (with an intergenerational elasticity of earnings of 0.071), followed by Finland (0.173), Norway (0.155), Sweden (0.258), United Kingdom (0.306) and the United States (0.517).

Meanwhile, Orsetta Causa, Sophie Dantan and Åsa Johansson (2009) provided a comparable estimate of intergenerational wage and education persistence across 14 European OECD countries based on a new micro data from Eurostat. The empirical estimates show that the relationship between parental or socio-economic background and offspring’s educational and wage outcomes is positive and significant in practically all countries. Intergenerational wage persistence is relatively high in southern European countries, as well as in the United Kingdom. Likewise, intergenerational persistence in education is relatively high both in southern European countries and in Luxembourg and Ireland. In contrast, both persistence in wages and education tends to be lower in the Nordic countries. Intergenerational social mobility is measured by several different indicators since no single indicator provides a complete picture.

In his analysis, Corak⁸ noted the large cross-country differences between on the one hand Denmark, Norway, Finland, Australia and Canada where the elasticity is less than 0.20, and the United States, United Kingdom and Italy, where the estimated elasticity is higher than 0.40. For example, an elasticity value of 0.50 - as in Italy or the United Kingdom - implies that 50% of the relative difference in parental earnings is transmitted, on average, to their children. An elasticity of 0.15 (as in Denmark) implies that 15% of the difference in parental earnings is transmitted to their children.

Chetty *et al*⁷ presented new evidence on trends in intergenerational mobility in the United States using administrative earnings records. They found that percentile rank-based measures of intergenerational mobility have remained extremely stable for the 1971-1993 birth cohorts. For children born between 1971 and 1986, they measured intergenerational mobility

based on the correlation between parent and child income percentile ranks. For more recent cohorts, they measured mobility as the correlation between a child’s probability of attending college and her parents’ income rank. They also calculated transition probabilities, such as a child’s chances of reaching the top quintile of the income distribution starting from the bottom quintile. Based on all of these measures, they found that children entering the labour market today have the same chances of moving up in the income distribution (relative to their parents) as children born in the 1970s.

The literature reveals a general consensus regarding the importance of education to the capacity of people to be upwardly socially mobile. Lochrie (2004) discussed the connections between parental education with child poverty, low educational attainment, family dysfunction and social exclusion in the United Kingdom. He also discussed how educational opportunities for the whole family can transmit the motivation to succeed to children. Lillard & Kilburn¹¹ showed that education regimes where access to education is unfavourable to lower income families adversely affect intergenerational mobility. Solon¹⁶ theoretical model reveals that a more progressive public investment in human capital tends to increase mobility. Another theoretical model by Davies, Zhang and Zeng (2004) affirms that “starting from the same inequality, mobility is higher under public than under private education”. However, an empirical study of Britain by Blanden, Gregg and Machin (2005) found that “the big expansion in university participation has tended to benefit children from affluent families more and thus reinforce immobility across generations”.

Chusseau, Hellier and Ben-Halima (2014) reviewed the economic literature on the impacts of several dimensions of education upon intergenerational inequality persistency. They stated that the critical increase in the population education level in all countries has not come with lower inequality. The basic tools of education and intergenerational mobility modelling are subsequently exposed education functions, education decision making etc. In the theoretical review section, they analysed the cases in which education leads (i) to human capital convergence in the long term and (ii) to social stratification with the emergence of under-education traps. A simple modelling of both cases is proposed for two types of educational decisions, one based on the family expenditure on education and the other on the time spent for education. The

factors that generate social stratification and under-education traps are especially underlined. Next, the empirical literature on the determinants of educational attainment and intergenerational mobility is reviewed. The review reveals the crucial impact of family backgrounds on educational attainment in all countries. It also demonstrates huge and lasting differences across countries in terms of intergenerational mobility.

Louw, Berg and Yu (2006) investigated the role that parents' education plays in children's human capital accumulation. The study analyses patterns of educational attainment in South Africa during the period 1970-2001, asking whether intergenerational social mobility has improved. It tackles the issue in two ways, combining extensive descriptive analysis of progress in educational attainment with a more formal evaluation of intergenerational social mobility using indices constructed by Dahan and Gaviria (2001) and Behrman, Birdsall and Szekely (1998). Both types of analysis indicate that intergenerational social mobility within race groups improved over the period, with the indices suggesting that South African children are currently better able to take advantage of educational opportunities than the bulk of their peers in comparable countries. However, significant racial barriers remain in the quest to equalise educational opportunities across the board for South African children.

A recent study conducted by researchers from the London School of Economics and Political Science (LSE) concludes that part of the reason for the decline in mobility in Britain has been the increasing relationship between family income and educational attainment - "this was because additional opportunities to stay in education at both age 16 and age 18 disproportionately benefited those from better-off backgrounds. The research also shows that "family income in the childhood years does make a genuine difference to educational outcomes, rather than reflecting other aspects which differ across families."

Azevedo and Bouillon (2010) stated that while intergenerational education mobility have improved in recent decades, which may increase income mobility for younger cohorts, overall, the Latin American region still presents lower intergenerational social mobility. Previous studies suggest that these results might be associated to social exclusion, low access to higher education, public policies and labour market discrimination. Joseph Rowntree Foundation (JRF 2005) found that class

origins were the key to children's occupational outcome but that having economic assets in the home, and having a highly qualified mother were also very important.

According to d'Addio (2007) parental background can influence their offspring's wages in various ways. In very general terms, parental background can affect these wages by boosting both the offspring's labour productivity and their successful insertion in the labour market. One way in which children's productivity, and hence their future incomes, can be enhanced is through the ability of parents to invest in their offspring's human capital. However, wealth and assets passed on from one generation to another, the inheritance of traits that are important for economic success, such as propensities to undertake education, work ethics and risk-related behaviours, as well as local conditions such as growing up in advantaged neighbourhoods are other important factors explaining the transmission of income across generations.

Based on a cross-country comparison, Esping-Andersen (2004) concluded that it is the social and cultural capital that parents are able to pass onto their children that might explain a lack of change in social mobility in many European and North American countries during the post-war period, despite a comprehensive schooling system.

Eberharter (2013) used data from the German Socio-Economic Panel (SOEP), the Panel Study of Income Dynamics (PSID), and the British Household Panel Survey (BHPS) to analyse the hypotheses that the extent and the determinants of intergenerational income mobility and the relative risk of poverty differ with respect to the existing welfare state regime, family role patterns, and social policy design. The empirical results indicate a higher intergenerational income elasticity in the United States than in Germany and Great Britain, country differences concerning the influence of individual and parental socio-economic characteristics, and social exclusion attributes on intergenerational income mobility and the relative risk of poverty.

Causa and Johansson⁵ noted that public policies such as education and early childcare play a role in explaining observed differences in intergenerational social mobility across countries. In addition, their study also found a positive cross-country correlation between intergenerational social mobility and redistributive policies.

Causa, Dantan and Johansson⁶ examines the potential role of public policies and labour and product

market institutions in explaining observed differences in intergenerational wage mobility across 14 European OECD countries. Their empirical results show that education is one important driver of intergenerational wage persistence across European countries. There is a positive cross-country correlation between intergenerational wage mobility and redistributive policies, as well as a positive correlation between wage-setting institutions that compress the wage distribution and mobility.

METHODOLOGY

Data: This study involves four states in the north Peninsular Malaysia which are Perlis, Kedah, Penang and Perak. All respondents are located in the rural areas. The sampling frame was obtained from the Statistics Department, Kuala Lumpur. From originally 400, only 333 samples were suitable for analysis after undergoing data refining process. All these respondents met the study criteria which is a father who is 50 years old and above and had at the very least one son who is working. Based on the respondents' profile, we conclude "father" as head of household even though it may include mother as a head of household, so the term of "father" is used to simplify the respondents' terms.

To achieve the study objectives, we employ the descriptive analysis and the regression model. In the descriptive analysis part, we first examine the extent of the inter-generation social mobility by looking at the social mobility indicators of the respondents (fathers) and their son.

Explanatory Variables: Based on literature review, we included nine independent variables which are Father education level (Edu_Father); Father attitude (Att_Father); Father community involvement (Inv_Community); Asset ownership in the family (Asset); Existence of a university in vicinity of the respondent's house (Avaialbe_Uni); Distance of respondent's house to town centre (Near_Town); Distance of respondent's house to highway (Near_highway); Distance of respondent's house to bus station (Near Bus Station) and Location of respondent's house to tourism centre (Near_TourismLoc).

As our interest in this research is to investigate the influence of father's education on social mobility, the variable Father education (Edu_Father) is included to examine whether a father's level of education will give an

impact on the probability of occurrence of social mobility or not. Here, dummy variable is used for the father's level of education. We assign the value of one (1) to fathers who have primary school education level, the value of two (2) to fathers who have secondary school education level and the value three (3) to fathers who have tertiary education level. The preliminary expectation of the study is Father education level will positive significantly affect the occurrence of social mobility.

Besides Father education level, Father attitude (Att_Father) and Father involvement in the community (Inv_Community) are also expected to influence the probability of occurrence of social mobility. Father's attitude or more accurately the self-spirit of the father while bringing-up his children probably influence their educational attainment.

Father's attitude is measured using a likert scale for a few constructed items. In this study, the chosen items to measure the father's self-spirit are hardworking, willingness to learn new things, willingness to take risk, and not easily discouraged. The respondents are requested to state the level of their spirit for each given item from highly disagreed; value one (1) to highly agreed; value five (5). All answer choices will be summed up and then transformed into percentages. The study expects that there will exist a positive relationship between fathers' attitude or self-spirit (Att_Father) and the probability of occurrence of social mobility.

Furthermore, we are also interested in investigating the effect of fathers' involvement in the community (i.e. how active the parent is within the community) on the probability of occurrence of social mobility. In the study, we categorised local community activities into four as follows: Parents-Teachers Association (PTA); Village Sub-Committee; MosqueCommittee and Neighbourhood Watch Activities.

The respondents were asked whether they are involved in these activities or not and the extent of their involvement. There are three involvement level categories listed in the survey questionnaire: not involved, occasionally, and frequently.

For analytical purpose, respondents' involvement result score will be summed up and then transformed into percentages form. The study expects that the more active the respondent or the higher score that he obtains

show how active a respondent is and the study expects that there exists a positive relationship between fathers' involvement and the occurrence of social mobility.

Moreover, the government's role in development which is the space and opportunity provided by the government is also expected to influence the probability of occurrence of social mobility. Five government development elements are used in the study namely Existence of a university in the vicinity of respondent's house (Available_Uni); Distance of respondent's house to town centre (Near_Town); Distance of respondent's house to highway (Near_highway); Distance of respondent's house to bus station (Near Bus Station) and Location of respondent's house to tourism centre (Near_TourismLoc).

These development elements are measured using Likert Scale (1-5) based on the contribution and influence of their existence to the respondents, from the value one (1) highly not contribute to the value of five (5) highly contribute. The likert values obtained are summed up and then we uses percentage scale for estimation purpose. The study expects there exists a positive relationship between all five elements with the probability of existence of social mobility.

Next, the study also considers asset ownership (Asset) factor in influencing the probability of occurrence of social mobility. There are five (5) asset items considered, namely shares/savings, land area, house ownership, rented house and machine ownership. It is expected that the higher the number of assets owned, the higher the probability of occurrence of social mobility.

Descriptive Analysis: The descriptive analysis focuses on the education and job profiles of the fathers and their son as a core assessment on the reality of empirical facts in understanding the extent of the occurrence of social mobility between generations that is, fathers who live in the rural areas and their son.

Regression Model: Based on the definition, "social mobility is the ability of individuals or groups to move upward or downward in status based on wealth, occupation, education, or some other social variable". Based on the literature, there is no strong evidence that support the best indicator for social mobility. Therefore, in some empirical studied such as Lillard and Willis¹², the relationship between parents' and children's' education is estimated to measure the extent of social mobility.

Causa, Dantan and Johansson⁶ for example, estimate of intergenerational wage (wage outcomes of children) and education level (parental background) as a proxy of intergenerational social mobility.

Then, in this study we measure the extent of social mobility by estimating the intergenerational earnings elasticity between fathers and their son. In a perfectly mobile society, there will be no statistically significant relationship between the earnings of fathers and their son, while in an entirely immobile society, fathers and their son will occupy precisely the same positions in the earnings distribution. As a proxy for fathers' earnings, we use educational attainments. Based on the previous studies, parents' education plays an important role in determining children human capital accumulation. Family income in the childhood years does make a genuine difference to children educational outcomes. These studies suggest the higher level of parents' education the higher the opportunities of their children to have higher outcomes.

The theoretical model of Becker and Tomes^{2,3} allows estimation of intergenerational income mobility through the following equation:

$$\ln Y_{i,t} = \alpha + \beta \ln Y_{i,t-1} + \varepsilon_{i,t}$$

where $Y_{i,t}$ is the children's permanent income when they are adults (t indexing the generation and i the family) and $Y_{i,t-1}$ is the permanent income of parents (generation $t-1$), α is the average income of the children (generation t) when adults, $\varepsilon_{i,t}$ captures unobserved components and β reflects the relation between the income of individuals and that of their parents.

This "intergenerational elasticity" expresses the fraction of relative income differences that is transmitted, on average, across generations; positive values imply generational persistence means that higher incomes of the parents will lead to higher child's incomes, while negative values imply generational reversion of income (i.e. higher parental income leads to lower child outcomes). In general, the empirical evidence suggests a parameter $0 \leq \beta \leq 1$.

FINDINGS

Social Mobility through Education: Table 1 shows information about the formal education possessed by the respondents who are fathers and the respondents'

son. The level of formal education is divided into four classifications, which are no schooling, primary school, lower secondary school (SRP/PMR), higher secondary school (SPM), tertiary education (diploma/degree).

This study examines the highest level of formal education attained between two generations, that is, the education level of parents and children. As shown in Table 1, the level of educational attainment by two generations, that is between parents (the new era of independence) and child (around 25-30 years earlier) shows a significant improvement. In accordance with the life in the new era of independence with rampant deprivation and limited access to education, 32.1 percent of the fathers have never received any formal education. Moreover, only 67.9 percent of the fathers have gone through a formal education system where 39 percent have attained secondary education level and 1.5 percent have tertiary education.

There is a noticeable increase in the level of education obtained by the sons where almost 100 percent of them have received formal education. Moreover, only 0.3 percent have never received any formal education while 1.8 percent have received primary education. Almost 98 percent of them have secondary level of education and above. In fact, almost 40 percent of the son has received a tertiary education.

Generally, the study has found that there has been a transformation in terms of mobility in rural communities based on the educational aspect that is achieved by the two generations under study, the generations of parents and children. Mobility by level of education is recognized in importance as a key prerequisite for achieving a better life for the rural communities. This reflects that people have become more aware of the importance of formal education in life. In addition, through the well-organised national education system, rural people are able to obtain formal education.

Table 1: Level of Education of Father and Son

Level of Education	Father		Son	
	Frequency	Percent	Frequency	Per cent
No Education	107	32.1	1	0.3
Primary School	91	27.3	6	1.8
Secondary School	130	39.0	198	59.5
Tertiary (College and University)	5	1.5	128	38.4
Total	333	100	333	100

Social Mobility through Occupation: A key feature that is often synonymous with rural communities is their dependence of their economic resources on agriculture. This section examines whether these communities still rely entirely on being a farmer, or have experienced occupational mobility between the generations of parents and sons.

Generally, the results show that there has been a substantial shift of employment between fathers and sons. The occupation as a farmer for a major source of income has been less interesting for the next generation. Occupation with the private and government sectors is more appealing and has increased in percentages for the current generation or the respondents' sons.

Table 2 and 3 show the types of employment and categories of occupation, respectively, for both fathers and sons. Most of the fathers are employed in the agricultural sector (48.35 percent) and most of them

are self-employed (70.27 percent). They are mainly involved in agricultural activities such as being rubber tappers, paddy-field farmers, coconut pickers, carpenters and fishermen. This is followed by 14.71 percent who do small-scale business. Meanwhile, of the respondents who work for a fixed salary 7.81 percent work in the private sector and 21.7 percent are in the public sector. The types fathers' occupation categorised as public and private employment category are professional (3 persons), technician (1 person), clerk (4 persons) and sales and services worker (3 persons).

Although there are sons who remain working in the agricultural sector, the number is significantly lower where only 15.3 percent of them are working in this sector. Another occupational category or labourers also shows a decline between the fathers and sons generations, from 22:52 percent to 15.92 percent. Similarly, participation in business shows an increase between fathers and sons, from 7:51 percent to 14.71 percent.

In contrast, social mobility in terms of public and private employment shows significant improvement between fathers and sons with an increase from 7.81 and 7.21 percent to 28.23 and 20.42 percent, respectively. This implies that economic activities in Malaysia are oriented towards the non - agricultural sector.

Job categorised as professionals also shows an interesting finding that is the percentage of sons in this category are significantly higher than the percentage of fathers. Since most of the sons are highly educated, it is expected that their occupation level would also be relatively high as compared to their fathers.

Table 2: Types of Employment of Father and Son

Type	Father		Son	
	Frequency	Percent	Frequency	Per cent
Employer/business	49	14.7	25	0.3
Government worker	24	7.2	68	1.8
Private sector worker	26	7.8	94	59.5
Self-employed	234	70.3	127	38.4
Total	333	100	333	100

Table 3: Categories of Occupation of Father and Son

Categories	Father		Son	
	Frequency	Percent	Frequency	Percent
Managers	0	0	0	0
Professionals	3	0.9	47	14.1
Technicians and associate professionals	1	0.3	27	8.1
Clerical support workers	4	1.2	44	13.2
Service and sales workers	3	0.9	10	3
Market-oriented skilled agricultural and livestock workers	0	0	0	0
Market-oriented skilled forestry, fishery and hunting workers	0	0	0	0
Subsistence farmers, fisherman hunters and gatherers	161	48.4	51	15.3
Craft and related trades workers	2	0.6	0	0
Plant and machine-operators and assemblers	16	4.8	40	12.0

Armed forces occupations	1	0.3	14	4.2
Businessman	53	15.9	34	10.2
Total	333	100	333	100

Regression Analysis to Examine the Extent of Social Mobility: Observation based on the descriptive analysis (Table 1 to 3) indicates that a change in economic returns has occurred for the latter generation as proven by the diversity in their level of education and types of work compared to the previous generation. While the descriptive analysis has explained about the changing patterns of education and employment of children against their parents, the question is how far can a child change without being influenced by the economic status of their parents? In other words, does a child who has a father having low economic status, able to increase

his economic status than those who have a father with higher economic status? From another dimensional angle, the question that may arise is whether the son of a wealthy person will continue to be wealthy in his generation? If equal space and opportunities are given to the father, regardless of whether they have low or high economic status, the possibility of the occurrence of a change in economic status to the sons' generation is the same. Therefore, to analyse the overall size of the mobility that occurs, the correlation coefficient values between the generations are investigated to demonstrate the possibility of change between income classes.

The results of the OLS estimation analysis in Table 4 shows that the level of education of sons is affected by the father’s education level, the attitude of the father, and the government’s role in the development of the area which is the existence of a university in the area. We expect the existence of development in the local area can help the process of social mobility that occurs for example, the establishment of a university, in addition to generating employment opportunities, can also provide spillover effect in terms of awareness of the importance of education to the locals. Therefore, the development could contribute positively to the respondents in that area.

Based on Table 4, the coefficient Edu-Father value is used to measure the possibility of mobility between generations and the finding indicates that the level of education of the father (Edu_Father) is positive and significant in influencing the sons’ level of education at the 1 percent significance level. The estimated intergenerational correlation coefficient is 0.12 that shows the former generation is able to transfer its economic status to the next generation.

Furthermore, the correlation coefficient value (0.17) is lower than the result obtained by Lillard and Kilburn¹¹ who estimated a value of 0.26 for Malaysia’s elasticity.

This result also confirmed Solon’s survey in 1999 which found that Malaysia as a developing country is more mobile than developed countries. Thus, it also supports previous finding that found the estimated elasticities are higher for developed countries, such as Corak⁸ noted that the estimated elasticity of the United States, the United Kingdom and Italy is higher than 0.40. Meanwhile, Jäntti⁹ found that estimated elasticity of the United Kingdom and the United States are at 0.306 and 0.517, respectively.

The findings reflect that social mobility in Malaysia is higher than in other countries where more space and equal opportunities are enjoyed by all walks of life in the nation’s development. In other words, there is a change in the economic status of in the children’s generation (sons’ education level is higher) even though they may have a father who has low economic status (low level of education). For example, the education level of the father is only at primary school or do not attend school, but the education level of the son is found to have changed to a higher level (up to tertiary level). The results based on the value of the correlation coefficient between generations has strengthened the research findings based on the descriptive analysis which shows that there exists an increase in the son’s level of education regardless of the educational status of the parents.

Table 4: Determinants of Son’s Education Level in Malaysia

Dependent Variable Son’s Education Level	Son’s Education Level (primary school, secondary school (1-3), secondary school (4-5), college/diploma/stpm, university (first degree), Masters and above)		
Independent Variable	Coefficient	Standard Error	P Value
Constant	0.485	0.782	0.536
Edu_Father	0.167	0.054	0.002
Att_Father	0.280	0.121	0.021
Inv_Community	-0.025	0.171	0.885
Asset	0.001	0.010	0.910
Avaiable_Uni	0.175	0.053	0.001
Near_Town	-0.014	0.063	0.829
Near_Highway	-0.026	0.065	0.682
Near_Bus Station	-0.020	0.030	0.513
Near_TourismLoc	0.041	0.048	0.399

CONCLUSION

Overall, the study shows there has been a change between the fathers’ generation who live in the rural areas and children that reflects the transformation of society from one social position to a better social position. Our

finding indicates that there is a change in the economic status of in the children’s generation (sons’ education level is higher) even though they may have a father who has low economic status (low level of education). Therefore, changes in the mobility form should be seen within the framework of a multi-causal or multi-factoral

analysis. For social mobility to occur, the person needs a combination of the driving factors, in particular, the factors of education, occupation, attitude and the role of government simultaneously through the effect of some development infrastructure in that area. Those that are in the high mobility position are fathers who have strong spirits and internal ability compared with fathers who experienced decreased mobility. Strong internal ability is seen through high self-regard to change. Moreover, the existence of the university near the respondents' area is perceived as one of the main factors that influence social mobility.

ABSTRACT

This piece aims to examine the outcome of number of factors on the business performance among SMEs Malaysia. A sampling survey was shared to 500 identified respondents in Malaysia. A total number of 207 valid responses were obtained. Results show significant relationship between each of the two (out of three) independent variables and SME business performance. Social capital emerged as the most germane factor controlling the SME business performance. This component is followed by social innovation. Results also indicated that social capital and social innovation have notable influence on the SME business performance. This research paper is perhaps of the first to investigate SMEs involvement in social entrepreneurship activities particularly leading to improve the business performance using comprehensive set of variables through RBV Theory, Social entrepreneurship and SME growth Performance model in investigating their influence on SMEs business performance.

Keywords: Social Entrepreneurship, Innovation, Knowledge, Malaysia, SME, Performance

INTRODUCTION

Malaysian New Economic Model (NEM) clamour for inclusiveness of all social strata in economic activities, including underprivileged groups who are typically the beneficiaries of Social Entrepreneurship activities. There is a growth of the microfinance industry throughout the world which now reaches more than 100 million customers worldwide Alekam et al¹; Alekam et al²; Rhyne 2010). Social entrepreneurship is having profound hints in the economic system: creating new industries, validating new business models, and shifting resources to abandon societal issues.

Ashoka's Founding CEO, William Drayton, who is recognised with creating the term "social entrepreneurship" Alekam et al¹; Hsu, 2005; Sen, 2007) and Bornstein (2004) considers that Asoka definition of social entrepreneurship is the most inclusive. Praszkiel, R., and Nowak, A¹⁵ reported that Asoka's definition of social entrepreneurship is new creative idea for solving a critical social matter, with an entrepreneurial behaviour,

visioning broad social impact of design and possess an unquestionable ethical thread.

The pure definitions of social entrepreneurship slash through fields and notions, indicating that the phenomenon exists in some dimensions. The central dimensions of social entrepreneurship are identified: social mission, social innovation, social change, entrepreneurial skills and personality.

Social entrepreneurship can be seen as a plan which is developed by a person or groups of people coming together to generate, dispense, and sustain or disseminate social or environmental value in a new way through enterprise operations, such as social enterprise, non-profit, private or public institution Granados et al., 2011; Lan, & Zhu¹²; Zahara, & Wright²⁰.

Underpinning theory: Resource-based Theory: The Resource Based Theory initiated from the design of the industrial organization firm standpoint (Russo & Fouts, 1997). Many theorists of resourced-based theory advocate that the triumph of the firm is determined by

both internal and external factors (Dierickx & Cool, 1989; Prahalad & Hamel, 1990; Wernerfelt, 1984). Organization attains sustained competitive benefits through the implementation of strategies exploiting their internal power by means of responding to their environmental opportunities while simultaneously dealing with external threats and keeping clear of internal weaknesses (Barney, 1991). Hence, the resource-based view studies the relationship between the organization's internal characteristics and its organizational performance as well as its capacity to maintain profitability. The theory suggests that every organization has clear resources and capabilities, that provide the essential for the organizational strategy and is the principal foundation of the organization's competitive advantage (Barney, 1991; Grant 1991). The thesis emphasizes on the resources as a component that is not easily-duplicated within other firms in an attempt to obtain competitive advantage Grant, 1991; Kim, Song, & Triche¹⁰.

The attributes and behaviour of the entrepreneur may be considered as a firm's resource that offers internal and/or external benefits. Khan and Anjum (2013) describe that leadership could create competitive advantage by cheering creativity and innovation in the organization. In their empirical study, they proved that leadership firmly influences competitive advantage of an organization. In addition to that, Mahmood and Hanafi (2013) have empirically shown that leaders that have the elements of adventure, innovativeness and pro activeness, which is deemed as the characteristics of the social entrepreneurs' act, positively influence competitive advantage as well as organizational performance. The characterises and act of the entrepreneur in terms of social entrepreneurial behaviour and entrepreneurial leadership may also lead to the enhancement of the industry's critical point in the competitive market through the provision of resources and simultaneously upgrading organizational performance.

Resource-based View Theory for SME Performance:

In this piece, theoretical framework (Figure 1) laid on the resource-based view (RBV) theory of the industry (Masakure, Henson, & Cranfield, 2009; Lockett & Thompson, 2001; Barney, 1991) by Jay Barner, Progenitor of Modern resource-based view. This theory is a body of thought in strategic management, which has been applied to the analysis of SMEs in developing nations and also applicable for this research. The work of Penrose (1959), discovered this theory (RBV), who stated that unyielding is a collection of the productive resources of a wide range of strategic management topics

Alekam et al²; Kang & Park, 2012. Its focus is explained the differences in a solid performance by recommending that there can be heterogeneity of firm-level differences among firms, thereby leading to sustenance of competitive advantage among them (Lavie, 2004). More so, this theory (RBV) perspective is to insist on strategic choice that will charge the firm managerial performance with the germane task of identifying, deploying and growing key resources to maximise the available resources. There exists a possibility of firms to generate, attain and sustained a competitive advantage as suggested by Ricardian, especially when the firms 'resources are valuable, rare, imitable, and organised (VRIO, formerly known as VRIN; non-substitutable) (Kang & Park, 2012; Lavie, 2004; Peteraf, 1993; Barney, 1991; Conner, 1991). Also, SMEs do not have the required power on resources, this is because of the distinctive product available to lots of them (financial or nonfinancial) that can produce and hold on to competitive advantages. Hence, only a few of the many possible resources are capable of generating and able to sustain competitive advantage (Wade & Hulland, 2004). The growth process of a firm requires various patterns of resolution and strategies. SME growth viewed as a series of phases or stages of expansion through which the business may pass in an enterprise cycle. It is essential to be able to demonstrate more substantial long-term sight and strategic intent amongst owner-managers.

HYPOTHESES

- H1: Social knowledge having notable involvement on social entrepreneurship
- H2: Social innovation having notable involvement on social entrepreneurship
- H3: Social capital having notable involvement on social entrepreneurship
- H4: Social entrepreneurship having notable involvement on business performance

H5: Social knowledge having notable involvement on business performance

H6: Social innovation having notable involvement on business performance

H7: Social capital having notable involvement on business performance

H8: Social entrepreneurship mediate the relation between social knowledge and business performance

H9: Social entrepreneurship mediate the relation between social innovation and business performance

H10: Social entrepreneurship mediate the relation between social capital and business performance

RESEARCH METHODOLOGY

Sampling and Instrument: SMEs from Selangor, Malaysia area constitute the population of interest. An individual with the managerial position of each company selected to complete the questionnaire. About 500 companies that had been selected at randomly are also registered with the Malaysia Small and Medium Development Council. Investigators distribute 500 questionnaires and manage to collect 207 from the targeted respondents (41% responses). In the study, a 5-point. Like scale was used, as it is also commonly used in marketing research and tested time and again in marketing and social science fields (Garland, 1991; Morgan & Hunt, 1994; Luck & Rubin, 1987; Tan &Teo, 2000; Alekam et al¹; Alekam et al² and Shih & Fang, 2004).

RESULTS

Composite Reliability: The standardized factor loadings that are obtained from the current revised structural model gave the computations of composite reliability based. Below summation is the composite reliability and it goes thus:

$$\text{Composite reliability} = \frac{(\sum \text{Standardized loading})^2}{(\sum \text{Standardized loading})^2 + \epsilon \sum j}$$

Studies of composite reliability Table 1 of all exogenous latent constructs are well above 0.60 except for customer fulfilment (below 0.60) – (Teschan, Nunnally, Bourne, Hamel et. al 1979).

In this study, all the Cronbach’s alpha Table 1 is higher than 0.6. Its shows that, all variables are acceptable to prove the instrument’s reliability. Nonetheless, all composite reliability values are higher than 0.7. All this support rule of thumb Hair et al (2010) which value CR 0.7 or higher is good reliability. For example, Cronbach alpha for business performance (SME) is 0.808 but composite reliability for the same variable is 0.98336. This indicates that composite reliability gives more accurate reliability reading than Cronbach alpha.

Table 1: Composite reliability (CR) and Cronbach’s Alpha (CA)

Variable	Composite Reliability (CR) CR>0.6	Reliability (CA) Cronbach’s Alpha = 207
Business Performance	0.98336	0.808
Social Entrepreneurship	0.91753	0.628
Social Knowledge	0.91574	0.807
Social Intension	0.90402	0.780
Social Capital	0.94656	0.736

Discriminant Validity: In order to substantiate discriminant validity Table 2, and Table 3, there was a comparison between the average variance extracted (AVE) and correlation squared of the interrelated variables of concerned (Fornell and Larcker, 1981). The AVE derived from the computation of variance extracted using the following equation:

$$\text{Variance extracted} = \frac{\sum (\text{Standardized SMC})}{\sum (\text{Standardized SMC}) + \sum \epsilon_j^2}$$

Table 2: Summary Table of Average Variance Extracted (AVE)

			Estimate	Correlation Squared
Business_Performance	<-->	SE	-0.056	0.003136
Business_Performance	<-->	SK	-0.098	0.009604
Business_Performance	<-->	SC	-0.053	0.002809
SE	<-->	SK	0.97	0.9409
SE	<-->	SC	0.985	0.970225
SK	<-->	SC	1.417	2.007889

Table 3: AVE Table Matrix of Exogenous Variables

Variable Name	1	2	3	4	5
Business Performance (1)	1.000				
Social Entrepreneurship (2)	(1+2)/2=1.2105	1.000			
Social Knowledge (3)	(1+3)/2=1.139	(2+3)/2=1.133	1.000		
Social Intension (4)	(1+4)/2=93.559	(2+4)/2=93.553	(3+4)/2=93.41	1.000	
Social Capital (5)	(1+5)/2=1.02275	(2+5)/2=1.2305	(3+5)/2=1.0875	(4+5)/2=185.9275	1.000

In this research, the variance value extracted for all the constructs explained 50 percent or more of the variance, which met the recommendation that the VE/AVE value should be at least 0.50 for each construct (Thompson Higgins, 1995; Bagozzi Yi, 1991; Holmes-Smith, 2001). To substantiate discriminant validity, the average variance draws (AVE) comparisons to correlation squared of the interrelated variables of concerned (Fornell and Larcker, 1981). For discriminant validity to uphold, the value of AVE must be more than correlation squared. When AVE > correlation squared, thus, discriminant validity is supported. Based on this study, all constructs support discriminant validity.

Hypotheses Results

Table 4

	Relationship	Estimate	S.E.	C.R.	P	Decision
H1	SE ← SK	.110	.110	1.676	.094	Not significant
H2	SE ← SI	.086	.044	1.982	.047	Significant
H3	SE ← SC	1.129	.097	11.634	***	Significant
H4	BP ← SE	.081	.081	2.163	.031	Significant

The results indicated that H1: Social knowledge has no significant connections with social entrepreneurship. Due to the relatively recent growth of interest in social entrepreneurship and with the diversity of actors and arenas involved, it is surprising that, terminology is an issue (Bielefeld, 2009; Alekam et al¹; Alekam et al². Also in H2: according to Helm (2007), there exist a positive relationship in social innovation and social entrepreneurship. Social entrepreneurship consists of risk taking, innovativeness and pro-activeness. This is because social innovation contained ‘the hard process of introducing new processes, products, and programs that can profoundly change the normal routines, resource and flows of authority, or social system beliefs in which the innovation occurs’ Alekam et al²; Westley &Antadze, 2010). Knowingly, H3: Social capital has a positive connection with social entrepreneurship. The reason is that social capital involves the relationships created by individuals, either formal or informal during their interactions with others in trying to gain rewards in the market (Woolcock, 2001). Kwon Heflin and Ruef (2013) findings stand in contrast to prevailing themes in the social capital literature on entrepreneurship and suggest

significant externalities are associated with social capital that accrues to the community at large. In addition, H4: Social entrepreneurship has a positive relationship with (SME) business performance. The secret of firm performance has long interested many researchers, most studies focused on large companies while neglecting small companies (Sorooshian, Norzima, Yusif, &Rosnah, 2011). It is a well-known fact that the small and medium enterprises (SME) play a huge role towards the economic performance of countries all over the world (Aziz & Mahmood, 2011). Swanson and Zhang (2010) are scholars who believe that social entrepreneurship as possible in for-profit businesses. They created a model that illustrates how an organization could legitimately pursue two separate objectives in terms of profit and social cause. Rahim &Mohtar (2015) advised a model of extended social entrepreneurship by dividing social entrepreneurship into non-profit and hybrid. The former consists of traditional NGO while the latter furthers divided into social hybrid and economy hybrid. The social hybrid and economy hybrid are organizations that have both social and financial goals; more so they are differentiated by their primary goals, either social or economy.

Revised/generated Model from SEM

Analysis of Revised Model: Examination of mediating structure begins with checking p-value and CR value on website, factor to threat and from threat to online shopping intention before adding line (direct effect) from website factor to online shopping intention. The directive of thumb said that P-value must be less than 0.05 ($p < 0.05$) and CR value must be more than 1.96 ($CR > 1.96$). Social entrepreneurship is fully mediator between social knowledge and SME business performance Table 5.

Table 5: SE mediator effect between SK and BP

Social entrepreneurship is fully mediator between social innovation and SME business performance Table 6.

Table 6: SE mediator effect between SI and BP

Social entrepreneurship is fully mediator between social capital and SME business performance Table 7.

Table 7: SE mediator effect between SC and BP

CONCLUSION

Finally, about the topic of “The Antecedents and Mediating Effects of Social Entrepreneurship towards Malaysian SME Performance”, the replica has been designed slightly gave the new involvement in terms of antecedents of social entrepreneurship especially social capital and social innovation. A for moderating factor, all three variables indicated social entrepreneurship is fully mediate between the three variables and the business performance. This study faced no germane impact towards the intermediaries. Plainly, gender does not moderate the social capital, social knowledge and social innovation and the business performance.

This research has established four direct impacts: (1) SK and SE; (2) SI and SE; (3) SC and SE; and (4) SE and BP. Perhaps, years to come the combination of theory may be given much germane impact or extended research method would be contributing to new results.

ABSTRACT

The aim of this study is to examine the level of spirituality among Malaysian youth. The sample for the study consisted of 4,703 youths through the stratified random sampling method. In this study the spirituality level for the sample were measured. This quantitative research was conducted using a survey method through questionnaires distributed to a total of 4,703 youths age between 15 to 40 years from all races, religions and education backgrounds throughout Malaysia. This study applies a systematic stratified random sampling and the data obtained was analyzed using descriptive statistics, t-test and analysis of variance (ANOVA). The result showed that the level of spiritual among Malaysian youth is relatively high with mean at 8.02 out of 10. The spirituality level of Malaysian youth was also found to differ according to category of gender, religion, ethnic, category of primary school, category of secondary school, highest academic qualification at school level and highest academic qualification. This result implies that the level of spirituality is still have room for improvement and the government, non-government organisation as well as parents should take into consideration all the background of the youth when planning any spirituality development program. These to ensure that the program will be effective to increase their level of spirituality once its suitable with their needs according to their different background.

Keywords: *Spirituality, Mental health, Malaysian youth*

INTRODUCTION

During adolescence, individuals undergo marked changes in body, mind, and social relationships. Faced with these change, many youths seek diligently to find their place in the world by defining who they are and how they Lerner, Roeser, & Phelps¹⁶. Youth search for a self definition about an indentity that enables them to matter to self, family, and society, both in the teenage years and in their future adult life Harter⁹. This search often encourages the young person to overcome a cognitive and emotional focus on themselves Elkind⁷ and to strive to contribute in an important way, valued, and also noble to his or her world.

Spirituality encompasses all aspects of being human and is a way of experiencing life. Islam does not view spirituality separately from daily activities. In Islam, everything is spiritual because all actions must be in line with God's pleasure. Researcher believes that generosity derives from such spirituality, and that such honorable purposes are the essence of spirituality Damon⁶.

Spirituality meant as the presence of a correlation with God that impacts the individual's self-esteem,

sense of meaning and connectedness with nature and others Nasr²². The correlation quality of spirituality indoctrinated to be a core theme of Islam which consists of beliefs, rituals, daily-life behaviors, and knowledge. The correlation quality of spirituality indoctrinated to be a core theme of Islam which consists of beliefs, rituals, daily-life behaviors, and knowledge. Therefore, central beliefs of Islam are lived out daily in spirituality, ways of connecting with God, yourself, nature, and others. Meanwhile in other religion such as Christianity, spirituality is an attachment to the things of the spirit rather than of the world Merriam-Webster¹⁸.

In this study, spirituality level is measured based on three basics elements which are "manners", "believe in God" and "religious practices". These three basics elements are important element in developing positive traits and noble values in order to improve the robust identity among youth.

LITERATURE REVIEW

There are research studies showing that spiritual and religious involvement is an important dimension in

adolescent development. For example, based on the data collected from “The Project Teen Canada”, Bibby (2006) found that 75% of the respondents regarded themselves as members of a religion, 60% viewed spirituality as important, and 48% indicated that they had spiritual needs. In a study based on 112,232 freshmen in 236 colleges and universities in the United States, Astin et al¹ reported that 77% of the students agreed that they were “spiritual beings” and roughly four-fifth of them indicated that they had interest in spirituality and they believed in the sacredness. These findings are consistent with the view of Benson and Roehlkepartain² that “most young people view spiritual development as an important part of their lives”. King and Boyatzis¹³ similarly commented that adolescence “may be a particularly important time period in which to study spiritual and religious development.

Studies on the effect of spirituality on human life have been carried out extensively. Spirituality encompasses all aspects of human being including health eg. Rippentrop, Altmaier, Chen, Found, & Keffala²⁴; Narayanasamy & Narayanasamy²¹; Beuscher & Grando³, business/ entrepreneurship eg. Mitroff & Denton¹⁹; Kamil Al-Kahtani, & Sulaiman¹²; Mohd Sarif, Ismail, & Pairman²⁰, leadership eg. Burack⁵; Pratt²³; Fry⁸, education and training eg. Thompson²⁶; Walker & Dixon²⁷.

With regard to youth development, spirituality is essential for the healthy, positive development of a person’s sense of self and for allowing identity to frame the individual’s pursuit of a life way eventuating in idealized adulthood, that is, an adulthood involving mutually beneficial relations between the individual and his or her social world Lerner, Alberts, Anderson & Dowling¹⁵. According to Shek (2011), “different ecological factors, particularly family and peer influences, were found to influence spirituality”. In Malaysian case, Krauss, Hamzah, Suandi, Noah, Juhari, and Manap¹⁴ noted that, unlike other Muslim countries, particularly those in the Middle East, Malaysia has arguably experienced a smoother transition to modernization, and has tried to balance between proponents of strict secularization and Islamic factions within the country. From the review of the literature, it shows that attempts have been made to measure spirituality and it was evidenced that spirituality affects in almost every aspects of human life. Keeping this perspective in mind, it is therefore essential to investigate the spiritual among Malaysian youth.

METHODOLOGY

The methodology utilized in this study is quantitative method to gather primary data through questionnaire by employing the stratified sampling technique. The population of this study is the Malaysian youth between 15 to 40 years old which comprises of approximately 50% (14 million) of the total Malaysian population (Malaysian Youth Index, 2015). Out of this total, a sample of 6000 youths was selected as the subject of this study. Based on the discussion with the officer at Department of Statistics Malaysia, 750 sampling blocks were selected and each block consists of 8 households. The sampling block covers all 16 states in Malaysia including Wilayah Persekutuan Kuala Lumpur, Wilayah Persekutuan Labuan and Wilayah Persekutuan Putrajaya. Each of the state was divided into two categories, urban and sub-urban. The respondents are youth of the country and they are from different family background, races and education. This study used questionnaire as an instrument. A total of 5,972 questionnaires were distributed. However, only 4,703 questionnaires had completed and fulfil the criteria that researcher need. The data gathered were analysed by using descriptive analysis, t-test and analysis of variance (ANOVA). This analysis is reflect the real situation of Malaysian youth population.

FINDINGS

This section is divided into three parts which are background of the respondents, level of spirituality and differences in the level of spirituality Malaysian youth based on demographics.

Background of the Respondents: According to Table 1 which is the background of the respondents, majority of the respondents are male (55.6%) compared to female (44.4%). Most of the respondents are aged between 21 to 25 years (29.9%), followed by 15 to 20 years (21.1). Meanwhile, in terms of ethnic, Malay has the highest percentage (71.6%), followed by Chinese (12.1%). Most of the respondents are Muslim (77.6%), followed by Buddhist (10.3%). In terms of education background of the respondents, majority of them are from national school (primary) (84.8%), national school (secondary) (87.7%), SPM/ O level for highest academic qualification at school level and diploma holder for category of highest academic qualification (49.1%) at high school or university level.

Table 1: Background of the Respondents (n = 4,703)

Background	Detail	Valid Percent
Gender	Male	55.6
	Female	44.4
Age	15-20 years old	21.1
	21-25 years old	29.9
	26-30 years old	19.9
	31-35 years old	14.1
	36-40 years old	15.0
Ethnic	Malay	71.6
	Chinese	12.1
	Indian	7.0
	Others	9.4
Religion	Islam	77.6
	Buddhism	10.3
	Hinduism	6.1
	Christianity	5.4
	Others	0.7
Category of Primary School	National School	84.8
	Religious School	2.0
	Chinese/Tamil School	12.6
	Self-Learning	0.3
	Others	0.3
Category of Secondary School	National School	87.7
	Private School	2.7
	Religious School	5.8
	Others	3.8
Highest Academic Qualification at School Level	Below UPSR	0.8
	UPSR	1.6
	PMR/SRP	4.6
	SPM/O Level	76.2
	STPM/A Level	16.8
Highest Academic Qualification	Diploma	49.1
	Bachelor	41.9
	Master	7.6
	PhD	1.4

Level of Spirituality: Based on the result shown in Table 2, this study found that the spirituality level of Malaysian youth is acceptably high where the mean score is 8.02 out of 10 points. The highest element of spirituality level is “believe in God” with a mean value of 8.49, followed by “manners” with a mean value of 7.79. In contrast, the lowest mean value is “religious practices” with a mean value of 7.76. Nevertheless, all the elements of

spirituality level for Malaysian youth are considered high.

As referred to Table 2, the highest mean for the items of spiritual level is 8.75 which is item ‘I believe in God and it makes my life meaningful’ in elements of believe in God. It shows that the level of spirituality is really effective to the respondents in aspect believe in God. However, the lowest mean for the items of spirituality level is 7.55 which is item ‘I never miss to pray’ in aspect to religious practices. The result indicates that eventhough the youth have a high spiritual level, especially in the aspect of belief in God but for “religious practices” aspects such as prayer is quite low. This means there are still have room to improve the level of spirituality among Malaysian youth especially in term of religious practice.

Table 2: Items of Spiritual Level, Mean, Standard Deviation and Cronbach’s Alpha Value

No.	Items of Spiritual Level	Mean	Std. Dev.
1.	I am outgoing/warmth	7.64	1.962
2.	I am dutifulness	7.84	1.727
3.	I am compliance	7.84	1.698
4.	I am calm	7.72	1.751
5.	I am open-minded but upholding principle	7.91	1.703
	Mean Score of Manners	7.793	
6.	I believe in God and it makes my life meaningful	8.75	1.685
7.	I believe that God accepts me even if I do wrong	8.61	1.788
8.	I never challenge the teachings of my faith	8.50	2.013
9.	I believe people who are religious have higher level of spirituality	8.08	1.806
	Mean Score of Believe in God	8.486	
10.	I am ready to accept any consequence if I cannot fulfill my responsibilities	8.00	1.917
11.	I never miss to pray	7.55	2.185
12.	I like fasting	7.73	2.303
	Mean Score of Religious Practices	7.757	
	Mean Score of Spiritual Level	8.015	
	Conbach’s Alpha Value	0.904	

Differences in the Level of Spirituality Malaysian Youth based on Demographics: Based on the t-test and ANOVA analysis as shown in Table 3, the results show that there are significant differences based on demographic factors which consists of gender, ethnic, religion, category of primary school, category of secondary school, highest academic qualification at school level, and highest academic qualification towards level of spirituality for Malaysian Youth.

Based on the t-test analysis in Table 3 indicates that level of youth spirituality for female is higher than male which mean score of 8.09 and 7.96 respectively. Then, based on ANOVA analysis indicates that Malay has the highest mean score for level of youth spirituality in term of ethnic (8.13). Meanwhile, in term of religion perspective, the level of youth spirituality has significant difference among this category where Islam is the highest for the level of spirituality (8.14) among youth. Muslim also found to have significant different with buddhism and hinduism.

In term of education background, the level of spirituality is significantly different based on primary

school category. The highest level of spirituality in this category is national school (8.11) and followed by religious school (8.02). The spirituality level for those from national school have significantly different compared to those from Chinese/Tamil School and self-learning. The level of spirituality is also significantly different based on secondary school category. The highest level of spirituality in this category is religious school (8.21).

Meanwhile, the result shows that the level of spirituality is significantly different based on their highest academic qualification at school level. The highest level of spirituality in this category are those who hold SPM (8.05). The spirituality level for those with SPM qualification have significant difference compared to those who have education only UPSR level and below. The results also show that the level of youth spirituality is significantly different based on their highest academic qualification. The highest level of youth spirituality in this category is Master qualification (8.20). However, the spirituality level for those who have master qualification is significantly different at 10% level compared to who have bachelor qualification.

CONCLUSION

As referred to findings above, this study found that the spirituality level of Malaysian youth is acceptably high. Nevertheless, all the elements of spirituality level for Malaysian youth are considered not extremely high. The highest element of spirituality level is “believe in God” which is item ‘I believe in God and it makes my life meaningful’. This result in line with the World Values Survey Lippman & McIntosh¹⁷ which found that in some countries, 75 percent or more of young adults believe in God and find both God and religion to be important in their lives. In Indonesia, Pakistan, Egypt, and Iran, for example, nearly all young adults said they believe in God. Three-fourths or more of young adults reported that God is important and religion is important in their lives. Many of these countries have a history of an influential dominant religion (e.g., Islam) and a developing economy. However, this study also found “religious practices” as the elements of spirituality is lowest than “manners” and “believe in God” which is item ‘I never miss prayer’. This finding implies that there are still have room to improve the level of spirituality among Malaysian youth through the religious practice. Practicing religious follow religious rules is very important to ensure the level of spirituality of a person will increase. As stated in Al-Quran, the practice of praying will guide the prayer to the right path which is acceptable by God.

Given the importance of spirituality, one of the way to promote youth spirituality through utilizing spiritual programs. For example, Hui and Ho¹⁰ evaluated a forgiveness training program via quantitative and qualitative methods. Although there was no significant

improvement in self-esteem and hope among the participants based on the pre-test and post-test scores, participants showed better conception of forgiveness and had a positive attitude by using forgiveness. They concluded that it was “viable to promote forgiveness as a classroom guidance program”.

Therefore, the researcher recommend that the level of youth spirituality can be enhanced through the participation of youth in programs oriented to spirituality or religious. Through the spirituality development program is expected to build an excellent identity subsequently to produce the youths who adhere to Syariah such as not to leave the prayer, fasting and avoid doing things wrong. The government also should fully accommodate and concern their media channel to promote and embark spirituality development program.

ABSTRACT

This paper contributes towards an overview of adoption level of reuse and recycles practice in Malaysia construction companies. Reuse and recycles practice includes in the activities of waste management. During the previous decades, waste of construction materials has become a serious issue as it contributes towards harm pollution for environment and human being. However, the practice of reuse and recycle of construction waste in developing countries such as Malaysia still at infancy level. Hence, this study focus to gain a local contractor perspective regarding the current level adoption of reuse and recycle implementation in construction sector. A survey method is employed through quantitative method by target the contractor's organization located in Peninsular of Malaysia as a unit analysis. The findings of this study indicate that majority of the construction companies have awareness towards implementation of policy, method and procedure of reuse and recycle practices. Thus, it shows that the current level of adoption reuse and recycle practice in Malaysia construction companies getting better compared previously.

Keywords: *Reuse, recycle, construction project, waste management, Malaysian construction industry.*

INTRODUCTION

Do you know that construction industry is the biggest consumer of natural resources and the largest polluters in many countries? According to the latest news, construction industry has contribute 23% of air pollution, 50% of climate change, 40% of drinking water pollution and 50% of landfill wastes (“How does construction impact the environment,”⁶). Whereas, DEFRA³ reported that UK has faces issue of landfill wastes as much 44%, US as much 29% and Australia with percentage 44% of same issue.

The percentage of pollution level is at alarming level. Hence, it is very important for stakeholders in the construction project play their role in minimizing the solid waste and other pollution type through an improvement in waste management. Now days, the need to improve waste management through reuse

and recycle in construction industry is generated by protection laws and regulation. However, awareness among stakeholders towards adoption of reuse and recycle in waste management still under moderate stage and required a full attention towards waste management practice compared with cost and time related issues (Shen & Tam, 2002). Many efforts have been undertaken by government to produce a greener among stakeholder in order to improve waste management practice through reuse and recycle of waste during construction.

Hence, the current adoption level of reuse and recycle practice in Malaysia is important to be finding out through this study to investigate level of awareness among stakeholders towards waste management in Malaysian construction industry. Next section of this paper review previous study about waste management practice and important of stakeholder involvement in minimizing the impact of pollution caused by

construction activities. The third section and fourth section of this paper present about research methodology of this study and finding respectively. The fifth section is discussing about the data finding of the study.

LITERATURE REVIEW

Waste Management Practice in Construction Industry:

A waste in construction industry is described as an unwanted materials or wastes of materials that have no value after the usage Winkler¹⁶. Meanwhile, Koskela⁸, defined waste in difference dimension by claimed waste as a result of inefficiency of activities in the use of equipment, construction materials, human resources or capital in a big scale. Based on previous study, waste in construction has lead into many type of pollution such as sound pollution, air pollution, water pollution and a climatic change in surroundings due to poor of waste management during construction. Meanwhile, waste itself can be classified into solid, liquid and gases Al-Hajj & Hamani². Construction industry is claimed as the worldwide biggest contributor towards pollution include in developed countries such as Hong Kong EPD⁵ and United Arab Emirates UAE Interact¹⁵, with landfill waste as much 23% and 75% respectively. Hence, it is very important to apply waste management in construction industry in minimizing the level of construction waste and impact of the pollution towards environment surroundings.

The practice of waste management in construction industry would help to reduce the non-added value of materials and as an advantage, reduce the cost of waste disposal and restrictive environmental conservation Pitt and Smith¹¹, and also help to improve the quality of human health Agamuthu et al¹. However, the practice of waste management need to be drive by both government and non-government to ensure the success of waste management practice in construction industry through formulating the policy of waste management and spread an educational of the practice in each level of construction organization. Stakeholder's involvement in practicing the waste management also is very important rather than looking into construction costs and time related issues. Malaysia has no exception to faces waste management problem as it becomes prime issues faced by stakeholders of the construction project Saeed et al¹².

Importance of Stakeholder Involvement of Reuses and Recycles Practice: An involvement of stakeholder in waste management practice is very important as it

contribute towards positive impacts to the construction sector towards sustainable development Yuan et al¹⁷. However, there is a lack attention among stakeholders towards the important of waste management and still at low priority for practice Teo&Loosemore¹³. In order to improve the waste management implementation among stakeholders of construction companies, government has put an effort by providing a regulation to improve waste management approach. The mandatory of waste management practices by stakeholders would improve productivity of the companies Tam¹⁴.

Reuse of construction materials is describe by the usage of same material more than once either material used for same purpose Yuan & Shen¹⁷. However, in difference dimension, reuse is defined as a usage of same materials more than once for difference purpose Duran et al⁴. However, there is a material that cannot be applied more than once either for same or difference purpose will either be recycles to become new materials for construction purpose. Through recycles of construction wastes into new materials, it's able to decrease the request for new raw materials, reduce cost of transportation and energy for materials production, reduce the amount of solid waste in landfill and secure the natural environment (Kartam et al⁷; Tam¹⁴, Osman, et al¹⁰; Osman et al⁹. Thus, stakeholders of the construction project should give a high priority towards waste management implementation in Malaysia construction industry by understanding the concept, method and policy of waste management. It is the objectives of this study to provide current level for waste management practices in Malaysia construction companies.

RESEARCH METHODOLOGY

Based on the objectives of the study which seeks to appraise Malaysian contractor's view of the implementation of reuse and recycle of construction materials, several phases were conducted as follows:

- i. **Phase 1:** Literature review on the concept of Malaysian construction industry, reuse and recycle issues and the concept of sustainable construction in the construction industry.
- ii. **Phase 2:** Literature review on the concept of Waste Management specifically on reuse and recycle implementation in the construction industry—to understand those concepts, principles, challenges

and advantages of their application in construction industry and identification of research framework and research hypothesis.

- iii. **Phase 3:** Postal survey - investigate the factors that affecting the systematic implementation of reuse and recycle among Malaysian contractors.
- iv. **Phase 4:** Investigate the factors/causes based - investigate the problems and challenges of application, factors affecting application, explain reasons for current level of practices and recommend ways for improvement.

This research involved collecting the respondents perception based on their experiences in construction industry. This study is a hypothesis testing. The unit analysis is focused on contractor’s organization as representatives to gain their perception regarding the practices of reuse and recycle of construction materials. The respondents consist of project managers, engineers, quantity surveyors and other relevant individual on behalf of the contractor. The targeted company for survey is located in Peninsular of Malaysia.

DATA FINDING

Qualitative data analysis has been carried out in this study with justification through statistical analysis and discussed in this section. The questionnaires were distributed to grade ‘A’ contractors that registered with the Contractor Service Centre (PKK). The respondents consist of engineer, technician assistant, resident engineer, project manager, site supervisor and administration division.

Respondent Working Experience: Each respondent have difference period of working experience. The respondent working experience is reported in Figure 1.

Figure 1: Respondent working experience

Based on the figure above, 5% of the total respondents have working experience for less than 5 years. Whereas, 38.8% of the respondents have 6 to 10 years working experience. Other 18.2% group of respondents have working experience for 11 to 20 years and the least of 4.1% respondents have experience of work more than 20 years. Respondents with working experience 6 to 10 years are the highest population in this study.

Establishment of Company in the Construction Industry:

In term of company establishment, each targeted construction companies has difference period of establishment. It was shown in Figure 2 below:

Figure 2: Establishment of Company in the Construction Industry

The longest period of 53.7 % of company establishment in this study is more than 20 years. The second highest are the companies that has been established between 11-20 years, which represent 23.1%. While 14% of the companies involved in the survey had established less than 5 years and the least group of companies of 9.1% were established around 6 to 10 years.

The Implementation Level of Reuse and Recycle Construction Waste Management

The implementation level of reuse and recycle practices is divided into policy application, company objective of reuse and recycle implementation and adoption of reuse and recycle procedure.

Application of Reuse and Recycle Policy in Companies:

As much 62.8% of the respondents mentioned that the policy of reuse and recycle is applied in their company. Whereas, 37.2% of the respondents mentioned that their company has not applied the policy of reuse and recycle of waste during construction. The proportion is summarized in Figure 3 below:

Figure 3: The percentage of reuse and recycle policy usage in construction company

Figure 3 shows that majority of the construction companies with percentage of 62.8% has applied the policy of reuse and recycle of construction waste.

Company objective of reuse and recycle implementation: Based on the analyzed data, 76% of the respondents mentioned that the company represented had an objective to implement reuse and recycle method without policy in the method applied. However, only small population of respondents as much 24% mentioned that company represented do not have objective in implementing reuse and recycle practice for waste management. Figure 4 is shows as per below to summarized the data:

Figure 4: The percentage of reuse & recycle method implementation

The Adoption of Reuse and Recycle Procedure by Construction Companies: The percentage of companies that adopted a procedure of reuse and recycle of construction waste according to the respondents are 66.9%. The remaining 33.1% of the companies according to the respondents mentioned that there is no procedure applied in implementing reuse and recycle of construction waste. Figure 5 summarized the data gained.

Figure 5: The percentage of adoption towards reuse & recycle procedure

DISCUSSION

Findings of the implementation level of reuse and recycle construction waste management are discussed in this section.

The Implementation of Waste Management (Reuse and Recycle Practice)

Based on the perception of contractors regarding the adoption level of reuse and recycle, the data gained is described through percentage. The level of policy implementation of reuse and recycle practice at level of construction companies indicated that most of the construction companies are concern about the importance of its implementation. Majority of 62.80% construction companies apply the policy compared with 37.20% without policy. However, some companies without policy of waste management still based on the company’s objective to implement the reuse and recycle practice. Data gained reported 76% construction companies is driven through the objective of it implementation. In addition, data also reported that majority of 66.90% of companies which represented by contractors are adopted a procedure of reuse and recycle of construction waste. It clearly shows that the current level of reuse and recycle implementation among Malaysian contractor are at satisfactory level. Awareness among practitioner towards reuses and recycles practice in waste management able to minimizing the environmental pollution in Malaysia.

Reuse and Recycle Practices Among Practitioner:

In a mean time, an understanding of the concept of reuse and recycle is very crucial even though without the policy and procedure application in the construction company. As much 92.60% of respondents practice the

reuse of waste materials to eliminate waste, save costs and other advantages. There is only small population as much 7.4% failed to implement the concept of reuse waste materials.

At a same time, research shows that 53.70% of the companies are practicing the concept of recycle while 46.3% failed for the implementation of recycle concept.

It clearly shows that most of the practitioners agreed with the reuse and recycle practices in local construction industry. It would help in maintaining a balance of construction environment and secure the natural environment (Taylor, 2011). Thus, stakeholder awareness on reuse and recycle practice would help to improve waste management in construction industry.

CONCLUSION

This paper has successfully achieved its aim of appraising the overview of adoption level of reuse and recycles practice in Malaysia construction companies from contractors' perspective. Majority of the construction companies in Malaysia have a good awareness towards implementation of policy, method and procedure of reuse and recycle practices. Established companies for more than 20 years is the highest population used in this study and it shows that implementation of reuse and recycle has earned attention over the last 20 years and it's no longer something new and only few contractors have no policy in its implementation. However, contractors with have no policy still have an objective to implement the process. Based on respondents' views, they are concerned of the basic knowledge related to the implementation of the reuse and recycle approaches at the construction sites.

ACKNOWLEDGMENTS

The authors would like to express their sincere gratitude to Universiti Utara Malaysia (UUM) and the Research Innovation and Management Centre (RIMC) of UUM for providing financial support for this paper to be published. This study is financed by the University's Grant (code s/o 13909).

Readiness for Shared Services in Higher Learning Institution: A Pilot Study

Juraifa Jais¹, Prashalini Naidu¹, Nor Hazlin Nor Asshidin¹, MaslindaMd Yusof²

¹College of Business Management & Accounting, Universiti Tenaga Nasional; ²College of Foundation and Diploma Studies & Chief Business Development Officer Office, Universiti Tenaga Nasional

ABSTRACT

Shared services are known as a great catalyst to drive a positive effect on the efficiency and effectiveness of an organisation. The aim of shared services is to streamline specific services in an organisation whereas those services had previously been managed in more than one of organisation's parts. Nevertheless, there is a limited indication of shared services in Malaysian higher institutions. Using quantitative approach, this paper describes a pilot study undertaken in higher learning institution that implements shared services initiative. The findings reveal that organisational readiness and employee engagement are positively related to employee job satisfaction in shared services implementation. Thus, organisations should diligently incorporate human resource approach in shared services planning.

Keywords: *Shared services, Organizational effectiveness, knowledge sharing, malaysia universities, learning organisation*

INTRODUCTION

The term shared services is quite profoundly used in the business arena. Many organisations, adopt shared services, specifically for support functions such as Finance, Accounting, Human Resource and Information Technology (Bergeron⁶). However, the same concept is still rather unheard, unfamiliar and unknown in higher learning institutions. Given the exception for some universities in the United States and in UK, shared services have yet to be seen proliferated among Malaysian universities. This irony brought about questions such as 'Is shared service only relevant in the corporate industry?' Are universities in Malaysia ready to implement shared service?

Shared services centre (SSC) is a service centre established by combining individual activities from several operational departments/business units (Accenture Consulting Services²). Schulz et al. (2009) cited in Uruthirapathy³⁶ states that shared-services centre offers a merging of processes within the group to prevent redundancies. SSC, a separate organisational unit within the group, delivers support processes associated with external customers as its core competency. SSC should have a clear focus on internal customers with business-like operation.

In Malaysia, the presence of shared services in Malaysian universities is rare (Miskon et al.²⁵). Only a few varsities have shown interest in the concept. Of late, universities are undergoing major stress and challenge due to massive competitions (Kristensen et al.²¹). In higher education industry, competitions emanate from several different levels and areas, such as self-competition to rank-based grading, consciously introduced or spontaneously started, all against all or groups against group (Kristensen et al.²¹). The awareness on shared services assist universities to reduce cost and improve efficiency has not been widely known.

Owing to the benefits of shared services, Universiti Tenaga Nasional (UNITEN) has taken the first step to implement shared services. According to its Vice-Chancellor, Dato' Prof. Ir. Dr. Kamal Nasharuddin Mustapha, UNITEN has embarked on three key strategic plans since 2007 known as UNITEN10, W15E and BOLD2025 (New Straits Times 2018). Its Strategic Direction 2010-2025 aims in becoming a research-led university by 2015, and a leading global energy university by 2025 (News Straits Times, 2018). These strategic plans aim for achievements and efficiency for the future. The latest strategic plan is BOLD 2025 that has devised 3 strategic goals, 10 strategic objectives and 30 strategic

initiatives. Among these 30 initiatives are blended learning, smart campus, global exchange and mobility, shared services, upskilling programs, research partnerships and synergy infrastructure. Through its BOLD 2025 initiative, implementing shared services has been one of its core plans. With reference to shared service, UNITEN shared service is still in its early stage. A research is required to find the best way to manage the new initiative. The main goal of the shared service inception in UNITEN is to increase efficiency and cut cost.

Shared service implementation will be done gradually through UNITEN, starting with the Chief Business Development Officer Office (CBDO office), a department that consists of five business units that are Programme Management Office (PMO), Business Development Department (BDD), Marketing and Corporate Communication Department (MCC), Strategic Planning Centre (SPC) and Office of Stakeholder Management (OSM). Currently, the establishment of CBDO office aims to help university's growth and identify business prospects. Specifically, CBDO office administration structure in UNITEN consists of 5 directors, 4 managers, 19 administrative executives, and 13 administrative assistants. The SSC pilot project will enable UNITEN to review SSC execution strategy and manage concerns prior to full system deployment. Thorough understanding of the implementation stage is crucial to identify the key success factors of SSC.

Among the major concerns in SSC implementation are the organisational readiness and employee engagement during work process restructuring within the organisation. The change process of SSC could create unstable and uncertain environment, which may impact on employee job satisfaction (Knol, Janssen & Sol¹⁹). The decision of forming SSC is often reliant on the long term costs and benefits of economies of scale without addressing and managing the human perspective of change process (Kunz & Kabrt²²). Thus, managers are largely unaware of the difficulties endured when developing and implementing SSC in organisations (Knol, Janssen & Sol¹⁹).

Weiner³⁷ states that organisational readiness for change is a multi-level construct. Readiness is expected to present at the individual, group, unit, department, or organisational level. Contrary to individual readiness for change, there are not many studies conducted on organisational readiness for change and hence has limited

extensive theoretical development or empirical study (Shea et al.³¹). Despite several attempts at measuring organisational readiness, most available instruments are not theory-based and exhibit limited reliability and validity (Shea et al.³¹). Consequently, it is prominent to study organisational readiness in the implementation of SSC. Within this perspective, this study aims to discover the relationship of organisational readiness, employee engagement and job satisfaction in SSC pilot project implementation in UNITEN.

LITERATURE REVIEW

A great amount has been published on shared service centres, generally by consultants, management experts, industry bodies and policymakers, and overwhelmingly from position of great enthusiasm (Elston & Dixon, 2017). In spite of having these many individual documented examples of how shared services have been applied in various organisations, there have been little research on the variables proposed in this study and in an institutional context like the Higher Education sector. More and more higher learning institutions are beginning to adopt shared services and it will be prominent to look at the relationship between organisational readiness and employee engagement towards job satisfaction in the HEI.

Organisational Readiness: The new change within an organisation can bring many challenges. Change management proponents emphasised on the importance of creating organisational readiness for change, suggesting variety of strategy for readiness (Weiner³⁷). The right strategy is accommodating the change process by helping employees with the unfamiliarity environment. The organisational readiness in the implementation of shared service is crucial to ensure employee engagement and job satisfaction.

The manner in which an employee embraces and accepts a particular change will reflect their readiness (Ahmad et al.³). The level of employees' commitment to the change and their perception whether the change can happen have an effect on organisation readiness for change (cited in (Weiner³⁷ cited in Ochurub, Bussin & Goosen²⁸). In short, employees remain a key determinant of organisation readiness to change. However, Ahmad et al.³ proclaims that trust management, communication and commitment are other factors that impact readiness for change in organisation.

Employee Engagement: Apart from organisational readiness, another important element associated to shared service implementation is employee engagement. In this fast pace competitive environment, to have committed employees is considered to be the way to retain people (Gast¹⁵). In the current climate where organisations are expected to stay competitive, driven employees are what employers are looking for. Despite having good times, maintaining a workforce engaged, positive and productive can be cumbersome (Catteuw, Flynn & Vonderhorst⁸). Kompaso and Sridevi²⁰ explains that employee engagement is the emotional commitment employees experience towards their organisation and the actions proceeded by them in ensuring the success of the organization. Care, dedication, enthusiasm accountability and results focus demonstrated are among the parameter to consider an individual as an engaged employees (Wessels³⁸). Abraham¹ further explains that employee engagement is employee emotional connection to the achievements of their organisation, resulting in improved productivity, innovation and retention. Kompaso and Sridevi²⁰ describe employee engagement as a wide construct that revolves human resource management facets. If a human resources issue is not addressed in change management, employees fail to engage with their job (Soni³³). Employee engagement can be associated with how the management and human resource team manages their people (Macey & Schneider²⁴).

Job satisfaction: Job satisfaction concerns employee's expectation towards their job (Abraham¹). Aziri⁵ says that job satisfaction combines both good and bad emotions that workers experience towards their work. Once a worker is employed, he brings with it the needs, desires and experiences which specifies expectations that he has set aside. Job satisfaction denotes the alignment between expectations awards, entailing how individuals enjoy or abhor their job (Rahman, Akhter & Khan³⁰). Abraham¹ states that job satisfaction is the extent to which employees appreciate their job. When an employee becomes satisfied and motivated, it contributes greatly to the productivity and growth of the organisation. Gregory¹⁷ supports this notion by claiming that employee satisfaction is quintessential to the success of any business. Maintaining an employee's satisfaction is directly related to a low number of turnover rate. Therefore, job satisfaction should be utmost importance for every employer. Moreover, employee job satisfaction is crucial to face the vigorous and ever-demanding

challenges of maintaining efficiency through engaged and motivated workforce (Misra & Sehgal²⁶).

Claiborne et al.¹⁰ found a positive relationship between organisational readiness and job satisfaction. It appears that job satisfaction is enhanced when employee perceive that organisational is ready for change. Jain, Kutty and Dani¹⁸ add that organisational change process generates a perceived efficacy by the workers. If a change is not handled effectively, then it impacts the satisfaction level of employees. Furthermore, a low level of readiness may impact negatively on the change process, creating dissatisfaction among employees (Lipińska-Grobelyń & Papińska²³). Thus, we propose:

Hypothesis 1: There is a significant relationship between organisational readiness and job satisfaction.

Additionally, there is a growing evidence that employee engagement enhances job satisfaction (Eldor & Shoshani¹¹). Job satisfaction was highly demonstrated when the employee engagement was high (Alarcon & Edwards⁴). Engaged employees who feel dedicated to their work may reinvest resources into the workplace. These invested resources may visible as job satisfaction (Alarcon & Edwards⁴). Bernburg et al.⁷ add that the positive emotions of engagement would further enhance the feeling of satisfaction. The following hypothesis is proposed:

Hypothesis 2: There is a significant relationship between employee engagement and job satisfaction.

METHODOLOGY

Data collection procedures: In this study, the survey was distributed using both paper-and-pencil questionnaire and online survey. The survey was distributed to 41 staff of CBDO (5 directors, 4 managers, 19 administrative executives, and 13 administrative assistants). CBDO is currently undergoing restructuring due to the implementation of shared services, where administration services of 5 business units (Programme Management Office (PMO), Business Development Department (BDD), Marketing and Corporate Communication Department (MCC), Strategic Planning Centre (SPC) and Office of Stakeholder Management (OSM) are centralised under shared services centre. Out of 41 questionnaires distributed, only 22 responded, which is approximately 53.66% response rate.

Instruments: The first independent variable is organisational readiness adapted from a theory of organisational readiness (Weiner³⁷). It contains 12 items which are divided into two dimensions. The first section (question 1- 5) used to assess change commitment of the respondent. Meanwhile the second section (question 6-12) used to assess change efficacy in order to capture the organisation's ability to respond to problems during the implementation (Shea et al.³¹; Weiner³⁷).

The second independent variable which is employee engagement variable was adapted from Gallup Q12, also known as the Gallup Work Place Audit to measure the employee engagement. Harter, Schmidt, Killham and Agrawal¹³ describes GWA as follows:

In short, the development of the GWA (Q12) was based on more than 30 years of accumulated quantitative and qualitative research. Its reliability, convergent validity, and criterion-related validity have been extensively studied. It is an instrument validated through prior psychometric studies as well as practical considerations regarding its usefulness for managers in creating change in the workplace.

The Q12 is divided into two categories of employee survey items. The first one measures attitudinal outcomes comprise satisfaction, loyalty, pride, customer service perceptions, and intent to stay with the company while the second category measures actionable issues that drive the outcomes mentioned earlier (Harter, Schmidt, Agrawal & Plowman¹²).

Meanwhile, the dependent variable which is job satisfaction was adapted from Job Satisfaction Survey 1994, in which the survey contains 36 set of questions to measure the employee satisfaction at workplace (Spector³⁴).

Data analysis: During the data analysis procedures, the data was coded using SPSS version 22. First, descriptive statistics was conducted. Next, a reliability analysis was conducted to acquire the proportion of systematic variation in a scale by determining the relationship between the scores obtained from different administrations of the scale. The high association in reliability analysis indicates that the scale produces consistent results and hence considered reliable. Lastly, a correlational analysis was done to find out whether there is any significant relationship between organisational readiness and employee engagement toward job satisfaction. This

study applied the Pearson product-moment correlation (Pearson r) to indicate both the direction and the strength of the relationship between variables.

RESULTS

Demographics: The sample of the study composed of 22 staffs who were accessible during the data collection procedure. The information on the participants' characteristics is shown in Table 1.

Table 1: Participants' characteristics

Items	Frequency (n = 22)	(%)
Gender		
Male	11	50.0
Female	11	50.0
Age		
21-38 years old	11	50.0
39-49 years old	6	27.3
More than 50 years old	5	22.7
Education		
SPM	4	18.2
Diploma	3	13.6
Bachelor	4	18.2
Master	8	36.4
PhD	3	13.6
Job Design		
Administrative	20	90.9
Others	2	9.1
Experience		
3 years	5	22.7
4-6 years	4	18.2
7-9 years	1	4.5
10-12 years	2	9.1
More than 12 years	10	45.5

As presented in Table 1, it shows that the study consists of 11 (50.0%) male respondents and 11 (50.0%) female respondents. Out of 22 respondents, 4 (18.2%) are SPM and Bachelor holder, 3 (13.6%) are Diploma PhD holder and 8(36.4%) are master holder. Besides, from 22 respondents, 20 (90.9%) are administrative job design and the rest 2 (9.1%) are others job design. For the work experience, 5 (22.7) have work experience less than 3 years, 4(18.2%) with 4-6 years' work experience, 1(4.5%) with 7-9 years' work experience, 2(9.1%) with

10-12 years' work experience, and the rest 10 respondent (45.5%) have more than 12 years' work experience.

Reliability: The three variables shows Cronbach's alpha values larger than $\alpha=0.7$ (George & Mallery¹⁶), that is a measure of lower bound reliability.

Table 2: Reliability

Variables	Number of items	Cronbach's alpha
Job satisfaction	36	0.891
Organisational readiness	12	0.982
Employee Engagement	12	0.825

According to Cavana, Delahaye and Sekaran⁹, the value of Cronbach's Alpha of greater than 0.7 is considered reliable. Since all the Cronbach's Alpha values were greater than 0.7, then the test items were found to be valid for the study.

Mean and standard deviation: The mean (M) and standard deviations (sd) for all variables are presented in Table 3.

Table 3: Mean and standard deviation

Variables	Mean	Standard deviation
Job Satisfaction	3.282	0.415
Organisational Readiness	2.704	0.767
Employee Engagement	3.609	0.459

As presented in Table 3, the mean for Job Satisfaction, Organisational Readiness and Employee Engagement are 3.282, 2.704 and 3.609 respectively. Meanwhile for standard deviation, the results gained are 0.415, 0.767 and 0.459 for Job Satisfaction, Organisational Readiness and Employee Engagement respectively.

Correlation

Pearson Correlation Coefficients: Pearson correlation coefficients were calculated between Organisational Readiness, Employee Engagement, and Job Satisfaction, allowing the strength of relationships between variables to be calculated (Table 4). Based on the table, Employee Engagement shows a significant relationship with the Job Satisfaction ($r = .728^{**}$, $n=22$, $p < 0.01$). The strongest relationship is between

Organisational Readiness with Job Satisfaction ($r = .738^{**}$, $n = 22$, $p < 0.01$).

Table 4: Correlation

Items	Job Satisfaction	Hypotheses Result
Organisational Readiness	0.738**	Accepted (H1)
Employee Engagement	0.728**	Accepted (H2)

** . Correlation is significant at the 0.01 level (2-tailed).

Based on the result of correlations between independent variable and dependent variable, relationship between organisational readiness and job satisfaction is ($r = .738$), the strength of association is strong, meanwhile for employee engagement and job satisfaction the result is ($r = .728$) which is show the strong association too.

DISCUSSIONS AND CONCLUSION

The current study aims to explore the relationship between organisational readiness, employee engagement, and job satisfaction in the implementation of shared service center. It was hypothesized that organisational readiness (hypothesis 1) and employee engagement (hypothesis 2) would predict job satisfaction. The findings demonstrate significant relationship between organisational readiness and job satisfaction. Given the limited research done in relation to organisational readiness for shared services change, the results of this study hardly compared to similar contextual setting. Nevertheless, this finding is consistent with Lipińska-Grobelny and Papińska²³ finding of a statistically significant relationship between organisational readiness and job satisfaction. In a survey of 102 manufacturing workers, the readiness to change to lean production has positively affected the organisation's human resource attitudes. In another study, readiness to implement evidence based practice and person centered care in university hospitals has generally reported positive job satisfaction (Olsson, Forsberg & Bjerså²⁹).

The current study also demonstrates robustly that employee engagement and job satisfaction are significantly related. Although there are different

understandings of engagement, most research reach a decision that engaged employees have high levels of job satisfaction (Alarcon & Edwards⁴; Shimazu & Schaufeli³²; Taris, Cox & Tisserand³⁵). The engaged employees exert great effort into their work because they identify with it (Kompaso & Sridevi²⁰). The positive experiences related to engagement increases satisfaction to the job (Shimazu & Schaufeli³²).

Undeniably, the findings of this study are beneficial towards the university that was being studied. However, there are few limitations that require attention. First, this study is a cross-sectional pilot study that involved only 22 respondents. Second, the findings of this study cannot be broadly generalised in Malaysia as it focused on only CBDO shared services in UNITEN. Hence, there is concern of results generalisation due to limited scope of study. Future research can be conducted on the same subjects or different shared services setting. The application of diverse samples will make the prediction on the relationship between Organisational Readiness, Employee Engagement, and Job Satisfaction more accurate.

Overall, the current study demonstrates the importance of organisational readiness and employee engagement in ensuring employees satisfaction during the shared services implementation. The research on organisational readiness may broaden our view of vital factors in change management process for shared services. Results of this study also point to significant challenges continuing for shared services in higher learning institutions. If shared services are to be effective, the organisation should be ready and the appropriate employee engagement tools must be identified.

Ethical Clearance: This study does not involve human or animal subjects that requires ethical clearance in Malaysia.

ABSTRACT

The doctrine of good faith is a vital issue amongst the contractual issues of this period. It is considered a main goal of every recognized law of contract system to be promoting good faith as well as fair dealing in forming and performance of contracts. Basically, it has been a common argument in supporting the notion of good faith that it helps in addressing bad faith manner in a clear and direct conduct, allow the law to safeguard the realistic anticipations of women and men as well as encourage a philosophy of contractual collaboration that would lead to economic efficiency. This study looks into the concept of good faith from both the conventional law and Islamic law (Shariah) to find to what extent both laws comply with each other. The study is doctrinal which utilizes descriptive approach of qualitative research methodology which relies on secondary data in form of text books, journals, newspapers, related websites etc. The study found that both the conventional law and Islamic law support the principle of good faith. Shariah recognized the principle of good faith as it asks the parties in a contract to abide by the requirement in various stages of the contract, especially sale contract. Thus, the concept of good faith should have the same application in both Islamic and conventional jurisdictions.

Keywords: *Good Faith, Islamic law (Shariah), Contract, Canon law, Rules of equity.*

INTRODUCTION

The doctrine of good faith is a vital issue amongst the contractual issues of this period Harrison¹⁴. It is considered a main goal of every recognized law of contract system to be promoting good faith as well as fair dealing in forming and performance of contracts (Johan 2004). Basically, it has been a common argument in supporting the notion of good faith that it helps in addressing bad faith manner in a clear and direct conduct, allow the law to safeguard the realistic anticipations of women and men as well as encourage a philosophy of contractual collaboration that would lead to economic efficiency Brownsword⁴.

Historically, the origin of the good faith concept goes back to Roman law. Just similar to equity of the English law, the limits of a recognized procedure in Roman law were overcome by actions taken by those given the responsibility of the administration of justice. Roman law was an example of the first legal system to adapt through the impact of equitable concepts Schermaier³⁰.

The ancient and famous procedure in the Roman law was later termed as legisactio (act or sue according to the law) Mousourakis²².

As for the history of good faith in the medieval *ius Commune*, certainly, the *ius commune* strengthened its established status as a part of Christian culture of Europe by the 14th century. The said scenario led to religion as well as law to be thoroughly linked in the late medieval writing Stein³¹. Actually, the medieval jurists who learnt canon and Roman laws clearly accepted the notion of good faith and equity in contract (Gordley).

The development of good faith in the English law is undoubtedly credited to Court of Chancery. This is a result of importation of the principles of good faith concept which are natural in the canon law in the early ecclesiastical chancellors into the Court of Conscience Baker³.

The aforementioned discussion is on the concept of good faith from the conventional view point. This study looks into the concept of good faith from both the

conventional law and Islamic law to find to what extent both laws comply with each other.

METHODOLOGY

This is a qualitative research where data was gathered from textbooks, journals, websites etc. In analyzing the data, content analysis approach was adopted. Thus, the researchers were able to systematically analyze large amount of textual information.

CONCEPT OF GOOD FAITH PRINCIPLE

The doctrine of good faith is a vital issue amongst the contractual issues of this period Harrison¹⁴. It is considered a main goal of every recognized law of contract system to be promoting good faith as well as fair dealing in forming and performance of contracts (Johan 2004). Basically, it has been a common argument in supporting the notion of good faith that it helps in addressing bad faith manner in a clear and direct conduct, allow the law to safeguard the realistic anticipations of women and men as well as encourage a philosophy of contractual collaboration that would lead to economic efficiency Brownsword⁴.

The main aim of the principle of good faith is allowing the injured party to limit, as much as possible, the damage he suffers due to the unjust rights and obligations as a result of the agreement Kolb²⁰. This can be performed by imposing the contract law standards of justice fairness and decency in legal transactions, complementing the provisions of other contract law principles and creating the precedence to overcome these provisions when needed if a strict obedience to them would lead to biased results. According to Robert Summers: "Without the principle of good faith, a judge might, in particular case, be unable to do Justice at all, or he might be able to do it only at the cost of fictionalizing existing legal concepts and rules, thereby snarling up the law for future cases" Brownsword⁴.

The National European legal systems have not provided a constant definition of the principle of good faith. However, the US legal system provided the definition as: "faithfulness to an agreed common purpose and consistency with the justified expectations of the other party" Tetely⁴⁹; Kolb²⁰. The jurists believe there are two different views of good faith which are subjective and objective good faith (Strine et al 2009).

The former refers to the subjective status of the mind of a contracting party (psychological condition) (Tetely 2010) while the latter which is the objective of good faith concept refers to the terms of the agreement, by matching between rights and obligations of the parties involved in the contract Nebbia²⁵. Based on those two elements, good faith has some meanings, which are: Fayyad⁹ (1) the normative meaning reflects the contractual justice enforced on the contracting parties to balance their legal relation. According to this meaning, the doctrine of good faith necessitates the party to act fairly, so as to protect justified expectations rising from their agreement; (2) the contextual meaning indicates the practical anticipations of the contracting parties in accordance with common standards utilized at the place of making the agreement. According to this meaning, good faith means the expectation of every contractor as the other party will fairly and honestly perform his contractual duties in a satisfactory manner to trade community; Powers²⁶(3) the essential meaning indicates the prevailing least standards of honesty at the time of making legal transactions Wightman³⁵.

Based on the aforementioned three meanings, good faith may be defined as an honest behavior, that both parties involved in a contract are expected to observe in their dealings, and even with third parties, who can be involved or afterward implicated; it is a negative action that needs each contractual party to consider the genuine interests and expectations of the counterparty, by means of restricting the own pursuit of self-interest.

According to Article (32) of the European Proposal, a term is considered as unfair if, by opposing the requirement of concept of good faith, it leads to a major disparity related to the parties' rights and obligations to the disadvantage of the consumer. In the valuation of the test of the concept, the negotiating situation of the parties involved in the contract has to be considered. The supplier or seller can fulfill the requirements of the doctrine by dealing with the consumer fairly and this may be performed through showing respect to the genuine interests as well as expectations of the customer Howells¹⁷. In line with the preamble of the proposal: "This requires contract terms to be presented to consumers fairly, reasonably transparent and do not operate so as to defeat the reasonable expectations of the consumer". The preamble of the said proposal explained that good faith shall be understood in both its objective and subjective sense. This may be done through observing

whether the consumer has given his free consent to the agreement as well as whether the supplier or seller considered the legitimate expectations and interests of the consumer when forming the contract Cuijpers⁷; Teubner³². In evaluating this scope, the conditions and entire terms and conditions of place of the contract as well as the nature of the goods and services of the contract must be taken into account.

Objective of good faith is manifested by looking at the balance of positions as well as rights and obligations between the parties involved in the contract. This balance occurs prior to entering into the agreement and also when performing contractual obligations (substantive good faith). Conversely, pre-contractual good faith is to enable the parties involved in the contract to be in a like position concerning awareness of the data as well as information of the agreement. This can be done by disclosing these data to each other. It indicates the just positions of the parties involved in the contract before signing the agreement; it investigates how contract terms are used and how they are presented to the consumer. This base transacts with the consumer right of information and choice. Substantive concept of good faith deals directly with the term in question; it looks into the impacts of the contract terms and concentrates in knowing to what extent the terms may be relied on to attain the interest of the consumers. According to this, a term is said to be against good faith if its end result will create disparity of rights and obligations amongst parties involved in the contract Whittaker³⁴. In accordance to this, notion of good faith may be extended to contain some forms of exclusive liabilities that may create imbalance amongst the contracting parties as well as entire cases in which one party abuses his powers Alpa²; Hondius 1997).

Imbalance of contract term is an indicator to judge that the principle of good faith has been breached; As provided by article (32/1) of the proposal, a term creating a major imbalance, by definition, contradicts the principle of good faith Roppo²⁸. Contractual imbalance between the contracting parties is the result where a contractor deals with the other party in bad faith; this balance must be detected before and after making the agreement. The first imbalance occurs where there is a disparity of awareness between the contracting parties concerning the entire data as well as information of the agreement; it may be overcome by disclosing these data amongst the parties involved in the contract. The second

imbalance occurs where there is a substantial imbalance relating to rights and obligations among the contracting parties; it may be overcome by focusing on the interests of the counter party when drafting the terms of the agreement Collins⁵; Teubner³².

In this approach, the proposal states dual lists of common used terms, indicative in addition to black lists, to measure this imbalance. According to both lists, this balance can be measured by the following factors: (1) the liability of the consumer is looked at in combining the liability of the seller or supplier "Exclusion clauses". This occurs where contract terms permit the seller or supplier who wants to retain sums paid by the consumer, where the latter chooses to cancel the contract. In contrast, a consumer may not be entitled to be compensated of the same amount from the seller or supplier if the latter cancels the contract Whittaker³⁴. In this form, the term may exclude all liability for a certain thing that might happen, or may exclude some specific kinds of liabilities; (2) a consumer does not have similar rights to a supplier or seller, or a consumer cannot respond in some way to rights that are exercised to a seller or supplier (penalty clauses" Heiderhoff¹⁶. This occurs where the term authorizes the seller or supplier to transfer his rights and obligations under the contract. In contrast, a consumer right of guarantee is reduced, without the latter's agreement Hughes¹⁸. This sort of terms enables the contracting party to impose an extremely unreasonable compensation upon the other party where the latter does not perform, or delay to perform, his obligations. In contrast, the latter does not have the same advantages where the former breaches his obligations; (3) the seller is authorized to control the legal relation (contract terms) without taking into consideration the will of the counter party "variation clauses". It occurs where the term enables the seller to terminate a contract of unspecified period devoid of realistic notice; despite not having serious grounds to do so Nebbia²⁵.

GOOD FAITH PRINCIPLE IN ISLAMIC LAW

According to Zahidet al³⁷, both the conventional law and Shariah support the principle of good faith. Shariah provides the principle of good faith and asks the parties in the contract to abide by the requirement in various stages of the contract, especially sale contract. Thus, the concept of good faith should have the same application in both Islamic and conventional jurisdictions.

According to Islamic law, a valid trade has to always make sure that benefits are always exchanged between the contracting parties by avoiding imposing unlawful pressure and all elements that will vitiate the free consent of a contracting party such as fraud, undue influence, coercion etc. Hazeem¹⁵. There are various guidelines in the Islamic jurisdiction that organize the principle of good faith; the rules refer to behaviors that Muslims need to observe in their dealings Abd El-Khalek¹; Marganee²¹. The rules deal with the internal belief of Muslims and reflected by observing the principles of good faith in transactions Salem²⁹. The rules contain particular legal sanctions which can create the basis of ruling out the usage of unfair terms Yoseef³⁶. This may be seen from the principles provided by El-majalla which dated back to 1876 which was derived from the Islamic law. For example the El-majalla provided several legal principles of contract involving the principles of good faith such as: “a private injury is tolerated in order to ward off a public injury” (Article (26) El-majalla); “severe injury is removed by lesser injury” (Article 27 El-majalla); “in the presence of two evils, the greater is avoided by the commission of the lesser” (Article 28 El-majalla); and “repelling an evil is preferable to securing a benefit” (Article 30 El-majalla) .

Another rule in support of the good faith concept is the system of (Hisbah) which according to the Muslim jurist Al-Mawardi is: “a system of enjoying what is just and right if it is found to be neglected or disregarded and to forbid what is unjust and indecent if it is found to be practiced” (Khan et al¹⁹; Cook⁶. The main functions of Hisbah are the protection of market rules against violation; protection of the honour of people and ensuring public safety. The function of hisbah is taken from the letter of the Caliph (Ali) to his governor (El-Ashter El-Nakee) telling him how to deal with behaviors of traders that may harm good faith dealings, where he said: “strictly address the greed of traders, their monopoly, anticomparative actions and their control of market transactions. These actions have bad effects and disadvantages to the detriment of the interests of the society and individuals. Prevent the monopoly, because prophet (Mohamed) recommended so, rule the fairness of market transactions, do not prejudice the rights of the seller and the buyer and punish the party who breaches these instructions without injustice or exceeding” Fayyad¹¹. According to Many jurists, the role of this system comprises merchant’s obligations of dealing with

consumers in a just and fair manner and commending the fulfillment of the trust and prohibition of all evils and offense mainly lying and dishonesty Kantakgee²⁸.

Based on the contemporary Arab scholars, the good faith notion is applicable in Islamic law in some aspects i.e. Radowan²⁷: concept of good faith in performing of the contract (corresponding in part to the principle of *pacta sunt servanda*); notion of good faith at the conclusion of the contract and the systems of options (*khiyarat*); concept of good faith in the termination of the contract, either voluntary or as a consequence of *force majeure*; the concept of (Riba) or usury and the notion of uncertainty (*gharar*).

The good faith notion has to be observed prior to entering into the agreement (The pre-contractual concept of good faith concept). The pre-contractual concept of good faith concept refers to the status of the parties involving in a contract prior to signing the contractual agreement. According to the Islamic law, the contracting parties are obliged to inspect and investigate the terms of the contract before signing it. The Islamic law requires Muslims to verify and probe any statement before taking a decision or action on it. The Prophet (saw) said: “a person does not believe until he prefers for his brother what he prefers for himself”. This requires the contracting parties to ascertain the permissibility or prohibition of dealing on the product as well as to examine the terms and conditions of the agreement Radowan²⁷.

Secondly, Islamic law forbids all kinds of fraudulent contracts both before and after the conclusion of the agreement. In a hadith the Prophet (saw) was reported to have passed by a heap of eatables (corn). He pushed his hand in that heap and his fingers were moistened. He said to the seller of the heap of eatable (corn) “what is this? These have been drenched rainfall”. He (the prophet) remarked “why did not you place this drenched part of the heap over other eatables, so that people could see it? He who deceives is not my follower”. The second caliph, Umar Ibn Al Khattab objected to diluting milk with water. He did so not because the milk was not suitable for drinking, but because the buyer would not be aware of relative quantities of milk and water before making the agreement Fayyad¹¹.

Third, any attempt of concealing the real features of a product in a sale contract is unlawful under the Islamic law (Ṣahīh Muslim 459). Thus, the seller is

required to disclose all relevant facts in the product to the buyer Fayyad¹⁵. Ibn al- AsqaWāthilah, a Muslim scholar, narrated a story where he said Fayyad¹¹: I bought a camel from a seller and when leaving the place of contract, OqbaibnNafī followed me and said: “The camel seems fat and healthy, did you buy it for meat or travel? I said for travel (hajj). He said: Its toe has a hall, and it is not appropriate for your travel. Are you looking to rescind the agreement? The seller asked Oqba. Oqba responded: I heard Prophet Muḥammadpbuh say that the contracting parties have the choice” (Al-Bukhārī 3/67).

Finally, El-majalla provides a specific topic as contracts of honesty (Aqd Al- Amana) “where acceptance is based on information that he receives from the other party. The theory of these contracts are based on the fact that the buyer trusts the seller to tell him the real price without the need to prove it by taking the oath or procuring evidence. It is therefore necessary that such contracts should be guarded against any dishonesty or the possibility of dishonesty” (<http://www.alriyadh.com>).

The Holy Qur’an calls the Muslim nation a balanced nation. Allah (swt) said: “Thus, have we made of you an (Umma) nation justly balanced” (The Holy Qura’n 01:143). And “the Firmament has He (God) raised high and He has set up the Balance (of Justice)” (The Holy Qura’n) 55:07); “in order that ye may not transgress (due) balance” (The Holy Qura’n 55:08). This balance can be extended to include the behaviors of this person with himself. A consumer is expected to act reasonably when satisfying his needs, by observing a balance between his needs and his consumption actions. The balancing principle in the (Qura’n) is that: “Those who, when they spend, are not extravagant and not niggardly, but hold a just (balance) between those (extremes)” (The Holy Qura’n 25:67).

Thus, Islamic law does not deal with action only in determining the balance but it also pays attention to the significances of the action itself that may create imbalance (Dawwas 1993). Furthermore, Islamic law orders parties in a contract to inform one another in case if one of them intends to dissolve the contract.

CONCLUSION

The study reveals that the conventional law requires parties involved in a contract to observe good faith in their dealing. The doctrine of good faith is a vital

issue amongst the contractual issues of this period. It is considered a main goal of every recognized law of contract system to be promoting good faith as well as fair dealing in forming and performance of contracts. The main aim of the principle of good faith is allowing the injured party to limit, as much as possible, the damage he suffers due to the unjust rights and obligations as a result of the agreement. This can be performed by imposing the contract law standards of justice fairness and decency in legal transactions, complementing the provisions of other contract law principles and creating the precedence to overcome these provisions when needed if a strict obedience to them would lead to biased results. According to Robert Summers: “Without the principle of good faith, a judge might, in particular case, be unable to do Justice at all, or he might be able to do it only at the cost of fictionalizing existing legal concepts and rules, thereby snarling up the law for future cases”.

Likewise, the Islamic law requires observance of the principles of good faith and asks the parties in a contract to abide by the requirement in various stages of the contract, especially sale contract. Thus, the concept of good faith should have the same application in both Islamic and conventional jurisdictions. According to Islamic law, a valid trade has to always make sure that benefits are always exchanged between the contracting parties by avoiding imposing unlawful pressure and all elements that will vitiate the free consent of a contracting party such as fraud, undue influence, coercion etc. There are various guidelines in the Islamic jurisdiction that organize the principle of good faith; the rules refer to behaviors that Muslims need to observe in their dealings.

ABSTRACT

Some WSN (wireless sensor network) by a lot of immobile node and with the limited energy and without further charge of energy. Whereas extension of many sensor nodes and their operation. Hence it is normal. Inactive nodes miss their communication in network, hence split the network. For avoidance split of network, we proposed a fault recovery corrupted node and Self-Healing is necessary. This paper presents a wireless distributed sensor system for tracking and identifying multiple humans based on their body heat radiation. Many intelligent environments and secure systems demand collectable, stable and reliable behavioral biometrics to identify individuals and track their actions based on their behavioral attributes. The behavioral biometrics (e.g., gait and habitual trajectory) are advantageous in their capability of recognition at a distance under changing environmental conditions, despite subjects' varying physical appearances. However, establishing identity and tracking actions from distances or in crowded scenes through behavioral biometrics are complex problems due to the intrinsic challenges associated with sensing modalities and feature selections.

Keywords: *Self-Healing, Biometrics, Sensing modalities, Healthcare professionals*

INTRODUCTION

Health is the level of functional or metabolic efficiency of a living organism. In humans, it is the general condition of a person's mind and body, usually meaning to be free from illness, injury or pain (as in "good health" or "healthy")¹. Health is one of the global challenges for humanity. According to the constitutions of World Health Organization (WHO) the highest attainable standard of health is a fundamental right for an individual. Heart rate measurement is one of the very important parameters of the human cardiovascular system. The heart rate of a healthy adult Healthy individuals also reduce pressure on the already overwhelmed hospitals, clinics, and medical professionals and reduce workload on the public safety networks, charities, and governmental (or non-governmental) organizations. To keep individuals healthy an effective and readily accessible modern healthcare system is a prerequisite. A modernized healthcare system should provide better healthcare services to people at any time and from anywhere in an economic and patient friendly manner. In the traditional approach the healthcare professionals

play the major role. They need to visit the patients for necessary diagnosis and advising. ECG is an expensive device and its use for the measurement of the heart rate only is not economical. Low-cost devices in the form of wrist watches. Heart beat sensor is used to measure the pulse rate of the heart in digital output. when a finger is placed on it. LED is used to detect the heart rate² A smart healthcare surveillance and fall detection system for elderly people provides a flawless security and a support for the elderly people³

There are two basic problems associated with this approach. Firstly, the healthcare professionals must be on site of the patient all the time. And secondly, the patient remains admitted in a hospital, wired to bedside biomedical instruments, for a period of time. In order to solve these two problems the patient oriented approach has been conceived. In this approach the patients are equipped with knowledge and information to play a more active role in disease diagnosis, and prevention. Thus a patient can be monitored from a remote location. Existing and widespread mobile phone networks can assist in this regard. Recently, mobile networks are considered

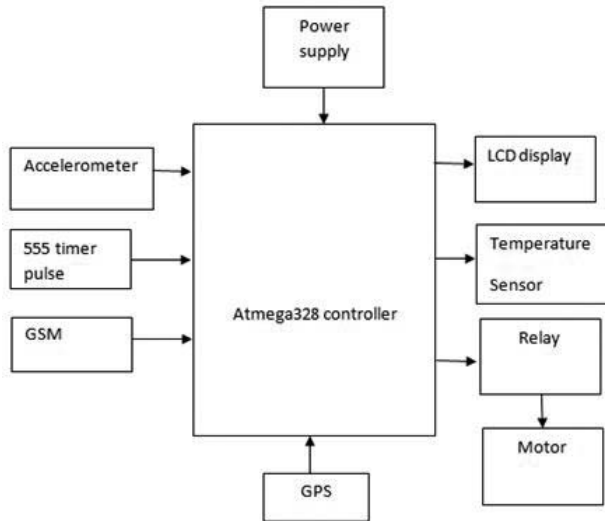

critical for solving future global health challenges. With the global market penetration of the mobile phones the mobile healthcare system (i.e., mHealth) is a matured idea now. By using the mobile phone healthcare system can be made available for people, who are living in remote areas without much access to other types of communications. Even a simple mobile phone can become a powerful healthcare tool now. Text messages and phone calls can quickly deliver real-time and critical information of a patient to a remote location. Thus the patients, living in remote areas, can reduce unnecessary back-and-forth travel to the far located healthcare centers. This will help the children of elderly to monitor the physiological condition of their parents from their working sites⁴ The data exchanged between the patient monitoring system and the microcontroller will be of a string format containing individual vital patient parameters like heart beat etc. separated by a delimiter⁵.

However, mobile devices have become “smart” now to do more rather than simply transmit medical information and advice⁶. Smartphone, supported with high speed data services, has revolutionized healthcare by playing the role of a powerful medical device for monitoring the patients’ health. Heart disease and diabetics monitoring and controlling systems are very much common now. Normally it is difficult to keep track on abnormalities in heartbeat count for patient itself manually. The average heartbeat per minute for 25-year old ranges between 140- 170 beats per minute while for a 60-year old it is typically between 115-140 beats per minute and body temperature is 37degree Celsius or 98.6 Fahrenheit. Patients are not well versed with manual treatment which doctors normally use for tracking the count of heartbeat. So there must be some device which would help patient to keep track on their health by themselves. There are various instruments available in market to keep track on internal body changes. But there are many limitations regarding their maintenance due their heavy cost, size of instruments, and mobility of patients. Zigbee Connection Buzzer Heart bit t/p p 3.2. To overcome these limitations a device use to keep track on heartbeat count of patient should be easy to use, portable, light weighted, small size etc so that it give freedom of mobility for patient. The devices which can be carried everywhere to keep track on patient’s health. This device that is a heartbeat sensor would help them to keep track on heartbeat counts of a patient and check

for any abnormalities. If any varied change takes place it is notified. This notification would help to take an appropriate action at an instance of a time. This would save patients from the future health problem which would arise. This would also help patient’s concern doctor to take an appropriate action at proper time. The e-healthcare systems have primarily been developed for observing the physiological parameters like body temperature, oxygen saturation level, heart rate, blood glucose level etc. However, with evolution of wireless technologies there has been a manifold variation and enhancement in the e-healthcare systems⁷

For a human, experiencing a fall unobserved can be doubly dangerous. The obvious possibility of initial injury may be further aggravated by the possible consequences if treatment is not obtained within a short time. For example, many elderly individuals can suffer accidental falls due to weakness or dizziness— or, in general, their diminished self-care and self-protective ability. Since they tend to be fragile, these accidents may possibly have serious consequences if aid is not given in time. The extensive usage of mobile technologies and their user-friendly applications related to health nowadays have given a rise to a new healthcare paradigm of eHealth, known as m-Health. According to the International Telecommunication Union there are now more than 5 billion mobile phone subscriptions in the world, with over 85% of the world’s population now covered by a commercial wireless signal. The growing sophistication of these networks Offering higher and higher speeds of data transmission alongside cheaper and more powerful handsets are transforming the way health services and information are accessed, delivered, and managed. With increased accessibility comes the possibility of greater personalization and citizen-focused public health and medical care ⁸The e-healthcare and now its mobile version, m-healthcare, system basically include wireless body sensor networks (WBSN) or/and wireless personal area networks (WPAN) for providing higher-quality medical services and more efficient medical responses and treatments to patients. In such an e-healthcare/ m-healthcare systems, the sensors placed around atients’body gather the vital parameters (e.g. heart rate, pulse rate, oxygen saturation level, sugar level and many more) and report them to remote healthcare service provider and/ or physician immediately for real-time and long-term monitoring of patients⁹.

BLOCK DIAGRAM

ATMEGA164: ATMEGA164/324/644 is a low power CMOS 8 bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATMEGA164/324/644 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed

555 Heart Beat Sensor: The 555 timer IC is an integrated circuit (chip) used in a variety of timer, pulse generation, and oscillator applications. The 555 can be used to provide time delays, as an oscillator, and as a flip-flop element. Derivatives provide up to four timing circuits in one package.

Temperature sensor: National Semiconductor's LM35 IC has been used for sensing the temperature. It is an integrated circuit sensor that can be used to measure temperature with an electrical output proportional to the temperature (in °C). The temperature can be measured more accurately with it than using a thermistor. The sensor circuitry is sealed and not subject to oxidation, etc

Acceleration for Fall Detection: The main research on the principles of fall detection focuses on the changes in acceleration that occur when a human is falling.

DC MOTOR: In any electric motor, operation is based on simple electromagnetism. A current-carrying conductor generates a magnetic field; when this is then placed in an external magnetic field, it will experience a force proportional to the current in the conductor, and to the strength of the external magnetic field.

LCD display: LCD stands for Liquid Crystal Display. LCD is finding wide spread use replacing LEDs (seven segment LEDs or other multi segment LEDs).

Arduino: Arduino is an open-source electronics prototyping platform based on flexible, easy-to-use hardware and software⁷. It's intended for artists, designers, hobbyists, and anyone interested in creating interactive objects or environments. Arduino can sense the environment by receiving input from a variety of sensors and can affect its surroundings by controlling lights, motors, and other actuators.

Power Supply: The present chapter introduces the operation of power supply circuits built using filters, rectifiers, and then voltage regulators. Starting with an AC voltage, a steady DC voltage is obtained by rectifying the AC voltage, then filtering to a DC level, and finally, regulating to obtain a desired fixed DC voltage.

Relays: A relay is an electrically controllable switch widely used in industrial controls, automobiles and appliances. The relay allows the isolation of two separate sections of a system with two different voltage sources.

CONCLUSION

The design of a low-cost microcontroller based device for measuring the heart rate, temperature and also the human fall detection has been described. The device has the advantage that it can be used by non-professional people at home and also in remote areas to monitor the patient easily and safely.

ABSTRACT

The Islamic faith involves beliefs, emotions, practices and behavior. The Islamic creed is more than emotions because it involves certain confidence of reward and punishment in the hereafter. It is also becoming the backbone of Islam. Clinging to the Islamic faith means to maintain the belief system about the concept of God, which is very virtuous and straight. Talking about the divinity that is pure and lawful in order to understand Islam from the sectarian context cannot run away from discussing the Ahlus Sunnah Wal Jama'ah. This approach is prevalent in the Muslim world since the early days of Islam. The two approaches which are dominant now within the group of Ahlus Sunnah wa al-Jama'ah in Malaysia are the Traditionalist and the Pro-Tajdid groups. Both groups are representing the Asyairah and the Pro-Tajdid. Yet, both of these sects sometimes are at disagreement when it comes to strengthening and extending their influence in Malaysia. Based on that, this paper seeks to analyze the method of argument from both groups. The paper highlighted its findings based on the methodology and arguments and based on deductive and inductive argument in the ahlus Sunnah Wal-Jama'ah school of thought in Malaysia. The methodology used in the study is qualitative with emphasis on content analysis. The data were also collected through interviews. The findings show that the difference in the methods of the two groups is small. The argument methods of both groups are based on deductive and inductive methodology of logic. Traditionalists used a deductive method, while Pro-Tajdid utilized an inductive method. This study presents a way of understanding the methods of both parties in an effort to avoid the blaming of both parties against each other.

INTRODUCTION

Islamic faith is a virtue that is significant to the Muslim's society because it can provide various effects either to an individual or to the Muslim community. The effects on individual faith are like positive emotions, good practices and conduct. (Shukri⁴). In fact, the impact of the Islamic faith also involves a belief system over rewards and punishments from God. In addition, belief in Allah also gives a great impact on the Muslim community for their unity and brotherhood. This is because the Islamic faith will bring unity to the believers, and of course, in the context of Islam, the faith of Islam will unite the Muslims who believe in one God. However, the differences of faith can also trigger hostility, misunderstanding and conflict. Many conflicts

are caused by the differences in terms of faith. In fact, the conflict also occurs within the believers due to the differences in approach and in understanding the content of such religion. However, many other factors are also contributing to the conflict in the society nowadays. It is such as an economic, social and oppression factors. For Muslims, faith is considered very important. The most popular group in Islam is the Ahlus Sunnah sects. This popular sect is practiced by most of the Muslims all over the world and has become a great contribution to the unity and harmony of the Muslims society over the years.

There are two main divisions that claim to represent the Ahlus Sunnah Wal Jama'ah school of thought which both are on many occasions have debated this concept

and seems to go against each other. In Malaysia, both are so dominant in representing ahlu Sunnah Wal Jamaah. They are called the Traditionalist and the Pro-Tajdid groups. These groups seem to represent previous sects in Islamic schools of thought, which both of them claimed that their teaching is based on the Quran and al-Sunnah (Abdul Fatah¹). The Traditionalists are representing the Al-Ash'ari (260H/873M-324H/935M) and al-Maturidi (870H/1465M-944H/1537M) schools of thought. While the Pro-Tajdid movement represents the Pro-Tajdid schools of thought. The former group is still influential in Malaysia nowadays and has resided in the most states of Malaysia. It was established in the Malay world since the 15th century. While the latter sect of Sunni is growing up in Malaysia and resided in Perlis, despite of not having a strong influence in the Malay Archipelago before. The Pro-Tajdid movement began to influence in Malaysia since the Saudi government adopted the Muhammad Abdul Wahhab school of thought. Then, after several centuries it started to encroach into Muslim minds in Malaysia through the educational system and modern technologies. In Malaysia, some opponents of this group named them as Wahhabism.

The different approach of interpreting Islamic theology between both parties often drags them in criticizing each other. The discussion of attribution of God is the most significant aspect that creates criticism from both sides. Analyzing the conflicts that exist in both parties, the composition of this paper is performed to study the rules and procedures that cause the differences of opinion, especially in Malaysia. In addition, this paper will also outline the results of the study related to the difference of thought from both groups. Later on, this paper will describe briefly a methodology in shaping the standards for setting the underlying conflict between the two groups. With that, it is hoped that any concerned parties can benefit from this study in evaluating the status of both groups in Malaysia.

THE DIVINE ISSUE

The divine issue is the core aspect of the difference between two groups of the Ahlu Sunnah Wal-Jamaah. However, both of them have the same fundamental beliefs about God. Firstly both parties acknowledge that Allah is the creator of all creatures and possesses the substance and nature of worthiness for him. They believe that all the attributes of God are perfect and infinite. While the Qur'an and al-Hadith explain the traits of perfection. Secondly the two sects admit that God is totally different from the beings. In other words, there is no equality of God with the same beings.

METHODOLOGY

The methodology used in this paper was based on a qualitative approach with an emphasis on content analysis. The data was also collected through interviews in detail on a small group of respondents which is based on sampling method aims. In addition, it also used some other instruments such as unstructured interviews and observation. Brain storming as well as formal and informal medium, method of "Triangulation" was fully utilized to improve the reliability of the study.

FINDINGS

Based on the overall fundamentals of the ASWJ methodology, there are similarities and differences between the Traditionalists and the Pro-Tajdid groups. The similarities and differences are presented in the form of mapping matrices in the diagram below. The diagram below shows there are 11 basic ASWJ methodologies as shown in Table 1. There are only a few differences in both groups in the aspect of Sufi practice and divine aspects. These differences do not come to the level of infidelity. Traditionalist strives to explain the attributes of God in allegorical interpretation {Ta'wil) in order to avoid indescribable mistake and blunder about the attributes of God and the similarities with His creatures. While Pro-Tajdid takes the approach of glorifying Allah by giving up and setting the true meaning of the verses about the nature of Allah (mutasyabihat) to Allah.

Soul purification is through the concept of akhlaq	✓	✓
Soul cleaning is through the concept of akhlaq and tasawuf	✓	✗

Deductive Argument of traditionalist versus Inductive Argument of Pro-Tajdid: Deductive argument, also deductive logic, is the process of reasoning from one or more statements (premises) to reach a logically certain conclusion (Sternberg⁵). It differs from inductive argument. Inductive argument (as opposed to deductive reasoning) is reasoning in which the premises are viewed as supplying strong evidence for the truth of the conclusion (Copi, Cohen, and Flage³). If we examine the method of argument used by both parties, the Traditionalist and Pro-Tajdid, we determined that both groups use their argument based on either deductive or inductive reasoning. The Traditionalist groups that support Ashairah and Maturidiyah emphasize deductive methods which are based on logical philosophical argument. The use of the science of law or the law of reason becomes the core argument of this trend. In other words, the use of the method is more on the logical premise. The traditionalist started from the premises of logic, which begin from the esoteric or metaphorical interpretation (ta'wil) in order to align with the text which is on the bottom (see Figure 1). Any verse or text of the Qur'an and Hadith regarding the attribute of Allah that can cause misunderstanding about the nature of Allah and the beings must be aligned with the premise of reason. To put it in other words, the use of reason must be preceded by the deductive method of logical philosophy.

On the other hand, the second group has used the inductive methods in reinforcing the concept of divinity. The inductive argument determines that the nature of God is stated in the Qur'an and al-Hadith and it is strong. This method is based on the premise of the message of authenticity, reliability and strong evidence, especially from the Qur'an and al-Sunnah. The inductive method

actually was used by Imam Malik (d. 179H) whenever he was asked about "how did Allah make *istiwa'* on the throne". Imam Malik has used the reliability of the Quranic statement about the attribute of Allah in order to support his argument. Imam Malik replied, "Istiwa' is not unknown (*ghayru majhul*), the modality of it, is inconceivable in the mind, but belief in it is obligatory, and inquiring about it is a heretical innovation (Anas²). So that, the method of argument used by Iman Malik was relying on the reliability of evidence.

Both of these sources are really the strongest authorities that must be believed by all Muslims. Clearly, the nasal texts are inductive arguments concluded to achieve the truth. Hence, the use of logic is no longer considered valid in understanding the nature of God. These groups may be considered using the top-down method (see Figure 1). They accept the text of the prophecies about the nature of God without any description of logic or reason. They used logic arguments just for strengthening the idea of the text. The model below illustrates the position of both groups and the method used.

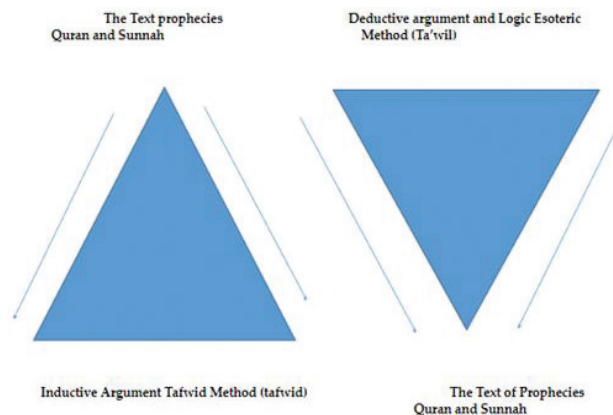

Figure 1: Top-down method

Towards a Model of Ahlus Sunnah Wal Jamaah in Malaysia: Based on the data that was collected through some literatures, interviews and observation, it can be summed up the differences between both groups is a matter of misunderstanding about using the method of argumentation. There are two main sources used by both parties, namely the logic and the text argument. Those who follow the logic school utilize metaphorical interpretation, while the other group leave problematic texts uninterpreted, believing that the reality of their meaning should be left to the one who told them, implying their unknowability. Both of these sources are important and acknowledged by each of them. The traditionalist uses the Jawi books in aqidah, which is more on logical argument. Their influence is more on the students of the traditional Islamic institution. While the pro-tajdid groups are mostly using the textbook and more influence in the Islamic School and the higher learning institution. Both are considered as the Ahl Sunnah Wal Jamaah groups, even both sides used to denounce each other. The model below shows the differences and the similarities of both groups (see Figure 2).

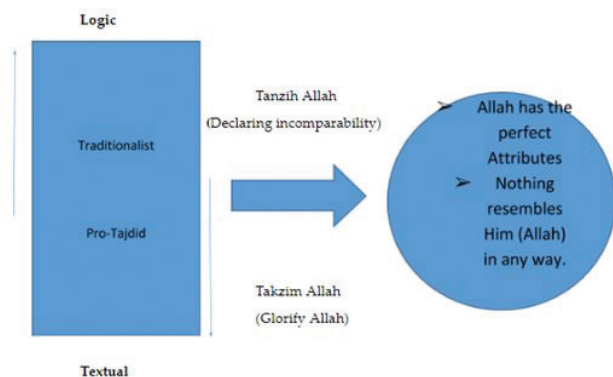

Figure 2: Differences & Similarities of both groups

CONCLUSION

There are two main divisions that claim to represent the Ahlus Sunnah Wal Jama'ah schools of thought which both of them are on many occasions have debated and seems to be against each other. In the 20th century, within the Malay-Muslim community in the Malay peninsula there were two schools of thought in Sunnis movement and popularly have been called the Traditionalist and the reformist. Today, these groups are

called the Traditionalist and the Pro-Tajdid groups. It is admitted that the Traditionalist and Pro-Tajdid groups are representing the Sunnah Wal Jamaah group. Both groups have never rejected the nature of God and claim that God does not resemble any creature in the totality. The differences between these two groups are only the corners of the method of submitting. In many cases, they have the same of characteristics and criteria as the Sunnah Wal Jamaah.

Vocational Schools Leadership Reinforcement Model

Jumintono¹, Suyatno¹, Muhammad Zuharty¹, Hamdan Said²

¹Magister of Vocational Education, Universitas Ahmad Dahlan Yogyakarta Indonesia, Jalan Pramuka No. 42, Sidikan, Umbulharjo Yogyakarta (55321); ²Department of Education Foundations, Universiti Teknologi Malaysia, 81310 Johor Bahru, Malaysia

ABSTRACT

Al-Qur'an is the main source and guideline in every worship and Muslim prayer. Similarly, how Islam provides basic understanding and concepts of leadership. In addition, vocational education is predicted to reduce unemployment among school graduates. Secondary vocational schools were blamed for failing to prepare students for the skilled workforce and eliminate the gap between the requirement of the industries and the competencies taught at school. This study examines school leadership reinforcement model for vocational secondary schools located in the Province of East Nusa Tenggara. This qualitative descriptive study employed development model for data collection. The observations and in-depth interviews were applied as prime data collection methods involving three (3) private and three (3) public vocational high schools. A total of 20 principals and senior school teachers participated in the study. The application of the school leadership reinforcement model requires the principals to have a clear vision in producing ready-to-work graduates. These supporting institutions can provide valuable inputs to enable schools to produce appropriate output that matched with the requirements of the industries. Strengthening the school leadership can be in the form of understanding of the local culture, benchmarking other schools, providing professional training, instilling good ethics and building strong character with high integrity.

Keywords: Leadership; Teacher; East Nusa Tenggara; Integrity; Holy Quran

INTRODUCTION

In the Qur'an the leadership uses the word Caliph, Ulu al-Amri, Imam and Malik. The Caliph has a functional connotation of someone who is appointed as leader and ruler on the face of the earth carrying out certain functions and tasks. Ulu al-Amri is the owner of affairs or the owner of power. The priest is as everyone who can be followed and shown in the future in various problems. Whereas Malik means someone who has the authority to order something and forbid something in relation to a government. The Qur'anic argument about leadership is stated as say (O Muhammad s.a.w.): "O Allah s.w.t.! Possessor of the kingdom, You give the kingdom to whom You will, and You take the kingdom from whom You will, and You endue with honour whom You will, and You humiliate whom You will. In Your Hand is the good. Verily, You are Able to do all things (Al Quran3: 26).

In contrast, there are several research reports and articles about vocational education predicted to reduce unemployment among school graduates.

Central Statistics Agency (CSA) data shows that open unemployment in exist among graduates, with 17.26% from secondary vocational schools, 14.31% high school graduates, 12.59% graduates of universities, 11.21% diploma holders, 9.39% from secondary schools and 4.57% from primary schools. Secondary vocational schools were blamed for failing to prepare students for the skilled workforce and eliminate the gap between the requirement of the industries and the competencies taught at school. The quality of school leadership is nowadays directly associated with better academic success and higher achievement for every student (Sumintono, Sheyoputri, Jiang, Misbach, & Jumintono²⁸). Leadership is a critical component of the organization's culture because leaders can create, maintain, or change the culture (Hinkin & Schriesheim¹³).

There are 188 Vocational High Schools (VHS) located in East Nusa Tenggara province. With a total number of 49,515 students and 6,665 teachers, with the ratio of 7.43 between students and teachers (Ditpsmk⁸).

This ratio is very far from the normal ratio determined by the National Standard of Education (NSE) i.e. 15-20 students for vocational schools. It needs an outstanding principal to run the school very well. This research focuses on the model for development of school leadership with reinforcement in vocational schools: a case study in East Nusa Tenggara Indonesia (developing countries context). As Widodo³¹ presented that VHSs were not managed and led well to prepare the future of their students. The public needs quality VHS graduates who can face the challenges of the competitive working environment. Most of the VHS principals still face obstacles in maximizing human resources and other school resources. One of the reasons is weak leadership and low managerial capacity of the principal himself/herself. In general, the principal of the school is a key determinant in improving school quality. The principal of the school is the central point in increasing the high achievement and good performance (Leithwood et al.¹⁹). Strong school leadership is one of the keys to the success of the institution in achieving, maintaining, and improving school performance (Pont, Nusche, & Hunter²⁵).

Central Statistics Agency (CSA) data shows that open unemployment for the year 2009 indicated that 17.26% were graduates of VHS, 14.31% were high school graduates, 12.59% were university graduates, 11.21% graduates of diploma, 9.39% were graduates of SMP, and 4.57% from primary schools. Even in the year 2012, unemployment in Indonesia reached 7.2 million people, mostly graduated from Vocational High School. Based on the level of educational qualification, unemployment among graduates of VHS was the highest in the country (9.87%), followed by graduates from Senior High School (SMA) (9.6%), graduates from Junior High School (7.76%), graduates from Diploma I / II / III (6.21%), graduates from university (5.91%), and from Primary School (3.64%) (BPS²). A school principal is a decisive factor in developing a high performing school. Principal effectiveness is crucial to improving student achievement, second only to classroom instruction among all the school-related factors contributing to what students learn at school (Nettles & Herrington²⁴).

One of the formal studies on school leadership was conducted by Analytical and Capacity Development Partnership (ACDP) in 2013. The samples of this study were selected from the relevant populations in some regions of Indonesia: Sumatra, Java, Kalimantan, Nusa Tenggara, Sulawesi, Maluku and Papua. The result was a

number of key issues emerged from the analyses of school principal competency. Specific competency indicators in the study shows that rural and remote school principals generally rate their competency lower than urban or semi-urban principals including in East Nusa Tenggara. Thus, it is very important to conduct a study focusing on rural and remote school principal competency

The study is significant because the results of the study can be used by the relevant parties and authorities including the central and local office of education, school principals, and teachers to reinforce the quality of school leadership in rural and remote schools. In the past, despite the presence of ideas to revitalize rural schools, the relevant people were still in confusion as to where they could start the reinforcement process from. The research will hopefully provide the list of actions that should be undertaken by the relevant authorities to accelerate the process of reinforcement school leadership in rural and remote school. The list will also highlight the actions that should be given priority.

The significance of this research also lies on the impact it can give to a wider rural and remote community especially to those who have a great interest in rural and remote education, particularly in Indonesia. One of the biggest impact is that this research is able to identify and inform the society and the relevant authorities regarding the actual conditions of vocational schools in Indonesia including the problems faced by these schools where action need to be taken urgently. Such important information can be used later as the means to formulate appropriate strategies to accelerate the process of reinforcement school leadership in rural and remote school. The result shows that this research, at the same time, can give benefits to those affiliated with vocational schools such as rural and remote students. One of the significant benefit is that they have the opportunity to access quality education (as long as the problems concerned can be dealt well by the relevant authorities).

Theoretical Overview: Leadership: The concept of leadership stated in Al-Quran where men are the protectors and maintainers of women because Allah has made one of them excel over the other, and because they spend out of their possessions (to support them). Thus righteous women are obedient and guard the rights of men in their absence under Allah's protection. As for women of whom you fear rebellion, admonish them, and remain apart from them in beds, and beat them. Then if

they obey you, do not seek ways to harm them. Allah is Exalted, Great (Al-Quran 4:34). The men is chosen as the qawwam or qayyim where is a person responsible for administering and supervising the affairs of either an individual or an organisation, for protecting and safeguarding them and taking care of their needs. Thus, with the terminology of imamah that highlighted, and We made from among them leaders guiding by Our command when they were patient and (when) they were certain of Our signs (Al-Quran 32:24).

In addition, school leadership reinforcement in the ASEAN region, such as Malaysia, Thailand, and Vietnam, are supported by the World Bank. Each country developed a national body for principals training and development since in the 1990s (Ndiga, Mumiukhacatherine khakasa, Flora, Ngugi, & mwalwa²³) school managers need to appreciate the new policies and laws that guide school management, namely Children's Act and Basic Education Act. Management of resources while ensuring accountability and integrity to the public is equally crucial. The reforms emanate from the Education changes brought about by the new constitution dispensation and the devolved system of Government. The managers of schools need to appreciate the new policies and laws that guide the management of schools such as: Education being a basic human right, therefore being free and compulsory and schools being disability friendly. There is also the element of participation which is important. Management of resources while ensuring accountability and Integrity to the public is equally crucial. Sessional Paper No 1 of 2005 emphasizes improving quality completion rates both at the primary and secondary school level of education (MOE: 2005). This national body has subsequently trained thousands of school principals. Several empirical studies reported the complexities of these issues which informed on the diversities about what they taught or not taught in the training (Hess & Kelly¹²) the role of the governments (Thody, Papanoum, Johansson, & Pashiardis³⁰) or even question about purpose and responsibility (Cowie & Crawford³). This shows the essential aspects of preparation for training before is appointed as a school principal, and the context of different cultures should also be taken into account (Yan & Ehrich, 2009). Following the preparation for training, the school principals, like other professions, have to undergo a leadership professional development program that helps them to become effective school leaders and improve

their practice from time to time (Cowie & Crawford³). The quality of program design, delivery, recruitment and retention in these professional 3 development activities must match the needs of the individuals (Hess & Kelly¹²) So the professionalism and reinforcement of the school management and leadership qualities are prerequisites before teachers are appointed to hold this position, including in all the provinces and districts in Indonesia.

Education and Principal Study in Indonesia: In the 1980s, the central government, who appointed public school principals throughout the country, introduced preparation training programs for school principal candidates. This preparation training program lasted for one week although it was not compulsory. The content of the training program was mostly about public administration and management which was provided by the education province office staff. Before taking office, most of the public secondary school principals held posts as vice 4 principals and were chosen for posts by their school principals. Some of them had administrative training but not necessarily about school leadership.

A drastic change of managing education that was practiced in a centralistic manner since the colonial era occurred in 1998 when the New Order collapsed. The new government stipulated the autonomy law, where starting in 2001, the education sector was managed at the district level (Kristiansen & Pratikno¹⁷). This situation also is marked the beginning of an era of educational reform which was the enactment of the New Education System Law in 2003 (Raihani²⁶). This was followed by the implementation of several new policies, such as school committee and education council (Sumintono et al.²⁸), school operational support that does not differentiate between public and private school (Fitriah, Sumintono, Subekti, & Hassan⁹), teacher certification program, and international standard school (Sumintono & Subekti²⁹).

From the year 2001, the appointment of public school principals was devolved to the district level (either a city or a regent), as part of an active system of decentralization. Many education districts sought help from the central government or local universities to train future school principals. However, in most cases, they just appointed teachers based on their personal preferences. This action is not surprising as a longitudinal study by Hofstede (Hofstede¹⁴) Geert Hofstede proposed four dimensions on which the differences among national cultures can be understood: Individualism, Power Distance, Uncertainty

Avoidance and Masculinity. This volume comprises the first in-depth discussion of the masculinity dimension and how it can help us to understand differences among cultures. The book begins with a general explanation of the masculinity dimension, and discusses how it illuminates broad features of different cultures. The following parts apply the dimension more specifically to gender (and gender identity regarding Indonesia society cultural model found that higher hierarchical powers can decide anything they like).

Because of this situation and the fact of widening capacities of district governments, starting from the year 2009, the Ministry of Education released a regulation (number 6/2009) stating that before becoming a principal, school leadership training was required (MoNe²²). As a result, a national agency name as Agency for School Principal Empowerment and Development(LP2KS) was established to provide this training(LP2KS²⁰). This training program is called the Development of Principal Managerial Skills. The syllabus for the training contains areas includes student management, human resource management, curriculum development, school development planning, monitoring and evaluation, and information and communication technology in school. This training is supposed to be in line with the Ministry of Education decree number 13/2007 regarding principal standards, where a school principal in Indonesia has to be competent in five areas, which are personality, managerial, entrepreneurship, supervision and social (MoNE, 2007). The first stage of the training is seven days training at the LP2KS (70 hours), located in Solo, Central Java; followed by three months (equal to 200 hours) on the job learning (OJL) (apprenticeship) in two schools (his/her own school and another school in his/her district) where participants are asked to prepare an action plan for change and improvement. The last stage of the process is three days training (30 hours) in the LP2KS which mostly consists of completing a portfolio of the activities undertaken during on the job learning and the presentation of the portfolio. Total time of this program is 300 hours lesson. Once principals have successfully completed all the training and assessment in LP2KS, the candidate will be awarded with a unique number of school principals' registration numbers (Nomor Unik Kepala Sekolah), which makes them eligible to be appointed as school principals by the mayor in their respective districts (LP2KS²⁰).

There are several reports discussed on school principals that appeared in the international literature which portrayed and reflected the situation of post-1998.

It is interesting to note that even the minister of education in 2002, stated that “the Indonesian government less educate the school leaders to be independent in many aspects of school administration” (Sofa, Fitzgerald, & Jawas²⁷). Further, from their study, Jones and Hagul (Jones & Hagul¹⁶) found that “school principals have little authority in running the school or in resource allocation, nor are they usually trained to manage or lead a school well”. This situation is also captured in Bjork's (Bjork¹) study which indicates that local authorities, which include school principals to district government, do not have enough capacity in terms of expertise and experience. Therefore they rely on a bureaucratic manner to handle challenges and opportunities of education autonomy. The result of this situation is that good practice such as shared-decision making and the empowerment of teachers most of the time did not happen as expected. In most cases, the school principals relied on their autocratic leadership's style (Sofa et al.²⁷). In addition, one indication by Lee and Hallinger (Lee & Hallinger¹⁸) based on PIRLS research, found that Indonesian school principals have less time in terms of practicing leadership role in their schools, which affirms that their main emphasis is on school management as previously stated.

An empirical qualitative study by Raihani (Raihani²⁶) which was based on successful school leadership perspectives, provided unique findings. With the involvement of three school principals from Yogyakarta, he found that all embraced “Islamic and cultural beliefs and values that underpinned their leadership...which were articulated in the school leadership and strategies” (p. 481). Raihani²⁶ developed An Indonesian Model of Successful School Leadership (AIMSSL). According to Raihani²⁶, “propositions about successful school leaders are drawn in that they demonstrate ability in analysing the school contexts and situations both internal and external to school; visioning and setting strategies; having strong personal and professional values and respecting and aligning others' personal and professional values; developing strong teaching-learning characteristics including curriculum and instruction; fostering professional development of themselves and staff through methods such as intellectual stimulation, providing individualized support and modeling; redesigning the organization including identifying and creating and/or changing the school cultures and modifying organizational structures; and building collaborative cultures in which the high involvement of the school's other stakeholders in the decision-making processes is exercised”.

Two further quantitative studies were conducted in Sumatra, they are Lampung and Padang which have revealed new findings^{25, 26}. The Lampung study found that teacher’s job satisfaction improves if the school principals’ decision-making style practice is rational, less dependent, and avoid intuitive, avoidant and spontaneous (Hariri et al.¹¹). Meanwhile, Damanik’s⁵ study emphasized that the leadership behaviours of the school principals and its influence on elements of the school climate are important for school improvement, in this case, teacher self-efficacy, in the context of education reform.

In another study conducted by Jawas¹⁵ in Malang, East Java, using the mixed-methods approach on instructional leadership, she found that there are four areas of improvement (curriculum, teachers’ professionalism, learning facilities, and students’ learning outcomes). In this regard, he found that instructional leadership actually supports the practices of managing, promoting, improving and assessing instruction by the school principals. However, this study found that the perception of principals and teachers were found to be different, and they do not necessarily lead to the increased frequency of practices that influence instructional improvement. The above study indicated that the spectrum of educational leadership practices happened in contemporary Indonesian schools. However, there has not been a single study done in the context of school principal preparation; thus, this study endeavors to fill in the gap.

RESEARCH METHODOLOGY

The study is based on research and development model by Gall, Borg, and Gall’s (Gall, Gall, & Borg¹⁰). A total of 20 respondents ranging from principal (P), vice-principal (VP) and senior teachers (ST) with 5–40 years of teaching experience were involved in the interview session. The interviews were conducted in approximately 30-45 minutes after the school hours.

The collected data were transcribed, coded and categorized following the emerging themes, and interpreted using inductive and deductive methods. This study will be conducted in the form of interpretive research where “the researcher is interested in understanding how participants make meaning of a situation or phenomenon, this meaning is mediated through the researcher as an instrument, the strategy is inductive, and the outcome is descriptive” (Merriam²¹).

This study took place in three districts in East Nusa Tenggara province, there are Kabupaten Timor Tengah Selatan, Kabupaten Timor Tengah Utara and Kabupaten Kota Kupang. The researchers selected three public vocational school principals and three private vocational school principals located at three different places in East Nusa Tenggara. The schools were being selected based on the number of student populations and their achievements. The office of education located in those districts will be consulted in selecting the schools. The samples of this study consisted of a purposive sampling of 20 people the profile is shown in Table 1. The researcher collected data using three different techniques: interviews, observations and document analysis. The three different instruments were adopted to ensure that rich data and information can be obtained in this research (Creswell⁴).

All the participants (except the students) were be individually interviewed at the time and place convenient to both the researchers and participants. The questions posed to the participants are meant to find answers to the research questions. All the interviews were be recorded using a digital tape recorder.

Table 1: Respondent’s Profile

	Demographics	Frequency	Per cent

RESULTS

The description of research data presented here is based on findings of interviews with involving twenty respondents from principals and senior teachers. Some school principals describe the model of school leadership strengthening that is applied in their respective vocational schools, as the respondent explained:

In this case under the provincial government, the Department of Education play the vital role as the principal of direct superior. The principal should work closed together and communicate with the teachers and parents in order to produce students who are able to perform well both in education and morals (P1). Similarly, another senior teacher from the different school stated:

The education office as the policy maker and the school community is only the executor (ST1).

The conclusion of the interview result is that all existing systems in schools are centralized from the provincial principal and teachers perform their duties that support student achievement and morals. Other school principals stated that the model of strengthening the school leadership is applied as follows:

The parents of the students and industries give feedback input to the principal who is the primary and public-facing representative for the school in assisting with admin, teachers, to process input from industries and parents in order to achieve the vision and mission (P2).

The senior teacher stated that: Vision and mission the school is made more focused and implemented in supporting the teacher’s duties and teacher’s role (ST3).

The other senior teacher stated that: A clear vision of vision mission will make the school work program more focused on quality of graduation (ST5).

The above statements highlight that principals have some traits of leadership, such as democratic and visionary leadership as well as collegial leadership. The parent has a role involving school programs. The role of the parents is not solely to send their school going children to be trained in school but also have a responsibility to their children at school. The most important from this interview is that the school’s leader must have an established direction of the employability issue of the graduate students. Producing ready-to-work graduates is a clear vision of the principal.

In other perspectives, other principals expressed their experiences of strengthening principal leadership as follows: The principal is the main leader and have a responsibility in the school. In carrying out his duties, he or she is assisted by the vice principal, admin and other teachers in running the school show to ensure the vision and mission goal delivered (P4).

Other principal point of view mentioned that the model of strengthening the school leadership is good management skills in all the lines of their respective duties which can positively impact productivity of the school performance (P6).

The teacher stated the existence of togetherness and teamwork enable all the work programs to be implemented properly (ST7). The other teacher concludes that a good relationship and teamwork as well as clear vision and mission will result in an innovative program in educating the students and able to advise each other by giving soft reminder without conflict of interest and able to be professional to improve the school management (ST6).

It is concluded that the model of the principal above is the democratic leadership. Vice principal, administration and senior teachers are an important component in assuring quality in the school programme.

Related to the training and other program enhancing school leadership, most of the respondents give good comments on the training methods: The training conducted by the government are relatively useful; it makes us know more how to become a good leader, and also we understand the duties of a principal in many situations (P8).

Mostly the training that I follow can improve our competency in managerial and leadership, especially in the internship section (ST9).

The training is effective because they taught everything that I need to become a principal (P1).

These findings highlight how important the principal's leading professional training is in building school leaders. This is in line with international research findings that reinforce how being in a deputy role can significantly influence the subsequent leadership practice and behavior of future principals (Day, Sammons, & Gu⁷).

The findings indicated that school employs many leadership models. The application of these models depended on the influence of the existing situation. The application of the school leadership reinforcement model requires the principals to have a clear vision in producing ready-to-work graduates. The school leaders must set up creative and innovation institutions to support and produce output in accordance with the steady plan. These supporting institutions can provide valuable inputs to enable schools to produce appropriate output that matched with the requirements of the industries. Strengthening the school leaders can be in the form of understanding of the local culture, benchmarking other schools, providing professional training, instilling good ethics, and building strong character and high integrity.

In line with many studies of successful school leadership, the principal's leadership in this study was reinforced by a set of personal beliefs and values (Day, Harris, & Hadfield⁶; Raihani²⁶). As the respondents said,

As a school principal, I don't know what I will be, but this is an "amanah"(trust) and given from God that I am responsible in my "akherat" (future) (P6).

Other principal said,

The principal is only a job position but also a trust given in my career path (P5).

Senior vice principal described his principal,

I know very well how my principal holds this vital position, he or she is very amanah (trusted) particularly in managing the money (VP4).

These statements, the beliefs, and values reinforces the importance of leadership of the principal in running the school.

DISCUSSION

From the description and field data obtained will enable to assist how strengthening the leadership

of the principal can be formulated. The formula for strengthening the headmaster model is clearly how a leader can ensure the direction and motion of organisational behavior toward a very clear goal. The purpose of a vocational high school is how to ensure graduate students are ready for the work market. The ability to obtain good work for himself and for others. The models of school leadership reinforcement in East Nusa Tenggara can be described in Figure 1.

From the Figure 1 explained the principal plays its role in a central way. The principal is appointed in a special institution who is responsible for designing, formulating and describing the qualifications of graduates demanded by the market consistently in the school system. The fulfillment of school qualifications is monitored directly by National Working Competency Standard of Indonesia (SKKNI) and Indonesia National Qualifications Framework (KKNI) to ensures that the educational stage is carried out correctly.

How does the principal strengthen his leadership? In the picture is clearly mentioned some research findings that provide strengthening of leadership. Strengthening school leadership is a local understanding of local culture, benchmarking, professional training, increased trust, strong character, and high integrity. The reinforcement received by the school will have an impact on the school's organizational system to design the needs of school graduates from the market demand, to determine postgraduate qualifications with the qualities and preparation of specific graduates before entering the workforce. The findings of models in remote areas, such as in the province of East Nusa Tenggara, became embryos for broader and more detailed developments because the number of students and understanding the needs of employees in world education.

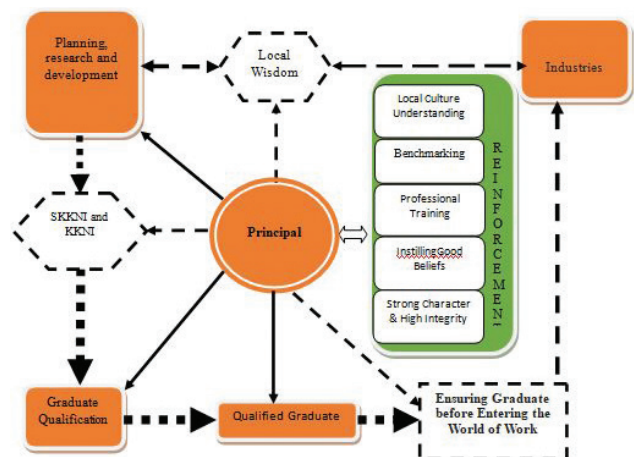

Figure 1: Model of school leadership reinforcement in East Nusa Tenggara

CONCLUSION

In this study the principal leadership is found by using several models of leadership. The application of this model depends on the influence of the existing situation and conditions. In implementing the model of school leadership strengthening requires the principal to have a clear vision in producing graduates who are ready to work. School leaders can establish similar institutions of planning, research and development institutions to support and produce appropriate outputs of the Vocational High Schools (VHS) vision and mission. These supporting institutions can provide valuable inputs to enable schools to produce output that meets the requirements of the industries.

ABSTRACT

This study discussed the computer simulation model development for Green Zone (GZ) of an Emergency Department (ED) using discrete event simulation approach. Due to the delay in getting treatment that contributed to patients overcrowds issue and long waiting time, the ED management needs a tool that can be used to analyze the current operation and understand their resource capacities to improve the services' quality. Any imprecise decision made to overcome this problem may lead to a more serious problem towards the future. The developed simulation model was used to test an increase in level of demands and how it will affect the performance of GZ. The computer simulation model development is based on 24 hours collected data for a month period. The results from the simulation runs are evaluated and discussed with the ED management for possible areas of improvements. The OptQuest functionality in Arena software was used to find the optimal number of resources required based on demands. The improvement model is developed based on the results of the optimization process and its conclusive findings show the enhanced model significantly improves ED's performance in term of the total average patients' waiting time and the utilization rate of staffs.

Keywords: *emergency department, simulation-optimization model, optimal resource*

INTRODUCTION

Emergency Department (ED) is a main entrance to the hospital that serves critical and non-critical patients in need 24 hours daily, where respectable and timely performance could save lives. However, with the increase in population every year, the number of ED visits may increase as well, and this will cause overcrowding and long waiting time issues. These issues are commonly faced by ED around the globe. ¹ stated that the EDs utilization rate in public hospital has increased in five years, and the GZ utilization rate is the highest as compared to other zones. Although, the GZ is for treating non-critical patients, long waiting time and overcrowding continually be an issue as the number of patients is always high for this zone². It may cause dissatisfaction among patients since they must spend more time to get the required service and the staffs also must work for a very long hour.

Previous studies have shown that the problem arises due to limited number of resources available in the department, where having a proper planning and reallocation of the resources are seriously important^{3,4,5,6}. ED management has implemented various actions to deal with these issues. Adding and reallocating the resources directly into current system are the common ED management decisions to overcome the problem and mostly being done manually by trial and error basis. In some cases, the outcomes of such decision may lead to even serious scenarios. Any decisions with uncertain implications will only risk the whole operation of ED, thus the management need to study every detail of the operation before the final decision being made.

The ED understudy has their own Key Performance Indicator (KPI) to measure the GZ performance. The main concern of the ED management is to find the optimal resources required in the zone when the number of patients increased without increasing the acceptable waiting time level as stated in the KPIs.

Computer Simulation is one of the tools that can be used to analyze the current problem. It has been widely used in many operations, such as healthcare industry, logistics and transportations, military operations and manufacturing to examine the processes involved and product flows⁷. Numerous studies have applied operational research methods to find solutions towards problems in healthcare domains⁸ but computer simulation is among the most popular method⁹. Computer simulation is suitable to study or modeling a complex system like ED. The embedded animation features in simulation model help the ED management to further understand their model easily, since they do not have a sufficient time to study methods that involved complex numerical equations⁵. Besides, the simulation model can assist the management to identify unforeseen bottlenecks, to avoid over or under utilization of resources and optimize system performance¹⁰. Simulation also able to evaluate the existing system and proposed tested alternatives without affecting the actual system.

Discrete Event Simulation (DES) is one of the simulation approach that is not time consuming, cost saving and proven to be the most effective tool for decision maker to analyze complex system¹¹ and to amend the system without affecting current operations¹⁰. Previous studies have used DES in improving the performance of ED by several scenarios such as to decrease patients' waiting time and length of stay^{12, 13, 14}, to analyze resource utilization and allocation of resources^{15, 16, 17}, to find an optimal number of resources^{18, 19} and to determine or predict number of patient load²⁰. Single implementation of DES is not sufficient because simulation model can only provide estimates value and not exact values⁵. Therefore, some other research had combined DES with other optimization techniques such as Data Envelopment Analysis (DEA), Particle Swarm Optimization (PSO), Ant Colony Optimization, Data Mining, Agent Based Optimization, Genetic Algorithm and others. Those methods used to study patients' flow²¹, to find optimal scheduling of staffs^{22, 23}, to determine resources allocation²⁴,²⁵ and to analyze system performance²⁴.

Therefore, the aim of this study is to develop a computer simulation model capable of depicting the current operation of the ED and the results obtained from the simulation model will be used to determine the optimal resources required based on the demand by using optimization approach.

This paper is organized into four sections; in section 2, the materials and methods used for the simulation

development process is discussed. In section 3, the results obtained from the simulation and optimization model are discussed. Lastly, conclusions and future work will be discussed in section 4.

MATERIALS AND METHOD

Based on the above issues of the current situation in ED's GZ, it seems necessary for the management to find more efficient optimal resources utilization to handle increasing level of demand. A simulation model is developed in this study to be utilized for assessment and strategic planning of ED. The objectives of this study are summarized as follows; to model the ED GZ actual system using simulation model, to examine the performance of the system when the number of patients increased and to determine the number of resources required (such as staffing and physical capacities) to improve the ED performance. This is to ensure that the service capacity is match to the patient demand.

System Description: The ED understudy operates 24 hours daily with total average of 2977 patients per week. It is divided into three zones; GZ for non-critical patient, Yellow Zone for semi-critical patient and the Red Zone for critical patient. The patients who arrived at the ED will be triaged first and will be attended for treatment according to the established target time of the ED understudy as shown in Table 1.

Table 1: Patient's triage system and established target time

Triage Zone	Case	Target Time
Red	Critical	Immediately
Yellow	Semi-Critical	Within 30 minutes
Green	Non-Critical	Within 2 hours

In this study, we only focused on GZ because based on patient arrival statistic recorded by the ED understudy, more than 70% of patients per week are from GZ. Besides, based on our previous study¹¹, it shown that the average patients' waiting time for GZ is the highest as compared to other zones. Therefore, the ED management attempt to improve more on GZ operation. Currently, the GZ operates with 4 consultation rooms handled by 4 doctors and 4 nurses for each shift. There are 2 medical assistants (MA) for triage process and 2 MAs for laboratory tests. Work schedule for doctors, nurses and MAs is shown in Table 2. Figure 1 shows the general flow of patient (from arriving until they are discharged or admitted) and the processes involved in GZ.

Table 2: Staff’s work schedule

	Shift 1	Shift 2	Shift 3
Doctor	10.00 am – 5.00 pm	5.00 pm – 12.00 am	12.00 am – 10.00 am
Nurse	7.00 am – 2.00 pm	2.00 pm – 9.00 pm	9.00 pm – 7.00 am
MA	7.00 am – 2.00 pm	2.00 pm – 9.00 pm	9.00 pm – 7.00 am

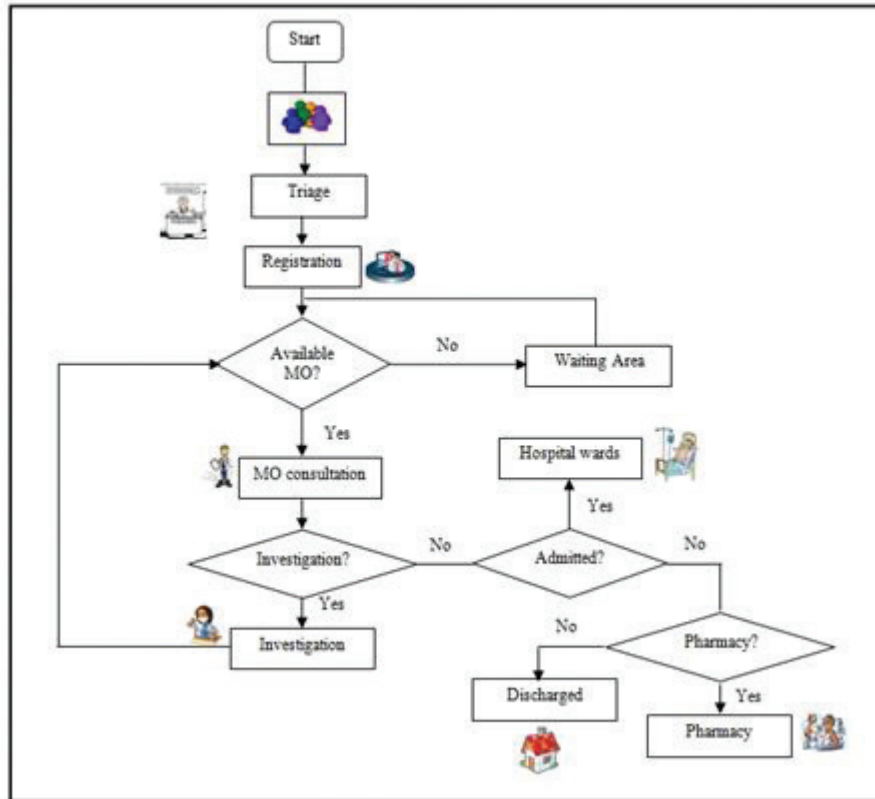

Figure 1: The general flow of patients at GZ

Patients usually arrives at ED’s GZ either by walk-in or by any means of transportation (personal or public transport). Once arrived, the patient will have wait for the triage process. Normally for this process, MA will check the vital signs and other patient’s conditions. After that, the patient is required to register at the designated registration counter and then they will have to wait at the waiting area until being called for treatment. Each patient may encounter different waiting time depends on the consultation rooms availability. After receiving consultation from the doctors, the patient are informed for further tests (lab tests, CT-scan, x-ray or else) if required. Results from the investigation tests are reviewed by the doctor and the decision for further tests will be made (if any). Otherwise, the patient will be discharged or admitted to the ward. According to the ED manager’s experience, about 80% of green zone patients will be discharged. Therefore, this study excluded the process of waiting to be admitted. Also, about 2% of patient will be temporarily observed at yellow zone

before being discharged. This process is also excluded in the simulation model. Medicine will be prescribed for discharged patients, where it can be collected at the pharmacy counter before leaving the system.

Process of Data Collection: To develop a reliable simulation model, the data is collected by interviewing the ED management including doctors, nurses and medical assistants. This process involved ED’s documents review and direct observations of ED operation. ED understudy is lack of some data especially the processing time for each treatment experienced by the patients. Most of the data is manually recorded in log books. Therefore, in this study, the data is collected and recorded manually through observations. The data collection process is being performed by an appointed team for a month duration. Then, the data are converted into the distribution functions to be used in the simulation model development process.

Development of Simulation Model: The first phase of this study is to develop a simulation model. The GZ simulation model was developed using Arena 14.1. Arena software is chosen as it is a flexible tool for modeling the ED. This software has an animated feature that tend to ease the understanding of ED management⁵ towards their system. The development of this model starts by investigating and analyzing the actual system. This process includes analyzing and observing the GZ layout, the flow of patient, the relationship between processes and available resources involved. This investigation helps to provide better understanding of the operation of this zone. It also helps us to identify the constraints to the flow, which to be included in the development process.

The data collected from the previous phase is inserted into Arena Input Analyzer to determine the suitable distributions. Those distributions are inserted into six connected modules (arrival, triage, register, consultation, investigation and pharmacy) and executed for 24 hours with 12 replications each to get average and accurate results. The completed simulation model is verified and validated to make sure that it successfully replicates the actual system operations. The model is executed and reviewed by ED management for errors. Once the verification is completed, the validation test took place. This is to ensure that the simulation results are as expected and represent the real system¹². Then, the results are presented to the ED management to confirm the validity of the model based on their knowledge and experience. Additionally, the validation test is also being performed using the mathematical formula as follows:

$$\text{Difference (\%)} = \frac{|\text{Simulation output} - \text{Actual data}|}{\text{Actual data}} \times 100\%$$

The results from the simulation model will be compared with the actual collected results and the resulting difference must be less than 10% for it to be considered as valid and achieved the accuracy level²⁶. To determine the optimal number of resources based on the number of patients, the embedded optimization tool in Arena software, named OptQuest, was used. For this optimization model, we used our previous model as discussed in⁷ and some modification made to the constraints part. The results from the optimization model were applied to the GZ model and the average patients' waiting time and the staff's utilization rate will be evaluated.

RESULTS AND DISCUSSIONS

Validation Results: For this validation test, the total number of patients, and number of patients went to pharmacy for the simulation model are compared to the actual 7 days data collected previously are shown in Table 3. This calculation is based on the mathematical formula stated in the previous section. The validation percentage between simulation model output and the actual data for the number of patients exit the system is 1.61% which is under the acceptable level of accuracy. Also shown in the table, the validation percentage for the total number of patients at pharmacy process, which is also in the acceptable range, 2.75%. Therefore, the simulation model is concluded as valid and acceptable to be used for decision making process.

Table 3: Validation results between simulation model and actual data

Item	Simulation Output	Actual data	Validation (%)
Total number of patients	2620	2663	1.61
Total number of patients for pharmacy	1519	1562	2.75

Simulation Results: There are 3 outputs monitored in this model for performance measures purposes as follows; total number of patient being treated in the system, total average patients' waiting time and staffs' utilization rate. The results are shown in Table 4 below. The average utilization rate for doctors, nurses and medical assistants are still in acceptable range of good utilization rate of a service sector, which is between 70% to 80% as stated in⁶. As we can see from the table, the total average of patients' waiting time is 264.78 minutes (almost 5 hours) which is quite high, and this is the reason why overcrowded situation occur and it also might cause dissatisfaction among patients.

Table 4: GZ simulation model's results

Item	Simulation Results
Total number of patients (per day)	377 patients
Total average patients' waiting time	264.78 (minutes)
Average Utilization Rate	
Doctor	71 %
Nurse	70 %
Medical Assistant	64 %

From the above results, the ED management needs to know the consequences if the number of patient increased than usual. This is to help them to understand how resource availability will affect the performance of the GZ. Table 5 illustrates the percentage of demand increase based on the discussion with ED management (the increase percentage is based on their

past experiences). From the table, the simulation model shows that when the number of patient increased, the total average patients' waiting time will also increase up to 7 hours (402.15 minutes) and the utilization of staffs also increase to almost 90%, which exceeds the acceptable range of 70% to 80% as stated before.

Table 5: Changes in number of patients, total average patients' waiting time and staffs' utilization rates

% Increase in number of patients	Number of arrival	Total average patients' waiting time (minutes)	Average utilization rate (%)		
			Doctor	Nurse	Medical Assistant
0 (GZ model)	377	264.78	71	70	64
5	396	281.78	75	73	69
12	422	298.37	80	78	74
15	434	323.35	85	84	78
21	456	365.74	88	86	81
23	464	389.44	91	89	85
30	490	402.15	93	90	87

Improvement Model: Several modifications to the GZ model are suggested and discussed with the ED management to determine the optimal resources required to cater the mentioned problem. The optimization model from our previous study was modified based on the current situation and the objective was set to "minimize total average patients' waiting time". Lower and upper bound for the resource constraints are set by the ED management. Table 6 shows the optimal number of resources suggested to serve the increase in number of patient obtained from the OptQuest function in Arena software. It shows that, number of resources needs to be added to the system to meet the number of demand.

Lastly, the simulation improvement model (IM) was constructed by altering related capacity based on the optimal results obtained from the previous phase. This improvement model is run similar as GZ model with 12 replications and the results are shown in Table 7 below.

Besides following the established targeted time as mentioned before in section 1, the ED understudy also has their own KPI for the total average patients' waiting time. For total average patients' waiting time, their KPI is to serve patients within 3 hours. Based on the results in Table 6, when the number of resources increased, the total average patients' waiting time has decreased significantly for improvement model, IM1 (53.32 minutes reduction), IM2 (125.13 minutes reduction) and IM3 (154.15 minutes reduction). Even though the improvement model, IM4, IM5 and IM6, are over the targeted time but it is not far enough to be accepted. The utilization rate for doctors, nurses and medical assistant are also reduced and within the acceptable range. Perhaps, it can reduce the dissatisfaction and tiredness among staffs due to long working hours.

Table 6: The Optimal number of resources for each demand

% Increase in number of patients	Number of resources		
	Doctor	Nurse	Medical Assistant
5	7	9	5
12	7	9	5
15	7	11	5
21	8	12	6
23	9	12	6
30	9	14	7

Table 7: The improvement model results compared to GZ simulation model (before)

Model	Total Average patients' waiting time (minutes)		Average utilization rate (%)					
			Doctor		Nurse		Medical Assistant	
	Before	After	Before	After	Before	After	Before	After
IM1	281.78	179.32	75	70	73	69	69	60
IM2	298.37	173.24	80	75	78	71	74	66
IM3	323.35	169.20	85	75	84	76	78	69
IM4	365.74	193.21	88	77	86	79	81	72
IM5	389.44	198.06	91	79	89	79	85	74
IM6	402.15	215.34	93	81	90	81	87	77

CONCLUSIONS AND FUTURE WORKS

This study presents a development of a computer simulation model of GZ in ED. The simulation model is developed using DES approach with the aim to provide the ED management with a better understanding towards their system and to help them in analyzing the performance of the system. This study incorporates the simulation model with optimization approach to determine the optimal number of resources required to meet an increase in demand without increasing the average patients' waiting time and staffs' utilization rate. The results from simulation model show that, when the number of patients increased to a certain percentage, the total average patients' waiting time and utilization rate of staffs will also increase. This may contribute to the overcrowded situation and dissatisfaction among patients and staffs. Therefore, an improvement models are tested to measure the performance of the GZ. These improvement models are constructed based on the optimization process using the OptQuest functionality in Arena software.

The results of the improvement models show that by increasing the number of resources (doctors, nurses and medical assistants), the total average patients' waiting time is reduced significantly and within the targeted KPI of the GZ. In addition, the average utilization rate of staffs is also reduced between the acceptable range of 70% to 80%.

Through this simulation model and optimization process, the ED management able to understand the problems occurred in their current system and they can utilize it to perform "what-if" analysis for any potential improvements. This model perhaps able to assist them in decision making without directly affecting the actual system.

Although the results obtained are acceptable and helpful to the ED management, there are many limitations and constraints needed to be considered for future works. Some of the data also are not included in the simulation model due to lack of information about the data. Therefore, for the future work, these constraints and unavailable data must be studied in thoroughly before it can be included in the model.

ABSTRACT

The increasing number of patients each year visiting to the Green Zone in Emergency Department of Hospital Universiti Sains Malaysia (EDHUSM) requires a reasonable projection and proper planning of resources in order to meet the growing demand of the patients. Proper planning and the repercussions are required to be conducted for the present and the future in order to assist the management to improve the patients flow and services in Green Zone EDHUSM during weekdays, weekends and public holidays. Since the system in the Emergency Department is very complex, a computer simulation model is essential in order to understand the structure and behaviour of the system. Therefore, System Dynamics simulation is used to predict the number of patients that will visit and the resources required to match the demand and supply during weekdays, weekends and public holidays in the Green Zone at the present and for the future for the next five and ten years. The results show at the present, there are resources gaps of three doctors and three nurses on weekdays, while six doctors and six nurses on weekends as well as on public holidays. Therefore, adding new staff are really important in order to improve the patients flow in Green Zone EDHUSM and vital for achievement of the department's KPI. The result garnered from this research will assist the management to make a sound decision within their stipulated budget to improve the quality of services rendered and further enhance the performance of EDHUSM's Green Zone.

INTRODUCTION

An emergency department (ED) is one of the busiest and vital units in hospitals as it provides immediate treatment to patients who either by walks in or transported in by ambulance without prior appointments in the healthcare systems. EDs are opened and resourced 24 hours every day including working days and holidays. Hence, EDs all over the world are vesting efforts and struggles to maintain high service levels, which are reflected and measured through the patient's waiting time while confronting the increased of patient volume and constrained by limited resources¹. The EDs are often zoned based on level of criticalities and services rendered. The Green Zone located in the ED is designated to attend patients with non-critical conditions and injuries². Although the Green Zone in EDs caters

non-critical cases, many patients still experiences long waiting time before receiving treatment. Due to this downside, a few patients even leave without being treated, particularly during peak hours and overcrowded situations. Consequently the priority of any ED in the world is to provide fast and swift treatment by reducing the patient's waiting time and length of stay³. Moreover, the other trouble that surrounds the ED is the shortage of resource allocations like medical officers and beds⁴.

In light of this, the hospital administrations are seeking and in their quest to find an effective way to achieve the effective balance between the demand and supply in ED⁵. Relatively, it's more than often that the difference in demand and supply contributes largely towards the bottlenecks faced in the ED. Therefore, in an effort to strive the balance between demand and supply,

several methods were explored by previous researchers to solve these problems. In resultant, some of the methods positively contributed towards the solution, sought while some of the methods explored deem to have failed⁶.

As healthcare environment is highly intolerant of failure, the most effective way for decision makers to study, analyze and evaluate processes, whether it is simple or complex processes is through the simulation method as it is proven to be the most powerful tool which garners better result⁷. Researchers have conducted various studies in the ED using simulation that are associated with resource allocation, improvement in patient flow and a reduction in the patient's waiting time^{8,11}. Relatively, there were also several exceptional studies conducted in the ED using System Dynamics (SD), a model developed and applied to predict ED demand¹². Previous scholars^{4,6} have applied SD to simulate the impact of an increase in patient's volume in a government hospital in the Northern region of Peninsular Malaysia. Similarly¹³ developed an SD model in order to project and predict on the future demand of medical specialists at Emilia-Romagna Region.

Although most studies focused on operations in ED which involves improvement in all three zones parallel using SD, but minimal focus were vested in detailing problems faced by each zone. Besides that, there are limited literatures that reports on the use of this approach in order to resolve the problems encountered by the Green Zone in the ED. Therefore, this study will focus on the EDHUSM' Green Zone, which is indeed one of the busiest hospitals located in the capital city of Kelantan, Malaysia. The lengthy patient's waiting time and overcrowded situation, especially after office hours throughout the weekdays, weekends and public holidays gravely contributes to the problem that occurs in Green Zone EDHUSM. These problems also indirectly contribute to the non-achievement of the department's Key Performance Indicator (KPI), especially on weekends and public holidays. In 2009, the Ministry of Health (MOH) introduced and set the maximum key performance indicator (KPI) to be within 90 minutes for patient to receive consultation and treatment at the ED's Green Zone⁵. In our case study, the KPI before receiving consultation and treatment for Green Zone at EDHUSM is at below 120 minutes.

Even though the KPI of EDHUSM is slightly higher compared to the KPI of MOH, the EDHUSM's Green

Zone still faces difficulty in achieving the targeted time. Based on the interviews and surveys conducted, the factors which contribute towards these problems is the insufficient resources whereby there are a low number of medical staffs such doctors and nurses working in the EDHUSM's Green Zone especially during weekends and public holidays. Currently, there are only two doctors and two nurses who serve at the Green Zone for every shift regardless whether it is on weekdays, weekends or public holidays. However, the imbalance occurs as the number of patients visit the EDHUSM's Green Zone on weekends and public holidays are twice more compared to the number of patients' that visits on weekdays. Therefore, the management of EDHUSM is concerned whether the department will be able to handle the increasing patient volume with the current resource capacity available.

System Description: The EDHUSM's green quarter operates 24 hours, every day in a year, which includes weekdays (Sunday to Thursday) and weekends (Friday and Saturday). Certainly to be mentioned that weekdays in Kelantan are from Sunday to Thursday at the same time as weekends are on Friday and Saturday. The green area's operations are divided into three shifts particularly morning, evening and night. The morning shift starts off evolved at 0700 to 1400 (7 hours), 1400 to 2100 for evening shift (7 hours), and 2100 to 0800 on the next day for night shift (10 hours), respectively. The manner flow in Green Zone begins with an affected person's arrival walk in to EDHUSM whereby upon arrival the patients forestall on the registration counter to sign up. After the registration method, sufferers may be triaged by means of a nurse on the triage counter and upon completing the triage, the patients will pass to the waiting place to peer the health practitioner.

In fact that there are five session rooms, handiest two rooms are operated and applied for every shift. Due to the lack of doctors and nurses works in every shift all through the weekdays, weekends and public holidays. Subsequently the doctor will decide if the patient requires similarly assessments, inclusive of medical laboratory tests, x-ray test, counselling session and Plaster of Paris (POP) remedy. Patient should wait as a minimum of half an hour to at least one hour for the end result in which the patient second consultation with the doctor will be accomplished shortly upon receiving the test results. In furtherance, the consequences acquired might be reviewed by doctor and decision can be made on the effects to either discharge the patient or admit them to other zones within ED or hospital wards.

For this case study, data were collected in one month manually for 24 hours in 2016. Interviews with the staffs were also carried out to fully understand Green Zone EDHUSM processes and to identify the critical aspects in the Green Zones EDHUSM that are required to be included in the SD model. Since EDHUSM started operating in new buildings in 2014, therefore data on patient register of 2014 are use as the base case for the SD model which includes a total number of 32000 patients visited EDHUSM on weekdays, while 28000 patients who visited on weekends and public holidays. This initial value is to forecast the number of patients that will visit, and predict the resources required to match the demand and supply during weekdays, weekends and public holidays in the Green Zone at the present and for the future next five and ten years.

Based on the interviews, EDHUSM’s management requires a tool that can assist them to foresee the consequences of their decisions prior to the implementation. The key challenges faced by the management of EDHUSM are in estimating the right number of doctors and nurses to be allocated in the Green Zone especially during weekdays, weekends, and public holidays which in reflect would enable the ED to manage the increase of patients at present as well as in the future. According to¹⁴, with the growth of population, the demand for health services, particularly in the ED has also increased. Henceforth, it is vital for proper allocation of doctors and nurses to be made in order to handle the increase of patients in EDHUSM’s Green Zone as this will improve the service rendered while smoothens the patient’s visitation in flow. Furthermore, this would enable patients to be treated within the allowed waiting time, thus permits the KPI set by EDHUSM to be achieved. Hence, this study will focus on predicting the number of a patient’s visit to EDHUSM’s Green Zone and the resources required during weekdays, weekends and public holidays at present and in future next five years and ten years using the SD method.

METHODOLOGY

As a result of the advancement in computer technology, the attention towards simulation has increased as this method is proven to be a powerful tool in helping decision makers to make a decision. With the aim of improving the decision-making process, SD was developed by Jay Forrester at Massachusetts Institute of Technology in the 1950s and proven to provide accurate insights on how a system behaves in both short and

longer periods¹. In fact, SD is a method used for the representation of complex and dynamic systems with the aid of computer simulation software¹⁵. Moreover, SD offers qualitative and quantitative aspect to further enhance the understanding of system behavior¹.

The SD method has been successfully applied in various fields, including economics, ecology, health science, physics, mathematics and biology. In brief, SD is an appropriate technique and is a suitable approach to study problems of a complex system. In addition to that, the SD method also focuses on the system from a macro level perspective which can be used for strategic level decision making. Furthermore, the holistic view offered by SD able to portray the complexity and the dynamic of an emergency service as well as reflects the impact of the ED towards other units in the hospital if changes were to be made in the ED⁴. Likewise, SD has the ability to predict the future conditions or demands which permits the prediction of patients’ requests at EDHUSM’s Green Zone in the future. For instance, the change in the population in future may consequently have an impact on the demand of patients in the future. Moreover, the SD method has the capacity to take into consideration different quantitative and qualitative factors in order to capture the dynamic interactions between these factors¹⁵.

Model Development: The SD model was developed using Vensim DSS software. Instead of modelling the whole EDHUSM completely, this study focused and began with the modelling of the Green Zone of EDHUSM. Even though the drawback of this principle is time-consuming, but by focusing on each zone, we can identify the factors that contribute to the problems in details and find the solutions for that zone. Causal loop diagrams (CLD), that act as the dynamics hypothesis for SD model construction were developed and converted into a formal computer model. According to^{16,17} CLD is to show the cause and effect relationship in a dynamic system. CLD also explain the behaviour of a system by showing a group of nodes that are interconnected by arrows and feedback loops. The arrows then show how a variable affects another variable. Figure 1 shows the CLD that represent the demand for Green Zone EDHUSM.

Figure 1: The CLD for Green Zone EDHUSM

As for this SD model, some of the inputs required were obtained based on the recommendation and discussion from the System Head as well as the management of Green Zone EDHUSM. The models adopted the simulation time range from 2014 to 2024 (10 years) since the objective for this study is to predict the demand needed in Green Zone EDHUSM for next five and ten years as it is the department’s strategic planning period. Figure 2 shows the SD model for Green Zone EDHUSM.

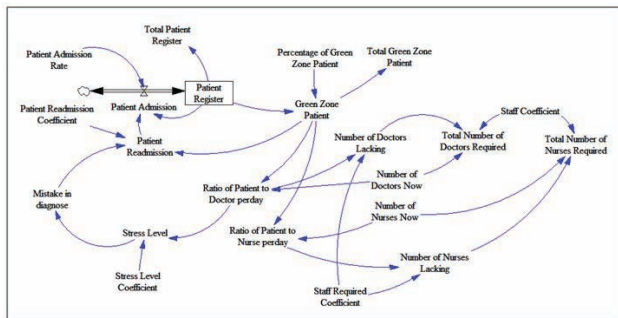

Figure 2: The SD model for Green Zone EDHUSM

According to^{16,19}, mathematically the SD model can be described as a set of integral equations which represent the accumulated stocks or integrated net flows to discrete time (t). A general mathematical representation of stocks and flows at time (T) can be presented in form as in equation (1):

Integral equation:

$$\text{Stock (T)} = (1)$$

The mathematical formulation relating to Patient Register stock as illustrated in Figure 3 is shown in equation (2). Furthermore, the significance variable and equation for the modelling are shown in equation (3), (4) and (5).

$$\text{Patient Register (T)} = (2)$$

$$\text{Total Green Zone Patient} = \text{Green Zone Patient} [\text{weekdays}] + \text{Green Zone Patient} [\text{weekends}] \quad (3)$$

$$\text{Total Number of Doctors Required} = \text{Number of Doctors Now} [\text{workweek}] + (\text{Number of Doctors Lacking} [\text{workweek}] * \text{Staff Coefficient}) \quad (4)$$

$$\text{Total Number of Nurses Required} = \text{Number of Nurses Now} [\text{workweek}] + (\text{Number of Nurses Lacking} [\text{workweek}] * \text{Staff Coefficient}) \quad (5)$$

Model Validation: Once the SD model has been completed, it needs to go through the validation process

before it can be used. According to¹⁷, there are two types of validation techniques which are behavioural validity and structure validity that can be used to build user confidence in using models developed in testing and designing strategies. Hence, in order to implement the behavioural validity test, the Green Zone SD model developed was presented and checked with the Head of EDHUSM to verify that the model represents the correct activities and flows in the department. In addition, the model was run and compared to ensure that the results generated from the model matched the empirical data collected from the Green Zone EDHUSM. Besides that, the Head of EDHUSM were also able to analyze the prediction results generated by the SD model for the number of patients’ visit to the Green Zone and the resources required at present and in the future for the next five years and ten years for weekdays, weekends and public holidays by Green Zone EDHUSM.

In this research we compared between the original data and SD output of total Green Zone patient register from 2014 to 2017 as presented in Table 1 to see the similarity that exists. According to⁷, the difference between the actual data and the SD outputs must be less than 10% using the following formula in equation (6). From the table, we can conclude that the results are valid because the differences are less than 10%.

$$\text{Difference (\%)} = \frac{(\text{Simulation output} - \text{Actual data})}{\text{Actual data}} \times 100\% \quad \dots(6)$$

Table 1: The comparison between the original data and the SD data of total Green Zone patient

Year	Actual data	SD output	Difference (%)
2014	33864	33840	0.1%
2015	35372	35470	0.3%
2016	37106	37286	0.5%
2017	39204	39323	0.3%

While for structural validation, the extreme conditions test was selected in this study. This test is effective in assessing the validity of the structure indirectly and it is one of the strongest tests to find a weakness in the model’s structure. According to^{16,17}, the smallest and greatest value will be used as extreme value to evaluate the validity of the developed model. Therefore, for the validation, the percentage of Green Zone patients for weekdays and weekends will be accumulated to the extreme value of 0 and 0.9 to see the effect on the number of patients’ visit to the Green Zone

in EDHUSM. Therefore, Figures 5 and 6 will show the comparison of both values as compared to the original percentage of Green Zone patients, which is 0.55% for weekdays and 0.58% for weekends. The original percentage of Green Zone patients for weekdays and weekend which been used in the SD model was obtained by discussions with the Head of EDHUSM.

Figure 3: Comparison of extreme value percentage 0 with original percentage

Based on Figure 3, when the percentage of Green Zone patient is accumulated to 0, it indicates that no EDHUSM patients are registered as Green Zone patients. Therefore, the total number of patients in the Green Zone will be 0 when compared to the total number of Green Zone patients based on the original percentage. Whereas when percentage of Green Zone patients are accumulated to 0.9, the total number of Green Zone patients will increase drastically compared to the total number of Green Zone based on original percentage as shown in Figure 4. As a result, after conducting extreme conditions test with extreme percentage value of 0 and 0.9, this Green Zone SD model developed is deemed valid and acceptable.

Figure 4: Comparison of extreme value percentage 0.9 with original percentage

RESULTS AND DISCUSSION

Results from the SD model reveal the prediction results of Green Zone EDHUSM at present and for the future on weekdays, weekends and public holidays. Figure 5 shows the results of the predicted number of patients' visit to Green Zone EDHUSM, number of doctors and nurses required at present and in the future for the next five years and ten years on weekdays, weekends and public holidays by Green Zone EDHUSM.

Time (Year)	2014	2015	2016	2017	2018	2019
Selected Variables Run: SDGreenZoneYear						
Green Zone Patient

Figure 5: Table results on predicting demand for Green Zone EDHUSM from 2014 to 2024

The results show that the demands in Green Zone EDHUSM are extremely increasing every year during weekends and public holidays compared to weekdays. This is due to the fact all outpatient clinics in government hospitals and all government clinics are closed for the duration of weekdays and public holidays. The results given by the SD model are matched with the current scenarios occurring in the Green Zones EDHUSM. In fact, the number of patients predicted by SD who visited Green Zone in 2014 during weekdays, weekends and public holidays are approximately equal with the real number of patients that visited Green Zone EDHUSM on weekdays, weekends and public holidays on 2014. However, the numbers of doctors and nurses who serve in Green Zones EDHUSM are not sufficient according to SD's results based on the current scenarios. Thus, this is the key factors which contributed to the current problems in the Green Zone, which mirrors the non-achievement of KPI by Green Zone EDHUSM.

Currently, there are two doctors and two nurses working for every shift in Green Zone EDHUSM which totals up to six doctors and six nurses working per day at Green Zone EDHUSM. Based on the results produced by the SD model which indicates that the total number

of doctors and nurses who are required to work in the Green Zone EDHUSM is 9 people per day compared to 6 people per day for weekdays while the number of doctors and nurses who are supposed to work on weekends and public holiday should be 12 people per day compared to 6 people per day as the current scenario practiced by the Green Zone EDHUSM. While for the next five years, no additional resources need to be made if the addition of resources has been made at present in Green Zone EDHUSM. However, in order to meet the number of patients' visit to Green Zone for the next 10

years, the addition of a doctor and a nurse on weekdays and two doctors and two nurses on weekends and public holidays are required.

Therefore, adding new staffs are really important in order to improve the patient flow in Green Zone EDHUSM and vital for the department's KPI achievement. Table 2 below, shows the predictions of the number of patients visit, reasonable number of doctors and nurses required for weekdays, weekends and public holidays at present and in the future for the next five and ten years by Green Zone EDHUSM.

Table 2: Comparison between actual data and SD results yearly in predicting demand for the present and in the future for the next five and ten years for Green Zone EDHUSM

Item	AD		Current (SD Results)		5 years (SD Results)		10 years (SD Results)	
	WD	WE/PH	WD	WE/PH	WD	WE/PH	WD	WE/PH
Number of Patients Visit in Green Zone	17600	16264	17600	16240	20792	23490	25352	43658
Number of Doctor	6	6	9	12	9	12	10	14
Number of Nurse	6	6	9	12	9	12	10	14

*Note: WD-Weekdays, WE/PH-Weekends/Public Holidays

CONCLUSIONS

This paper presents the study on developing SD model to predict and forecast the patients' volume in Green Zone EDHUSM at present and in the future for the next five years and ten years on weekdays, weekends and public holidays. Besides that, the results also show that the appropriate number of doctors and nurses, which is required to serve the demand from the patients who visits the Green Zone during weekdays, weekends and public holidays at the present time and in the future. Based on the results, it clearly shows that patient's arrivals at Green Zone EDHUSM are higher and busier on weekends and public holidays compared to weekdays. The need for resources such as the number of doctors and nurses to serve the demand from the patients should be greater compared to weekday demand. Therefore, the management needs to have proper planning and derive with a new working schedule for doctors and nurses for weekdays, weekends and public holidays in order to improvise the services in Green Zone EDHUSM. Furthermore, the SD results obtained from this study, might be an initial benchmark to assist and guide the management of Green Zone EDHUSM to initiate some improvement within

the department's budget allocation to solve the current scenario that occurs at the Green Zone throughout the weekdays, weekends and public holidays. Besides that, the findings are also benefits and provide a preliminary outline for the management to come out with strategic and long term planning for the preparation towards the growing number of the patients' visit as well as to plan the appropriate resources to cater the demand in the next five years and ten years period. Additionally, the results can also be used at the strategic level decision making in improving the quality, performance and services at Green Zone EDHUSM. While the future plans for this research is to come out with hybrid methods of simulation and mathematical programming techniques for a greater improvement in Green Zone EDHUSM.

ACKNOWLEDGMENT

The authors would like to thank the Emergency Department of Hospital Universiti Sains Malaysia (HUSM) for granting permission to conduct this study. This research received no specific grant from any funding agency in the public, commercial, or not-for profit sectors.

Ethical Clearance: Taken from the committee

The Perceptions of Residents toward Safeness of Living Vicinity of Telecommunication Base Station

Norazmawati M. S.¹, Muhammad Arkam C. M.², Kai X T³

^{1,3}*School of Housing, Building & Planning, Universiti Sains Malaysia, Malaysia;* ²*School of Environmental Engineering, Universiti Malaysia Perlis, Malaysia*

ABSTRACT

Studies about the telecommunication base station in both medical and economic contexts have been carried out over the past decades. With advanced technology, the users of cellular phones are increasing. Meanwhile, the public is concerning about the health issues which comes along with the increase usage of cellular phone; particularly regarding the exposure to electromagnetic field (EMFs). However, its impacts toward the residents living in close proximity to the telecommunication base station in Malaysia have yet to be studied in detail. Using the quantitative survey method, this study applied the binomial logit model to investigate the perceptions of residents who are living within close proximity to the telecommunication base station in Malaysia. The degree of awareness regarding the possible health effects of living in close proximity to the telecommunication base station was significantly different in different demographics and type of resident. This comparison would allow the telecommunication industry to understand the perceptions of these residents. Besides that, recommendations were also suggested to ease the health concerns of these residents.

Keywords: *Telecommunication base station, residents' perceptions, binomial logit model, safe to live, health awareness.*

INTRODUCTION

In the era of globalisation, the use of mobile communication technologies for phoning, texting and internet services are vital part of human life. Based on the statistical data from ITU¹⁷, global mobile penetration has increased approximately 126% in 2016 compared to the past 10 years, and mobile phone subscription is expected to increase further in the future. Technology advancement in Malaysia, especially in networking (mobile broadband), devices (smart phone), and mobile applications (Web streaming, video surfing), has led to the high demand of internet services, which has risen from 21.38% in 2000 to 78.79% in 2016 ITU¹⁸.

To fulfil the demand of internet users, infrastructure for the telecommunication network has widely expanded in Malaysia. Telecommunication companies have to build more base stations at strategic locations to ensure the high quality mobile network service for end-users, in addition to stay ahead of their competitors in term of signal coverage. Most of the base stations are located in highly populated residential or business areas, such as on the rooftops of shop lots and apartments, open spaces

at playing fields, or parking lots of shopping complexes Din⁹. The closer the base station to human, the higher risk impacts on human health condition Cousin & Siegrist^{6,7}; Neubauer et al²⁷; Ngui²⁹; Van Kleef, Fischer, Khan, & Frewer⁴⁵; Viel et al⁴⁶ despite the recent and rapid introduction of mobile communication technologies. This study aims to identify factors that are influential in determining the tradeoffs that Bangladeshi citizens make between risks and benefits in terms of mobile phone technology acceptance and health concerns associated with the technology. Bangladesh was selected as representative of many developing countries inasmuch as terrestrial telephone infrastructure is insubstantial, and mobile phone use has expanded rapidly over the last decade, even among the poor. Issues of importance were identified in a small-scale qualitative study among Bangladeshi citizens (n = 13). Malaysia has an estimated a total of 16,000 to 18,000 telecommunication base stations (cellular and broadband) nationwide Ngui²⁹.

The installation of telecommunication base stations in residential areas has resulted in substantial controversies about the potential harmful effects of the radiofrequency electromagnetic fields (EMF) emissions

D'Angelo, Costantini, Kamal, & Reale⁸; Din⁹; Isabona, Srivastava, & Robert¹⁶; Ozovehe, Usman, & Hamdallah³⁰; Siegrist, Earle, Gutscher, & Keller⁴⁰ According to Cousin and Siegrist (2010), and Hallberg and Oberfeld (2006) while experts consider exposure under the current international standards as unproblematic. These conflictive estimations may be attributed to the different mental models of lay people and experts. Less is known about lay people's knowledge in regard to mobile communication and their intuitive understanding of the associated health risks. An adaptation of the 'Mental Models Approach' was used to reveal lay people's beliefs about mobile communication and to learn more about lay people's information requirements, potential knowledge gaps, and misconceptions. Through the means of open interviews with Swiss experts (N = 16, the health effects of EMF are headaches, dizziness, nausea, skin rashes, feeling warm, depression, night sweats, memory loss, disturbances in menstruation, and insomnia. Many prior studies indicated that people living in the vicinity of telecommunication base stations suffer from adverse health conditions e.g. Augner & Hacker²; Isabona et al¹⁶; Roje, Poljak, & Sarolic³³; Shahbazi-Gahrouei, Karbalae, Moradi, & Baradaran-Ghahfarokhi³⁹.

In Malaysia, the health issues resulted from effects of EMF require more attention. Only a handful of studies which investigate the residents' health awareness towards the telecommunication base stations in Malaysia. The only record found was a study conducted in Penang, Malaysia by Suleiman, Gee, and Krishnapillai⁴¹ health related problems and the public concern. Comparison of symptoms frequencies and its significance (Chi-square test). Hence, this study aimed to fill the void and expand the research by including study sites in selected states in West Malaysia. The study identified the residents' perceptions about whether it is safe to live near to telecommunication base stations, the cause variables of types of resident, degree of awareness, and the possible health symptoms of EMF.

Studies on telecommunication base station impacts:

Studies regarding the health effects of EMF have been widely conducted in the last decade (Kundi & Hutter²¹; Santini, Santini, Danze, Le Ruz, & Seigne^{36,37} but the research outcomes are heterogeneous and inconsistent. Klaps et al¹⁹ outlined the problems for studying the impacts of base stations. The first problem is about the proper selection of the independent variable, or a list of measurement indicators to examine the exposure to

base station signals. The second problem is about the discrepancies found between the outcome of assessments conducted in the environmental trials and the laboratory tests Hutter, Moshammer, Wallner, & Kundi¹³; Neubauer et al²⁷ 365 subjects were investigated. Several cognitive tests were performed, and wellbeing and sleep quality were assessed. Field strength of high-frequency electromagnetic fields (HF-EMF. The third problem is concerning the population selection. Even though base stations are ubiquitous, the actual intensity of exposure is relatively low and hardly detectable, making it hard to measure an accurate exposure level. Therefore, random selection of study sites or respondents carries the risk of including only a few persons - or virtually no one has been exposed to EMF, resulting in inaccurate research findings Klaps et al¹⁹. As a result, the residents who are living near to base station within 500m were selected for this study.

Many studies have been conducted to examine the health effects of EMF in real life. In France, Santini et al^{36,37} 260 women studied the correlation of gender and the distance from the base station toward the health symptoms experienced by the residents. The results showed that residents living within the distance of 300 m from base stations experienced tiredness; those within 200m experienced headaches, sleep disturbances, and discomfort; while those within 100m experienced irritation, depression, loss of memory, dizziness, decrease in libido, and other symptoms. More women than men were reported to have suffered from headache, nausea, loss of appetite, sleep disturbance, depression, discomfort and visual disturbances.

Navarro, Segura, Portolés, and Mateo²⁶ conducted a health survey in Murcia, Spain which involved 101 residents living in the immediate vicinity of base stations. The survey examined microwave sickness and RF syndrome. The microwave power density was measured at each respondent's house, while the strength of an electric field in the frequency range 1 MHz to 3 GHz was assessed in bedrooms. This study reported that the respondents suffered from severe health symptoms such as headaches, sleep disturbances, concentration difficulties, and discomfort.

Hutter et al. (2006) A cross-sectional study was conducted by Mohler et al²⁴ which is a common public health concern. We assessed self-reported sleep disturbances and daytime sleepiness in a random

population sample of 1,375 inhabitants from the area of Basel, Switzerland. Exposure to environmental far-field RF EMFs was predicted for each individual using a prediction model that had been developed and validated previously. Self-reported cordless and mobile phone use as well as objective mobile phone operator data for the previous 6 months were also considered in the analyses. In multivariable regression models, adjusted for relevant confounders, no associations between environmental far-field RF EMF exposure and sleep disturbances or excessive daytime sleepiness were observed. The 10% most exposed participants had an estimated risk for sleep disturbances of 1.11 (95% CI: 0.50 to 2.44) to examine the relationship between the exposure of EMF from the base station and health symptoms. This study randomly selected residents in urban and rural areas who have been living near to 10 base stations for more than one year. A total of 36 households at each location were investigated. Several cognitive tests were conducted, and the well-being and sleep quality of respondents were evaluated. The RF-EMF measurement was collected in the bedrooms of 336 households. The findings found that health symptoms were generally more frequent at higher exposure levels, in addition to more prevalent of headache, vegetative symptoms, and difficulty in concentration. Sleep quality was not significantly affected by the EMF emitted from the base stations.

Abdel-Rassoul et al¹⁹ Egypt, 37 are living in a building under the station antenna while 48 opposite the station. A control group (80 identified the possible neuro-behavioural deficits among residents living near a base station in Menoufiya Governorate, Egypt. A total of 85 respondents were involved, comprising 37 residents living underneath base station antennas, and another 48 respondents working in an agricultural directorate building which was located approximately 10m opposite the base station. Headache, memory changes, tremors, dizziness, depression, and sleep disturbances were found to affect the respondents significantly and more frequently than the controls of the study. However, according to Kundi and Hutter's²¹, this study could be criticised for including employees who worked near the base stations because other factors such as stressful working environment, indoor pollutants and other attributes of the workplace might have caused such health symptoms.

In Germany, researchers incorporated personal

dosimetry in studies and managed to reveal different results. For example, Heinrich, Ossig, Schlittmeier, and Hellbrück¹¹ used a double-blind experiment (*i.e.* neither experimenters nor the respondents knew whether the antenna was on or off) to investigate the effects of base station's EMF emission on the well-being of employees working in close proximity. There was no statistical difference between having the antenna on or off toward the health symptoms observed. Kuhnlein, Heumann, Thomas, Heinrich, and Radon²⁰, Thomas et al⁴³, and Thomas, Heinrich, Von Kries, and Radon⁴² also found that the symptoms exhibited by adults, children nor adolescents were not significantly correlated to exposure. However, Heinrich, Thomas, Heumann, von Kries, and Radon¹² study found different results. They found that a few symptoms were significantly associated with exposure. For example, Adolescents were reported to have experienced headache at noon and irritation during bedtime after being exposed in highest quartile of EMF in the morning and afternoon respectively. On the other hand, children were reported to have suffered from concentration problems.

Mohler et al²⁴ and Mohler, Frei, Fröhlich, Braun-Fahrlander, and Röösli²⁵ conducted a series of investigations, combining a cross-sectional study (with 1,375 participants) and longitudinal study (955 respondents) in the area of Basel, Switzerland. The studies revealed homogeneous results and the association between RF-EMF exposure and sleep disturbances or excessive daytime sleepiness was not found. This corresponded with Hutter et al¹³ study. Numerous meta-reviews have been done by researchers to understand the effects of EMF exposure on the well-being of mankind (*e.g.* Klaps et al¹⁹; Kundi & Hutter²¹; Röösli, Frei, Mohler, & Hug³⁴; Röösli & Hug³⁵

In more recent studies, Baliatsas et al³ discovered that non-specific symptoms became prevalent among residents living in the proximity of a base station before and after an increase in number of base station antennas. A total of 1,069 adult participants from different regions in the Netherlands were analysed. The study compared two periods (before and after) and revealed that after increasing the number of base stations, most non-specific symptoms became prevalent. For instance, the participants experienced some health symptoms in ear, muscle and skeleton. Wiedemann, Freudenstein, Böhmert, Wiart, and Croft⁴⁷ *i.e.*, the extrapolability of

risk perceptions expressed in a survey, to risk perceptions in everyday life. To that end, risk perceptions were measured by a multidimensional approach. In addition to the traditional focus on measuring the magnitude of risk perceptions, the thematic relevance (how often people think about a risk issue) conducted an online survey with 2454 respondents in six European countries to identify the potential risks of staying close to base stations and access points such as Wi-Fi routers and cell phones. This study found that respondents believed that even a very low EMF exposure can lead to detrimental effects in health.

On the other hand, Suleiman et al⁴¹ health related problems and the public concern. Comparison of symptoms frequencies and its significance (Chi-square test) conducted a study in Penang, Malaysia. 14 symptoms were used to compare the possible health effects on residents exposed (170 respondents) and not exposed (31 respondents) to EMF from the telecommunication towers. Residents who live within the radius of 0 to 150m from the base station were considered being exposed to EMF, while more than 150m were considered as not exposed. The findings revealed that symptoms like headache, giddiness, insomnia, loss of memory, diarrhoea, mental slowness, slower reaction times and mood swings were observed in both exposed and non-exposed residents, however more severe health effects were reported in the residents exposed to EMF compared to those who were not. Overall, health awareness toward the radiation or EMFs effects requires more attention. This awareness would directly influence the perception of residents towards living near to base station.

Several organisations have been established to handle the health issues brought by the EMF emission from the base station. These bodies provide guidelines and standards aiming to allay public fear on the effects of EMF. Malaysian telecommunication companies use the guidelines provided by the International Commission on Non-Ionising Radiation Protection (ICNIRP)¹⁵, Institute of Electrical and Electronics Engineers (IEEE)¹⁴ and the World Health Organisation (WHO) Din⁹; Tukimin, Mahadi, Ali, & Thari⁴⁴ in their operations. Based on radiation detection tests by the Malaysian Communications and Multimedia Commission (MCMC), the radiation effects of EMF from telecommunication base stations in Malaysia are still at a low level Ngui²⁹, with simulation tests and

empirical tests at base station sites showing radiation levels to be well below 1%. This indicated that the radiation is less than one per cent, compared to the ICNIRP-recommended level of mandatory standards for emission of EMFs from infrastructure. However, there is still lack of research demonstrating the perceptions of residents on safety level of living proximity base station.

METHODOLOGY

Sampling and Data Collection: Quantitative method involving a survey questionnaire was employed. This approach was selected because this research was based on pragmatic grounds; with respect to perceptions on demographic, type of resident, awareness, and health symptoms from living in the vicinity of base station. The data collection started with the development of a survey instrument, aimed to establish the measurement indicators: five demographic items, four types of resident items, seven health awareness items, and seven health symptoms which would affect residents' perception of whether it was safe to live in vicinity of the base stations in West Malaysia. The questionnaire was designed as a self-administered survey. Next, the survey instrument was pilot-tested and then refined. The selection of respondents took place by random sampling in several states of Malaysia (Kelantan, Penang, Kedah, Perlis, Selangor, Negeri Sembilan) between January to July 2017. The questionnaire included a set of questions on certain themes, respondents' demographic, type of resident, health awareness, and health symptoms to gauge residents' perception on safety level towards the impact of base station. The items asked in questionnaire were presented in Table 1.

Table 1: Dependent and independent variables themes

Variable	Characteristics	%
Dependent Variable		
Safe to live	Does this area is safe to live even there is a telecommunication tower?	
	No (Code 0)	31.63
	Yes (Code 1)	68.37
Independent Variables		
Demographic		
Gender	Male (reference alternative)	54.03
	Female	45.97

Loss of appetite	Yes (reference alternative)	7.27
	No	92.73
Nosebleed	Yes (reference alternative)	2.95
	No	97.05

DATA ANALYSIS

The data were first analysed by using chi-square tests to explore the single-dimensional relationship between the two group of respondents (those who feel safe and those who feel unsafe) with categorized measurement items (demographic, type of resident, awareness, and health symptoms). In the next stage, the binomial logit model was used to examine the difference between these two group of respondents. The model proposed by McFadden^{22,23} was adapted, whereby the choice of yes (coded 1) and no (coded 0) indicated that code 1 was those who felt safe to live near to base station and code 0 was those who were not. McFadden’s model relied on the assumption that the respondents who feel safe to live are a non-random function, V_1 of the travel characteristics plus a random error term:

$$T(\text{safe to live} = 1) = V_1 + e_1$$

On the other hand, the respondents who felt unsafe to live as a random error term:

$$T(\text{unsafe to live} = 0) = V_0 + e_0$$

As a result, the measurement items (demographic, type of resident, awareness, and health symptoms) related more to safe to live rather than the otherwise if, and only if:

$$T(\text{safe to live} = 1) > T(\text{unsafe to live} = 0)$$

Or

$$V_1 - V_0 > e_0 - e_1$$

In the case of the distributions of e_0 and e_1 , the probability that safe to live = 1 was

$$P(\text{safe to live} = 1) = \exp(V_1) / [\exp(V_1) + \exp(V_0)]$$

However, if case 1 was unable to estimate the absolute levels of the parameters of V_1 , it would be able to estimate the measurement variable parameters

of the respondents felt safe to live relative to those who felt unsafe to live. This was known as the logodds_i of occurrence on safe to live over unsafe to live, as expressed by the function:

$$V_1 - V_0 = b_0 + \sum b_j x_j$$

Then,

$$P(\text{safe to live} = 1) = \exp(b_0 + \sum b_j x_j + V_0) / [\exp(b_0 + \sum b_j x_j + V_0) + \exp(V_0)] \text{ ---- with parameters } V_1$$

Or

$$P(\text{safe to live} = 1) = \exp(b_0 + \sum b_j x_j) / [\exp(b_0 + \sum b_j x_j) + 1] \text{ ----- without parameters } V_1$$

Then, dividing the numerator and denominator by $\exp(b_0 + \sum b_j x_j)$ yields the logit model as:

$$P(\text{safe to live} = 1) = 1 / [1 + \exp(-(b_0 + \sum b_j x_j))] \dots (1)$$

Therefore, the logit model in equation (1) showed the probability of the intra-safe/unsafe to live, where the measurement variable x_j included the demographic, type of resident, awareness, and health symptoms. This logit equation was used to run the logistic regression analysis in Stata software 14.2. The Hosmer-Lemeshow test was used for the goodness of fit test. Additionally, the vector of the coefficient b_j was estimated by the maximum likelihood. For measuring the goodness of fit of the equation, McFadden (1974, p. 121) suggested the use of the likelihood ratio index:

$$1 - L_{UR} / L_R$$

Where L_{UR} was the unrestricted vector of the log-likelihood function at the maximum likelihood estimation of the parameters b_j , while L_R was the value of the likelihood function when all the parameters were restricted to zero Reece³².

FINDING

Table 2 presented the chi-square test results of the safety level related to demographic, type of resident, awareness, and health symptoms. The results showed that three variables demographic (age and marital status), type of resident (house type), and awareness (comfortable, factor to move, and health problem experience) were significantly different ($p < 0.50$) in term of whether it was safe to live nearby the base station. However, significant difference was not found in those who felt it was safe live in proximity of the base station and those who were not.

Due to the weakness in the statistical power of the chi-square test as it is a non-parametric test, binomial logistic regression analysis was selected as a more understandable approach for this study (Table 3). The first column of Table 3 showed the coefficient b_j of equation (1), the standard errors associated with the coefficients, the Wald statistic or Wald chi-square value together with the 2-tailed p-value, and the odds ratio or exponential of the coefficients. In assessing the model fit, two statistical tests were applied to assess the significance of the binomial logit model. Hosman-Lemeshow statistic of overall fit indicated that there was no significant difference between the actual and predicted classifications, where the p -value > 0.05 [0.829]. The likelihood ratio index measure of the goodness of fit of the estimated equation was 0.205. These two statistics provided good support for the logit model.

The fourth column showed the p -value for these parameters (Table 3). The age (25-35) in demographic, house type (terrace house and office), ownership (own), and distance from the base station (210-300m) under type of resident, comfortable (yes) and factor to move out (yes), under theme of awareness, and nosebleed (no) for health symptom were found to be significant to the predictive ability of the model. The p -value of 25-35 years old was 0.05. The odds of the residents age between 25 to 35 was 0.485, value less than 1. This expressed that respondents aged 25-35 years old were less likely to feel safe to live in vicinity of base station. Significant results were observed in the respondents living in terrace house, working in office or owning a house with a p -value of 0.05, 0.00, and 0.01 respectively, and the odds ratio obtained for these variable (0.478, 0.192, and 0.502 respectively) was less than 1. This indicated that residents who selected these items were more likely to feel unsafe to live nearby the base station.

Two items under the theme of awareness ‘Comfortable’ and ‘factor to move out’ were found statistically significant with p -value 0.00. The residents who feel comfortable to live near to base station would more likely to agree that it was safe to live there (odd ratio: 2.449, which >1), however, there were also residents who plan to move out from the area because they felt it was harmful to live around there (odd ratio: 0.168, which <1). There was only one item found statistically significant from the health symptoms which was the item ‘nosebleed’ with p -value:0.03 and odd ratio 3.889,

more than 1. This implied that the residents who did not experience nosebleed would be more likely to feel safe to live close to the base station (see also Pallant (2010), p. 175-178, for further explanation on the p -value and odd ratio of the binomial logit model analysis).

DISCUSSION AND CONCLUSION

The study examined residents' perceptions on whether it was safe to live in the vicinity of telecommunication base stations in Malaysia, through four measurement indicators: demographic, type of resident, and their awareness towards the effects of living near the constructions, as well as the health symptoms. A questionnaire survey was conducted and the data was used to analyse the relationships between the measurement indicators toward the safety conscious of adjacent residents to base stations. Two analyses, namely the Chi-square test and the logistic regression analysis, were used to determine their relationships and they were presented in the early part of this article. The Chi-square results revealed that age and marital status were statistically significant in deciding whether it was safe to live in close proximity to the base station. The study of Shahbazi-Gahrouei et al³⁹ by tremendous use of mobile phone telecommunication, a growing concern about the possible health hazards has increased greatly among public and scientists. The mobile phone exposure has been shown to have many effects upon the immune functions,

stimulating hormones, mammalian brain, sperm motility and morphology, and neurological pathologies syndrome. The aim of this study was to find out the psychological and psychobiological reactions of the people who are living near mobile phone base transceiver stations (BTS and Siegrist et al⁴⁰ base stations, and other sources of electromagnetic fields (EMF also found that different age groups have different sensitivity towards EMFs. Different house type, feeling of comfort, factor to move out, and health problem experience were influencing the perceptive safety level of living near to base station.

For deeper understanding, binomial logistic regression was used and it discovered that people with the age between 25 to 35 years old tended to feel their health was threatened when they were living in proximity to base stations. This might have due to the younger generation was more aware about the hazardous risks of EMFs. People living in terrace houses or working in the offices adjacent to base stations would have higher probability to feel unsafe. It was surprising to disclose that the house owners would feel dangerous to live nearby

the base stations. Perhaps this was because the house owners considered themselves as permanent residents, unlike those who rented premises at the same place. These people considered themselves to be temporal residents. There are many studies revealed that distance away from the base station was a significant variable to determine the exposure level from EMFs e.g. Augner & Hacker²; Baliatsas et al⁴; Bond⁵; Kundi & Hutter²¹; Santini et al³⁶; Schüz & Mann³⁸; Viel et al⁴⁶ some people living close to these masts reported symptoms they attributed to electromagnetic fields (EMF). However, this study revealed that distance was not related to safety concern. There were two items of awareness significantly influence the perception of safety in term of living near to base stations, feeling of comfort and factor to move out. People who felt comfortable living near the telecommunication tower have positive coefficient indicating that they feel safe to live there. On the other hand, those who agreed that the base station could be a factor to move to another area would be more likely to feel unsafe to live around that place.

The study of Abdel-Rassoul et al¹, Mohler et al²⁴, Navarro et al²⁶, Santini et al^{36,37} and Suleiman et al⁴¹ 260 women revealed that fatigue, sight problem, and loss of appetite were the health risks of living in proximity to base stations. However, the present study showed only one item 'nosebleed' was significantly affected the perception of people and causing them to feel unsafe to live near to base station. People might perceive that the illnesses brought by EMF were rather chronic than acute. In addition, the Malaysian Communications and Multimedia Commission (MCMC) has distributed information to Malaysian citizens to raise public awareness regarding the health risks of EMF Din⁹; Ng²⁸; Tukimin et al⁴⁴.

To reduce the intensity of EMFs exposure, telecommunication companies should consider sharing base stations to mount their transceivers rather than increase the number of towers. Local authorities should regulate base station constructions to ensure that the constructions were carried out follow the guidelines provided by the Institute of Electrical and Electronics Engineers (IEEE)¹⁴ and the International Commission on Non-Ionizing Radiation Protection (ICNIRP)¹⁵. The MCMC should conduct random audits to ensure that the wireless communication environment is conformed to the EMF safety level.

Furthermore, the MCMC should openly disclose details on the localities of each telecommunication base station, including the names of the telecommunication companies operating them, on an official website. This will not only encourage transparency in conduct but it can also avoid the operation of illegal base stations. Lastly, public opinion should be heard and considered before any construction of base stations was taken place to avoid controversy.

ACKNOWLEDGMENT

Much appreciation is extended to the Ministry of Higher Education Fundamental Research Grant Scheme (FRGS) with the account number 203/PPBGN/6711518, USM members and those involved in this study.

Ethical Clearance: Taken from the committee

Bayesian Spatial Survival Models for HIV/AIDS Event Processes in East Java

Nur Mahmudah¹, Nur Iriawan¹, Santi Wulan Purnami¹

¹Department of Statistics, Faculty of Mathematics, Computing, and Data Science, Institut Teknologi Sepuluh Nopember, Kampus ITS Sukolilo–Surabaya, Indonesia

ABSTRACT

Survival analysis can be defined as a statistical analysis of the duration of time of an event happen as a response that can also be influenced by several influencing covariates. This paper would elaborate this analysis to understand the survival rate of HIV/AIDS patients in East Java province, Indonesia. The spread of HIV/AIDS infection which affects the human immune system caused by some factors, i.e. the level of reproductive health education in the area, imported cases, the number of people at risk in the area. An incidence of HIV infection from one area will be suspected to affect the others. Modelling of spatial survival, therefore, will be suitable for this case. A model that includes the spatial random effect of Conditionally Autoregressive (CAR) was used to adjust unexplainable spatial dependent in the model. The weighted matrix Queen's contiguity is employed and the Moran's I statistical test is used to detect the existence of an effect of between-districts/cities toward the incidence rate of HIV/AIDS cases are exist. The preliminary analysis to the data show that there is a significant effect of space (spatial) to the HIV/AIDS incidence in every districts/city in East Java province, and the distribution of the survival time of HIV/AIDS patients is following the 3-parameter Lognormal. The work of the approach demonstrates that the survival function of HIV/AIDS patients reduced as the more extended treatment time while hazard function increased, and additionally all districts/cities had different survival rate.

Keywords: Bayesian, CAR (Conditionally Autoregressive), HIV/AIDS, Moran's I, Queen Contiguity, Survival analysis, Survival spatial.

INTRODUCTION

Survival analysis is a part of the statistical procedure to analyze data over which response variable induced time until the phenomenon happened. The objective of this analytical method is to identify risk factors of incidence and handle a situation when a risk factor is fluctuating toward time. Based on the statement as mentioned above, a researcher has to have an objective to determine the factors affecting a phenomenon to happen. With risk factors of incidence over time, thus the survival model will be reliable to be used¹.

Spatial survival analysis is a Hazard function estimating a possibility of an object that experiences an event in time to t based on location effect. It is called a spatial factor because of an event is frequently correlated with location over which this event is happening and affected by these location factors. In determining spatial dependence to random effect of closely related areas by

distance, a Bayesian method is suitable to be applied². Spatial reliance further is coded by prior conditionally autoregressive (CAR) to raise an autocorrelation that previously should not be present in the random effect of survival model to acceptably exist. These autocorrelation is exhibiting a correlation between geographically close areas coded by a matrix called adjacent (neighboring pattern). Further, hierarchical survival model is implemented using Markov Chain Monte Carlo (MCMC) method with Gibbs sampling^{3,4}.

Darmofal³ implemented spatial survival model in political science of which time has been modelled until parliament member sequence announced by NAFTA (American government). The term "survival" was not referring to death cases but instead referring to the survival time of a unit until a political event happened. Spatial survival model by Aksiomaand Iriawan⁵ on HIV/AIDS incidence in East Java province was conducted to model a time until a patient died or referred out of

anti-retroviral (ART) Program with spatial effect. The use of survival model in health sciences is based on death cases with spatial impact. Hasyim, Iriawan, and Prasetyo⁶ employed the spatial analysis in the survival mixture model on dengue incidence in Pamekasan, where the time is recorded when the patient of dengue hemorrhagic fever come to the hospital until getting well or he back home and identified as the existence of censored data or failure. The utility of survival mixture model in health sciences can also be used to estimate death cases while considering spatial effect. Previous reports regarding spatial survival model which include spatial effect concluded that model would result in proper estimation if the survival data of every location is assumed to be having some equally distributed variables. In reality, not all distribution of survival data in every area could represent as clear distribution. This research on HIV/AIDS data follows the 3-parameter Lognormal distribution.

METHODOLOGY

Data in this research are derived secondarily from Dr. Soetomo hospital of Surabaya – Indonesia that includes house-based treatment (treatment condition of HIV-AIDS patients) involving spatial/lattice factor. The data is found as a medical record obtained from 2012 to 2017. The additional observation to the on-going treatment is followed at the time until referred out from ART or failure event. The spatial factor is stated as adjacent between locations (as an adjacent matrix).

Response variable in this research is treatment time symbolized by *t*, the time at which treatment-derived ART of HIV-AIDS patients is prescribed or on progress until referred out from ART therapy, died or lost-of-follow up from last visit (identifying a censored data or failure). Covariate variables to explain the diversity of the response time are sex (X_1), age (X_2), education (X_3), sort of job (X_4), marital status (X_5), body weight (X_6), absolute level of CD4 (X_7), stadium of the patient (X_8), functional status (X_9), adherence of therapy (X_{10}), opportunistic infection (X_{11}), status of tuberculosis (X_{12}), risk factor of infection (X_{13}), history of ARV (X_{14}), Adherence of ARV (X_{15}), regiment of ARV (X_{16}), and companion of taking medicine (X_{17}). Besides those variables, the spatial variable is also included which stated the lattice data of the district where the patients originated from. The step of the analysis would be as follows:

1. Discussing survival model by considering the existence of location effect with the step of adding the spatial random effect (spatial frailty term) on the proportional hazard model and determining prior distribution, posterior distribution, and determining the algorithm of parameter estimation of spatial survival model by using MCMC couple with the Gibbs sampling.
2. Determining spatial effect by frailty distribution of CAR on HIV-AIDS patients in East Java province based on factors affecting the survival rate of the patients. The sequence of steps are: determining the spatial weight (inputting a map area of East Java into program package of Win BUGS while deciding adjacent matrix), testing for spatial autocorrelation using statistical test of Moran’s I, testing the assumption of the proportional hazard modelling and distribution of survival time data, and finally calculating the survival and hazard function.
3. Determining spatial survival model by estimating its parameters using MCMC couple with the Gibbs sampling.

RESULTS

In this research, distribution of treatment time (survival time) of HIV-AIDS patients was following a 3-parameter Lognormal distribution (β, τ, γ). This distribution has a likelihood concentrated function as follows:

$$f(t; \beta, \tau, \gamma) = \frac{1}{(t - \gamma)\tau\sqrt{2\pi}} \exp\left\{-\frac{[\ln(t - \gamma) - \beta]^2}{2\tau^2}\right\} \dots(10)$$

where $\tau > \gamma \geq 0, -\infty < \beta < \infty, \tau > 0$ and γ is location parameter. If it is a response changing factor which has 3-parameter Lognormal distribution, then $y = \ln(t - \gamma)$ possesses a normal distribution with average and variance τ^2 . When $\gamma = 0$, then the distribution become 2-parameter Lognormal. A lognormal distribution that transformed into normal deviation distribution could be obtained by:

$$f(t) = \frac{P\left(Z = \frac{\ln(t - \gamma) - \beta}{\tau}\right)}{\tau(t - \gamma)} \dots(11)$$

The cumulative distribution function of 3-parameter Lognormal distribution or $F(t)$ has an equation of:

$$F(t) = \int_0^t \frac{1}{(u-\gamma)\tau\sqrt{2\pi}} \exp\left\{-\frac{[\ln(u-\gamma)-\beta]^2}{2\tau^2}\right\} du, \dots(12)$$

and its survival function would be as follows:

$$\begin{aligned} S(t) &= 1 - F(t) \\ &= 1 - \int_0^t \frac{1}{(u-\gamma)\tau\sqrt{2\pi}} \exp\left\{-\frac{[\ln(u-\gamma)-\beta]^2}{2\tau^2}\right\} du \\ &= P(T > t) \\ &= P\left[Z > \frac{\ln(t-\gamma)-\beta}{\tau}\right]. \dots(13) \end{aligned}$$

While its hazard function is given by:

$$\begin{aligned} h(t) &= \frac{f(t)}{S(t)} \\ &= \frac{P\left(Z = \frac{\ln(t-\gamma)-\beta}{\tau}\right)}{\tau(t-\gamma)\left\{P\left[Z > \frac{\ln(t-\gamma)-\beta}{\tau}\right]\right\}}. \dots(14) \end{aligned}$$

The general Cox regression equation on equation (4) for the 3-parameter Lognormal model is

$$\begin{aligned} h(t, X) &= h_0(t) \exp(\beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_p X_p) \\ &= \frac{P\left(Z = \frac{\ln(t-\gamma)-\beta}{\tau}\right)}{\tau(t-\gamma)\left\{P\left[Z > \frac{\ln(t-\gamma)-\beta}{\tau}\right]\right\}} \dots(15) \end{aligned}$$

Further $h_0(t)$ is a function which value is dependent on the value of t , while $\exp(\beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p)$ is free from the value of t , this μ parameter could be stated as follows:

$$\begin{aligned} \mu &= \frac{P\left(Z = \frac{\ln(t-\gamma)-\beta}{\tau}\right)}{\left\{P\left[Z > \frac{\ln(t-\gamma)-\beta}{\tau}\right]\right\}} \\ &= \exp(\beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_p X_p) \dots(16) \end{aligned}$$

and the hazard baseline $h_0(t)$ could be reported as follows:

$$h_0(t) = \frac{1}{\tau(t-\gamma)}. \dots(17)$$

Therefore, the hazard function is considered by:

$$\begin{aligned} h(t, X) &= \frac{P\left(Z = \frac{\ln(t-\gamma)-\beta}{\tau}\right)}{\tau(t-\gamma)\left\{P\left[Z > \frac{\ln(t-\gamma)-\beta}{\tau}\right]\right\}} \\ &= \left\{\frac{1}{\tau(t-\gamma)} \exp(\beta_0)\right\} \\ &\quad \exp(\beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p + W_i) \dots(18) \end{aligned}$$

where W_i is a form of stratum-specific frailty that is formed by stating a difference between strata/group, and W_i is assumed to be identical, independent and

iid $W_i \sim N(0, \sigma^2)$. CAR distribution is used as a prior distribution for ν parameter representing random effect (frailty) over which spatially inter-correlated, and could be stated as⁷:

$$W^* | \lambda \sim \text{CAR}(\lambda)$$

where $\lambda = 1/\nu$. While the general form of prior CAR has joint proportional distribution as:

$$\begin{aligned} &\lambda^{I/2} \exp\left[-\frac{\lambda}{2} \sum_{i \text{ adj } i'} (W_i^* - W_{i'}^*)^2\right] \propto \\ &\lambda^{I/2} \exp\left[-\frac{\lambda}{2} \sum_{i=1}^I m_i W_i^* (W_i^* - \bar{W}_i^*)\right] \dots(19) \end{aligned}$$

where i and i' : neighbouring areas

$\bar{W}_i^* = m_i \sum_{j=1}^I W_j^*$ is an average of W_j^* neighbouring to W_i^* ,

$i \text{ adj } j$ is neighbouring locations, and

m_i : the number of neighbour possessed by i

Estimating the spatial survival model parameters throughout the Gibbs sampling can be explained as in the following steps:

Determining initial value or initial estimation for each parameter.

$(\gamma^{(0)}, \tau^{(0)}, \lambda^{(0)}, \beta_1^{(0)}, \dots, \beta_p^{(0)})$ and set $s = 0$

Afterward, the random sequence can be obtained as below:

Increase s by one, or $s = s + 1$

$\tau^{(s)}$ from $p(\tau | t, \gamma^{(s-1)}, \lambda^{(s-1)}, \beta_1^{(s-1)}, \dots, \beta_p^{(s-1)})$

$\gamma^{(s)}$ from $p(\gamma | t, \tau^{(s)}, \lambda^{(s-1)}, \beta_1^{(s-1)}, \dots, \beta_p^{(s-1)})$

$\lambda^{(s)}$ from $p(\lambda | t, \tau^{(s)}, \gamma^{(s)}, \beta_1^{(s-1)}, \dots, \beta_p^{(s-1)})$

$\beta_1^{(s)}$ from $p(\beta_1 | t, \tau^{(s)}, \gamma^{(s)}, \lambda^{(s-1)}, \beta_2^{(s-1)}, \dots, \beta_p^{(s-1)})$:

$\beta_j^{(s)}$ from $p(\beta_j | t, \tau^{(s)}, \gamma^{(s)}, \lambda^{(s)}, \beta_2^{(s)}, \beta_{j-1}^{(s)}, \dots, \beta_p^{(s-1)})$:

$\beta_p^{(s)}$ from $p(\beta_p | t, \tau^{(s)}, \gamma^{(s)}, \lambda^{(s)}, \beta_2^{(s)}, \beta_{p-1}^{(s)}, \dots, \beta_p^{(s-1)})$

Repeating the second step until convergence condition (sample for model parameter inference) is sufficient^{8,9}.

The Gibbs sampling process above will provide the parameter estimation of the 3-parameter Lognormal survival model and will report predictor variables that affect the time to survive until the patient is referred to ART or dies and loses follow-up by involving location factors. Table 1 shows the estimation result of all the parameter in the spatial survival model 3-parameter Lognormal with frailty CAR.

Table 1: Estimation result of spatial survival model 3-parameter Lognormal with frailty CAR

Table 1 shows factors considered to be significantly affecting the recovery rate of HIV-AIDS patients if the

credible interval between 2.5% to 97.5% does not hold zero. Table 1 exhibits that not all factors are significantly being an effect of recovery rate or survival rate of HIV-AIDS patients. Parameter column is factors suspected being an effect of recovery rate or survival rate of HIV-AIDS patients, while mean column exhibit the value of the model parameter, and the other three columns are the 97.5% credible interval of the estimated parameter. CAR frailty parameter of τ , where $\tau = 1/\sqrt{\lambda}$, significantly affect the survival rate of HIV-AIDS patients from death which means there is an existence of unexplainable spatial dependence in a standard survival model, thus causing the rise of dependency on random effect. This dependence on random impact exists between observation units in a group while the unexpected result of between-group will be reciprocally independent. Based on the estimation of survival model parameter by frailty CAR on Table 1, it can be concluded that female patient factor following ART program affects the survival rate of HIV-AIDS patients from death as much as $\exp(-11.430)$ or 0.00011 times compared to a male patient. Thus, it is indicating that female patient is apparently quickly recovered or statistically 0.000011 times faster than the male HIV-AIDS patient. Therefore, the vast majority of death caused by HIV-AIDS more likely come from male than the female patient. This is because a male patient is more susceptible to HIV-AIDS virus. The contribution of other variables can be read in the same way.

Table 1 gives the following summary of the survival model parameter by frailty CAR. Based on equation(18) and those estimated parameters, the hazard of HIV-AIDS patients in each district/cities East Java province can be modelled as follows:

$$\begin{aligned} h(t, X) &= h_0(t) \exp(\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_p X_p) \\ &= \frac{1}{\tau(t-\gamma)} \exp(6.303 - 11.430X_{1,1} - 11.180X_{1,2} \\ &\quad - 1.141X_{2,0} + \dots - 0.746X_{17,3} + W_i) \end{aligned}$$

Random effect between units in a district/city is reciprocally dependent and stated in a value of i^{th} district, W_p , and these values will be different among districts/cities. Based on the model, the hazard of HIV-AIDS patients can be determined based on time (days) and factors affecting these hazard value, while considering the original area of the patients. For example, the hazard of HIV-AIDS patients based on the element that they

used to have prior ARV treatment by following ART program. This hazard value is obtained by considering that other factors are constant and the hazard of the patients is only affected by a real report of the patients used to get ART prior following program.

The result of Spatial Survival Analysis using lifetime 3 parameters Lognormal distribution with Bayesian method shows that every Regency/City in East Java has each model in determining survival rate or healing of HIV / AIDS patient. This finding differs from the previous studies which is done by Aksioma and Iriawan⁵. They found that using a lifetime distribution of Weibull has only one model representing all districts in East Java in determining the survival rate of HIV/AIDS.

The high level of HIV/AIDS in East Java can be epidemiologically important in relation to health program focused on people at risk in the area with routine surveillance and monitoring system based on survival in the location where the patient lives. In line with this research, some of them have described lifetime distribution. The findings of this study indicate that factors affecting the survival rate of HIV / AIDS are sex (X_1), education (X_3), marital status (X_5), and the absolute level of CD4 (X_7). This also applies to the functional status (X_9), adherence to therapy (X_{10}), and opportunistic infection (X_{11}). This finding also differs from the Aksioma and Iriawan⁵ study in which factors affecting the HIV/AIDS survival rate are patient stages, ARV history, functional status, and absolute CD4 levels.

CONCLUSIONS

Based on the aforementioned analysis, it can be concluded that survival time distribution of 3-parameter Lognormal can implicate on spatial survival model. Whereas adding frailty spatial that result in the random effect of spatial dependence caused of significant correlation between patient's condition and unsuitable environmental factor creates every district/city having a different range of credible interval for the survival rate of HIV-AIDS patients. The spatial survival model 3-parameter Lognormal is easy to be performed by a Bayesian approach using MCMC couple with Gibbs sampling which is implemented in Win BUGS.

Survival Analysis of Chronic Kidney Disease Patients using Stratified Cox Regression in Arifin Achmad Hospital, Pekanbaru, Riau

Muhammad Muhajir¹, Cynthia Hazirah Imanina¹

¹Department of Statistics, Faculty of Mathematics and Science Islamic University of Indonesia, Yogyakarta, Indonesia

ABSTRACT

Chronic Kidney Disease (CKD) is a clinical condition characterized by decreased kidney function requiring renal replacement therapy were fixed, in the form of dialysis. The mortality rate caused by CKD increases significantly each year and needs to be reduced. The purpose of this study to determine the factors that affect patients from CKD in hospitals Arifin Achmad, Pekanbaru, Riau in 2015-2017. The sample of this study amounted to 230 samples. One of the tools to analyze the longer survival of patients with CKD is cox proportional hazards regression. In the long survival data of patients with CKD there is a possibility of ties, so there is one method in determining the partial likelihood estimation parameters, that is exact. Based on the analysis results obtained the factors that most influence with the best parameter estimation is the exact approach are diastolic blood pressure, respiratory rate, urea levels, and action. There is a variable that does not meet the proportional hazard assumption, is the action variable. One way to overcome this by using Cox Stratified Regression Without Interaction and Cox Stratified Regression with Interaction. Based on the results of the analysis that meets the proportional hazard assumption is the method of Cox Stratified Regression Without Interaction and obtained the factors that affect the length of survival of CKD patients are age, diastolic blood pressure, respiratory rate, and urea levels. Interpretation of equation model of Cox Stratified Regression Without Interaction obtained result of increase of age patient have chance to die bigger of 1.0208 times, increase of diastolic blood pressure patient has chance to die smaller equal to 1.0571 times, increase of respiration rate patient have chance to die bigger equal to 1.0677 times, and increase of ureum level patient have chance to die bigger of 1.0073 times.

Keywords: CKD, Cox Proportional Hazard, Stratified Cox

INTRODUCTION

Chronic kidney disease (CKD) is a condition in which the kidneys are damaged or cannot filter blood as well as healthy kidneys¹. CKD is a global public health problem with increased prevalence and incidence of CKD, poor prognosis and high costs. The prevalence of CKD increases with the increasing number of elderly population and the incidence of diabetes mellitus and hypertension. About 1 in 10 global populations experience CKD at a particular stage. The result of systematic review and metaanalysis conducted by Hill et al, 2016, get the global prevalence of CKD of 13.4%. According to the 2010 Global Burden of Disease results, CKD was the 27th leading cause of death in the world in 1990 and increased to 18th in 2010. In Indonesia in 2013, 499.800 Indonesians suffered CKD. While

in Indonesia, the treatment of kidney disease is the second largest funding ranking of BPJS health after heart disease². Based on the Basic Health Research data of 2013, the prevalence of CKD in Riau Province is 0.1% of the population of patients with kidney disease in Indonesia, including patients undergoing treatment, renal replacement therapy, peritoneal dialysis, and hemodialysis by 2013³.

Arifin Achmad Hospital is one of the government-owned hospitals in the city of Pekanbaru, Riau. This hospital is used as a referral hospital from government hospitals and puskesmas in Riau Province. In addition the hospital also has hemodialysis service and installation of CAPD (Continuous Ambulatory Peritoneal Dialysis) for patients with CKD. CKD itself is a disease classified in the list of 10 major outpatient diseases. CKD lies in the

9th sequence after medical observation and evaluation for alleged illness and condition, gastric function disturbance, lower back pain, impact teeth, follow-up examination after fracture treatment, primary essential hypertension, insulin dependent militat militus, and other ear disorders outside.

Departing from the background of the above phenomenon, then selected life test analysis method as a method of analysis to solve the problem. Life test analysis is an analysis of the individuals of one population by focusing on the length of time the individual performs its function well until the individual's healing or death. Live test data usually will follow a certain distribution pattern. Therefore, in this study will be compared some results of life test analysis using Cox regression method.

In addition to looking for factors that influence and the best model of CKD data in RSUD Arifin Achmad Pekanbaru, Riau, there is one assumption that must be met in cox regression method that is proportional hazard assumption. This assumption is useful for examining the independent variables in the model meeting the proportional hazard assumptions or not. If the assumption is fulfilled then the model can be directly interpreted, whereas if the assumption is not met can be done two ways. First issue an independent variable that does not meet the proportional hazard assumption. The two do strata on variables that do not meet the proportional hazard assumption with the Cox Stratified Regression method. Independent variables that previously met proportional hazard assumptions remain included in the model, but not strata in those variables.

METHODOLOGY

The data used in this study is secondary data in the form of medical record data of CKD patients in 2015-2017 at Arifin Achmad Hospital, Pekanbaru, Riau. In this study, the target population was taken namely patients affected by chronic kidney disease from 2015-2017 which amounted to 454 patients. As well as the sample that the authors use in this study as many as 230 patients. The research variables used were survival variable as dependent variable, while the independent variables used were gender variables (X_1), age (X_2), disease history (X_3), systolic blood pressure (X_4), diastolic blood pressure (X_5), respiratory rate (X_6), pain (X_7), pain scale (X_8), diabetes mellitus (X_9), urea (X_{10}), *creatine* (X_{11}),

action (X_{12}), dan therapy (X_{13}). The research method used as follows:

- a. Cox Proportional Hazard Regression with Paramal Likelihood Parameter Estimation Approach
Cox regression is generally more commonly used in the health field, but the growing time of Cox regression can be applied to other fields. In general, the Cox Proportional Hazard equation can be written as follows⁵:

$$h(t, X) = h_0(t) \exp(\beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p) \\ = h_0(t) \exp\left(\sum_i^p \beta_i X_i\right)$$

The method with partial likelihood exact approach is an alternative method of case incident. However, this method has a very intensive computational level but is capable of generating estimated parameters that have a bias close to 0 even if the data of joint events or ties are of a very large size. In general, the partial likelihood exact approach has the following form of equation⁶:

$$L(\beta_{\text{Exact}}) = \prod_{i \in D} \frac{\exp(\sum_k S_k)}{\sum_{i \in R_{t_i}, d_k} \exp(\sum_k X_i)}$$

- b. **Testing Parameters:** In regression cox proportional hazard required testing the significance of parameters in order to know whether the independent variable significantly affect the cox equation formed. Testing of significance is done by simultaneous test (overall), partial test, and proportional hazard assumption test⁵.

1. Overall Test

Hypothesis : $H_0 : \beta_i = 0$

$H_1 : \text{At least there is one } \beta_i \neq 0 \text{ where } i = 1, 2, \dots, p$

Level of Significance: $\alpha = 5\% = 0.05$

Statistic Test: $G = -2[\ln L_R - \ln L_j] \dots(3)$

Area of Critism: H_0 is rejected if $p\text{-value} \leq \alpha$ or $G \geq \chi^2_{\alpha; ab=p}$

2. Partial Test

Hypothesis: $H_0 : \beta_i = 0$

$H_1 : \beta_i \neq 0 \text{ where } i = 1, 2, \dots, p$

Level of Significance: $\alpha = 5\% = 0.05$

Statistic Test: $Z = \frac{\beta_i}{SE(\beta_i)} \dots(4)$

Area of Critism: H_0 is rejected $p\text{-value} \leq \alpha$ or $|Z| \geq Z_{0.05/2}$

3. Proportional Hazard Assumptions Test

Hypothesis: $H_0 : \rho = 0$ (Proportional hazard assumptions are met)

$H_1 : \rho \neq 0$ (Proportional hazard assumptions are not met)

Level of Significance: $\alpha = 50\% = 0.05$

Statistic Test: *p-value* ... (5)

Area of Critism: H_0 is rejected $p\text{-value} \leq \alpha$

c. Selection of the Best Model: AIC method is a method that can be used to select the best regression model invented by Akaike and Schwarz⁷. How to select several models to choose the best model is based on AIC with the following formula+:

$$AIC = 2\ln \hat{L} + 2k$$

d. Cox Stratified Regression: Cox Stratified Regression is one of the methods used to overcome independent variables that have non proportional hazard assumptions. Cox Stratified model is a modification of the Cox Proportional Hazard model in which the Cox Stratified model divides the hazard function into the strata or stages of the covariate. The covariates divided into these strata are covariates that do not meet the proportional hazard assumptions⁵.

Cox Stratified model without interaction is as follows:

$$h_g(t, X) = h_{0g}(t)\exp(\beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p) \dots (7)$$

The Stratified Cox model with interaction is as follows:

$$h_g(t, X) = h_{0g}(t)\exp(\beta_1 X_1 + \beta_2 X_2 + \dots + \beta_{pg} X_p) \dots (8)$$

RESULTS

There are three forms of probability distribution of survival, namely parametric survival function, non-parametric survival function, and semi-parametric survival function. In this parametric survival function there are three methods, namely Regression with Exponential Distribution, Weibull, and Log-Logistics. While in this semi-parametric survival function there is one method, namely Cox Regression. In this study, the data obtained will be comparative analysis using

regression method with parametric and semi parametric survival function. Based on calculations using software R, then obtained comparison of analysis using regression method of survival function with the best parameter estimation as follows:

Table 1: Selection of the Best Survival Function Model with AIC Value Comparison

Regression Models	AIC Values
Ekspponential Distribution	583.5625
Weibull Distribution	543.1974
Log-Logistic Distribution	537.3215
Cox with Breslow Partial Likelihood Approach Method	392.1115
Cox with Efron Partial Likelihood Approach Method	384.7155
Cox with Exact Partial Likelihood Approach Method	321.0316

Based on Table 1, it's to obtain the best model by looking at the smallest AIC value as a relative measure of the fit goodness of the statistical model. The smallest AIC value is in Cox Regression model with Exact Parameter Estimation. Furthermore, because the value of AIC for regression analysis with parametric survival function and cox regression with Breslow and Efron Partial Likelihood parameter estimation still big enough, then the next step the authors do regression analysis using cox regression method with estimated parameters of Exact Partial Likelihood.

Cox Regression with Exact Partial Likelihood Approach Method: The parameter estimation using the exact partial likelihood approach method is the same parameter estimation method as the approach of the efron parameter used to overcome the common occurrence in small and large size. However, the approach method of the exact parameter is capable of producing better estimation value. It's caused by the resulting error is close to zero compared to other parameter estimation approach methods. The calculation result of cox regression parameter with approach of partial likelihood approach is obtained by the model determined by using backward elimination method. Backward elimination method is a way to get the best model by issuing one by one the largest p-value first. Based on calculations using software R, then obtained the best parameter estimation as follows:

Table 2: Best Parameter Estimation Results Using Cox Regression with Exact Partial Likelihood Approach

Variables	Coefficients	p-value			Decisions
X_2	0.0245	0.0290	<	0.05	Reject H_0
X_5	- 0.0592	3.01×10^{-8}	<		Reject H_0
X_6	0.0679	4.91×10^{-5}	<		Reject H_0
X_{10}	0.0081	7.26×10^{-7}	<		Reject H_0
X_{12} (Drug Administration and Blood Transfusion)	- 1.6761	5.42×10^{-6}	<		Reject H_0
X_{12} (Drug Administration, Blood Transfusion and Surgery)	- 1.9646	0.0002	<		Reject H_0

Based on Table 2 it can be seen that the p-value of all variables is less than 0.05, so H_0 rejected. This is because the p-value < level significance. It can be concluded that the cox regression model with parameter estimation using the exact partial likelihood approach is feasible to use. The model formed is as follows:

$$h(t, X) = h_0(t)\exp(0.0245X_2 - 0.0592X_5 + 0.067X_6 + 0.0081X_{10} - 1.6761X_{12} \text{ (Drug administration and blood transfusion)} - 1.9646X_{12} \text{ (Drug administration, Blood transfusion and Surgery)})$$

The next step to find out whether a best equation using cox regression method with exact partial likelihood approach has independent variable which influence significantly to dependent variable, hence need to do testing which include test of overalls, partial test, and proportional hazard assumption test. Based on the results of the analysis of the overall test on the cox regression

with exact partial likelihood approach can be concluded with the significance level of 0.05 H_0 rejected, because the p-value < significance level, ie $0 < 0.05$, causing one of the parameters contained in regression β_i has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient β_i .

Based on the partial test results obtained results that the six variables in Table 1 are analyzed significantly to the model. This is because the p-value < level of significance, thus causing the six variables affect the long survival of CKD patients. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Schoenfeld’s residual value is one of the statistical tests used in this method. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 3: Schoenfeld Residual Correlation Value

Variables	Correlation	p-value			Decisions
X_2	0.0420	0.7087	>	0.05	Failed to Reject H_0
X_5	-0.1086	0.4362	>		Failed to Reject H_0
X_6	0.0043	0.9797	>		Failed to Reject H_0
X_{10}	-0.0274	0.8292	>		Failed to Reject H_0
X_{12} (Drug Administration and Blood Transfusion)	0.3253	0.0401	<		Reject H_0
X_{12} (Drug Administration, Blood Transfusion and Surgery)	0.3699	0.0252	<		Reject H_0

It can be seen in Table 3 that not all variables have p-value more than 0.05. Based on the result of assumption test proportional hazard can be concluded with significance level 0.05 H_0 failed to be rejected for variable X_2 , X_5 , X_6 , dan X_{10} , because the p-value > level of significance. Then it can be concluded that there is data that supports the value of H_0 , so that the four independent variables meet the proportional hazard assumption. While the significance level of 0.05 H_0 is rejected for X_{12} variables with the category of Drug Administration

and Blood Transfusion and Drug Administration, Blood Transfusion and Surgery category, because the p-value < level of significance. Then it can be concluded that there is data that supports the value of H_1 , thus causing the two independent variables do not meet the proportional hazard assumption. The next step to overcome these problems, the authors tries to issue a variable that does not meet the proportional hazard assumptions and use Cox Stratified Regression.

Cox Regression with Exact Partial Likelihood Estimation Approach Without Action Variable in Overcoming Non Proportional Hazard Assumptions:

One of the easiest ways to overcome the non proportional hazard assumption is by removing the independent variable from within the model. In this research, the

authors use exact partial likelihood parameter approach. The calculation result of cox regression parameter with exact partial likelihood approach without action variable in overcoming non proportional hazard assumption using software R as below:

Table 4: Best Parameter Estimation Results Using Cox Regression with Exact Partial Likelihood Approach Without Action Variable in Overcoming Non Proportional Assumptions Hazard

Variables	Coefficients	p-value			Decisions
X_2	0.0316	0.0027	<	0.05	Reject H_0
X_5	-0.0532	1.36×10^{-7}	<		Reject H_0
X_6	0.0612	0.0001	<		Reject H_0
X_{10}	0.0076	1.02×10^{-6}	<		Reject H_0

Based on Table 4 it can be seen that the p-value of all variables is less than 0.05, so H_0 is rejected. It because the p-value < level of significance. It can be concluded that the cox regression model with parameter estimation using the exact partial likelihood approach without the action variable is feasible to use. The model formed is as follows:

$$h(t, X) = h_0(t) \exp(0.0316 X_2 - 0.0532 X_5 + 0.0612 X_6 + 0.0076 X_{10})$$

The next step is to find out whether a best equation using cox regression method with exact partial likelihood approach without action variable has independent variable which have significant effect to dependent variable, it is necessary to test which include test of overalls, partial test, and proportional hazard assumption test. Based on the result of the analysis of the overall

test on the cox regression with exact partial likelihood approach without the action variable can be concluded with the significance level of 0.05, H_0 rejected, because the p-value < significance level, ie $4.846 \times 10^{-13} < 0.05$, which causes one of the parameters contained in the regression β_i has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient β_i .

Based on the partial test results obtained the result that the four variables in Table 4 were analyzed significantly to the model. This is because the value of p-value < level of significance, thus causing the four variables affect the long survival of CKD patients. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 5: Schoenfeld Residual Correlation Value

Variables	Correlation	p-value			Decisions
X_2	-0.0809	0.477	>	0.05	Failed to Reject H_0
X_5	-0.1189	0.391	>		Failed to Reject H_0
X_6	0.0011	0.995	>		Failed to Reject H_0
X_{10}	-0.0618	0.605	>		Failed to Reject H_0

It can be seen in Table 5 that all variables have p-value values greater than 0.05. Based on the result of testing proportional hazard assumption can be concluded with significance level 0.05 H_0 failed to be rejected for all variable, because the p-value > level of significance. So it can be concluded that there is data that supports the value of H_0 , so that the four independent variables meet the proportional hazard assumption. The next step

The authors tries to overcome in another way against the variable that does not meet the proportional hazard assumption, namely using Cox Stratified Regression.

Cox Stratified Regression in Overcoming Non-Proportional Hazard Assumptions: Cox stratified regression is one way to overcome independent variables that do not meet proportional hazard assumptions. Cox Stratified Regression is a modification of the Cox

Regression model by strata on independent variables that do not meet the proportional hazard assumptions. Independent variables that previously met proportional hazard assumptions remain included in the model, but not strata in those variables⁴.

Cox Stratified Regression without Interaction: Regression method cox stratified without interaction is a method to overcome the assumption of non proportional hazard that produces the model with the same parameters assumption. Based on calculations using software R, then obtained parameter estimation as follows:

Table 6: Parameter Estimation Results Using Cox Stratified Regression Without Interaction

Variables	Coefficients	p-value			Decisions
X ₂	0.0206	0.059	>	0.05	Failed to Reject H ₀
X ₅	-0.0555	8.43 × 10 ⁻⁸	<		Reject H ₀
X ₆	0.0655	5.84 × 10 ⁻⁵	<		Reject H ₀
X ₁₀	0.0073	2.90 × 10 ⁻⁶	<		Reject H ₀

Based on Table 6 it can be seen that not all variables have p-value less than 0.05. However, this does not have a significant effect due to stratified cox regression without this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Then the parameter estimation in Table 6 obtained the model formed is as follows:

$$h_g(t, X) = h_{og}(t) \exp(0.0206 X_2 - 0.0555 X_5 + 0.0655 X_6 + 0.0073 X_{10})$$

The next step to find out whether a best equation using stratified cox regression method without interaction has independent variables that significantly affect the dependent variable, it is necessary to test that includes the test of overalls, partial test, and proportional hazard assumptions test. Based on the results of the overall test analysis on stratified cox regression without interaction can be concluded with the significance level of 0.05 H₀ rejected, because the p-value < significance level, ie 2.867 × 10⁻¹² < 0.05, causing one of the parameters

contained in the regression β_i has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient β_i.

Based on the result of partial test, it is found that not all variables in Table 6 are analyzed significantly to the model. This is because there are only three variables, namely X₅, X₆, and X₁₀ which have the p-value < level of significance, thus causing the three variables to affect the long life of CKD patients. While one of variable, that is X₂ has the p-value > level of significance, so cause variable X₂ does not have an effect on long life of CKD patient. However, the variable X₂ remains incorporated into the model, due to stratified cox regression without this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 7: Schoenfeld Residual Correlation Value

Variables	Correlation	p-value			Decisions
X ₂	0.0076	0.948	>	0.05	Failed to Reject H ₀
X ₅	-0.1187	0.405	>		Failed to Reject H ₀
X ₆	0.0425	0.808	>		Failed to Reject H ₀
X ₁₀	-0.0480	0.731	>		Failed to Reject H ₀

It can be seen in Table 7 that all variables have p-value values greater than . Based on the result of testing proportional hazard assumption can be concluded with significance level failed to be rejected for all variable, because the p-value > level of significance. So it can be concluded that there is data that supports the value of , so that the four independent variables meet the proportional hazard assumption.

Cox Stratified Regression with Interaction: Cox stratified regression method with interaction is a method to overcome non proportional hazard assumption which produce model with different parameter assumption for each strata. Based on calculations using software R, then obtained parameter estimation as below:

Table 8: Parameter Estimation Results Using Cox Stratified Regression with Interaction

Variables	Coefficient	p-value			Decisions
X_2	0.0239	0.0890	>	0.05	Failed to Reject H_0
X_5	-0.0570	0.0003	<		Reject H_0
X_6	0.0914	0.0055	<		Reject H_0
X_{10}	0.0089	0.0001	<		Reject H_0
$X_2 \times X_{12}$ (Drug Administration and Blood Transfusion)	-0.0193	0.4278	>		Failed to Reject H_0
$X_2 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.2028	0.1016	>		Failed to Reject H_0
$X_5 \times X_{12}$ (Drug Administration and Blood Transfusion)	0.0058	0.8011	>		Failed to Reject H_0
$X_5 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	-0.0548	0.2145	>		Failed to Reject H_0
$X_6 \times X_{12}$ (Drug Administration and Blood Transfusion)	-0.0641	0.1926	>		Failed to Reject H_0
$X_6 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.4112	0.0721	>		Failed to Reject H_0
$X_{10} \times X_{12}$ (Drug Administration and Blood Transfusion)	-0.0036	0.3060	>	Failed to Reject H_0	
$X_{10} \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.0170	0.2212	>	Failed to Reject H_0	

Based on Table 8 it can be seen that not all variables have the p-value less than 0.05. This does not, however, have a significant effect due to stratified cox regression with this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Then the parameter estimation in Table 8 obtained model which formed is as follows:

$$\begin{aligned}
 h_g(t, X) = & h_{og}(t) \exp[0.0239 X_2 - 0.0570 X_5 \\
 & + 0.0914 X_6 + 0.0089 X_{10} \\
 & - 0.0193 (X_2 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) \\
 & + 0.2028 (X_2 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) \\
 & + 0.0058 (X_5 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) \\
 & - 0.0548 (X_5 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) \\
 & - 0.0641 (X_6 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) \\
 & + 0.4112 (X_6 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) \\
 & - 0.0036 (X_{10} \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) \\
 & + 0.0170 (X_{10} \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)})]
 \end{aligned}$$

The next step is to find out whether a best equation using cox stratified regression method with interaction has independent variable that significantly influence dependent variable, it is necessary to do testing which include test of overalls, partial test, and proportional

hazard assumption test. Based on the results of the overall test analysis on stratified cox regression with interaction can be concluded with a significance level of 0.05 H_0 rejected, because the p-value < significance level, ie $1.225 \times 10^{-10} < 0.05$, which causes one of the parameters contained in the regression β_i has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient β_i .

Based on the partial test results obtained the results that not all variables in Table 8 analyzed significant to the model. This is because there are only three variables, namely X_5 , X_6 , and X_{10} which have the p-value < level of significance, thus causing the three variables to affect the long life of CKD patients. While the rest have the p-value > level of significance, thus causing these variables do not affect the long survival of CKD patients. However, the non-influencing variables are still incorporated into the model, due to stratified cox regression with this interaction only to overcome the problem of non-fulfillment of proportional hazard assumptions. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 9: Schoenfeld Residual Correlation Value

Variables	Correlation	p-value			Decisions
X_2	0.0192	0.874	>	0.05	Failed to Reject H_0
X_5	-0.0341	0.800	>		Failed to Reject H_0
X_6	-0.5090	0.719	>		Failed to Reject H_0
X_{10}	0.0605	0.677	>		Failed to Reject H_0
$X_2 \times X_{12}$ (Drug Administration and Blood Transfusion)	-0.0700	0.536	>		Failed to Reject H_0
$X_2 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.1138	0.490	>		Failed to Reject H_0
$X_5 \times X_{12}$ (Drug Administration and Blood Transfusion)	0.0107	0.943	>		Failed to Reject H_0
$X_5 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	-0.1593	0.408	>		Failed to Reject H_0
$X_6 \times X_{12}$ (Drug Administration and Blood Transfusion)	0.1944	0.249	>		Failed to Reject H_0
$X_6 \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.1392	0.530	>		Failed to Reject H_0
$X_{10} \times X_{12}$ (Drug Administration and Blood Transfusion)	-0.0799	0.575	>		Failed to Reject H_0
$X_{10} \times X_{12}$ (Drug Administration, Blood Transfusion and Surgery)	0.1103	0.607	>		Failed to Reject H_0

It can be seen in Table 9 that all variables have p-value values greater than 0.05. Based on the result of testing proportional hazard assumption can be concluded with significance level 0.05 H_0 failed to be rejected for all variable, because the *p-value* > level of significance. So it can be concluded that there is data that supports the value of H_0 , so that the four independent variables meet the proportional hazard assumption.

Selection and Interpretation of the Best Cox Regression Model: To get the best model can be done comparison of AIC value of each regression model that formed. The AIC value is a relative measure of the fit goodness of the statistical model. Based on calculations using software R, then obtained comparison of analysis using cox regression method as follows:

Table 10: Selection of the Best Model of Cox Regression with AIC Value Comparison

Cox Regression Models	AIC Value
Exact Partial Likelihood Approach Method $h(t, X) = h_0(t) \exp(0.0245 X_2 - 0.0592 X_5 + 0.0679 X_6 + 0.0081 X_{10} - 1.6761 X_{12} \text{ (Drug Administration and Blood Transfusion)} - 1.9646 X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)})$	321.0316
Exact Partial Likelihood Approach Method (without variable Action) $h(t, X) = h_0(t) \exp(0.0316 X_2 - 0.0532 X_5 + 0.0612 X_6 + 0.0076 X_{10})$	342.4729
Stratified Without Interaction $h_g(t, X) = h_{0g}(t) \exp(0.0206 X_2 - 0.0555 X_5 + 0.0655 X_6 + 0.0073 X_{10})$	262.8794
Stratified With Interaction $h_g(t, X) = h_{0g}(t) \exp[0.0239 X_2 - 0.0570 X_5 + 0.0914 X_6 + 0.0089 X_{10} - 0.0193 (X_2 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.2028 (X_2 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) + 0.0058 (X_5 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) - 0.0548 (X_5 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) - 0.0641 (X_6 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.4112 (X_6 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) - 0.0036 (X_{10} \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.0170 (X_{10} \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)})]$	266.6776

Based on Table 10 to get the best model by looking at the smallest AIC value, that is equal to on Cox Stratified Without Interaction Regression model. The best model that is formed is as follows:

Table 11: Estimated Cox Stratified Regression Parameters without Interaction

Variables	Coefficients	Exp (Coefficients)
X_2	0.0206	1.0208
X_5	-0.0555	0.9460
X_6	0.0655	1.0677
X_{10}	0.0073	1.0073

$$h_g(t, X) = h_{0g}(t) \exp(0.0206 X_2 - 0.0555 X_5 + 0.0655 X_6 + 0.0073 X_{10})$$

The above model can be interpreted as follows:

1. At Variable Age has a positive influence. The value of this variable hazard ratio states that with every age, the patient has a greater chance of dying by times.
2. In Diastolic Blood Pressure Variables have a negative effect. The hazard ratio value of this variable states that every increase in diastolic blood pressure, then the patient has a smaller chance of dying by $\frac{1}{0.9460} = 1.0571$ times.
3. In the respiratory rate variable has a positive effect. The value of this variable hazard ratio states that each increase in the respiratory rate, then the patient has a greater chance of dying by 1.0677 times.
4. In the Ureum Content Variables have a positive effect. The value of the hazard ratio of this variable states that every increase in urea level, then the patient has a greater chance of dying by 1.0073 times.

CONCLUSIONS

The best regression model equation is Cox Stratified Regression without Interaction formed is as follows:

$$h_g(t, X) = h_{0g}(t) \exp(0.0206 X_2 - 0.0555 X_5 + 0.0655 X_6 + 0.0073 X_{10})$$

Based on the above equation, the factors that influence the duration of survival of patients with chronic kidney disease are age, diastolic blood pressure, respiratory rate, and urea level. Interpretation of the above model equation is obtained as the result of increasing the age of the patient has a chance to die larger by times, the increase in diastolic blood pressure of the patient has a chance to die smaller by times, increased respiration rate of patients have a greater chance to die by times, and increased urea levels of patients have a greater chance of dying by times.

Principles of Skin Cancer Detection in Image Processing: Challenges and Techniques

A. Omar Adil Dheyab¹, B Rahmatullah¹, C. M. Hashim¹

¹Universiti Pendidikan Sultan Idris, Malaysia

ABSTRACT

Skin cancer is most common and widespread type of cancer. Fortunately, its early diagnosis assists to prevent and cure several cases and increase the possibilities of reducing its dangerous effect. However, proper detection of skin cancer especially malignant melanoma in its early stages is still challenging. Image processing is a good choice for skin cancer early detection. Image processing techniques for skin cancer detection commonly include several stages such as pre-processing to enhance images, segment the interest regions to extract significant features, and finally perform classification process. This paper introduces the principles of skin cancer detection in image processing and addresses the challenges of each stage and the common techniques used in analysis.

Keywords: Skin cancer; segmentation; classification, feature extraction

INTRODUCTION

Skin cancer is the most popular type of cancer that prevailed in many areas of the world such as the United States, Australia, and Europe over the last decades (Zeljko et al.⁴⁹). According to World Health Organization, around 2-3 million cases of non-melanoma and 132000 cases of melanoma occur every year universally (Bhowmik, et al.⁶). However, its early diagnosis assists to prevent malignant melanoma and cure many cases (Elgamal¹¹; Wen et al.⁴⁵). Most automated systems for skin cancer early detection and diagnosis systems use an imaging instrument, such as dermoscopy, or employ mathematical models, and utilize computational algorithms to evaluate the skin lesion. Natural computing plays a key role in providing flexible solutions to analysis problems of medical image. It includes fuzzy sets, neural networks, genetic algorithms, rough sets, swarm intelligence, and other techniques that mimic biological and physical nature processes (Mitra and Shankar³²). Image processing is a good choice for skin cancer early detection, since it is not an expensive technique, powerful due to advance computer systems and applications. Image processing techniques for skin cancer detection commonly require pre-processing procedures to enhance images, segment the interest regions to extract significant features, and finally perform classification process (Alfed and

Khelifi⁴). All these stages have their own challenges that affect the outcome of each stage and the final results. However, current researches for skin cancer detection from medical images that use supervised techniques such as fuzzy systems, support vector machines, and artificial neural networks coupled with techniques of feature extraction have achieved optimal results (Salah et al.³⁷; Jain and Jain¹²; Mhaske and Phalke³¹; Elgamal¹¹; Kaur et al.²¹; Dalila et al.⁸).

PREPROCESSING

The aim of the preprocessing is to enhance the image quality and remove the background noise and the artefacts in order to determine the important areas in the image by utilizing image segmentation to properly identify the skin cancer (Demir and Yener⁹).

Image Quality: There are many skin cancer types, each type has a various color, size and features. Many skin features may have effect on digital images like hair and color, in addition to other impacts of lightness, noise due scanner or digital camera type and sensitivity (Elgamal¹¹). Several imaging techniques are used in diagnosing skin lesions. Clinical images (Macroscopic images) are normally used in skin lesions analysis. These images may be taken by using normal digital video or image cameras. However, in most cases the imaging

conditions are inconsistent. For instance, images are taken under various illumination conditions and from variable distances as well as the images may have low resolution. Moreover, the images may contain artefacts, such as hair, shadows and reflection. All these issues impeded the proper analysis of the skin lesions (Oliveira et al.³⁴). Therefore, in the preprocessing step, it is necessary to perform, Noise reduction, color space transformation, contrast enhancement, and artifact removal such as black frames, ink markings, rulers, air bubbles (Elgamal¹¹). Many techniques are used for enhancing image quality such as histogram equalization, low-pass, high-pass, and homomorphic filters. To remove the noise, wavelet thresholding, Gaussian smoothing, total variation and anisotropic filtering are used, and for deblurring, many techniques are available such as inverse filter, regularized filter, Wiener filter (Al-Ameen and Sulong, 2016). To smooth images of skin lesions as well as to remove artefacts A median filter is applied (Oliveira et al.³⁴).

Segmentation: Image segmentation is one of the major image processing steps. It is the process of separating an image into regions that include groups of identical linked pixels. The regions include region of interest (ROI) and non-region of interest (NROI). Image segmentation is utilized for locating objects and borders (edges, lines, corners, curves, etc.) in images. In particular, image segmentation process assigns a label to every image pixel, where pixels with same label have certain visual characteristics. The image segmentation result is a segments set that jointly cover the whole image, or a contours set extracted from an image. Each pixel in a region is similar with some property, such as color, texture, or intensity. The adjacent regions are mainly diverse with respect to the same properties (Mandal and Baruah²⁹). Several image segmentation techniques have been reported for medical images such as color k-means, fuzzy c-means, total variation fuzzy c-means, and texture based segmentation, but most of the techniques have limitations in terms of segmentation accuracy and computational cost (Kumar et al.²⁵). There is no optimal technique for image segmentation, because each image has its own diverse type, moreover, it is hard task to find a segmentation method for a certain image type (Khan²²). Several factors influence Image segmentation such as images homogeneity, image continuity spatial characteristics; image and texture content (Kannan et al.¹⁸). Moreover, many artifacts during image processing such as noise artifact, non-sharp edges, motion and,

intensity inhomogeneity affect the segmentation techniques outcome (Sharma and Aggarwal³⁸). Image segmentation methods into homogeneous regions with respect to a selected feature such as luminance, color, texture, etc can be classified into many categories such as clustering, edge-based, histogram region-based, thresholding, morphological, active contours, model-based, and soft computing (Elgamal¹¹). Each method has its own advantages and disadvantages in terms of performance, applicability, computational cost, and suitability. However, none of the mentioned methods can meet all requirements of a given research problem (Mitra and Shankar³²). Some of the common image segmentation methods include region based, clustering based, threshold based and soft computing based.

Region Growing: Region based segmentation is simple compared with other methods and also noise resilient and it includes three categories; region growing, region splitting, and region merging (Khan²²). Region growing is a segmentation approach to group pixels into larger regions based on their similarity based on predefined similarity criteria relating to their intensity, color or object. Similarity criteria alone are not an effective basis for segmentation and it is necessary to consider the adjacency spatial relationships between pixels. Therefore, the grouping should consider the similarity and the statistical properties of their own neighborhoods (Solomon and Breckon⁴⁰). Region growing technique doesn't considered robust (Thirumaran and Shylaja⁴²), because its performance depends on regions selection and whether these regions are clearly and accurately defined. Moreover, there is a possibility of image over or under-segmentation (Wanjari et al.⁴⁴). K-means, Fuzzy C-Means, and Markov Random Fields are some examples of region growing techniques.

Clustering Methods: Clustering is an unsupervised data analysis which is used to partition a set of records or objects into clusters or classes with similar characteristics (Simhachalam and Ganesan³⁹). In these methods, the image is segmented into clusters of pixels with similar characteristics using unsupervised clustering algorithms. These methods include two types namely hard clustering, and soft clustering. In hard clustering, the image is divided into clusters, where each pixel belongs to only one cluster using a membership function of 1 (pixel belong) or 0 (pixel not belong). K-means image clustering method is a favorite example of hard clustering methods (Hadi et al.¹²). In soft clustering, one pixel can belong

to more than one cluster, where the belonging degree is described by membership values. Soft clustering is most useful and flexible than hard clustering. Fuzzy c-means clustering is an example of soft clustering. Fuzzy uses partial membership therefore; it is more useful for real problems (Kaur and Kaur²⁰). Clustering techniques are characterized by computational cost due to use distance calculation metrics such as Euclidean and Mahalanobis distances (Deserno, 2011). Moreover, these techniques may not provide optimal results; generally, there is no perfect clustering algorithm for a specific application (Sharma and Aggarwal³⁸).

Thresholding: Thresholding is one of the easiest and most commonly used techniques for image segmentation. It is useful to discriminate background from the foreground (Mandal and Baruah²⁹). The pixels of image are divided with respect to their intensity level (Kaur and Kaur²⁰). An optimal gray-level threshold value for separating objects of interest in an image is selected from the background based on their gray-level distribution (Patil and Shaikh³⁵). These techniques are categorized into global thresholding and local (adaptive) thresholding. In the global thresholding, a single threshold value is assigned to the entire image. In the local thresholding, a threshold value is used to each pixel to calculate if it belongs to the foreground or the background pixels using local information around each pixel. Global thresholding is a common technique

because it is easy and simple to implement (Mandal and Baruah²⁹). Selecting a threshold is difficult (Sharma and Aggarwal³⁸), and improper threshold leads to destroy the object contour (Affi et al.²). On other hand, this technique is sensitive to unintended and uncontrolled illumination differences; and affected by noise. Furthermore, in this technique, the spatial relationships among pixels are not considered (Läthén²⁶; Solomon and Breckon⁴⁰). OTSU, type-2 fuzzy logic, and Renyi entropy method are among the thresholding techniques (Oliveira et al.³⁴). OTSU method is one of the wide use global thresholding methods, due to its simplicity and effectiveness (Patil and Shaikh³⁵). The Otsu method requires computing a gray level histogram before running. Thresholding is less computations compared with other techniques (Yogamangalam and Karthikeyan⁴⁷).

Soft Computing: These methods involve the classification of pixels using soft-computing techniques including neural networks, fuzzy logic, and evolutionary algorithms (Elgamal¹¹). However, most techniques need inclusive supervision and training (Sharma and Aggarwal³⁸). Neural network is commonly used for medical images segmentation to separate the target image from background (Kaur and Kaur²⁰). Hopfield, multi-layer perception MLP, and self-organization map SOM are some of the common neural networks for image segmentation (Khan²²). Table 1 shows a comparison between various segmentation techniques.

Table 1: Comparison of Different Segmentation Techniques (Udomhunsakul and Wongsita⁴³; Sharma and Aggarwal³⁸; Solomon and Breckon⁴⁰; Kaur and Kaur²⁰; Wanjari et al.⁴⁴)

Segmentation Techniques	Description	Advantages	Disadvantages
Region Growing	Based on partitioning image into homogenous regions	-More immune to noise. -Useful when it easy to define similarity criteria.	-Possibility of image over or under-segmentation. -Consume time and memory. -Its performance depends on clear and accurate definition of regions
Clustering Method	Based on division into homogeneous clusters	-Easy to define real problem and understandable	-Determining membership function is not easy. -Characterized by computational cost. -Sensitive to noise
Thresholding	Based on the histogram peats of the image to find particular values	-No need of previous information. -Simplest method. Reduce the noise	-Highly dependent on peaks. -Selecting a threshold is difficult. -Spatial relationships among pixels are not considered.
Soft Computing Method	Based on simulation of learning process for decision making	-No need to write complex programs -Model complex system	-Long training time -Provide optimal solutions

FEATURE EXTRACTION AND SELECTION

Feature extraction transforms the total dataset features into new reduced features set by merging features instead of deleting them. The new features set can attain better performance in extracting relevant information from the input dataset (Krizek²³; Kantardzic¹⁹). Image transformation into a set of features that define it is a crucial stage to analyze and explore the image in proper way for the consequent classification process (Arias et al., 2017). Feature extraction is very important. After enhancing the image quality, it is necessary to identify the region of interest (ROI). The ROI may be characterized by various parameters such as size, color, texture and shape. These parameters are described by a feature vector (figure 1), which contains information that assist to classify skin lesions.

Figure 1: Features Vector

Each component of the vector has its own distinctive features. The features for each vector component and their properties are introduced in table 2.

Table 2: Image features and their properties (Manojbhai and Rajamenakshi³⁰)

Image Feature	Properties
Shape Based Features	Area, Circularity, Irregularity, Perimeter, Roundness
Intensity Features	Mean, Median, Intensity, Standard, Variance, Kurtosis, Skewness
Texture Features	Contract, Correlation, Entropy, Homogeneity, Sum of Square Variance, Spectral And Special
Color Based Features	Impression , Expression And Construction RGB, LUV, HSV and HMMD

Extraction or selection of features, in combination with classification techniques is subsequently applied for malignancy diagnosis. Changes in skin color are the key features in skin cancer detection. However, the skin dermatography quality is mainly affected by the environment, such as lighting and instrument. Lightings may cause shadows and illumination on the skin, which may cause segmentation errors. Moreover,

segmentation based on color features only may not be efficient to address the nature skin colors variations. Clinical diagnosis also uses other features such as asymmetry, border irregularity, and area. Researches combine these clinical features to detect skin cancer automatically (Lee and Chen²⁷). In automatic analysis of images, the feature extraction is very crucial step in skin cancer screening system. ABCD, Menzies method, CASH (color, architecture, symmetry, and homogeneity) algorithm, etc. are used by experts to evaluate visual features in dermoscopy images for detecting melanoma lesions (Chakravorty et al.⁷). The ABCD includes primary clinical criteria or diagnosing suspected lesions. The ABCD guidelines include four visual features: It can be based on the ABCD-rule of dermoscopy. The ABCD stands for Asymmetry, Border, Color Variation and Diameter of Lesion (Murumkar and Gumaste³³). Principal component analysis (PCA) is an example of the common used algorithms for feature extraction (Xie et al.⁴⁶). While it is probable to extract many features, small subset of them can be used in the classification due to dimensionality curse. Data dimensionality is a significant problem in machine learning that affect the reliable analysis of any dataset and increases the computational cost. Feature selection is a substantial technique for dimensionality reduction and data preprocessing (Jebur et al.¹⁶). Therefore, it is necessary to select a small number of features that can maintain the information as much as possible as in the whole dataset (Hira and Gillies¹³). Analyzing the data with small features is simple, consuming less computation time and computer resources (Jebur et al.¹⁷). Several challenges are identified for feature extraction such as how to select best features for class discrimination, which features should be extracted, and what is the best technique for feature extraction.

CLASSIFICATION

The image classification objective is the automatic categorization of all image pixels into classes (Thakur and Maheshwari⁴¹) to distinguish the cancer structures into benign, or healthy. High classification rate can be achieved by extracting the significant object features (Jebur et al.¹⁷). The classification methods mainly utilize unsupervised and supervised approaches. The unsupervised approach is commonly known as clustering and produces statistics for spectral and statistical clusters. K-means clustering is an example

of unsupervised approaches (Ma and Tavares²⁸). In the supervised approach such ANN (Abdulkaki¹), support vector machine SVM (Ahmed and Chaya³), and ensemble learning, the image pixel categorization process is supervised by defining numerical descriptors of the various classes to the computer algorithm (Kumar²⁴). The classification rate depends on the extracted features, dataset, and the efficiency of the classification techniques. For the dataset, several challenges raise such data dimensionality, suitable dataset training samples, and data imbalance problem. However, categorizing objects is a difficult task and need more researches (Zahradnikova et al.⁴⁸). Moreover, classification techniques or methods have pros and cons and they vary in their performance. Current classification trend of medical image data is the intelligent hybrid techniques such as artificial neural network, fuzzy logic and genetic algorithm (Hota et al.¹⁴) or k Nearest Neighbor (kNN) and a Neural Network (NN) (Elgamal¹¹; Dalila et al.⁸), ornaïve Bayes and fuzzy systems (Pota et al.³⁶).

CONCLUSION

The medical image processing field and the applications in computer assisted diagnoses have great importance in modern medicine. The basic motive of medical image processing is to extract clinical knowledge or information from medical images. The medical image processing encompasses several and various stages, and the key of them are segmentation of image, extraction of feature, and classification. This helps to early diagnosis of skin cancer to decrease its danger and effects. Most stages have challenges; however, artificial intelligence, soft computing and machine learning can tackle the challenges or at least mitigate them.

Workplace Stress Experienced by Contractor in Malaysian Construction Industry

Roshartini Omar¹, Aina Mardia Sallehudin¹

¹*Faculty of Technology Management and Business, Universiti Tun Hussein Onn Malaysia (UTHM), Malaysia*

ABSTRACT

Work pressure can be experienced by any of the parties and organizations within various sectors. The work pressure issue also can be found in the construction industry, as the orientation and the nature of the job lead toward work pressure, such as organization factors, work demand factors, job roles and challenging work environment. Besides, previous studies have proven that uncontrollable of work pressure also led positively towards accident on a construction site. However, this issue had a lack of support and consensus among the parties itself. Therefore, this study is being carried out to explore the issue work stress in the Malaysian construction industry. The aim of this study is to identify the major contributor and measure work stress level in the Malaysian construction industry. The study was conducted within 78 individuals that involved from G7 class of contractors in Malacca with 74% rate of respond. This research is statistically descriptive orientation and questionnaire is being used as a research instrument. Data were analyzed by using the Statistical Package for the Social Sciences 20.0 software. Based on the results, it showed that work demand is the main factors contributing to the high-pressure jobs. Level of work stress experienced by the respondents is high, but they still have a good job in terms of achievements and satisfaction. Therefore, based on the results, all parties; DOSH, CIDB, contractors and others should take this issue seriously. The parties also need to put effort to handle the issue as its consider as an alternative to reduce the number of accidents in construction sites as well as improving performance of the industry.

INTRODUCTION

The rapid growth of development and globalization today make each of organization in various sectors become alert and well ready to face the challenges from multiple dimensions to maintain its competitive advantages. Several of innovations, unique and complex ideas are being introduced to maintain productivity and sustainability and improve organization's performance in the wide world market. However, within the midst and bustle to meet all the demands from client and tasks that are parallel towards the mission and vision of the organization, there are times where the organization tends to be insensitive towards organization's precious assets of itself which in human resources. This negligence may induce huge problems to the organization, such as stress at work. Prolonged of uncontrolled of this issue may affect various parties, including colleagues and organization's performances (Yip, 2009).

According Asquin et al.⁴, the work stress can be experienced by any parties and organizations in various sectors of industries. Therefore, work stress also exists in the construction industry. According to Ibem et al.¹⁹, construction industry is being described as an industry that exposed towards stressful working environment. The construction industry has also been labelled as industry with nature of 3D working environment; Dangerous, Dirty and Difficulty. According to Poon et al.³⁰, individual that associates within this industry need to work in extremely dangerous and uncomfortable working conditions such as exposed towards direct heat, inefficient ventilation system, dusty environment and high noise levels. While Lingard et al.²⁴ also stated that, the construction industry is usually associated with financial problems, an insistence upon timelines completion of the project, long working hours, unreasonable demand from clients and massive communication problems thru various parties.

Therefore, to investigate this issue a study will be conducted to assess the current level of work stress on individuals who worked in the construction industry which is professional contractors. Besides this study also will discuss on the main factors that contribute to work stress problems among contractors and work stress level within the construction industry.

PROBLEM STATEMENT

Based on 2016 statistic of Department Occupational Safety and Health first three sectors that contribute to the highest number of accidents at the workplace are; manufactured, forestry and construction. According to the statistic 2016, the construction sector is the third sector that contributes to high number in the workplace, however construction sector is the highest number that contribute to death in workplace compare to others. Table 1 shows the accident at workplace statistic that's been reported by DOSH¹⁴.

Table 1: Number of Accident in Malaysia Sectors (DOSH¹⁴)

Sector	Death (%)	Permanent Disability (%)	Temporary Disability (%)
Manufacture	17	57	50
Mining and Quarrying	0	1	0
Construction	40	5	13
Agriculture, Forestry and Fisheries	19	20	1
Facilities	0	3	10
Transport, Storage and Communication	5	5	7
Wholesale and Retail Trade	0	5	10
Hotel and Restaurant	7	4	4
Finance, Insurance, Real Estate and Business Services	7	3	3
Public Services and Statutory Authorities	5	2	3
Total	100	100	100

According to Enshassi et al.¹⁷, extension of uncontrollable of work-stress in construction industry leads to an increment of number accident in site positively.

In fact, work-stress issue also been declared connected towards accidents issue in sight. This issue may be proven as many previous studies discussed on towards the topic. According to Nahrgang et al.²⁷, high level of uncontrolled work-stress, enhance towards increment of accident in the Palestine construction industry.

According to Bowen et al.⁹, job role may induce to work-stress. Individual with different tasks and responsible, experienced different levels of work-stress (Arzmi³). Bowen el al.⁹ stated that, individuals with greater task and responsibility suffered a high degree of work stress in the construction industry. This statement also agreed by Lingard et al.²⁴ by stating that professionals usually experienced high level work stress compared to non-professionals. While Nordin²⁹ state that, professional that working in contractor firm experience high level of stress compare to professional in consultant firm. This issue also had been detailed by Wahab³² by stating that, work-stress experienced by professional not only will affect individual but it also may affect other people and surroundings.

According to Nordin²⁹, professionals that experience uncontrollable work stress issue tends to be incompetent while working. They tend to be negligence and careless which may induce to mislead direction or unprofessional decision-making. In some of the circumstances they to tend ignore safety requirement while make decision and disregard ethic of safety while enter to construction site (Nordin²⁹). Lack of disciplinary among professional such as do not wear properly safety attire and failed to follow the site regulation become one of factors accidents in construction site (Love et al., 2010). The issue become more serious when it also may involve other people as professional is considered as important person while decision making. Therefore, uncontrollable work-stress may among professional may lead to bad decisions that may bring lots of negative impacts (Love et al.²⁶).

Despite of accidents, decontrol work stress also may result to chronic health problem based on the level of stress, such as heart attack, high blood pressure and more (Nahrgang et al.²⁷). According to Brickford¹¹, each level of stress brings different of health problem based on individual health status. Therefore, this study is conducted to investigate work stress issue among contractors in Malaysia construction industry. This study also may consider as a vital study as it is considered as one of alternative to reduce number

accident in Malaysia construction industry as well as to improving its performance to world quality of standard. However, according to Lingard et al.²³, the work stress issue received a lack of attention towards many parties. Asquin et al.⁴ also agreed by stating that work stress issue with construction industry get lack of attention compared to public facilities sectors; lectures, nurses, doctor, policemen and more.

In fact, Chartered Industrial of Building (CIOB¹³) also figured that 82% of construction industry players had a lack of level resistance towards work-stress issue. They also have a lack of knowledge on the issue and known how technique to control work-stress in place. While Arzmi³ also claimed that, most of participant had zero tolerance on the issue and implement multiple mitigation method inefficiently. Furthermore, according to Dr Rajinderit Singh Hulton; Vice President of Health Department, for the time being there is no formal documentation or report on this issue at the Department of Occupational Safety and Health (DOSH). Therefore, this study will be conducted to explore current work-stress in Malaysia construction industry.

LITERATURE REVIEW

Work Stress in Construction Industry: According Lingard et al.²³, work-stress issue in the construction industry can be resulted due to the nature of high tense working environment within the sector. According to Asquin et al.⁴, work-stress is a component of human response that is not specify towards any part of the body while received any form of insistence of responsibility. While Arzmi³ characterizes work-stress as a psychological syndrome and negative emotional response to someone due to a stressful work environment. Enshassi et al.¹⁷ also supports the statement by emphasizing that high job demands that exceed the ability of an individual ability may lead to workplace stress problems.

Work-stress issue also exists in the construction industry as the industry is known as a high demand industry. According to Bowen et al. (2013), construction industry is basically known of nature high work demand as it consists of complex problems and complicated task that requires usage of both mentally and physically. In addition, uncomfortable working environment and exposure towards a high degree of dangerous become one of challenges in the industry (Bowen et al.¹⁴). The nature of working environment become tense when Leung et al.²¹ defines that issues such incompetent

management, financial issue, insist upon timelines completion of project, unrealistic demands of clients and communication issue usually happens while working. Prolonged associating with these issues may induce to work-stress.

According to Poon et al.³⁰, professionals that experience uncontrollable work stress issue tends to be incompetent while working. They tend to be negligent and careless which may induce to mislead direction or unprofessional decision-making. In some of the circumstances they tend to ignore safety requirement while make a decision and disregard ethic of safety while enter to the construction site (Nordin²⁹). Lack of disciplinary among professional such as do not wear properly safety attire and failed to follow the site regulation become one of accidents factors in construction site (Poon et al.³⁰). The issue becomes more serious when it also may involve other people as professional is considered as an important person while decision-making. Therefore, uncontrollable work-stress may among professional may lead to bad decisions that may bring lots of negative impact (Love et al., 2010).

Besides, uncontrollable of work-stress issue may induce many negative outcomes such as; burnout, health problems, accident at workplace and productivity deterioration (Yip, 2009). According to Enshassi et al.¹⁷, prolonged of work-stress issue may induce to accident in construction site positively. Wahab³² also agreed by stating that prolonged of work-stress issue that especially experienced by professionals leads to negligence while work and exposed many parties towards accident in a construction site. According to Arzmi³, work-stress issue experienced by professionals, not only will expose themselves towards dangerous working environment, they also tend to expose other individual as they are the main person that give order to others. Furthermore, extension of work-stress issue also may bring a negative reputation and performance towards firm (Wahab³²).

Work Stress in Malaysian Construction Industry: Work stress issue is not a new phenomenon in the work field. Work stress issue had been experienced by most of the communities either public or private sector. Recently many articles discussing on health problems often associated with higher treatment costs. Nahrgang et al.²⁷ agreed the statement of the problem of protracted pressure may cause the employer to bear high medical costs. Asquin et al.⁴ also concurred by explaining that the problem of work pressure leads to high medical costs

as it includes two different medical costs; accidents and health. In addition, Dopkeen & DuBois¹⁵ stated that the total liability cost of employers due to uncontrolled work stress is high, especially for developing countries and the world. The total average liability cost for health problems in the United States each year is estimated at 310 billion dollars (Dopkeen & DuBois¹⁵). These costs include the overall costs of medical costs, accidents, losses, costs and the cost of employee turnover (Dopkeen & DuBois¹⁵). While, the cost of liability for a developing country like Malaysia is RM 2,488.02 million (SOCISO³¹). Thus, the work stress is noteworthy because this issue is potentially harmful to national economy and image (Arzmi³).

Issue of protracted work stress may also lead to physical health problems and mental (Wahab³²).

Recently Malaysia has been rocked by a number of incidents of mental problems as a result of protracted work stress. According to local newspapers; Borneo Post¹⁰, there was an incident resulting in death, where construction workers were attacked by colleagues. According to Local Chief Police Officer, a 50-year-old victim was found dead at the scene with multiple stab wounds in the body. Based on the police report, the motive of murder is vague and still under investigation. But the offender was suspected of having a mental illness problem (Borneo Post¹⁰). In another incident that occurred in Johor Bahru, Johor. One contractor believed to have killed his family members. The contractor is accused of killing his wife and children their residency (Archive¹). According to the newspaper report every incident shows that they can be said to have symptoms of serious mental health problems arising in the workplace, the home and the feeling of pressure or stress.

Besides of mental and physical health issues, work stress issue also related to an increment number of accident issue (Leung et al.²²). Based on 2016 statistic of Department Occupational Safety and Health first three sectors that contribute to the highest number of accidents at workplace in Malaysia are; manufacture, forestry and construction. According to the statistic (2016) construction sector is the third sector that contributes to high number in the workplace, however construction sector is the highest number that contribute to death in workplace compare to others. Enshassi et al.¹⁷ claimed that factors of accidents on construction sites happened due several factors such as; contractor's negligence, fails to comply with safety guidelines and work in a dangerous condition is the result of work pressure checked. Nordin²⁹

also stated that the negligence of the contractor is a key factor to accidents in the construction industry is which is due to prolonged of work stress issue.

Besides, Malaysia construction industry also facing accident problem such as the Second Penang Bridge collapse in June 2013 (Bernama⁵) and the collapse of the Mass Rapid Transit (Bernama⁶). According to the press reports, both incidents occurred due to the negligence of the contractor and failure to comply with the safety aspect in which the issue of the Second Penang Bridge collapse in June 2013 is a work failure and failure in safety (Bernama⁵). While the incidence of collapse of Mass Rapid Transits, Mass Rapid Transit Corp Sdn Bhd (MRT Corp) said no adequate oversight of the factors that led to the collapse of the foundation blocks of the project (Bernama⁶). MRT Corp Chief Executive Officer Datuk Azhar Abdul Hamid also said the investigation found deficiencies have caused runway shims have limited stability and therefore when the parapet is mounted on one side of the bridge, it resulted in the foundation of the bridge collapse. Based on two of these incidents, it is clear negligence of the contractor contributed to the accident at the construction site.

Based on the paragraph before, the needs of study in this research are high. This research will be conducted to explore regarding on the issue. This research also can be as a reference for future purpose. This research also may help many parties; DOSH, CIDB and contractors. Therefore, research will be conducted to explore the current situation regarding the issue. This research also will be conducted to give formal information and create awareness regarding this issue as it considers of one of the best alternative to reduce the number of accidents in construction industry as well as improve the industry performance.

METHODOLOGY

This research is descriptive and using questionnaires as a research instrument. The questionnaire was developed based on a literature review and established sets of questionnaires were used in the previous study. Data were analyzed using the Statistical Package for the Social Sciences (SPSS) version 20.0. The target population involved in the survey is individual professionals in the construction industry in the state of Malacca. Individual professionals such as architects, engineers, project managers, health and safety officers and others were chosen as samples because they are

more vulnerable to the dangers of the work environment and stress (Bowen et al.⁹). Stressful and dangerous working environment not only expose them to accidents, but other people are also involved (Enshassi et al.¹⁷).

The scope of research is professional individuals who are employed by the contractors for the mega project. According to the CIOB¹³, mega-sized projects, known as mega projects, infrastructure projects that involve an investment of more than 1, 000,000 USD. Projects selected for mega-sized projects are more exposed to a high work conflict that led to the issue of work stress and accidents (Yip, 2009). Furthermore, the scope of research narrowed by focusing on the construction industry within Malacca as it consists of numerous conflicts and challenging work because of the issue of the growing population and limited land availability. Therefore, to fulfill all demands for development of the construction industry within the stated, land reclamation projects should be carried out. According to EPU¹⁶, land reclamation projects had been carried since 1970 due to limited land issue in Malacca.

Based on the scenario, researcher has determined the population that involved in this study is professional individuals who serve first class contractor’s organization in the state of Malacca. The researcher also determined the sample of contractor organizations dealing with mega-projects due to high exposure of dangerous working environment and advance machinery. Therefore, its shows the unit of analysis for this study based organization. Researchers also figure out the number of samples involved in this study based on the reference in Krejcie & Morgan²⁰ sample study table in accordance with the number of classes G7 contractors in the state of Malacca. According to the official website CIDB¹², the number of registered contractors G7 class in Melaka is the latest of 144 organizations. Thus, the numbers of samples involved in this study were 105 individuals.

DATA ANALYSIS AND DISCUSSION

Major Contributor of Work Stress towards Contractor in Malaysian Construction Industry:

Based on the findings, researcher found that all these factors; working environment, workload, work conflict and organization contributed greatly to job stress positively in Malaysia construction industry. In fact, all these factors lead to high impact pressures of work at the construction site. All factors contributor to work stress level in higher degree. This shows

the entire factor influenced towards work stress in Malaysia construction industry positively. However, based on the total average of score min as shown above, work demand contributed the highest degree towards work stress in the industry with value of 4.11.

Table 2: Overall Min Scores of Work Stress Contributor in the Construction Industry

Factors	Total Average of Min	Level
Organisation	3.95	High
Work Demand	4.11	High
Work Conflict	3.75	High
Work Enviroment	3.95	High

Highly work demand aspect in construction field faced by professionals such as; long working hour, inconsistent working hour, complicated work conflict and problems, wide exposure to communication issue due to many parties involved within a task led to work stress in construction industry. Hence, based on the illustrated table above, research may consider the first objective of the research has been achieved clearly as shown in table 2.

Work Stress Level Experience by Contractor in Malaysia Construction Industry:

The second aim of this research is to measure the work stress level experienced by contractor in Malaysia construction industry. Based on gathered research data, researcher found that level of work stress experience by contractors in Malaysia construction industry is relatively high. This statement is proven with high value to the total average score min of 4.86 as shown in Table 3. This value shows that, work stress in Malaysia construction industry in exist. This research also shows that, work stress issue in the construction industry need to be highlighted as well as other sectors such public sectors.

Table 3: Overall Min Scores of Work Stress Level in the Construction Industry

Stress Stage	Total Min Average	Level
Emotional Exhaustion	5.59	High
Depersonalisation	4.52	Medium
Achievement	4.48	Medium
Total	4.86	High

Based on the table 3, it proves that professional that associated with contractor organization experience high level of work stress. This study also shows that contractor faced emotional exhaustion stage frequently where they tend to feel tense and angry at the end of the day. However, researcher found that the contractors has medium level for both depersonalization and achievement stage with a value of 4.52 and 4.48. This value shows that, contractors still have good achievement and the ability to communicate well with colleagues and others. Hence, the researcher concludes that, the level of stress experienced by contractors in Malaysia construction industry is relatively high, but the contractors still able to communicate and perform better in their task. Besides researcher also may conclude that the second aim of the study is achieved by succeeding to measure the work stress level.

CONCLUSION

Research based on descriptive analysis orientation and using questionnaires as an instrument for collection data purposed. This research has considered received a good feedback from many individual as the response rate for the research is respectively high with 74% and involvement from 78 individuals from contractors in Malacca. Research used latest software of the Statistical Program for Social Science version 20.0 for data evaluation.

Based on a survey study conducted by CIOB¹³, there were four main factors that led to work stress in the construction industry which were environmental, organization, work demand and work conflict. Therefore, based on the study and literature review, 24 questions were constructed to identify the major contributor to work stress in construction field. Each of the questions is also being constructed by using the Michigan Organizational Assessment Package which had been widely used in the working environment study area. Based on research data, all those factors influence towards work stress in the Malaysian construction industry are positive. In fact, result showed all those factors bring great impact in work stress within the industry. However, work demand is considered as the major contributor towards work stress experience by a contractor with highest value total min of 4.11.

Besides, this research data also had been supported by previous studied conducted by Lingard et al.²⁴ regarding work stress in a construction site. According to Lingard

et al.²³ work demand factors such as long working hour and unstable working hour leads positively toward work stress. Lingard et al.²³ also found that professional within the construction industry usually spend more than 60 hours per week to fulfill organization tasks. According to Brickford¹¹ having prolonged working hour will lead low satisfaction level, reduces performance and degraded individual achievement. Beside other high work demand issue comes from clients such as expecting high quality project in the short term and limited budget also made the working in construction huge challenges and led to work stress. In addition, work demand issue such as deliver construction in short time - period and unstable work hours may bring work pressure experienced by the contractor at the construction site (Ng et al.²⁸).

According to Ng et al.²⁸, one of the demands of working in the construction industry, which can tend towards the working pressure is the scope of work that involves too many individuals from various parties, including clients and consultants. In addition, Nordin²⁹ also believes that the involvement of too many individual professionals, especially in construction activities such as project managers, engineers, architects and others brought pressure upon each of them has a different view of work and opinion may lead discussion activities more stressful and intense. Involvement of too many individuals also may lead too communication issue and decision making period prolonged. This issue can be proven when work demand problem such as many involvements in construction field aspect brings the highest mean value of 4:35. It shows many professionals within the contractor firm agreed that involvement from too many parties may lead towards work stress.

According to Bowen et al. (2013) stress the workplace consists of three stages; emotional exhaustion, depersonalization and destructive performance. Individuals who suffer from workplace stress will have symptoms that vary with the level of stress experienced (Love et al., 2010). In order to fulfill the second aim of the study, researchers prepare the questions of 22 questions based on concepts Likert scale of seven to represent each level as discussed in the literature. The question is constructed to assess the level of work stress experienced by the individual.

Based on the assessment that has been carried out, the researchers found that the level of work stress experienced by the contractor in the construction industry

is said to be at a high level with an average value of 4.86. These findings are also supported by the results of previous studies that have been carried out by Wahab³² on the pressure of work in the construction industry in Nigeria. Based on the findings of the study, as many as 86.70% of individual professionals in the construction industry in Nigeria were reported having problems with working pressure. Work stress levels experienced by individual professionals in Nigeria are also said to be high level (Wahab³²). However, these findings contradict the findings of a study conducted by Yip (2009) in Hong Kong. According to Yip (2009), the level of work stress experienced by the contractor is a moderate level. This is because the cultural lives of the people of Hong Kong attach great importance to the family of the job. Yip (2009) also argues that family oriented culture may help to reduce work pressures in the construction industry.

Based on this conclusion, the level of work stress in the construction industry is not a new phenomenon in the construction industry. The issue of work stress in the construction industry need to be considered as an extension of this issue leads to job performance weakens and thus the destruction of his career. Based on the findings, family factors also affect the level of pressure of work on construction sites as evidenced in the study (Yip, 2009). However, this study is descriptive and is free from any form of family factor contact. In addition, the findings also prove that even individual contractors are experiencing high levels of work stress, but they still have a level of performance and job satisfaction that simple. This can be seen in the respect that people are still enthusiastic in their work and they can control their emotions when working with a higher mean number of 4.79. This proves that although the level of work stress experienced by the contractors at construction sites is high, but they still have a good level of job satisfaction and work performance is good.

Therefore, employers should be alert and always strive to ensure job satisfaction can be improved for outstanding work performance. Based on these findings, it is evident that the problem of work pressure in the building construction industry does exist. This study clearly shows that workplace stress is an important issue because the situation and the work environment in the construction industry led to job stress experienced by the contractor in the construction industry.

ABSTRACT

With advanced technology, the users of cellular phones are increasing, yet the public concern on health issues, particularly to the impacts of exposure to electromagnetic field (EMFs). However, it is unknown that the impacts of EMFs perceived by the adjacent residents. This paper presents the results of a case study to determine residents' perceptions towards living proximity of telecommunication base station in Malaysia and how they evaluate the impact of these constructions. Using the quantitative survey method, this paper applied the chi-square test and binomial logit model to investigate the perceptions of residents who are living within close proximity to the telecommunication base station in Malaysia. The result shows that demographic (age), types of residence (length of stay and distance), and health symptoms (nausea vomiting and sight problem) were statistically significant to determine whether the residents felt comfortable to live nearby telecommunication base station. The result of logistic regression exhibits that residents who live more than 100 m away from the base station would more likely to feel comfortable, and the longer they live, more likely to choose comfortable compared to those who live there less than 5 years. The implications were also presented.

Keywords: *telecommunication base station, binomial logit model, feeling of comfort, health symptoms, types of residency.*

INTRODUCTION

In recent years, the use of mobile communication technologies for phoning, texting and internet services are becoming main part of human life. Based on the statistical data from ITU¹⁵, global mobile penetration has increased approximately 126% in 2016 compared to the past 10 years, and mobile phone subscription is expected to increase further in the future. Technology advancement in Malaysia, especially in networking (mobile broadband), devices (smart phone), and mobile applications (Web streaming, video surfing), has led to the high demand of internet services, which has risen from 21.38% in 2000 to 78.79% in 2016 (ITU¹⁶).

To satisfy the demand of internet users, infrastructure for the telecommunication network has widely expanded in Malaysia. Telecommunication companies have to build more base stations at strategic locations to ensure the high-quality mobile network service for end-users, in addition to stay ahead of their competitors in term of signal coverage. Most of the base stations are located in highly populated

residential or business areas, such as on the rooftops of shop lots and apartments, open spaces at playing fields, or parking lots of shopping complexes (Din⁹). The closer the base station to human, the higher risk impacts on human health condition (Cousin & Siegrist^{6, 7}; Neubauer et al.²³; Ngui²⁴; Van Kleef, Fischer, Khan, & Frewer³⁶; Viel et al.³⁷). Malaysia has an estimated a total of 16,000 to 18,000 telecommunication base stations (cellular and broadband) nationwide (Ngui²⁴).

The installation of telecommunication base stations in residential areas has resulted in substantial controversies about the potential harmful effects of the radiofrequency electromagnetic fields (EMF) emissions (D'Angelo, Costantini, Kamal, & Reale⁸; Din⁹; Isabona, Srivastava, & Robert¹⁴; Ozovehe, Usman, & Hamdallah²⁵; Siegrist, Earle, Gutscher, & Keller³⁵). According to Cousin and Siegrist (^{6, 7}), and Hallberg and Oberfeld¹⁰, the health effects of EMF are headaches, dizziness, nausea, skin rashes, feeling warm, depression, night sweats, memory loss, disturbances in menstruation, and insomnia. Many prior studies indicated that people living in the vicinity

of telecommunication base stations suffer from adverse health conditions (e.g. Augner & Hacker²; Isabona et al.¹⁴; Roje, Poljak, & Sarolic²⁸; Shahbazi-Gahrouei, Karbalaee, Moradi, & Baradaran-Ghahfarokhi³²).

In Malaysia, the health issues resulted from effects of EMF require more attention. Only a handful of studies which investigate the residents' health awareness towards the telecommunication base stations in Malaysia. The only record found was a study conducted in Penang, Malaysia by Suleiman, Gee, and Krishnapillai³⁴. Hence, this study aimed to fill the void and expand the research by including study sites in selected states in West Malaysia. The study identified the residents' perceptions about whether it is comfortable to live near to telecommunication base stations, the cause variables of demographic, types of residency, and the possible health symptoms of EMF.

STUDIES ON TELECOMMUNICATION BASE STATION IMPACTS

The researches regarding the health effects of EMF have been widely conducted in the last decade (Kundi & Hutter¹⁸; Santini, Santini, Danze, Le Ruz, & Seigne^{29, 30}, but their research outcomes are heterogeneous and inconsistent. Klaps et al.¹⁷ outlined the problems for studying the impacts of base stations. The first problem is the proper selection of the independent variable, or a list of measurement indicators to examine exposure to base station signals. The second problem is to study the outcome assessment due to people suffering from idiopathic environmental intolerance attributed to EMF in experimental trails, while lab experiments may cause inaccurate results in studying the subjective well-being and physiological indicators of the subjects (Hutter, Moshammer, Wallner, & Kundi¹¹; Neubauer et al.²³). The third problem concerns population selection. Even though base stations are ubiquitous, the actual exposure intensity is very low and hardly detectable, making it hard to measure an accurate human exposure level. Therefore, a random selection of study sites or respondents carries the risk of imprecise findings that may include only a few persons - or virtually no one - who have been exposed to EMF (Klaps et al.¹⁷). As a result, the residents who living near to base station within 500m are selected for this study.

In more recent studies, Baliatsas et al.³ explored a possible change in the prevalence of non-specific

symptoms, registered by general practitioners, among residents living in the proximity of a base station before and after an increase in installed base station antennas. A total of 1,069 adult participants from different regions in the Netherlands were analysed. The study compared two time periods (before and after) and revealed that after increasing the total number of base stations, a higher prevalence of most non-specific symptoms was observed. Also, a statistically significant prevalence of ear symptoms and musculoskeletal symptoms was found for the two different periods. Wiedemann, Freudenstein, Böhmert, Wiart, and Croft³⁸ conducted an online survey with 2454 respondents in six European countries to identify the potential risks from base stations and access points comprising Wi-Fi routers and cell phones. This study found that respondents were convinced that even a very low EMF exposure can have chronic negative health effects. They regarded EMF exposure as a moral issue, which elicits antagonistic feelings.

On the other hand, in the case of Penang, Malaysia, Suleiman et al.³⁴ used 14 symptoms to compare the possible health effects on residents exposed (170 respondents) and not exposed (31 respondents) to EMF from telecommunication towers. Residents who live within the radius of 0 to 150m from the base station were considered as EMF exposed, while more than 150m were considered as not exposed. The findings revealed that symptoms like headache, giddiness, insomnia, loss of memory, diarrhoea, mental slowness, reduced reaction times and mood swings were observed to significantly affect both exposed and non-exposed residents, but that the existing base station caused more adverse health effects in exposed residents compared to those who were not exposed.

To deal with the public fear, several bodies have been established internationally to minimise these health symptoms. These bodies provide guidelines and standards aiming to allay public fear on the effects of EMF. Malaysian telecommunication companies use the guidelines provided by the International Commission on Non-Ionising Radiation Protection (ICNIRP)¹³, Institute of Electrical and Electronics Engineers (IEEE)¹², and the World Health Organisation (WHO) (Din⁹; Tukimin, Mahadi, Ali, & Thari³⁵). Based on radiation detection tests by the Malaysian Communications and Multimedia Commission (MCMC), the radiation effects of EMF from telecommunication base stations in Malaysia are still at a low level (Ngui²⁴), with simulation tests and empirical

tests at base station sites showing radiation levels to be well below 1%. This indicates that radiation is less than one per cent, compared to the ICNIRP-recommended level for mandatory standards for emission of EMFs from infrastructure. However, there is not found research shows the perceptions of adjacent residents on comfortable of living proximity base station.

METHODOLOGY

Quantitative method involving a survey questionnaire was employed. This approach was selected because this research was based on pragmatic grounds; with respect to perceptions on demographic, types of residency, and health symptoms from living in the vicinity of base station. The data collection started with the development of a survey instrument, aimed to establish the measurement indicators: five demographic items, four types of residency items, and six health symptoms which would affect residents’ perception of whether residents felt comfortable to live in vicinity of the base stations in West Malaysia. The questionnaire was designed as a self-administered survey. Next, the survey instrument was pilot-tested and then refined. The selection of respondents took place by random sampling in several states of Malaysia (Kelantan, Penang, Kedah, Perlis, Selangor, Negeri Sembilan) between January to July 2017. The questionnaire included a set of questions on certain themes, respondents’ demographic, types of residency, health awareness, and health symptoms to gauge residents’ perception on whether comfortable to live nearby the base station. The items asked in questionnaire were presented in Table 1.

Table 1: Dependent and independent variables themes

Variable	Characteristics	%
Dependent Variable		
Comfortable	Do you feel comfortable living/working near to this telecommunication tower?	
	No (Code 0)	27.90
	Yes (Code 1)	72.10
Independent Variables		
Demographic		
Gender	Male (reference alternative)	54.03
	Female	45.97

Conted...

Age	19-24 years old (reference alternative)	24.36
	25-35 years old	26.72
	36-45 years old	22.99
	>46 years old	25.93
Marital status	Single (reference alternative)	36.54
	Married	59.33
	Widow	4.13
Education level	Primary (reference alternative)	9.82
	Secondary	37.52
	Degree	37.13
	Master	3.14
	PhD	1.77
	No formal education	10.61
Occupation	Management (reference alternative)	13.95
	Engineer	5.30
	Doctor	3.73
	Education	9.04
	Other	44.60
	Unemployed at the moment (Housewife/students)	23.38
Types of residency		
House type	Bungalow (reference alternative)	15.91
	Terrace house	54.62
	Semidetached house	14.73
	Office	14.54
Ownership	Rental (reference alternative)	34.58
	Own	44.20
	Heritage house	21.22
Length of stay	Live within 1 year (reference alternative)	12.18
	Live 2-5 years	26.92
	Live 6-10 years	27.11
	Live more than 10 years	33.79
Distance from the base station	Less than 100m (reference alternative)	21.22
	Between 101-200m	22.79
	Between 201-300m	23.18
	More than 300m	32.81
Health symptoms: Have you ever experience the following symptoms since living in this residential area?		

Conted...

Headache	No (reference alternative)	32.22
	Yes	67.78
Fatigue	No (reference alternative)	33.46
	Yes	66.54
Nausea vomiting	No (reference alternative)	4.91
	Yes	95.09
Skin problem	No (reference alternative)	5.89
	Yes	4.11
Loss of appetite	No (reference alternative)	7.27
	Yes	92.73
Nosebleed	No (reference alternative)	2.95
	Yes	97.05

DATA ANALYSIS

The data were first analysed by using chi-square tests to explore the single-dimensional relationship between the two group of respondents (those who feel comfortable and those who feel uncomfortable to live nearby telecommunication towers) with categorized measurement items (demographic, types of residency, and health symptoms). In the next stage, the binomial logit model was applied to examine the difference between these two group of respondents. The model proposed by McFadden^{19,20} was adapted, whereby the choice of yes (coded 1) and no (coded 0) indicated that code 1 was those who felt comfortable to live near to base station and code 0 was those who were not. McFadden’s model relied on the assumption that the respondents who felt comfortable to live are a non-random function, V1 of the travel characteristics plus a random error term:

$$T(\text{comfortable to live} = 1) = V1 + e1$$

On the other hand, the respondents who felt uncomfortable to live as a random error term:

$$T(\text{uncomfortable to live} = 0) = V0 + e0$$

As a result, the measurement items (demographic, types of residency, and health symptoms) related more to comfortable to live rather than the otherwise if, and only if:

$$T(\text{comfortable to live} = 1) > T(\text{uncomfortable to live} = 0)$$

Or

$$V1 - V0 > e0 - e1$$

In the case of the distributions of e0 and e, the probability that comfortable to live = 1 was

$$P(\text{comfortable to live} = 1) = \exp(V1) / [\exp(V1) + \exp(V0)].$$

However, if case 1 was unable to estimate the absolute levels of the parameters of V1, it would be able to estimate the measurement variable parameters of the respondents felt comfortable to live relative to those who felt uncomfortable to live. This was known as the log odds of occurrence on comfortable to live over uncomfortable to live, as expressed by the function:

$$V1 - V0 = b0 + \sum bjxj.$$

Then,

$$P(\text{comfortable to live} = 1) = \exp(b0 + \sum bjxj + V0) / [\exp(b0 + \sum bjxj + V0) + \exp(V0)] \text{ ---- with parameters } V1$$

Or

$$P(\text{comfortable to live} = 1) = \exp(b0 + \sum bjxj) / [\exp(b0 + \sum bjxj) + 1] \text{ --- without parameters } V1$$

Then, dividing the numerator and denominator by exp(b0 + sum bjxj) yields the logit model as:

$$P(\text{comfortable to live} = 1) = 1 / [1 + \exp(-(b0 + \sum bjxj))] \dots(1)$$

Therefore, the logit model in equation (1) showed the probability of the intra- comfortable/uncomfortable to live, where the measurement variable xj included the demographic, types of residency, awareness, and health symptoms. This logit equation was used to run the logistic regression analysis in Stata software 14.2. The Hosmer-Lemeshow test was used for the goodness of fit test. Additionally, the vector of the coefficient bj was estimated by the maximum likelihood. For measuring the goodness of fit of the equation, McFadden (1974, p. 121) suggested the use of the likelihood ratio index:

$$1 - LUR/LR,$$

where LUR was the unrestricted vector of the log-likelihood function at the maximum likelihood estimation of the parameters bj, while LR was the value of the likelihood function when all the parameters were restricted to zero (Reece²⁷).

FINDING

Table 2 presented the chi-square test results of residents' feeling of comfort related to demographic, types of residency, and health symptoms. The results showed that three variables: demographic (age), type of residency (length of stay and distance from base station), and health symptom (nausea vomiting) were significantly different ($p < 0.50$) in term of whether it was comfortable to live nearby the base station. Due to the weakness in the statistical power of the chi-square test as it is a non-parametric test, binomial logistic regression analysis was selected as a more understandable approach for this study (Table 3). The first column of Table 3 showed the coefficient b_j of equation (1), the standard errors associated with the coefficients, the Wald statistic or Wald chi-square value together with the 2-tailed p-value, and the odds ratio or exponential of the coefficients. In assessing the model fit, two statistical tests were applied to assess the significance of the binomial logit model. Hosman-Lemeshow statistic of overall fit indicated that there was no significant difference between the actual and predicted classifications, where the p-value > 0.05 [0.580]. The likelihood ratio index measure of the goodness of fit of the estimated equation was 0.125. These two statistics provided good support for the logit model.

The fourth column showed the p-value for these parameters (Table 3). The demographic: education level (degree), types of residency: house type (semidetached house), length of stay (live more than 6 years), and distance from the base station ($> 100m$), and nausea vomiting (yes) for health symptom were found to be significant to the predictive ability of the model. The p-value of education level (degree) was 0.03 and the odd ratio was 2.663, value more than 1. This expressed that respondents with undergraduate degree were more likely to feel comfortable to live in vicinity of base station. Significant results were observed in the respondents living in semidetached house with a p-value of 0.04, and the odds ratio obtained for this variable was 0.434, which was less than 1. This indicated that residents who have undergraduate degree were less likely to feel comfortable to live nearby the base station.

Furthermore, as p-value of length of stay - 6-10 years and more than 10 years were .00 and .01 respectively, with odd ratio was 3.219 and 2.939 respectively. Both results show odd ratios were more than 1 and therefore

the respondents who live more than 6 years in proximity of base station would more likely to feel comfortable than those who have live less the 6 years. The house distance from the base station also found statistically significant (p-value of 101-200m, 201-300m, and more than 301m were .05, .00, and .01 respectively), their odd ratio was 1.1910, 3.135, and 2.251 respectively. The results show these odd ratios were more than 1, indicating that the respondents who live more than 100 meters from the base station would more likely to feel comfortable to live compared to those who live less than 100m. There was only one item found statistically significant from the health symptoms which was the item 'nausea vomiting' with p-value:0.00 and odd ratio .201, less than 1. This implied that the residents who experience nausea vomiting would be more likely to feel comfortable to live close to the base station (see also Pallant²⁶, p. 175-178, for further explanation on the p-value and odd ratio of the binomial logit model analysis).

DISCUSSION AND CONCLUSION

The study examined residents' perceptions on whether it was comfortable to live in the vicinity of telecommunication base stations in Malaysia, through three measurement indicators: demographic, types of residency, and health symptom towards the effects of living near the constructions. A questionnaire survey was conducted and the data was used to analyse the relationships between the measurement indicators toward the adjacent residents' feeling of comfort to base stations. Two analyses, namely the Chi-square test and the logistic regression analysis, were used to determine their relationships and they were presented in the early part of this article. The Chi-square results revealed that age was found statistically significant in deciding whether it was comfortable to live in close proximity to the base station. The study of Shahbazi-Gahrouei et al.³² and Siegrist et al.³⁵ also found that different age groups have different sensitivity towards EMFs. This might have due to the younger generation was more aware about the hazardous risks of EMFs. Length of stay, distance from base station and nausea vomiting of health symptom were influencing the perceptive on living comfort near to base station.

For deeper understanding, binomial logistic regression was used and it discovered that people with undergraduate degree tended to feel comfortable living in proximity to base stations compared to those who with only primary education level. The residents who live more than 6 years would more likely to feel comfortable to live nearby base station. There are many studies revealed that distance away from the base station was a significant variable to determine the exposure level from EMFs (e.g. Augner & Hacker²; Baliatsas et al.⁴; Bond²³;

Kundi & Hutter¹⁸; Santini et al.²⁹; Schüz & Mann³¹; Viel et al.³⁷). Similarly, this study revealed that distance was found related to feeling of comfort, the farer they stay, more comfort they felt.

The study of Abdel-Rassoul et al.¹, Mohler et al.²¹, Navarro et al.²², Santini et al. (29, 30), and Suleiman et al.³⁴ revealed that fatigue, sight problem, and loss of appetite were the health risks of living in proximity to base stations. However, the present study showed only one item 'nausea vomiting' was significantly affected the perception of people and causing them to feel uncomfortable to live near to base station. People might perceive that the illnesses brought by EMF were rather chronic than acute. Therefore, the health organisation was suggested to raise public awareness regarding the health risks of EMF and encourages residents to keep track of their yearly medical check-up record.

In the other hand, to reduce the intensity of EMFs exposure, telecommunication companies should consider sharing base stations to mount their transceivers rather than increase the number of towers. Local authorities should regulate base station constructions to ensure that the constructions were carried out follow the guidelines provided by the Institute of Electrical and Electronics Engineers (IEEE)¹² and the International Commission on Non-Ionizing Radiation Protection (ICNIRP)¹³. The Malaysian Communications and Multimedia Commission (MCMC) should conduct random audits to ensure that the wireless communication environment is conformed to the EMF safety level.

Furthermore, the MCMC should openly disclose details on the localities of each telecommunication base station, including the names of the telecommunication

companies operating them, on an official website. This will not only encourage transparency in conduct but it can also avoid the operation of illegal base stations. Lastly, public opinion should be heard and considered before any construction of base stations was taken place to avoid controversy.

What Do Undergraduates Think About Green Investment? Empirical Evidence From A Developing Nation

Kar Hoong Chan¹, Tuan Hock Ng¹, Almowallad Fadi¹

¹Faculty of Business, Multimedia University, Jalan Ayer Keroh Lama, 75450 Bukit Beruang, Melaka

ABSTRACT

Climate change and its disastrous effects have called for more concentrated efforts of all parties to accelerate the transition to a low-carbon economy. Green investment seems a solution to tackle environmental degradation issues but existing study in this area remains scanty. This study adopted Theory of Planned Behaviour (TPB) to examine the relationships between personal attitude, subjective norms and perceived behavioural control (PBC), and the intentions of making green investment among university students in Malaysia. 260 university students were surveyed (Kuala Lumpur and Melaka) with a response rate of 77%. The results of multiple linear regression analysis show that these factors (personal attitude, subjective norms and PBC) are significant predictors. Various measures and policy recommendations are provided in this study to promote green investment.

Keywords: *Green Investment Intentions, Theory of Planned Behaviour, Personal Attitude, Subjective Norms, Perceived Behavioural Control*

INTRODUCTION

The intensifying effects of global climate change such as drought and wildfires, due mainly to increase in annual emissions of Greenhouse gases (GHG), have necessitated speed in mitigation efforts. As a developing nation in Asia, Malaysia is no exception with deteriorating carbon dioxide (CO₂) emissions per capita, rose from 4.76 metric tons in 1999 to 8.03 metric tonnes in 2014 (The World Bank²²). Taking into account this worrying and rising trend, Malaysia's government has pledged to reduce carbon emissions by 40% in 2020 with various measures and policies well underway under Malaysia Plans 2006-2020 (Lokman¹⁵).

Over the recent decades, green investment which by definition refers to "approaches that seek to invest capital in 'green' assets" (Cambridge Institute for Sustainability Leadership⁵) has turned out to be progressively popular. This financing alternative is believed to be the spearhead of a greener economy as larger flows of funds committed to low-carbon infrastructure developments, including smart grid and energy efficiency projects play a vital role in creating a low-carbon environment (The Organization for Economic Co-operation and Development [OECD]²¹). It is a source of capital that essentially meets not only the objective of economic growth but also sustainability, according to a report

by World Economic Forum²⁷. Braunstein⁴ highlighted that, with higher awareness of and stronger interest in the importance of environmental protection, investors and financial institutions begin to put priority to green financing tools for investments.

While it is clear that green investment is the catalyst promoting cleaner environments, as far as we are concerned, there is no existing empirical evidence in the area that analyses what factors influence the intentions to make green investment from the perspective of individuals. This is the research gap that we aim to bridge. Understanding motivational factors affecting intentions of individuals to invest in companies delivering on environmental performance is important to ensure abundant financial capital is mobilised to support the financing of climate action which in turn help meet the objective of lower greenhouse gas emissions.

The rest of the paper is organized as follows. We discuss the literature review in the next section, followed by the research methodology and analysis results. This paper ends with the conclusion and implications of study.

LITERATURE REVIEW

The interplay among financial development, economic growth and environmental degradation have

formed an important question among policymakers and environmentalists. Hence, this section provides a review of studies concerning green investment intentions, particularly the motivational factors affecting that intentions.

Green investment is a broad financial term that covers socially responsible investing (SRI), environmental, social and governance investing (ESG), sustainable, long term investing and other similar thoughts (Inderst, Kaminker, Stewart¹⁴).

Aside from that, practices of companies which involve sustainable energy, energy efficiency, waste management, or water management are also categorised as green investment (Inderst, et al.¹⁴). Green investment is also clearly demonstrated by the efforts of reducing greenhouse gas and air pollutant emissions (Eyraud & Clements⁹).

Green investment is a process of making investment decisions which are expected to produce a positive impact on the environment and generate certain amounts of financial return on the capital invested. It is a tool to mitigate the rising issues of pollutions and global warming. In other words, the main objective of green investment is to be actively involved in the improvement of environmental health and to compensate investors with the financial return from the capital invested.

According to Theory of Planned Behavior (TPB), people's attitude, subjective norms and perceived behavioral control (PBC) are the major factors directly influence the intention to perform a certain behavior (Ajzen⁵)1985, 1987. As alluded by TPB, behavioural intention is the immediate antecedent to behaviour. Ajzen² stated that individuals intend to perform the behaviour when they evaluate it positively, when they experienced a positive feedback from the society and when they believe it is worth and have opportunities to perform the said behaviour. Thus, intention of the behavioural actions is being viewed as the internalized summary of pros and cons from the expected actual behaviour taken place. Behavioural intention is being viewed as the motivator of performance of the said behaviour (Ajzen⁵)1985, 1987.

Attitude is an expression either thinking or feeling about someone or something which it is reflected in a person's behaviour. Attitude emerges from a person's

beliefs about the outcomes of his execution of behaviour and reaction towards the result of his behaviour (Cordano & Frieze⁶). Therefore, attitudes towards a behaviour are the actions link to the behaviour in believing of a certain outcome from the action performed (Ajzen⁵)1985, 1987. In the case of pro-environmental behaviour, attitude towards the behaviour is being justified as the feelings or thinking regarding practices in environmental friendly activities (Wang, Zhang, Yin, & Zhang²⁵). In short, if the person has a favorable attitude towards environment concerns, he or she has higher possibility to commit in environmental protection actions. Studies conducted by Wang, Zhao, Yin, and Zhang²⁶China's environmental pollution and energy security issues have become increasingly more prominent. As a result, new energy vehicles (NEVs and Goh, Ritchie, and Wang¹¹ for instance demonstrated that attitude has a positive impact on the behavioural intention.

Social norms are another factor that links to an individual's intention and behaviour. In order to perform a certain form of behaviour, the perception of stress given by his or her social circle has a major influence (Ajzen⁵)1985, 1987. In other words, it is the decision made by a person to perform a particular behavior given the social pressure. Subjective norms in this context mean the various external forces which can influence the individual's intention to invest or not in companies with green initiatives. For instance, a person who are subject to social pressure is more likely to be positive in terms of food consumption, choice of accommodation, green products purchase or recycling intention (Scalco, Noventa, Sartori, & Ceschi¹⁸the purchase of organic food within a sustainable consumption context has gained momentum. Consequently, the amount of research in the field has increased, leading in some cases to discrepancies regarding both methods and results. The present review examines those works that applied the theory of planned behavior (TPB; Ajzen, 1991; Tan, Ooi, & Goh²⁰the current investment trend is showing signs of power supply inadequacy. Hence, many countries have embraced energy efficiency as a partial solution to looming energy problems. In reality, many people are not replacing their household appliances with energy-efficient ones. The use of energy efficient products in Malaysia is still at unsatisfactory level. Hence, this study aims at closing the gap by applying the moral extension of the theory of planned behavior (TPB; Wan, Shen, & Choi²³; Han, Hsu, & Sheu¹²).

PBC is defined as the self-perception on the level of difficulty towards performance of certain behaviour. It is connected with self-belief in which the belief of a person regarding the factors that exist in order to facilitate the performance of the behaviour. In other words, it means the degree of difficulty perceived by a person to execute the said behavior (Ajzen⁵)1985, 1987. PBC on green investment intentions means the perception of an individual about the degree of difficulty in their investment choices. Studies conducted by Freire¹⁰; Wu, Li, and Sung²⁸; Zhang, Wang, and Zhou²⁹; Wang, Fan, Zhao, Yang, and Fu²⁴ and Long, Chen, Du, Oh and Han¹⁶ show that PBC and the intentions to perform green practices behavior are positively related.

On the other hand, there is a growing awareness of the importance of sustainable environment and its practices among Malaysians, specifically youth (Osman, Isa, Othman, & Jaganathan¹⁷). The authors reported that attitude is positively related to recycling behavioural intentions. Another study on green consumption was also carried out in Malaysia, Azizan and Suki³ found that attitude is the most important factor for the green consumption intentions. Despite these overwhelming studies, research in relation to green investment seems neglected. Therefore, this study aims to close the research gap in the area of green investment in Malaysia.

Recently, the number of countries with focus on green investment has increased drastically due mainly to its potential environmental benefits (Higgins, Hajkowicz & Bui¹³) to maximise multiple environmental benefits. The problem was formulated as a multi-objective integer programming model, with objective functions representing biodiversity, water run-off and carbon sequestration. We applied a multi-objective Greedy Randomised Adaptive Search Procedure (GRASP). Nevertheless, in the case of Malaysia, the participation of private investors in green investments is relatively low compared to other nations. For example, the first issuance of Socially Responsible Investment (SRI) sukuk or green sukuk by Malaysia was small, at RM 100 million. The size of issuance is considerably insignificant compared to the total issuance of the global market which was USD 40 billion (Malaysia International Islamic Financial Centre [MIFC], 2016). Hence, this study, is keen to examine the motivational factors that contribute to the intentions of making green investment among undergraduate students.

RESEARCH METHODOLOGY

Research Framework: Below is the research framework constructed from the above literature review:

This study adopts TPB, in which personal attitude, subjective norms and PBC are the independent variables. Based on the literature, the hypotheses formed are as follows:

Hypothesis 1 (H₁): There is a positive relationship between personal attitude and undergraduates' intentions towards making green investment in Malaysia.

Hypothesis 2 (H₂): There is a positive relationship between subjective norms and undergraduates' intentions towards making green investment in Malaysia.

Hypothesis 3 (H₃): There is a positive relationship between perceived behavioural control and undergraduates' intentions towards making green investment in Malaysia.

DATA COLLECTION

A total of 260 questionnaires were distributed to the universities students across Melaka and Kuala Lumpur from different institutions. 215 questionnaires were returned, where out of 215 questionnaires, 15 questionnaires were found inappropriate and were discarded. Consequently, 200 questionnaires were found usable for the final analysis. This concluded with the response rate 76.92%.

Pilot Study: The pilot study for this study has been conducted over a period of one week and a total of 30 questionnaires were collected. The collected data was analysed statistically using Statistical Package for the Social Sciences (SPSS) version 23 to determine the reliability of the scales in the questionnaire. Table 1.0 shows the results of reliability test with Cronbach's Alpha above 0.70, indicating high internal consistency. Therefore, the questionnaires are valid and readily distributed.

Table 1.0: Reliability Test for Pilot Study

Variables	No. of Items	Cronbach's Alpha
Personal attitude	3	0.950
Subjective norms	4	0.821
Perceived behavioural control	4	0.965
Intentions	4	0.771

Descriptive Analysis: The majority of the participants for this study are female (62%) while there are 41% of male participation in this survey. The distribution of sample by age group is: below 18 (2.5%), 18-20 years (22.5%), 21-23 (41%), 24-26 years (25.5%), and above 27 (8.5%). In this study, 41% respondents are Chinese, followed by other races (25%), Malay (20%) and Indian (14%).

Most of the respondents are in their third year of their study. 22.5% of the respondents are in their second year of study, followed by 4% of them who are in their fourth year of study. The participation of the first year students in this study is low at 2.5%.

Reliability Test: Table 2.0 illustrates the result for reliability test. The value of Cronbach's Alpha for the 200 participants for each of the variables used in this study are above 0.7. Hence, there are high internal consistency.

Table 2.0: Reliability Test

Variables	No. of Items	Cronbach's Alpha
Personal attitude	3	0.932
Subjective norms	4	0.702
Perceived behavioural control	4	0.908
Intentions	4	0.721

Multiple Linear Regression: This section presents the results of the regression analysis pertaining the test of relationship between independent and dependent variables of the study. This study applied the statistical test through using SPSS v 23 for the confirmation of relationship between the independent and dependent variables. Table 3.0 shows the results for multiple linear regression.

This study reports a positive relationship between personal attitude and intentions of making green investment among university students ($\beta = 0.162$), at the 0.05 significance level. This means that a person with a positive attitude towards environment is more likely to invest in green projects.

Likewise, there is a positive relationship between subjective norms and intentions of making green investment ($\beta = 0.255$), significant at the 0.01 level. Not only that, PBC is positively related to intentions ($\beta = 0.149$), at the 0.05 significance level. Based on these results, it is believed that social norms and PBC play a role in encouraging students to participate more actively in green projects financing.

Table 3.0: Multiple Linear Regression

		Beta Coefficients	Sig.
H1	PA -> I	.162	.017**
H2	SN -> I	.255	.000***
H3	PBC -> I	.149	.028**

Notes: PA = Personal attitude, SN = Subjective norms, PBC = Perceived behavioural control,

I = Green investment intentions

*P-value < 0.10

** P-value < 0.05

*** P-value < 0.01

CONCLUSION AND IMPLICATION OF STUDY

In accordance with the Eleventh Malaysia Plan (2016-2020), Malaysia has set a goal to become an advanced economy by 2020. This can be accomplished in a resilient, low-carbon, resource-efficient, and socially-inclusive manner. The goal is to move from the conventional model to a greener model in term of cost efficiency and environmental friendly approaches. Financial and technology advancement are the fundamental in raising the quality of lives of Malaysians, however in the event that limited natural assets are not utilized effectively, it will bring about irreversible harm and put Malaysia's development in danger. Thus, green growth is the key to change the vital situation. It considers all three pillars of sustainable development which are economic, social, and environment, and better prepares the nation for future challenges. On the off chance that it is successfully carried out, it will benefit the economic, change of mentality and behaviour at all levels of the society, as well as influence policy decisions in government, production decisions in industries, and consumption decisions by individuals. In addition, it will influence the policy decisions in government, production

decisions in industries, and consumption decisions by individuals(Economic Planning Unit⁸).

Premised on TPB, this research aims to investigate the relationship between personal attitude, subjective norms and PBC and intentions of making green investments among undergraduate students in Malaysia. The multiple linear regression results show that all the identified variables have a positive relationship with intentions of making green investments. In which, the findings shown in this study appeared to be consistent with the findings shown in both Spence, Stancu, Elliott and Dean¹⁹ and Cronan, Mullins and Douglas⁷.

Through the last decade, the trend of green investment has been increasing around the world. As more people understand the critical situation of the global climate change, there will be more chance that more people will be willing to invest in green companies. This study contributes to increasing the awareness level on the global warming and climate change issues and their impact on our lives. It is importance to understand the trend of investment among undergraduates as they are the future investors in the country.

Commitment on Corporate Social Responsibility by the Government Link Companies in Malaysia

Rozita Arshad¹, Zalinah Ahmad¹, Kalthum Hassan¹

¹School of Government, Universiti Utara Malaysia, 06010 Sintok, Kedah, Malaysia

ABSTRACT

Corporate social responsibility (CSR) is a concept whereby organizations consider the interests of the society by taking responsibility for the impact of their activities on customers, suppliers, employees, shareholders, communities and other relevant stakeholders. CSR portrays the collaboration and integration between public and private sectors towards ensuring the healthier and better quality of life of society. The concept of CSR is based on the mutual dependence between a corporate and society as well as the indicators that affect these relationships. Society at large is looking at private sectors for answers regarding problems such as health crises, and environmental issues that related to their daily lives. Therefore, this study will explore the types of social responsibility programs provided by public companies in Malaysia. In other words, the paper tries to look at the Government-Linked Companies roles in anchoring Malaysia Government socioeconomic structure by identifying their initiative to provide CSR programmes or activities to the community.

Keywords: *Corporate Social Responsibility; Government Link Companies; CSR Programmes; society;*

INTRODUCTION

In the current situation of economic globalisation, corporate social responsibility (CSR) is becoming a major topic of concern that been seen to offer innovative solution through the collaboration of private and public sector to encounter some basic socio-economics and politics challenges. According to Béthoux, Didry, and Mias⁷, CSR through the roles of corporate entity is a new mode of governance that can be voluntary or spontaneous actions of solution for some social issues in developing countries. Today's corporate social responsibility (CSR) has become a new tool for organizations and their managers in the modern commercial era. The concept of CSR is based on the mutual dependence between a corporate and society as well as the indicators that affect this relationship. There are some interactions plays in this relationship: corporate and stakeholders, corporate and governments, corporate and environment, corporate and ethical, and corporate and sustainable competitive advantage.

CSR can be conceptualized as "the social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point of time" (Mallin³⁰). According to Carroll¹¹, there is the existence of relationship between business (companies) to the

public (stakeholders) whether indirect or direct relation between both parties. Publics always look for answers from the companies regarding some basic daily activities such as environmental issues, social problems, poverty, disaster and others on how the companies can help them to resolve the problem (Gyves, and O'Higgins²⁴). Companies, society, government and stakeholder have to collaborate together in finding ways of solution to ensure that each of them will gain mutual benefit. Nowadays, from the perspective of business, CSR can be used as one of the element to attract investors or to gain consumer trusts. It can bring prosperity and benefits to the company, such as a distinct position in the marketplace, protecting the company's brand as well as can be portrayed as part of nurturing ethical corporate image in the company (Abdul Rahman & Omar¹). Due to this reason, corporations that implement CRS are belief can better able to establish a positive image to their stakeholders or public (Chiu&Hsu¹⁵).

CORPORATE SOCIAL RESPONSIBILITY IN MALAYSIA

There are many programmes initiated by government in order to promote CSR agenda. The Malaysian government has introduced various

initiatives in promoting the CSR agenda and this can be observed through the incorporation of CSR practices and reporting in years 1990's and after including the government-linked companies (GLCs) Transformation Plan (the Silver Book), the New Economic Model (NEM), the Government Transformation Programmes (GTP) and introduced the National Integrity Plan (NIP). Government also endorsed other initiatives in order to enhance more in participations in CSR including PM CSR Award, Companies Commission of Malaysia Corporate Responsibility (CR) Agenda, and UN Global Compact (Allen³).

In upholding the principle of accountability and sharing amities, The Prime Minister's CSR Awards was launched in 2007, as Malaysia highest recognition of corporations in CSR through the Ministry of Women, Family and Community Development. This is perhaps to instill recognition to the companies that having work much and made a difference to the communities in which they are active and participate in their CSR programmes. Therefore, this CSR award and all CSR initiatives are important to be comprehended as an agenda and tool to achieve mutual understanding between companies and society. Besides, according to Allen³, the Malaysian Government had required all PLCs to disclose their CSR activities in their annual report effective from year 2007. This requirement affects all the Public Listed Companies in Malaysia and without exception to the Public Listed GLCs, which is being monitored and controlled under the Bursa Malaysia regulations.

GOVERNMENT LINK CORPORATIONS (GLCS)

GLCs can be defined as companies that have primary commercial objective and in which there is ownership and direct controlling state by the Malaysian government. Companies have controlling stake in it for instance subsidiaries or affiliates. The government does have abilities (not just percentage ownership) to appoint Board members, senior management, and/or make major decisions (e.g. contract awards, strategy, restructuring and financing, acquisitions and divestments etc.) for GLCs, either directly or through GLICs (www.pcg.gov.my). The GLCs in Malaysia has evolved and become important national institution recognised for their achievement locally and regionally. GLCs constitute crucial part of Malaysian economy and make up of nearly 49 percent of

the market capitalisation of Bursa Malaysia (Esa¹⁸). The government has emphasised the importance of GLCs to promote the well-being of society through corporate social responsibility (CSR) activities. In doing so the government has firstly introduced GLC Transformation Programme in May 2004. The programme is a part of ongoing effort initiated by Malaysian government to gear the economic development of the country. There are three key principles under the programme which are: 1) programme is part of the larger national development strategies; 2) programme is focused on enhancing performance at the GLC's; and 3) programme takes full cognisance of matters relating to governance, shareholder value and stakeholder management.

The aim of the programme in general is to improve the performance of GLCs to have positive effect on the corporate world and also towards achieving the Vision 2020. By doing so, the government has set up the Putrajaya Committee on GLC High Performance (PCG) in 2005 to follow and catalyse the programme. The PCG is chaired by 2nd Finance Minister and consists of heads of GLICs, namely Khazanah Nasional Berhad, Permodalan Nasional Berhad, Employees Provident Fund, Lembaga Tabung Amanah Tentera and Lembaga Urusan Tabung Haji. Representatives from the Ministry of Finance and Prime Minister Department also included in the Committee to monitor the developments and recommend measures of improvement for GLCs.

Abdul Razak, Ahmad and Joher² mention that majority of the studies have shown negative result when looking at the government ownership and performance or firm valuation. Reasons explaining the poor financial performance are first, the government is guided by the social altruism which may not in line with the profit oriented. Second, the government played the role as an agent of the citizens who are the real owner of the companies; however, the bureaucrats, who do not have personal interest in ensuring that an organisation is run efficiently or governed well since they may not have gained any benefits of good governance. A government corporation or government owned corporation is a legal entity created by a government to exercise some of the powers of the government in which it may appear to be not-for-profit corporations (Mishra, & Suar³¹).

In case of Malaysia, despite the negative public perception of GLCs, study done by Lau and Tong²⁶ shows in favour of government intervention. The higher degree

of government ownership ensures that they are being better governed and finally to value creation. In addition, their study suggests that although GLCs' attention is divided between several goals, the goals are attained without damaging the goal of wealth maximization.

LITERATURE REVIEW

Corporate social responsibility (CSR) refers to the ethical conduct of a corporation, which is responsible for the general stakeholders, and not just its stockholders (Chiu & Hsu¹⁵). The concept of CSR is based on the mutual dependence between a corporate and society as well as the indicators that affect this relationship. There are some interactions between corporate and stakeholders or governments or environment or ethical or sustainable competitive advantage (Gholami²³). Surely, when talking about corporate social responsibility we should know its vastness; a topic that includes a variety of ideas and concepts incorporated in the same number of definitions, each definition has its unique characteristics and every definition is relying on the origin country, organization or the author.

According to Roy, (2010) the origin of Corporate Social Responsibility (CSR) is traced around 1950s, a period that the advocate of the concept and activist of the time express the need and call for the business owners and corporations to show more empathy, sympathy and understanding of the vulnerable situation of the society in general. The prelude or the origination of corporate social responsibility dates back to early 1930s, when it drew the attention of scholars and practitioners in the sphere of business ethics and management (Fairbrass & Zueva-Owens²⁰). Corporate social responsibility (CSR) connotes corporate responsibility, corporate conscience or corporate citizenship embedded into a business model which is self-regulating. There exists no clear universal definition of CSR, but widely cited includes Archie Carroll's (1991), pyramid of corporate social responsibility, encompassing legal, economic, ethical and discretionary expectation of the society on organizations. Robins³⁵ posited that CSR is a voluntary action by the company that impacts on social stakeholders. Carroll¹² (pg. 2) in his revisit on his Carroll's CSR pyramid posited that "CSR as policies and practices that business people employ to be sure that society, or stakeholders, other than business owners, are considered and protected in their strategies and operations". Carroll¹² also added

that many arguments exist related to CSR definition, which claims other elements should be included such as voluntary, legal compliance, element of ethics and corporate philanthropic.

World Business Council for sustainable Development has defined CSR as the continuing commitment of business to behave ethically and contribute to economic development while improving the quality of life of the work force and their families as well as the local community and society at large (Barret⁵). Social responsibilities of the companies can be seen through their policy and practice, which voluntarily incorporates social and environmental issues, follows the principles of respect for all stakeholder groups, society and environment (Dahlsrud¹⁶, Žėkienė & Ruževičius⁴⁴). In addition, the Australia Standards Association (2003) in developing a standard for corporate social responsibility defines CSR as a voluntary mechanism that integrates societal, environmental issues into the core activities of the company and it should be beyond the legal responsibilities of the company. CSR is defined as open and transparent business practices that are based on ethical values and respect for the community, employees, the environment, shareholders and other stakeholders (Bursa Malaysia¹⁰).

Notably, governments give more attention to CSR as a tool to encourage businesses in raising social and environmental standards. However, most businesses are still convinced that CSR must be a voluntary initiative led by businesses (Freeman & Hasnaoui²¹). They argue that government role should only be limited to soft policy measure, such as information provision and the spread of best practice (Georgeta²²). The obligation of being social responsible that made by a firm must be a voluntary act or optional action and not mandatory. Besides, the obligation is something broader, meaning that it extends beyond the traditional duty to the shareholders, to other groups in society such as consumers, employees, suppliers and neighboring communities.

Following the 1997 Asian financial crisis, the Malaysian government has established the Malaysian Institute of Corporate Governance in 1998 and subsequently the Malaysia Code on Corporate Governance that has been released in year 2000. The Bursa Malaysia has introduced a CSR Framework and Guideline in 2006 as a part of its efforts to promote CSR. The CSR framework is essentially a set of guidelines for

Malaysian public listed companies to assist them in CSR practice. The framework emphasize on four main areas, namely the environment, the workplace, the community and the marketplace.

PURPOSE OF THE STUDY

The study focuses on the disclosures of CSR programmes in the annual report and online basis of the GLCs to identify their commitment in providing CSR programmes. This paper seeks to contribute to the literature by reviewing and documenting CSR programmes disclose by GLCs as part of identifying their commitment in providing CSR to society. Basically, this study tends to provide a preliminary understanding on the commitment shows by the GLCs in supporting government policy as they are the main actors to lead the corporate companies as stated in the Silver Book guideline that they should contribute to the society. More specifically, the objectives of the paper is to identify the types and themes (i.e., environment, community, marketplace and workplace) of CSR programmes been disclose in their annual report and online web page of the GLCs, and also to identify the division of GLCs sectors that intends and commits to disclose their CSR programmes

RESEARCH METHODOLOGY

This paper is a preliminary study which intends to explore the commitment of GLCs in providing CSR programmes in Malaysia from 106 GLCs. This paper tends to explore a descriptive explanation on the commitment of the GLCs in disclosing their CSR programmes in their online webpage and annual report. The CSR programmes cover six areas: environment, community, education, health care, workplace and marketplace.

This study is limited to the analysis of the annual reports as being used frequently in CSR disclosure studies and content analysis (Shirley et al⁴¹, Che Hassan, Yusoff and Yatim¹⁴, Pozniak, Ferauge, Arnone, and Geerts, 2011, Zakaria and Dewa⁴³). The measurement instruments in this study were adapted and modified based from Shirley et al⁴¹ and Bursa Malaysia framework that covers six types of CSR programmes as summarised below:

1. Environment: climate change, energy (renewable energy, energy efficiency, biofuel), waste management, biodiversity, and endangered wildlife;

2. Community: Employee volunteerism, community development, philanthropic (giving money to specific charities, which may be linked to their line of business) or charity, and sponsoring sporting or recreational projects;

3. Education (Schools Adoption Scheme), youth development, underprivileged, graduate employment and children;

4. Health: paying attention to health of general public living in surrounding areas of the project (provide fund to the Health Department, physical examination programme,

5. Marketplace: green products, stakeholder engagement, ethical procurement, supplier management, vendor development, social branding and corporate governance; and

6. Workplace: employee involvement, workplace diversity, gender issues, human capital development, quality of life, labour rights, human rights and health & safety.

For the purpose of this study, education and health have been separately measured for CSR programmes. Community programmes will focus on charity/philanthropic and employee volunteerism and community development activities only.

FINDING AND DISCUSSIONS

Table 1 provide descriptive background on the number of GLCs and types of CSR programmes. Majority of the GLCs (37 or 35%) of the GLCs disclosed that they have provided CSR environment and community programmes, respectively. This is followed by 32 GLCs or 30% disclosed on their education programmes, and 30 GLCs or 28% marketplace programmes. Only 22 GLCs or 21% disclosed that they have workplace programmes. The least number of GLCs disclosures was related to healthcare programmes, which is only 19 GLCs or 18% to be disclosed by GLCs.

From the result, it shows that the environment, community, education and marketplace are among the highest scores of CSR programmes disclosed by the GLCs. This result is consistent with Che Hassan, Yusoff, and Yatim¹⁴ and Branco and Rodrigues⁸ who found that environment and community are among the highest scores committed by the organization in indicating CSR

programmes. According to Silly (2015), community programmes is called as philanthropic, and most of the programmes are related to the intention to provide money or in kind or call charities to the society. The charities are used to support the society and should be linked with the business of the organizations. Such a result implied that the disclosure for environmental and community programmes are among the common to be reported (Thomson and Zakaria⁴²). Besides, this finding in line with Shauki⁴⁰ that found CSR content and CSR format that reflect the CSR performance of the company are important in influencing investment decision by the shareholder. Thus, to have better commitment in providing CSR programmes to the society is very important for the GLCs.

Table 1: Number of GLCs and types of CSR by programmes.

No.	CSR Programmes	No. of GLCs	Percentage %
1.	Environment	37	35
2.	Community	37	35
3.	Education	32	30
4.	Health Care	19	18
5.	Workplace	22	21
6.	Marketplace	30	28
	Total	177	

Table 2 show the types of CSR programmes and GLCs by sector. GLCs of Malaysia in the sectors of economic, land transport and infrastructure companies are the largest to disclose their CSR programmes (79 programmes), followed by GLCs of Malaysia social sector companies (54 programmes), 35 programmes under GLCs of Malaysia infrastructure sector companies (air & sea) and only 9 CSR programmes disclosed under GLCs of Malaysia technology & infrastructure companies (land transport) sector.

Education programmes (17 programmes) have been identified to have the highest number of CSR programmes for GLCs of Malaysia economic, land transport & infrastructure companies, Followed with 16 environment programmes and 13 healthcare programmes. For the GLCs of Malaysia social sector companies, the highest number of CSR programmes belongs to environment programmes (12 programmes) and followed with community programmes (11 programmes). For the GLCs of Malaysia infrastructure sector companies (air & sea), the community and workplace programmes with 8 programmes respectively have been identified to have highest number of CSR programmes. Community programmes (3 programmes) are also the highest score under GLCs of Malaysia technology & infrastructure companies (land transport) sector. Due to these finding, the different types of CSR programmes have been identified to fulfill the priority of the GLCs by sectors in providing CSR programmes to the society.

Table 2: Types of CSR programmes and GLCs by sector

GLCS by sector / CSR	Environ-ment	Com-munity	Edu-cation	Health Care	Work-place	Market-place	Total
Malaysia economic, land, transport & infrastructure companies	16	15	17	13	6	12	79
Malaysia infrastructure sector companies (air & sea)	7	8	4	1	8	7	35
Malaysia technology & infrastructure companies (land transport)	2	3	2	0	1	1	9
Malaysia social sector companies	12	11	9	5	7	10	54
Total	37	37	32	19	22	30	177

CONCLUSION

This paper has explored the fact of CSR programmes provided by the GLCs in Malaysia to the society. Basically, people are very sensitive and difficult to accept unethical business practices or organisation who acts

irresponsibly. The CSR programmes in the corporate company mainly bring good image on their initiative to contribute towards better well-being of the society. The society at large gains benefits of the programmes, specifically CSR programmes provided by the GLCs because they also known as agent of development for

the government. In conclusion, the CSR programmes contribute towards the well-being of the society. The paper has highlighted the types of CSR programmes and sectors of GLCs in Malaysia. Majority of the GLCs have disclosed that they have provided CSR environment and community programmes as well as education and marketplace programmes. This study also found that GLCs in the sectors of land, transportation and infrastructure are among the highest GLCs to provide CSR programmes to the society. However, this study is limited to focus on those GLCs which had disclosed their CSR programmes in the website or online information of the company only. Overall, based on the findings and CSR programmes disclosed by GLCs in Malaysia have shown their commitment towards contributing benefit and prosperity for the society. Government can utilize this effort and commitment by providing more encouragement and assistance to those GLCs that have very high commitment in providing CSR programmes. This is in line with the government agenda as stated in the GLC Transformation Programme in May 2004, which to gear up the economic development of the country.

ACKNOWLEDGMENT

The authors would like to thank the Ministry of Education Malaysia and Universiti Utara Malaysia for providing financial support to this study through its Fundamental Research Grant Scheme (FRGS). Special thanks also dedicated to all parties who indirectly involved in completing this research.

GSM and GPS Based Solid Waste Management for Smart Cities

A. Chaitanya krishna¹, K. Subramanyam Chary¹, K. Anil Kumar¹

¹Assistant Professor, Department of Electronics and Communication Engineering,
CMR Engineering College, Hyderabad

ABSTRACT

Smart city has various annotations such as intelligent city, clean city, digital city, green city and many more. This conceptual project aims at developing a device & portal for solid waste processing unit which needs the classified information regarding solid waste and the portal also enables the waste processing unit to collaborate with other satellite units and waste collectors for efficient and faster actions. Today, waste management from its inception to its disposal is one of the important challenges for the municipal corporations in all over the world. Dust bins placed across cities set at open places are flooding because of increment in the waste each day and making unhygienic condition for the citizens, to maintain a strategic distance from such a circumstance we have proposed wireless solid waste management system for smart cities which allows municipal corporations to monitor status of dustbins remotely over web server and keep cities clean very efficiently by optimizing cost and time required for it [4]. As soon as dustbin has reached its maximum level, waste management department gets alert via SMS along with location via GSM & GPS module placed at dustbin so department can send waste collector vehicle to respective location to collect garbage. The objective of the project is to enhance practicality of IoT based solid waste collection and management system for smart city.

Keywords: Solid waste, GSM, GPS

INTRODUCTION

The Internet of Things (IoT) is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction. In other words, IoT is short for Internet of Things. The Internet of Things refers to the ever-growing network of physical objects that feature an IP address for internet connectivity, and the communication that occurs between these objects and other Internet-enabled devices and systems [8].

A thing, in the Internet of Things, can be a person with a heart monitor implant, a farm animal with a biochip transponder, an automobile that has built-in sensors to alert the driver when tire pressure is low or any other natural or man-made object that can be assigned an IP address and provided with the ability to transfer data over a network. IoT has evolved from the convergence of wireless technologies, micro-electromechanical systems (MEMS), micro services and the internet. The convergence has helped tear down the silo walls between operational technology (OT) and information technology

(IT), allowing unstructured machine-generated data to be analyzed for insights that will drive improvements.

Kevin Ashton, cofounder and executive director of the Auto-ID Center at MIT, first mentioned the Internet of Things in a presentation he made to Procter & Gamble in 1999. Here's how Ashton explains the potential of the Internet of Things:

“Today computers -- and, therefore, the internet -- are almost wholly dependent on human beings for information. Nearly all of the roughly 50 petabytes (a petabyte is 1,024 terabytes) of data available on the internet were first captured and created by human beings by typing, pressing a record button, taking a digital picture or scanning a bar code.

IPv6's huge increase in address space is an important factor in the development of the Internet of Things. According to Steve Leibson, who identifies himself as “occasional docent at the Computer History Museum,” the address space expansion means that we could “assign an IPV6 address to every atom on the surface of the earth, and still have enough addresses left to do another 100+ earths.” In other words, humans could easily assign an IP address to every “thing” on the planet. An increase in the

number of smart nodes, as well as the amount of upstream data the nodes generate, is expected to raise new concerns about data privacy, data sovereignty and security.

Practical applications of IoT technology can be found in many industries today, including precision agriculture, building management, healthcare, energy and transportation. Connectivity options for electronics engineers and application developers working on products and systems for the Internet of Things [1].

Broadband Internet is become more widely available, the cost of connecting is decreasing, more devices are being created with Wi-Fi capabilities and sensors built into them, technology costs are going down, and smart phone penetration is sky-rocketing [2]. All of these things are creating a “perfect storm” for the IoT

An Embedded system is a computer system designed for specific control functions within a larger system and often with real-time computing constraints. It is embedded as part of a complete device often including hardware and mechanical parts [3]. By contrast, a general-purpose computer, such as a personal computer (PC), is designed to be flexible and to meet a wide range of end-user needs. Embedded systems control many devices in common use today.

Embedded systems contain processing cores that are typically either microcontrollers or digital signal processors (DSP) [5]. The key characteristic, however, is being dedicated to handle a particular task. They may require very powerful processors and extensive communication, for example air traffic control systems may usefully be viewed as embedded, even though they involve mainframe computers and dedicated regional and national networks between airports and radar sites (each radar probably includes one or more embedded systems of its own) [6].

EXISTING AND PROPOSED

The first step is to clearly define the attributes of the trash, make it uniquely identifiable and then classify it in to three different buckets such as dry, wet and hazardous. The unique identifier could be barcode placed directly on the trash item bag containing a group of similar waste items like a bag of waste tissue papers identified by the digitally coded label that serves as a unique identifier.

The Proposed System shown in Figure 1, we make use of this device to construct an automatic solid waste management system. The decisions of sending a notification are taken by an onboard Arduino to which the ultrasonic sensor is interfaced. The display and GSM & GPS modules module and are interfaced to the same onboard Arduino [7].

This onboard Arduino consists of number of input and output ports. The onboard Arduino is commonly termed as micro controller. The input and output port of the micro controller are interfaced with different input and output modules depending on the requirements. In other words, micro controller acts as a communication medium for all the modules involved in the project. The device also consists of LCD which displays the information about the filling of Bin.

The Solid waste management system runs using the raspberry pi board. The data is collected from the sub-station and send to the hub where the raspberry pi is installed. The raspberry pi collects the information from the sub-station and analyses the data along with the satellite data and sends the vehicle to collect the trash. A SMS is sent using a GSM & GPS Module to the team about the waste management. The block diagram of the proposed work is shown in the Figure 1.

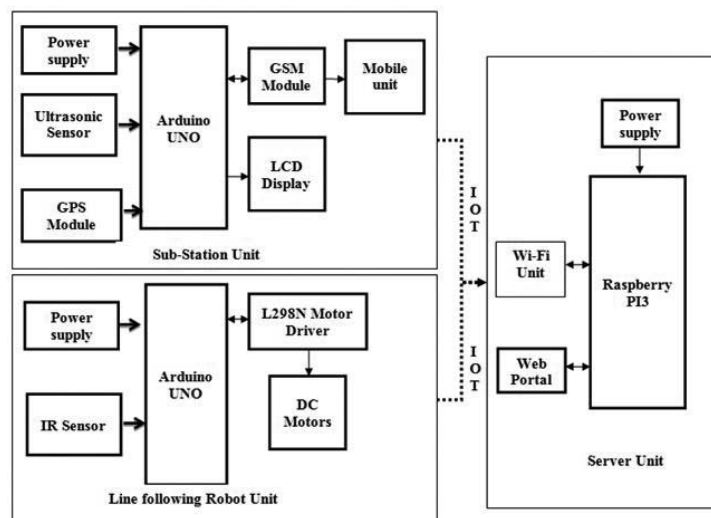

Figure 1: Block Diagram of the Proposed System

Ultrasonic sensor ^[5] is used to check the level status of dust bin so to determine if it is full or empty. Algorithm has developed which checks filled level continuously and if dustbin is filled to its maximum limit then there is indication on LCD display. Monitoring the webpage will help the garbage collection department to track for the exact location and amount of the garbage. The garbage vehicles can then unload the garbage from a particular location. The function of GSM module is to send a message to the garbage collection department. The allure of the Raspberry Pi comes from a combination of the computer's small size and affordable price. Enthusiasts envision using the small form-factor PC as a cheap home theater PC (HTPC), or secondary low-power desktop. Institutions, like schools and businesses, could benefit from deploying a fleet of computers for a fraction of the cost of traditional desktop towers. The small size makes for an easy-to-hide computer that sips power and can be mounted behind the display with an appropriate case. It could also be used in niche applications, like digital signage. While it will not blow away any recent hardware in performance, it does make for a cheap secondary computer which could be useful for troubleshooting and researching solutions if your man rig fails to boot as well.

ALGORITHM

Raspberry Pi board uses Linux-Kernel operating systems supporting programming languages like C, Python etc., Python language is used in ARS system makes easy to communicate with a serial port, GSM modules. GSM module responds to AT commands through serial communication. AT means attention. Set of AT commands perform different functions.

By following below steps the system is implemented:

1. Import all the required modules for serial communication
2. Initialize serial port for communicating with GSM module.
3. Communicate with GPS module to read the location.
4. When Ultrasonic sensor detects the distance of the object the notification is displayed in the LCD screen and notification is sent to the user.
5. If motion is detected, then message is sent is sent.
6. If a motion detection fails, then surveillance continues.
7. Message is sent by GSM module which sends the notification to the user.

FLOW CHART

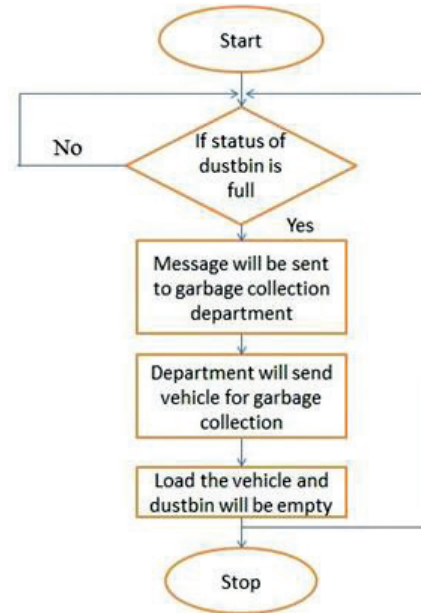

Figure 2: Proposed System Flow Chart

Ultrasonic sensor is used to check the level status of dust bin so to determine if it is full or empty, while Load cell senses the weight of the garbage present in the dustbin and to determine if the threshold limit is reached or not. Algorithm has developed which checks filled level continuously and flow chart in given in Figure 2, if dustbin is filled to its maximum limit then there is indication on LCD display. Active status of dustbin is shown on web page using connections through Ethernet shield. Simplified flowchart of proposed system is shown in figure. Monitoring the webpage will help the garbage collection department to track for the exact location and amount of the garbage. The garbage vehicles can then unload the garbage from a particular location. The function of GSM & GPS module is to send a message to the garbage collection department.

RESULTS AND DISCUSSION

This system is practically tested and the results are obtained successfully as shown in Figure 3. We have performed 5 test runs which completed 2 full cycles of loading and unloading of garbage. The empirical outcomes shown in Table 1 and Figure 3 represent the bin filling level values for both ultrasonic sensors placed at top of the bin, weight of waste inside the bin and respective status shown in Figure 4.

Various possible combinations have been tested to assess performance of proposed prototype under different conditions. As shown in Table, if the bin is

almost empty level shown by both ultrasonic sensors is less than 5 cm for filling level. Gradually, we loaded bin with garbage and recorded readings for the same. At certain point when bin was fully filled no values were displayed by ultrasonic sensor this is nothing but overload condition. Again, we unloaded the garbage from bin because garbage was mainly unloaded from right side of bin and which resulted in unbalanced level of garbage in bin. The result of this system is follows:

Figure 3: Bin filling level values in LCD

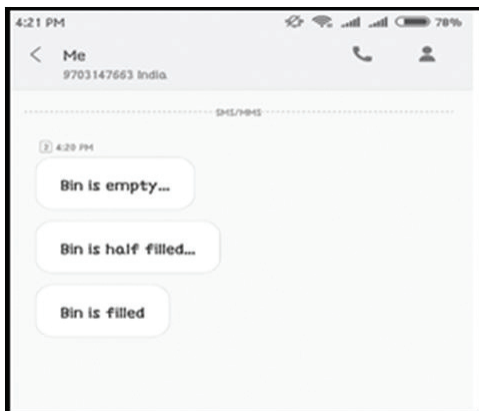

Figure 4: Bin filling level status

Table 1: Outcomes

Test No.	Level Sensor (cm)	Status
1.	25 cm	Bin is Empty...
2.	20 cm	Bin is Empty...
3.	10 cm	Bin is Half Filled...
4.	8 cm	Bin is Half Filled...
5.	7 cm	Bin is Filled...

CONCLUSION AND FUTURE SCOPE

We have recommended making use of popular data science and analytics classification algorithm to make sense of data and convert into actionable insights. The processed information is also ready to be consumed by stakeholders in waste management by making use of proposed collaboration portal WPU-CP. In future, we can include few vital and measurable parameters that have potential to become part of e governance are like the following:

1. Quantity of wastes processed and disposed safely
2. Quantity of wastes recycled and reused
3. Number of trash service requests placed
4. Number of trash service requests fulfilled
5. Percentage increase in income from manufacturing of recycled and reused trash

Inter Region Minutiae Transitive Measure Based Finger Print Analysis for Forgery Detection in Health Care Systems

Vinoth A¹, S. Saravana Kumar²

¹Research Scholar, Department of Computer Science, Bharathiar University, Coimbatore, Tamilnadu;

²Associate Professor, Shanmuganathan Engineering College, Tamilanadu, India

ABSTRACT

The problem of forgery detection has been well studied and the forged finger prints produces highly impacting results in the biometric based security systems. There are number of approaches available for the detection of forged finger prints. However, they suffer to achieve higher performance in terms of security. To improve the security performance, an inter region minutiae transitive measure (IRMT) based approach. The method reads the input finger print image and preprocesses the image to remove the noisy points by applying the multi-level Gabor filters. The enhanced image has been split into number of sectional images to produce regional image. From the regional image, the method extracts various features of finger print like island, dot, enclosure, bifurcation and edges. Extracted features have been converted into a feature vector which has been used to estimate the IRMT measure. Based on the IRMT measure, the presence of forged finger print has been identified and the same has been used to identify the region which has been modified. The proposed algorithm improves the performance of finger print analysis and reduces the false classification ratio.

INTRODUCTION

The growing development of information technology supports not just the growth of organizations and the same has been utilized towards the demolishing of the same organizations. As the most organizations maintains their data belongs to their business, customer in their own database server in a centralized or decentralized manner. Whatever the case, the data present in the database server has to be restricted from illegal access. In most cases, all the data present in the database server cannot be allowed to be accessed by different malicious users who has no access rights. Also, it is a responsibility of the organization to maintain the integrity of the data.

There are number of authentication approaches available which uses different features. However, the application of biometrics is highly influenced in the authentication schemes. The face recognition algorithms have been used in many situations to restrict the malformed access of any person. Eventhough there are many issues identified in the restriction of illegal users. The finger print based authentication algorithms are more efficient in restricting the illegal access. The finger print is a biometric which does not change due to age or

any factor. The other features of biometric are subject to change due to the age factor and due to other reasons. So by using finger print the authentication can be performed in most efficient manner.

Still at the finger print based applications, there are a malicious user who modifies or alter the finger prints to produce a fake one to intrude into the system. Forgery detection is the process of detecting forged or altered finger print using some metrics. To identify the altered finger prints, the finger print analysis can be performed. The finger print has number of components and falls into one against four categories. It has minutiae edges, islands, enclosures, and bifurcation. By identifying the parts of finger print, the finger print analysis can be performed in an efficient way to authenticate a person.

The health care organization is highly depending on more efficient authentication systems because of they maintain various information about different patients which must be safeguard. The details would cover many personal information which cannot be exposed to others in any kind. So access restriction in the health care units should be enforced in a rigid way to ensure the information security.

There are number of approaches available to work over the forged detection of finger prints. Each uses various features of the finger print and uses different measures. However the methods suffer to achieve higher performance on the restriction process. To improve the performance of finger analysis, an efficient inter region minutiae transitive measure has been presented in this paper. To perform this task, a region based approach is incorporated which split the image into number of sections. From the sections, the features are extracted and estimates the transitive measures. Based on the measures estimated, the method identifies the forged or altered print. The detailed approach is discussed in the next section.

MATERIALS AND METHOD

There are number of approaches discussed towards the detection of altered finger print and this section discusses some of the methods.

A support vector machine with kernel has been used for the classification of finger prints in ^[1]. The method uses finger print data set and has been presented towards the usage in access restriction, user verification in ATM and criminal identification process. The method has produced efficient results in altered finger print identification.

In ^[2], the author performs an analysis on fake finger prints and concludes that the image quality software is not suitable in detecting the altered prints in efficient manner. It has been identified that the image quality does not change because of alteration in the finger prints. Toward the detection of altered finger print an efficient approach is presented. The method uses the distribution of minutiae and detects the finger prints based on the orientation fields of the image. Based on the distribution value the fake prints are identified.

A novel approach to fingerprint identification using method of sectorization ^[3], introduce a complete (fully-implemented) algorithm for fingerprint recognition. The work describes image preprocessing based on our previous works and feature vector creation that bases on sectoralization. The image preprocessing includes filtering, skeletonisation, minutiae extraction by CN (Crossing Number) algorithm and spurious minutiae removal. The feature vector creation is based on dividing the fingerprint into sectors. The division is done on the basis of image height.

Altered fingerprint detection—algorithm performance evaluation ^[4], present a comparative study on the performance of altered fingerprint detection algorithms. Different algorithms from different institutions have been evaluated on two different datasets. Both datasets feature real alterations on fingers and the ground truth regarding the alteration is known a priori, as, in some cases, corresponding pre-altered fingerprints were also available.

In ^[5], a synthetic alteration on the finger prints has been generated artificially and the generated finger prints are used to evaluate the performance of various finger print analysis approaches. This supports the research of finger print alteration detection by providing dataset to the researchers. Similarly in ^[6], an efficient approach has been proposed and has been validated with the dataset generated. In ^[7], an orientation based altered finger print identification and detection has been presented.

In ^[8], the author performs a survey on attack detection methods which detects altered finger prints. As the biometrics are mostly used in overall systems for the restriction and authentication of different users, the malicious users try to access the system by generating fake finger prints. There are number of approaches available to perform altered finger print detection and the author performs a detailed survey on the methods.

In Critical Analysis and Detection of Altered Fingerprints ^[9], the author performs optimization of image quality based algorithm in altered finger print. The method uses neuro fuzzy in the detection of altered finger print and the fuzzy rule has been generated using image database.

An investigation of fake fingerprint detection approaches ^[10], the author performs a detailed review on various methods of fake finger print detection. Number of research articles has been considered and based on that various taxonomy of fake prints has been generated. In ^[11], a gradient texture based altered finger print detection algorithm is presented. The method extracts the co-occurrence matrix and gradient features from the image. Based on the features extracted, the multi order gradient features are generated to identify the altered finger print detection.

Towards the detection of spoofing attack by altered finger print, an efficient approach is presented based on counter measures in ^[12]. In ^[13], CNN feature based

finger print liveliness detection is presented. The method initially segments the input image and using the segmented image, the distribution of various features has been identified. The distribution measures have been used to perform altered finger print detection. In [14], the quality features have been used to perform spoofed or altered finger print detection. The method considered the Gabor feature, frequency of ridges, direction map and frequency filed. Based on the above mentioned features, the method performs altered finger print detection. Similarly, in [15], the same set of features has been considered and evaluated using large data set.

In [16], a minutiae match algorithm using divide and conquer approach is presented to identify the altered finger print. The method divides the image into different sections and for each section the method matches the minutiae with the template available. Based on that the altered finger print has been detected and produces efficient results. In [17] a security protocol for the securing of health care record using biometric is presented. The method considers the advantages, disadvantages, and ethical consequences of utilizing biometric technology to secure the electronic health record in regards to cost, usability, accessibility, and accuracy. In addition to evaluating the primary application, the essay acknowledges the potential use of biometric technology to identify patients by vasculature scanning in the future.

Biometric Fingerprint System to Enable Rapid and Accurate Identification of Beneficiaries [18], founded SimPrints, a nonprofit health technology organization centered on development of a pocket-sized fingerprint scanner that wirelessly syncs with a health worker’s smartphone to link individuals’ fingerprints to their health records.

Fingerprint and Iris Template Protection for Health Information System Access and Security [19], focus on template database attacks which includes attacks on the integrity of biometric templates by presenting a new approach using both chaos and Hadamard matrices. Although a considerable amount of work was conducted on protecting biometric templates, the proposed approaches in the literature do not satisfy the main requirements of security, performance, diversity and revocability. However, our approach contributes better results in case of recognition rate i.e., 100 percent, zero percent false rejection rate and false acceptance rate and satisfies the requirements of revocability, diversity and privacy.

In [20], combination of biometrics and other personal identification techniques were used to identify individual’s resident within a surveillance population seeking care in two district hospitals. Visits from resident individuals were successfully recorded and categorized by the success of the techniques applied during identification. The successes of visits that involved identification by fingerprint were further examined by age.

All the above discussed methods suffer to achieve higher performance in forgery detection and requires some strategically approach.

The proposed inter region minutiae transitive measure based forgery detection algorithm performs preprocessing of the input finger print image to remove the noisy particles from the image. From the enhanced image, the regional images are split. From each regional image, the method extracts various features and estimates the transitive measure to identify the forged one. The detailed approach is discussed in this section.

The preprocessing is the process of preparing the input finger print image for the forgery detection. To perform this, the input image has been read and applied with the median filter. The median filter has been initialized with number of levels and at each level, the method applies the median filter. Then the noise removed image has been applied with histogram equalization. The histogram equalization helps to retain the edges of the finger print which support higher accuracy.

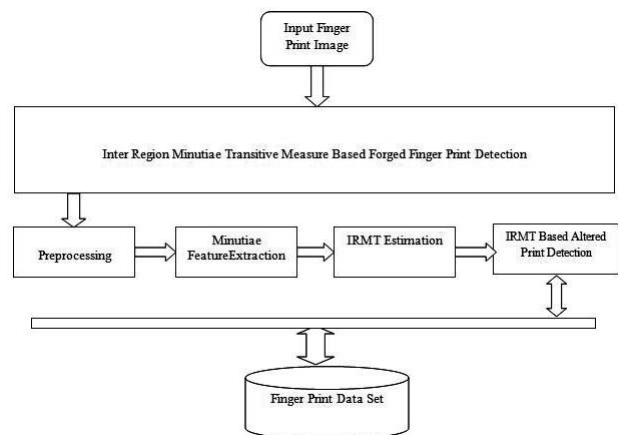

Figure 1: Architecture of proposed IRTM based Forged Finger Print Detection system

The Figure 1, shows the architecture of proposed region based forged finger print detection algorithm which uses IRTM measure.

Preprocessing Algorithm:

Input: Finger Image Fimage
 Output: Preprocessed Image Pre-img
 Start
 Read input finger print image Fimage
 Initialize number of levels $Nl=y$
 Initialize coordinates of filter $x=\{1\dots y\}$
 Initialize Median Filter $MF(Nl,x)$
 For each level l of MF
 Pre-img = Apply $MF(l, Fimage,x(l))$
 End
 Pre-Img = Histogram Equalization(Pre-img)
 Stop

The above discussed algorithm removes the noise from the image by applying median filter in number of levels by varying the window size. The noise removed image has been applied with the histogram equalization technique. The enhanced image has been used to extract the features of finger print.

The preprocessed image has been taken for feature extraction. First, the image has been split into number of sectional image based on the window size. From each regional image, the method extracts the number of dots, edges, enclosure, island and bifurcation present in the regional image. Extracted features are converted into feature vector which will be used to estimate the IRTM measure in the next stage.

Algorithm:

Input: Preprocessed Image Pre-Img
 Output: Feature Vector Fv.
 Start
 Read preprocessed image Pre-Img.
 Split image into sectional image.
 $Si = \int_{i=1}^{Nos} \text{split}(\text{PreImg} < \text{Scoord}, \text{Ecoord}>)$
 Nos – no of sections or regions
 Scoord – Starting coordinate
 Ecoord- Ending coordinate
 For each sectional image Si
 Extract Minutiae island $Mi = \sum \text{Islands} \in Si$
 Extract Minutiae dots $Md = \sum \text{Dots} \in Si$
 Extract Minutiae End $Me = \sum \text{End} \in Si$

Extract Minutiae enclosures $Men = \sum \text{Enclosures} \in Si$
 Extract Minutiae Bifurcation $Mb = \sum \text{Bifurcation} \in Si$
 Construct feature vector $Fvi = \{Mi, Md, Me, Men, Mb\}$
 Add to feature vector $Fv = \sum (Fvk \in Fv) \cup Fvi$
 End
 Stop

The feature extraction algorithm extracts various features from each sectional image and adds to the feature vector. Generated feature vector has been used to estimate IRTM measure in the next stage.

The IRTM measure represents the transition of the minutiae feature towards different regions. The minutiae feature may start from any region and move towards other region. So the transition measure has been measured for all the directions like clock wise, anti clock wise, up and down. To estimate the IRTM value, the number of dots, edge, bifurcation, end and enclosures are computed. Then the number of edges, enclosures, bifurcation and edges carried on the next region has been computed. Based on the count of each, the IRTM measure has been estimated. The estimated IRTM value has been used to classify the input finger print image.

Algorithm:

Input: Feature Vector Fv
 Output: IRTM Set IRTMS
 Start
 Read Feature vector Fv.
 Compute Number of dots present $Nod = \int_{i=1}^{\text{size}(Fv)} \sum Fv. \text{Minutiae} == \text{dot} \ \& \ \& \ Fv. \text{dot} \gg Fv. \text{Region}(\text{coordinate})$
 Compute No of Edge $NoE = \int_{i=1}^{\text{size}(Fv)} \sum Fv. \text{Minutiae} == \text{Minutiae. edge}$
 Compute no of ends $Noed = \int_{i=1}^{\text{size}(Fv)} \sum Fv. \text{Minutiae} == \text{Minutiae.end}$
 Compute no of enclosures $Noen = \int_{i=1}^{\text{size}(Fv)} \sum Fv. \text{Minutiae} == \text{Minutiae. enclosure}$
 Compute No of bifurcation $Nob = \int_{i=1}^{\text{size}(Fv)} \sum Fv. \text{Minutiae} == \text{Minutiae. Bifurcation}$

Compute no of dots falls to clock region Nodcr

$$= \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{dot} \ \&\& \ Fv. \text{dot} \ \gg \ Fv.$$
 Region (clock region)

Compute no of dots falls to anti clock region

$$\text{Nodacr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{dot} \ \&\& \ Fv. \text{dot} \ \gg \ Fv.$$
 Region (anti clock region)

Compute no of edges falls to clock region

$$\text{Noecr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{edge} \ \&\& \ Fv. \text{edge} \ \gg \ Fv.$$
 Region (clock region)

Compute no of edge falls to anti clock region

$$\text{Noeacr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{edge} \ \&\& \ Fv. \text{edge} \ \gg \ Fv.$$
 Region (anti clock region)

Compute no of ends falls to clock region

$$\text{Noedcr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{end} \ \&\& \ Fv. \text{end} \ \gg \ Fv.$$
 Region (clock region)

Compute no of ends falls to anti clock region

$$\text{Noedacr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{end} \ \&\& \ Fv. \text{end} \ \gg \ Fv.$$
 Region (anti clock region)

Compute no of enclosure falls to clock region

$$\text{Noencr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{enclosure} \ \&\& \ Fv. \text{enclosure} \ \gg \ Fv.$$
 Region (clock region)

Compute no of enclosure falls to anti clock region

$$\text{Noenacr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{enclosure} \ \&\& \ Fv. \text{enclosure} \ \gg \ Fv.$$
 Region (anti clock wise)

Compute no of bifurcation falls to clock region

$$\text{Nobcr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{bifurcation} \ \&\& \ \text{bifurcation} \ \gg \ Fv.$$
 Region (clock wise)

Compute no of bifurcation falls to anti clock region

$$\text{Nobacr} = \int_{i=1}^{\text{size}(Fv)} \Sigma Fv. \text{Minutiae} == \text{bifurcation} \ \&\& \ \text{bifurcation} \ \gg \ Fv.$$
 Region (anti clock wise)

IRTM set IRTMS = {Nodcr, Nodacr, Noecr, Noeacr, Noedcr, Noedacr, Noencr, Noenacr, Nobcr, Nobacr}

Stop

The above discussed algorithm computes the minutiae transitive measure and add to the inter region transitive set and returns that. The generated transitive set has been used to perform classification.

The forged finger print or articulated finger print has been classified based on the inter region transitive measures of various minutiae features and their measures

on a given image The input image has been read and preprocessed to remove the noise and enhance the image. The enhanced image has been split into number of regional image and for each regional image various minutiae features have been extracted. From the extracted features various minutiae transitive measures are estimated. Using all these minutiae measures estimated, the method estimates the IRTM measure for the input image. Based on estimated IRTM measures, the method computes the similarity with the various feature set available. Based on the similarity threshold, the method classifies the finger print as natural or articulated.

Algorithm:

Input: Finger print image Fpi, Data set Ds.

Output: Boolean

Start

Read Input image Fpi

Read data set Ds.

PI = Proprocessing (Fpi)

Fv = Minutiae feature extraction (PI)

For each feature Fvi

IRTMsetIRTMS_{Fvi} = Estimate IRTMS (Fvi)

End

Compute IRTM =

$$\int_{i=1}^4 \frac{\text{Dist}(Fv(i)\text{Nodcr}, Fv(i+1).\text{Nodacr})}{\text{NoE}} \times \frac{\text{Dist}(Fv(i)\text{Nodcr}, Fv(i+1).\text{Noeacr})}{\text{Noed}} \times \frac{\text{Dist}(Fv(i)\text{Nodcr}, Fv(i+1).\text{Noedacr})}{\text{Noend}} \times \frac{\text{Dist}(Fv(i)\text{Noencr}, Fv(i+1).\text{Noenacr})}{\text{NoEn}} \times \frac{\text{Dist}(Fv(i)\text{Nobcr}, Fv(i+1).\text{Nobacr})}{\text{Nob}}$$

For each feature Fvd from data set

Compute IRTM similarity IRTMsim

$$= \sum_{i=1}^{\text{Size}(ds)} \frac{\text{Dist}(Ds(i).\text{IRTMS}, \text{IRTMS})}{\text{size}(Ds)}$$

End

If IRTMSim > IRTMTh then

Forged and return false

End

End

Stop

The above discussed algorithm computes the inter region transitive minutiae measure with all the feature set available in the data set. Based on the similarity measure and the threshold value, the classification is performed.

FINDINGS

The proposed algorithm has been implemented using Matlab and has been evaluated for its efficiency in the classification. The proposed algorithm has produced efficient results on the forged finger print detection and improves the performance of classification. The efficiency of the method has been evaluated and compared with other methods. The proposed method has produced the following results.

Table 1: Details of evaluation

Parameter	Value
Tool Used	Matlab
No of classes	1000
No of fake prints	90

The Table 1, shows the details of evaluation being used to measure the performance of the proposed algorithm. The method has been evaluated with the finger prints of thousand different peoples. For the classification, there are 90 fake finger prints has been considered. The proposed method has produced the following results.

Figure 2: Comparison on liveness detection accuracy

The Figure 2, shows the comparative result on liveness detection accuracy produced by various approaches. The proposed algorithm has improved the performance of liveness detection accuracy than other methods.

Figure 3: Comparison on false classification ratio

The Figure 3, shows the comparison result on false classification ratio produced by various methods and the proposed algorithm has produced less false ratio compare to other methods.

Figure 4: Comparison on time complexity

The Figure 4, shows the comparative result on time complexity produced by different methods and the result shows that the proposed method has produced less time complexity than other methods.

Figure 5: Experimental results of the proposed method

The algorithm proposed in this paper is applied to all the sub-images to get the standard deviations of their noise residues. Matching results shown in Figure. 5 shows that our system is capable to successfully distinguish all the real finger tips from the fake ones.

Figure 6: Classification outcome of intensity based approach

Figure 7: Classification outcome of ridge based approach

Figure 6 and 7 illustrates the training and test classification rates for live and non-live fingerprints for different device using the intensity and ridge based methods. The capacitive DC scanner demonstrates between 93.8-95% both for live and non-live respectively, correct classification rate using the intensity method and 95-96.9% for the ridge technique. The optical scanner proves between 90-92% correct classification rate using the intensity technique and 95-96% using the ridge technique. Finally, the electro-optical scanner has a minor classification rate which establishes between 76-88.9% correct classification rate using the intensity technique and 77.8-88% using the ridge technique, compared to the former two technologies.

CONCLUSION

An efficient inter region minute transitive measure based forgery detection algorithm is presented. The method reads the input image and removes the noise from the image. Then the method improves the image quality by applying histogram equalization technique. The enhanced image has been cropped into number of regional image according to the window size considered. From each cropped image, the method extracts various minutiae features. Using the features extracted the method estimates the IRTM value with corresponding features of neighbor regions. Finally, the similarity with the feature set has been measured and based on the threshold the classification is performed to identify the forged finger print. The proposed algorithm has improved the performance of forgery detection and reduces the false ratio and time complexity as well.

ABSTRACT

Mobile Ad Hoc Networks (MANETs) demonstrates a fundamental job for impermanent and brisk correspondence. The two directing conventions, for example, tree-based and work based convention gives the assurance and effective conveyance. As a result of the presence of just a single connection between two hubs Tree-based gives low data transfer capacity utilization, high sending proficiency. A tree-based multicast steering convention is best reasonable for lightweight specially appointed systems. Lempel-Ziv-Oberhumer (LZO) coding technique is proposed in this paper to reduce the congestion. The QoS (Quality of Service) and execution is corrupted when the heap of system increments. By combining the advantages of the tree structure and work structure the impact of system load can be made strides. This outcome in improved execution in the system even in thick limit specially appointed systems.

Keywords: Mobile Ad Hoc Networks, congestion, Quality of Service, LZO coding technique.

INTRODUCTION

A MANET is a kind of specially appointed system that can change areas and arrange itself on the fly. Since MANETS are versatile, they utilize remote associations with interface with different networks. This can be a standard Wi-Fi association, or another medium, for example, a cell or satellite transmission. Ad hoc arrange plan objective is to give web get to whenever described by absence of framework and nonappearance of base station, versatility and heterogeneity which require a dynamic proficient routing convention. MANET is a system of portable nodes which is framework less, self-designing and is picking up prominence lately because of the simplicity of organization. Applications, for example, sound/video conferencing require exceptionally stringent and unyielding QoS in information conveyance. To give QoS in Routing in MANET is a testing issue due to the dynamic idea of nodes and restricted node vitality.

MANET is an unconstrained, self configurable system comprising with different portable nodes. Every one of the nodes that are conveying in organize acts like switch and take after an irregular, regularly changing topology for sharing information on any versatile situation. Because of this consistently changing system

topology, one of the testing undertakings in interactive media specially appointed system is to give QoS amid spilling transmission. QoS alludes as some application situated parameters that give a type of certification to any expansive and versatile network. Change of QoS in interactive media spilling is exceptionally basic for smooth and powerful transmission.

A few MANETs are confined to neighborhood remote devices; others might be associated with the Internet. For instance, A Vehicular Ad Hoc Network (VANET) is a sort of MANET that enables vehicles to speak with roadside hardware. While the vehicles might not have an immediate Internet association, the remote roadside device might be associated with the Internet, enabling information from the vehicles to be sent over the Internet. The vehicle information might be utilized to traffic movement conditions or monitor trucking fleets. Due to the dynamic idea of MANETs, they are ordinarily not extremely safe, so it is vital to be careful what information is sent over a MANET.

MANET is a gathering of remote nodes that can progressively frame a network to trade data without utilizing any prior settled network foundation. The exceptional highlights of MANET bring this innovation

extraordinary open door together with serious difficulties. The military strategic and other security-touchy tasks are as yet the principle utilizations of ad hoc networks, despite the fact that there is a pattern to receive ad hoc networks for business utilizes because of their one of a kind properties. In any case, they confront various issues. A portion of the specialized difficulties MANET presents are likewise introduced in view of which the paper calls attention to the related piece boundary.

A portion of the key research issues for ad hoc networking administration innovation are talked about in detail that are required to advance the improvement and quicken the business utilizations of the MANET innovation. Amid the most recent decade, propels in both equipment and programming methods have brought about versatile hosts and remote networking administration normal and different.

RELATED WORK

MANETS are a gathering of remote versatile nodes with no prefixed foundation that can move anyplace breaking and framing the connections with the gadgets. Every node is in charge of directing the packets. Subsequently, every node goes about as a router. MANETs are exceptionally reconfigurable systems of versatile nodes which convey by remote connections. The primary issues in MANETs incorporate the portability of the network nodes, vitality constraints and data transfer capacity. A multi rate organizes permits a higher transmission limit with wide range and furthermore the signs can be transmitted with various bit rates. Along these lines there are numerous imperatives worried with the multi rate arrange like the information activity combination, Quality of administration and course foundation and so on. In MANET, QoS convention incorporates the intermediate nodes which have adequate assets along the route. Nodes may turn non helpful when they are running with lack of assets, which debilitates the adequacy of the convention.

The Uncertain Rule-based Fuzzy Logic QoS Trust Model (FQTM) chooses the nodes which are competent and helpful. Node ability is assessed through the QoS parameters and helpfulness is estimated regarding dependability [1]. Fluffy logic is connected to figure the node trust an incentive by thinking about its quality and dependability measurements. FQTM chooses the nodes with higher trust esteems to build route from source

to destination. The execution of proposed strategy is displayed hypothetically and experimentally.

MANETS are haphazardly circulated self configurable systems utilized in an ad-hoc form. Because of its expanding network information, load balancing turns into an unmanageable perspective in these systems. An Enhanced Co-Operative Game Theory (ECGT) based arbitrary stage based calculation for load balancing to spare the node from contortion at a prior stage and can ready to decrease the network delay [2]. This co-operative irregular versatile GT limits the loss factor. Moreover, a circulated Nash balance approach, can decide the measure of load the network can deal with before it really achieves the most minimal level.

A multicast routing protocol that develops numerous multicast trees and utilizes network coding is introduced for lossy MANETs, where every multicast tree can fulfill a predefined level of the data bandwidth requirement. The proposed convention can decrease the aggregate data bandwidth consumption utilization while giving bandwidth consumption certifications to an asked for stream and continuous streams. As an outcome of utilizing network coding, no excess packet is created, and no booking calculation for appropriating packets among the multicast trees is required [3].

Outline of a profoundly productive and steady convention at IP benefit layer alongside overseeing heterogeneous sub systems having numerous innovations is a testing undertaking. Solid system layer convention with improved postponement and power for MANET in light of the Concept of AODV is present in this paper [4]. The proposed convention enhances throughput in information transmission with ensured parcel conveyance and least data transfer capacity.

System coding is a promising innovation demonstrated to enhance the execution of remote systems. Too effectively plan a QoS - fulfilled directing convention with organize coding, the transfer speed utilization of a coding host ought to be resolved. Characterize the coding conditions to distinguish a coding host is present in this paper. The data transmission utilization of a coding host is then assessed under the dispute based remote systems with an irregular access method. Bandwidth-Satisfied and Coding-Aware Multicast Protocol introduced a transfer speed fulfilled and coding-mindful multicast directing convention. By considering the leftover transfer speed

of the transporter sense neighbors of the forwarders, the proposed convention can fulfill the transmission capacity necessities of the asked for stream and other progressing flows. As an outcome of considering coding openings in multicast tree development, the multicast convention can diminish the aggregate transmission capacity utilization ^[5].

Least Delay Path Estimation (LDPE) Routing Protocol ^[6] explained diverse defers that is included amid packet transmission thinking about various courses, bounces and distinctive rates with essential numerical plans and conditions which turns out to be sufficient for fulfilling requests of QoS like finding a way with insignificant time delay. In the meantime alternate ways should be used to maintain a strategic distance from the information rates to get debased. For this reason, Packetizing is utilized which can expand the effectiveness and utility of a system. However, this scheme cannot control the congestion.

Q-Learning based Adaptive Routing model (QLAR), created by means of Reinforcement Learning strategies, which can recognize the level of portability at various purposes of time with the goal that every individual node can refresh routing metric in like manner. The proposed convention presents: 1. new model, created through QLAR strategy, to identify the level of portability at every node in the system; 2. another metric, called Qmetric, which represent the static and dynamic routing measurements, and which are joined and refreshed to the changing system topologies. Broad reproductions approve the viability of the proposed show, through correlations with the standard Optimized Link State Routing conventions ^[7].

Automatic Neuro-Fuzzy Inference System (ANFIS) and Kalman Filter are utilized to enhance the learning and disclosure of consistently changing parametric qualities shrewdly and naturally ^[8]. Various parameters are really in charge of the working of any MANET, these parameters should be sifted and advanced to discover through more enhanced network. This ANFIS framework gives the speed and insight to MANETS, ideal optimality is being given by the multi-heuristic and stochastic methodology of Kalman filtration. The parameter esteems are checked and examined on informational index of reproductions conveyed before refreshing improvements are found.

The QoS imperatives of the system that incorporates least delay, most extreme data transfer capacity and

successful throughput for ongoing interactive media gushing should be upgraded. Specially appointed on Ad-hoc on-demand Distance Vector Multipath routing (AOMDV) convention is utilized on Mac layer or in arrange layer for continuous and consistent gushing of sound, video and content kind of information. This work explains methodology of information pressure with AOMDV to improve the QoS of the system ^[9]. QoS mindful weight in light of demand Multipath Routing convention (QMR) to improve QoS. QMR depends on cross-layer plan, which participates in sharing system status data inside various layers of convention while keeping up the layers' partition to enhance in general system execution. In QMR, the heaviness of the connection is chosen by various QoS factors like flag quality, and remaining vitality. The greatest accumulated weight chosen by these components picks the most ideal course which is steady and vitality effective among source and destination ^[10]. This paper made a variation and QoS safe adaptable system utilizing lossless pressure method over multipath AODV component. The principle part of this paper is to upgrade the gushing rate by change of QoS parameters by apply Mpeg4 pressure ^[11].

In ^[12] explained a distributive and methodical calculation to address the flooding component in routing. To lessen the control overhead of RREQ packets likelihood system is utilized. After that found courses are examined for the accessibility of QoS bolster as far as Bandwidth and delay. Whenever required most extreme transfer speed and least postponement are accessible over a route, at that point the way is chosen for information transmission for an application. This calculation is in truth a stage to soak up QoS support to AODV convention as decreased control overhead. QoS mindful steering is expected to give ideal courses as an element of parameters like data transmission, delay, packet loss and so forth. This methodology is centered around QoS empowered course disclosure technique which includes estimation of node data transfer capacity and delay at each node. The directing necessities of hard continuous applications with stringent limitations of data transfer capacity and postpone breaking point can be satisfied utilizing this methodology. Existing connection recuperation procedure includes visit course revelations which cause high routing overhead and expanded end-to-end delay. The greater part of the directing conventions in this classification utilize single route and don't use different interchange ways. In this scheme, effective connection disappointment technique

is additionally fused by evaluating join lapse metric with the assistance of flag force level to give forecast before course separate [13].

The two directing conventions, for example, tree-based and work based convention gives the assurance and effective conveyance. In light of the presence of just a single connection between two nodes, Tree-based gives low data transfer capacity utilization, high sending productivity. A tree-based multicast routing convention is best reasonable for lightweight specially appointed systems. The QoS and execution is corrupted when the heap of system increments. By mixing the advantages of the tree structure and work structure the impact of network load can be made strides. To enhance the effectiveness and packet conveyance proportion clog control instrument is presented by transmitting the compacted information parcel [14].

A defer vitality mindful directing convention called as receptive blockage mindful multipath steering convention RCRP mean to choose the route in view of vitality decrease rate and packet conveyance time it address two imperative attributes of MANETs: enhancing life time of systems and dodging clog. It consider the packet delivery time and node energy reduction rate to process the delay energy drain rate hopefully regarding current vitality and movement condition [15].

PROPOSED SYSTEM

This algorithm improves information transmission by taking into account congestion control. Congestion happens when the load of the network is more than its ability in a network. That implies the quantity of information packets transmit to the network is bigger than the quantity of packets. Congestion control method is presented which will enhance the packet delivery ratio.

Step 1: Characterize add up to numeral of nodes. The node is introduced as Source Node (SN). Presently SN makes a course by communicating hi text to all its Neighbor Nodes (NN). It likewise gets answer for hello message sent from NN.

Step 2: It rehashes the procedure and registers every single conceivable route from a sender to a target node. It additionally computes the expense of each route.

Step 3: Compression decreases correspondence cost and calculation cost. Lempel-Ziv-Oberhumer (LZO)

Coding Technique is appropriate for without loss of information compression. Therefore utilizing this strategy the information is compressed. The measure of the information packet is decreased. This Compression procedure diminishes the collision which results in complex PDR. The network layer utilizes the component of queue. In the queue, if there are a few packets which as of now exist, at that point the packets holding up time increments as the past packets in the queue ought to be served first. In the event that the congestion happens in the queue, at that point the packet will hold up until the point when the congestion is lessened. This expands the deferral in steering. Some of the time the packets may likewise lost amid congestion. Along these lines, the controlled of congestion leads to decreases the movement as well as expands the execution. Compression proportion is characterized as:

$$C = CDS / UCDS \quad \dots(1)$$

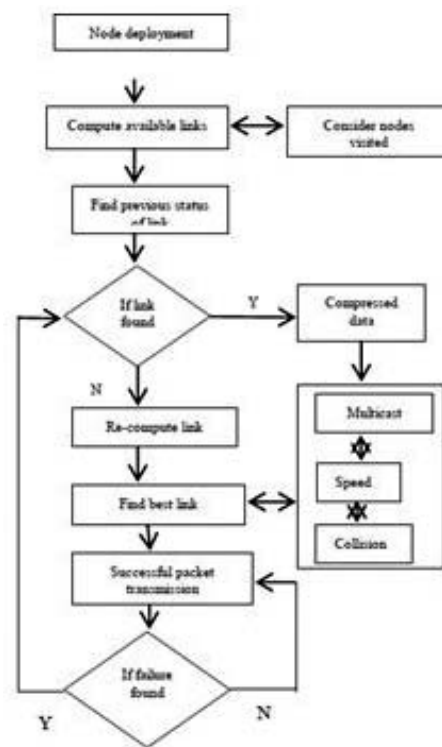

Fig. 1: Proposed System

Fig. 1 explains the flowchart of proposed system. Where CDS is compacted information size and UCDS is uncompressed information estimate. Holding up occasion of the packet which located in queue is ascertained by the transitional node. This may go about as the packet compression criteria. On the off chance that the holding up time is more noteworthy than the ascertained limit, at that point the node will pack the packet as delineated.

$$W > T - (1 - CR) * PS / B \quad \dots(2)$$

Step 4: A link state protocol (OSPF) is utilized to make a database of connections. Every router holds the connection subtle elements in the connection state database. Utilizing this we can check and locate the past status of connection. On the off chance that the past connection exists in the database at that point utilizing that connection the compressed packet is routed.

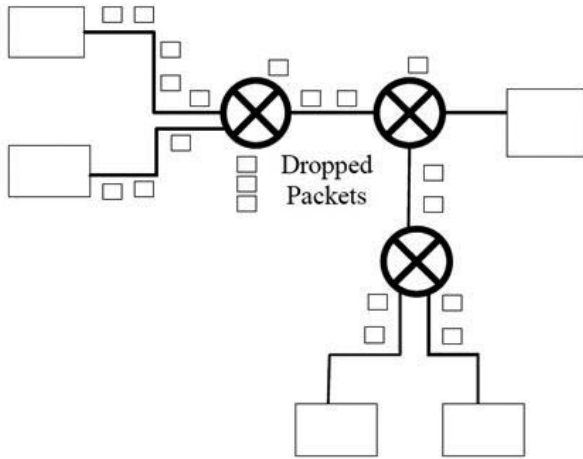

Fig. 2: Network suffering from Collision

Fig 2 explaining the packet dropped and collision effects that caused in the network.

Step 5: Utilizing phase 2, think about every one of the expenses of registered connections. Think about least hops and most limited way to routing. At long last a route with least expense is chosen which a best way is. For the best way determination Dijkstra’s calculation is utilized.

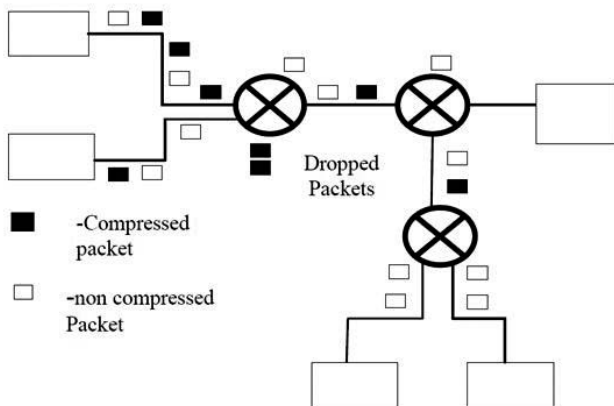

Fig. 3: Network with compressed and non-compressed data flow

Fig 3 explains the data flow of compressed and non-compressed packets. The Non-compressed packet suffers collision and packets are dropped.

Step 6: The host can pick to take part in the multicast gathering. Where W is the holding up packet time, T is the packet compression process time, CR is the compression proportion, PS is packet size and B is the bandwidth.

Step 7: The router in this system sends a multicast packet or, in other words prepared by individuals from the multicast gathering.

Performance Evaluation: The performance of the projected method is examined by the Network simulator. The simulation of the projected method has 50 nodes disposal in the simulation region 600×600. The nodes are communicated with others by the help of communication protocol User Datagram Protocol.

Average Delay: The difference of time among the current packets received and the previous packet received is called Average Delay. It is calculated by the equation 3.

$$\text{Average Delay} = \frac{\sum_0^n \text{Pack Recvd Time} - \text{Pack Sent Time}}{n} \quad \dots(3)$$

Fig. 4: Average delay of MCD and TMCD

Fig 4 indicates that the range of delay is small for the projected method TMCD than the presented method MCD. The throughput value is larger means that of delay value is smaller in the network. The delay in the network may lead to lose the information. The information must not get lost because of the delay factor, therefore proper sharing is required in this phenomenon during data transmission.

Throughput: The average of victorious messages sends to the base station. The throughput is calculated using equation 4.

$$\text{Throughput} = \frac{\sum_0^n \text{Pkts Received } (n) * \text{Pkt Size}}{1000} \dots(4)$$

Fig. 5: Throughput of MCD and TMCD

Fig 5 indicates that the projected method TMCD has better throughput when compared to the presented method MCD. Throughput is the important parameter in determining the presentation of the network. If there is improved throughput, system can perform in an efficient manner. The efficiency thus plays a significant part in the communication networks.

Residual Energy: The quantity of remaining energy in a node at the present case of time is called as residual energy. In the network operations the rate of consumed energy is calculated by the residual energy.

Fig 6 indicates that in the network the residual energy is enhanced for the projected method TMCD when compared with the presented method MCD. In TMCD, reduce the node will be dead also As long as there is residual energy, the network would have an enhanced network lifetime in the network.

Fig. 6: Residual Energy of MCD and TMCD

CONCLUSION

In MANET, congestion is the main factor that collapses the forwarding packets. The congestion may occur by forwarding excess number of data packets or overflow of packets which has been sent otherwise the delay may be leads to congestion. To overcome this problem, the proposed method takes place at seven stages. By using the Lempel-Ziv-Oberhumer Coding (LZOD) the congestion could be controlled. The simulation result shows that the proposed method performance is 30% higher than the existing method.

The Development of Mypobes-PAF: A Health Education Program with Child-Friendly Approach to Prevent Obesity among Children

A. M., Maziah¹, R., Saemah²

¹Department of Nursing, Faculty of Medicine, Universiti Kebangsaan Malaysia Kuala Lumpur Campus, 56000 Cheras, Malaysia; ²Faculty of Education, Universiti Kebangsaan Malaysia, 43000 Bangi, Malaysia

ABSTRACT

Unhealthy lifestyle, lack of awareness on health behaviors, and lack of documentation on health aspect in the education of 3-6 year-old children are some of the concerning issues that contributed to the increase of childhood obesity cases. Hence a study with developmental research design was conducted to develop a health education program for 3-6 year-old children in preventing childhood obesity. MyPObes-PaF was developed based on the data obtained from i)focus group discussion conducted with 38 children between 4-6 year-old, ii)interview sessions with four experts in physical activities, dieticians, and experts in educational psychology, iii)interview sessions with eight school teachers, and iv)document analyses. The findings of the study indicated that the MyPObes-PaF program with the application of child-friendly approach is a health education program with high content validity, with S-CVI for physical activity module =0.89, S-CVI for diet module =0.90, and I-CVI for the application of child-friendly concept =0.88; ACP=90%. In conclusion, MyPObes-PaF is a health education program that can be implemented to children of 3-6 year-old. This study suggested that kindergartens and pre-school in Malaysia to establish health education programs with the implementation of child-friendly approach as an effort to prevent childhood obesity.

Keywords: Health Education Program, Childhood Obesity, Physical Activity, Diet, Prevent Childhood Obesity.

INTRODUCTION

Cute and cuddly children are liked by many. However, when the children have obese, it becomes a problem that has to be taken seriously^{1,2}. A number of opinions indicated that there is no problem to have chubby and obese child as they might lose their weight while growing up^{2,3}. Such opinion contradicts with studies which showed the pattern of obese children to grow up as obese adults. A study conducted by Junior et al.⁴ discovered that obese children at the age of 1-5 years-old are significantly at high risk to grow up as obese adults. They are also at risk to remain inactive and unwell⁵, as well at the risk of chronic ailments such as psychosocial problems, high blood pressure, and coronary heart disease in their teenage or adult years^{4,6}. Furthermore, when these children start socializing with their peers, they might be teased and ridiculed verbally due to their physical condition. Eventually these children might be impacted psychologically and might be a reason

for them to feel alienated⁷. Such situation illustrates that childhood obesity is an important issue that need to be addressed immediately. This is consistent with the statistics started at the end of 2009 in Malaysia which indicate that obesity is not an exclusive issue to adults only. In fact, 6.6% of children at the age of seven years-old were found obese and the case increased to 13.8% for 10 year-old children⁸. Recent statistics reported that childhood obesity continues to increase at the average of 1% of reported case to hospital every year⁹. Therefore, it is necessary to take a moment to think the reason behind childhood obesity.

The results of literature study indicated that they are various factors contributing to the increase of childhood obesity. One of the factors include unhealthy and imbalanced eating habit such as excessive intake of sweet food and soft drink, low levels of water intake, fruit and vegetable, and constantly skipping breakfast. Such eating habits are found to have positive

relationship with the increase of adiposity tissue in the body which leads toward childhood obesity^{10,11}. Another contributing factor to childhood obesity is the lack of physical activities such as exercise, doing house chores, and playing sports. Studies have shown that 76% of children between 3-6 years-old with obesity problem were having lack of physical activities^{12,13}. Therefore, the children need to be exposed and educated about being healthy and prevent obesity in order for them to grow as healthy adults in the future.

Children with obesity issue will be likely to gain the benefit of joining awareness-raising intervention program and will be more willing to practice active and healthy lifestyle, and to practice balanced and healthy diet in their daily routine. Forming regular health practices in children should be considered as important. This is supported by previous studies which indicated that routine practices of the children will become a habit while they are growing up¹³. WHO² agreed that early education on healthy diet and physical activities is the best step in overcoming childhood obesity. The process of educating the children can be done at home or at school with the collaboration from parents, society, and related authorities to raise awareness about health. Recommendations on education-based awareness program that emphasizes on healthy diet and physical activities are important. However, so far there is no structured health program or module implemented as recommended by WHO². Research conducted on the curriculum for early childhood education in Malaysia discovered that there is a lack of documented information emphasizing on healthy diet and physical activities. Most of the planned programs conducted on the children were focusing on preparing them for their schooling years¹⁴. The most exposure given if any was focused on general health such as dental care, hand washing, and daily diet¹⁵, but there was no specific module or program on health and prevention of obesity.

In that regard, it is deemed necessary to develop a structured health program for 3-6 year-old children and should be focusing on general health with more emphasis on healthy physical activities and diet to prevent obesity. The only question is what type of learning program or module that can impart knowledge and practical skills of health and obesity prevention to the children? A number of previous studies conducted in Hatyai, New York, Chicago, Massachusetts, and California have developed and implemented a number of health programs which

included equal emphasis on diet and physical activity components as well as on general health. Those programs were developed to prevent obesity among children at the age of 1-10 years-old. Findings from studies conducted by Mo-suwan et al¹⁶, Harvey-Berino & Rourke¹⁷, Dennison et al¹⁸, Fitzgibbon et al¹⁹, Gortmaker et al²⁰, and Weiss et al²¹ indicated that education-based health programs have given positive impacts to the children in losing weight and in curbing the increase of their BMI. Those studies discovered that there were significant differences in their health behaviors after participating in the health education programs prepared for them. The researchers were also able to notice and record the increase on health knowledge among the children as they were able to give health related ideas and suggestions to their parents in providing them with healthy diet and encouraging them to be more active physically as compared to their habits and lifestyle before getting involve with the intervention program. Hence, those researchers suggested for the development of health promotion to be imparted to the children as early as 3-6 years-old as one of the efforts to prevent childhood obesity.

Additionally, the process of educating children about health and obesity is a challenge due to the nature of children who love playing and the complexity of imparting awareness on health in their learning process. In fact, children spend their every second awake with playing²². Thus this shows that the children need a fun and exciting learning process so that it will become a meaningful process to master the mind, attract, and motivate the children to practice what they have learned in their daily lives as acquired health behaviors. Omrod²³ agreed by stating that the implementation of psychological approach in children education is one of the approaches towards fun and effective learning process for them to develop the desired behaviors. Studies conducted by Broberg, Kytaa, and Fagerholm²⁴ on the application of psychology and the implementation of child-friendly approach in childhood education discovered that majority of the children (80%) were able to be in control to what they were learning and to master the content without being forced and showed enthusiast to share the knowledge with others such as telling their parents on the lesson that they had in the classroom or to scold their siblings for littering.

Referring to related issues and literary research on past studies have sparked an idea to the current researchers to develop a health education program

for children at the age of 3-6 years-old with fun and interesting teaching and learning approach that can attract them to learn and to prevent obesity. Therefore this paper is going to discuss further on the development of the health education program which consisted of modules for physical activity and diet. In this study, the researchers intended to develop a child-friendly health education program that is interesting and meaningful for the children and in the same time effective to impart knowledge and practical skills on the prevention of obesity through health behavior practices.

METHODOLOGY

This study was conducted by using developmental research design²⁵ with the purpose to develop a health education program for 3-6 year-old children in preventing obesity. This study adopted concurrent triangulation method²⁶ where the researchers used qualitative and quantitative approaches simultaneously to ensure the content validity of the developed program. The dependent variable for this study was the childhood obesity prevention among 3-6 year-old children, and the independent variables were dietary module, physical activity module, and child-friendly approach which were measurable through interview analysis conducted with 4-6 year-old children, dieticians, experts on physical activity and educational psychology, and teachers as well as document analysis.

Sample: The samples for this study were consisted of 4-6 year-old children, dieticians, experts on physical activity, experts on educational psychology, and kindergarten teachers. A total of 38 children with parental consent, 4 dieticians, 4 physical activity experts, 4 educational psychology experts, and 8 kindergarten teachers were involved in this study. They were chosen through purposive sampling and were interviewed according to the interview protocol in order to collect data for this study.

Data Collection: Data collection methods used in this study consisted of i) focus group discussion with the 4-6 year-old children, ii) interviews with the experts, iii) interviews with kindergarten teachers, and iv) document analysis. Interview protocol was developed and implemented in order to obtain the needed information²⁷ and it started with introduction and followed by transition questions, key questions, and closing/reflection^{28,29}. Data were collected by note taking and video recording. The data collection sessions were done until each protocol question reached saturation level²⁹.

Instrument: The instrument used in this study was interview protocol. The protocol was based on the findings of document analysis. Five protocols were prepared to cater each group of sample which included i) focus group discussion with 4-6 year old children, ii) interview sessions with experts in physical activities, iii) interview sessions with dieticians, iv) interview sessions with experts in educational psychology, and v) interview sessions with kindergarten teachers. This instrument was used to develop content validity for the dietary and physical activity modules for the obesity prevention program for children at the age between 3 to 6 years old. The interview sessions were conducted according to the protocol developed which consisted of 10 questions: 3 introductory questions, 1 transition question, 3 key questions, 2 reflection questions, and 1 closing question. Internal validity and reliability of the instrument were statistically proven to be satisfactory based on the high value of Cronbach's alpha between 0.83 and 0.89. Collected data were used to develop the content for dietary and physical activity modules of the health educational program with the inclusion of child-friendly approach and were analyzed to determine the strength of the program.

RESULTS

This study was conducted with the objective to develop a program to prevent childhood obesity for children between the ages of 3-6 years-old. The program was developed based on the information gathered through interview sessions conducted on the experts, teachers and children within the targeted age range in order to ensure the efficacy of the program in imparting the knowledge and practical skills on health through the modules.

Program Module Development: The study was initiated with data collection process in order to develop the modules for childhood obesity prevention program. Collected data were analyzed inductively and were coded descriptively by using ATLAS.ti version 7 in order to process the needed information to develop the content for the program. The contents were then framed and arranged thematically and discussed based on the objective of the childhood obesity prevention program. Data collected through interview sessions conducted on dietary experts, physical activity experts, and educational psychology experts provided the needed information to develop modules related to physical activity and diet with

the inclusion of child-friendly approach. Hence a program known as MyPObes-PaF was developed. The content planning of each module is as described as below.

(1) Content on physical activity module in childhood prevention program for children between 3 to 6 years old

Physical activity module content

1. Objective: By the end of physical activity module implementation, the children should be able to:

- do physical activity as thought as daily their daily routine
- remain BMI at the 85th percentile with low body fat level
- accept and respond in the physical activity module developed

2. Focus of the module: It consisted of the following aspects:

- Knowledge
- Activities

3. Features of knowledge aspect: Health knowledge on physical activity is to be delivered to the children through indoor and outdoor classroom activities aided with notes included with child-friendly approach such as:

- the use of language suitable for the children
- the use of cartoon illustration
- the use of animation
- colorful and cheerful notes
- the insertion of music or nursery rhymes

4. Features of activity aspect: The activities prepared and conducted with child-friendly approach with the following features:

- Casual and playful activities
- Able to assist in child growth and development
- Cater for physical and emotional health of the children
- Enable the children to be choose the activity to be conducted in order to fulfill their emotional, needs and nature

5. Teaching and learning notes: Inclusion of child-friendly approach in the preparation of notes with the following topics:

- Physical activity
- Types of physical activity
- Physical activity pyramid
- Ways to exercise
- Exercise recommendation (Part 1)
- Exercise recommendation (Part 2)
- Exercise recommendation (Part 3)
- Exercise recommendation (Part 4)

** parents' involvement required in childhood obesity program

** parents to receive same notes as used in school for the program

6. Activity planning: Activities to be planned in physical activity module with the inclusion of child-friendly approach:

a. Stretching exercise

- Light exercise for warming up
- Duration: 5-10 minutes

b. Aerobic (alternate with games)

- Aerobic with animated video
- Aerobic by using 'SenamSeni Malaysia' video
- Aerobic by using '1 Murid 1 Sukan' video
- Duration: 30-40 minutes

c. Games (alternate with aerobic)

- Group games
- Example: ball game, hurdled race, jump rope, exploration/treasure hunt, poison ball, musical chair, inventive games, arranging straws, poison box, Lego or bowling
- Traditional games: chicken and fox, cat and mice, *enjit-enjitsemut*, *pukulberapa Datuk Harimau*
- Duration: 30-40 minutes

d. Total duration needed: 1 hour per day or session

e. Frequency

- 3 days a week
- Every Tuesday, Wednesday and Thursday

7. Schedule: The program to be conducted as follows:

- a. Stretching – warming up (2 minutes)
- b. Aerobic/games (30-40 minutes)
- c. Stretching – warming down (2 minutes)
- d. Short break and water drinking (5 minutes)
- e. Teaching session related to module and quiz (5-10 minutes)
- f. Homework (weekend)

8. Affirmation method: Affirmation methods need to be applied throughout the session which include:

- praising and giving reward/award
- performance of the students to be recorded in their star chart
- smile and cheer from the instructors

9. Parental involvement: Purpose of parental involvement in the program:

- to report physical activity conducted by the children at home
- to help in maintaining positive changes of the children to continuously be motivated to practice the lesson that they have learned at home
- to assist in the daily learning and practice of the children as they are still young to make decision and fully depending on the activities of the parents at home
- to practice the same affirmative technique used such as praising and giving reward/award or the use of star chart to ensure that they will be continuously motivated even at home

(2) Content on dietary module in childhood prevention program for children between 3 to 6 year-old

Content on dietary module

1. Objectives: By the end of the implementation of dietary module, the children should be able to:

- consume healthy and balanced diet in their daily meal
- maintain BMI at 85th percentile with low body fat level

- accept and respond in the dietary module
- follow healthy and balanced eating habit

2. Focus of the module: Dietary module consisted of the following aspects:

- Knowledge
- Activities

3. Features for knowledge: Health knowledge on physical activity is to be delivered to the children through indoor and outdoor classroom activities aided with notes included with child-friendly approach such as:

- the use of language suitable for the children
- the use of cartoon illustration
- the use of animation
- colorful and cheerful notes
- the insertion of music or nursery rhymes
- the use of appropriate videos
- narrative learning sessions

4. Features for activities: The activities prepared and conducted with child-friendly approach with the following features::

- Casual and playful activities
- Able to assist in child growth and development
- Cater for physical and emotional health of the children
- Enable the children to be choose the activity to be conducted in order to fulfill their emotional, needs and nature
- Healthy and balanced food preparation activity for the children (kindergarten menu)
- Food preparing by using healthy food and methods (as taught by teachers and cooks)

5. Teaching and learning notes: Inclusion of child-friendly approach in the preparation of notes with the following topics:

- Healthy
- Food pyramid
- Animation video related to healthy and balanced diet

- Healthy and balanced diet for children
- Your plate
- Rice and cereal
- Fruits and vegetables
- Cartoon video on healthy and balanced diet
- Oil and fat
- Snack
- Spinach and broccoli
- Eating healthily

** parents' involvement required in childhood obesity program

** parents to receive same notes as used in school for the program

6. Activity planning: Activities to be planned in physical activity module with the inclusion of child-friendly approach:

a. Stretching exercise

- Light exercise for warming up
- Duration: 5-10 minutes

b. Aerobic (alternate with games)

- Aerobic with animated video
- Aerobic by using 'SenamSeni Malaysia' video
- Aerobic by using '1 Murid 1 Sukan' video
- Duration: 30-40 minutes

c. Games (alternate with aerobic)

- Group games

Example: matching game (food and pyramid level), rearranging food in the pyramid, matching food to its category, food related games, treasure hunt/exploration on diet, poison food, musical chair, poison box or food related puzzle

- Duration: 30-40 minutes

d. Total duration needed: 1 hour per day or session

e. Frequency

- 3 days a week
- Every Tuesday, Wednesday and Thursday

7. Schedule: The program to be conducted as follows:

- a. Stretching – warming up (2 minutes)
- b. Aerobic/games (30-40 minutes)
- c. Stretching – warming down (2 minutes)
- d. Short break and water drinking (5 minutes)
- e. Teaching session related to module and quiz (5-10 minutes)
- f. Homework (weekend)

8. Affirmation method: Affirmation methods need to be applied throughout the session which include:

- praising and giving reward/award
- performance of the students to be recorded in their star chart
- smile and cheer from the instructors

9. Parental involvement: Purpose of parental involvement in the program:

- to report eating habit of the children at home
- to help in maintaining positive changes of the children to continuously be motivated to practice eating healthily at home
- to assist in the daily learning and practice of the children as they are still young to make decision and fully depending on the diet routine prepared by parents

Validity of the modules developed: Content validity analysis was conducted in order to ensure that the content of dietary and physical activity modules developed in this study is adequate for all measurable variables. Table 1 presents the computation on the content validity index for the scale of 9 main items in physical activity module. Referring to Table 1, the result for inter-rater test analysis indicated high content validity for physical activity module in MyPObes-PaF program with S-CVI = 0.89. This value indicated that the content reliability of the program was high thus indicating that the module can be accepted for implementation. The result of this analysis supported the researchers' hypothesis that health education program for children should emphasize on healthy and active physical activities in order to provide optimum impact on preventing childhood obesity.

Table 1: Computation of content validity index for the scale of 9 main items in physical activity module

Second expert rater	First expert rater		Total
	'Item' Scale 1 & 2	'Item' Scale 3 & 4	
'Item' scale 1 & 2	1	0	1
'Item' scale 3 & 4	0	8	8
Total	1	8	9
S-CVI = 8/9 = 0.89			

Table 2 presents the computation of content validity index for the scale of 10 main items in dietary module. Referring to Table 2, the result of inter-rater test analysis indicated high content validity for dietary module in MyPObes-PaF program with S-CVI = 0.90 thus indicating that the module can be accepted for the implementation in the program. The result of this analysis supported the hypothesis that health program for children should emphasize on healthy and balanced diet in order to provide optimum impact in preventing childhood obesity.

Table 2: Computation of content validity index for the scale of 10 main items in dietary module

Second expert rater	First expert rater		Total
	'Item' Scale 1 & 2	'Item' Scale 3 & 4	
'Item' scale 1 & 2	1	0	1
'Item' scale 3 & 4	0	9	9
Total	1	9	10
S-CVI = 9/10 = 0.90			

Table 3 presents the expert rate on 4-scale items: item at scale 3 or 4 at 4 relevance score scale. Referring to Table 3, the result of inter-rater test analysis indicated high validity for the features of child-friendly approach application in MyPObes-PaF with I-CVI = 0.88; ACP = 90% thus indicating high reliability of the program. This signified that the child-friendly features were acceptable to be implemented in the program. The result of this analysis supported the hypothesis which stated that health program for children should emphasize on child-friendly teaching and learning approach in order to provide optimum meaningful learning experience in promoting health and preventing childhood obesity.

Table 3: Expert rate on 4-scale items: item on scale 3 or 4 in 4 relevance score scale

Item	Expert 1	Expert 2	No. of agreement	CVI
1	X	-	1	0.5
2	X	X	2	1.0
3	X	X	2	1.0
4	X	X	2	1.0
Mean expert proportion	1.0	0.8	**Mean I-CVI = Relevant proportion **ACP =	0.875 0.875 90%

** I-CVI = item-level content validity index

** ACP = average congruency percentage

The researchers also conducted internal consistency test for the content of MyPObes-PaF program. Table 4 presents the statistical explanation on the internal consistency of the program. The result for the test indicated that the Cronbach's Alpha value for the internal consistency of the program at 0.87. Thus it indicated that the content of MyPObes-PaF program has high internal consistency and reliability and the content were fit to be implemented in childhood obesity prevention program for children 3-6 years old.

Table 4: Internal consistency statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.865	.900	102

The results of inter-rater test and internal consistency of the modules indicated that the development of health education program in preventing childhood obesity developed through this study was a good model for such program with acceptable quality, strength and content adequacy to be implemented to 3-6 year old children. Therefore MyPObes-PaF program fits to be a model to prevent childhood obesity. Generally, the inter-rater and reliability analyses conducted have statistically proven that the views provided by the experts in physical activity, diet, and educational psychology were valid to be developed as physical activity and dietary modules to be implemented with child-friendly approach for the program.

DISCUSSION

This study indicated that MyPObes-PaF program is a program with quality, strength, and content adequacy to be accepted and implemented to 3-6 year-old children. The development of MyPObes-PaF program contributed to the development of two main modules which were physical activity and dietary module through child-friendly delivery. MyPObes-PaF was the main focus of this study even though there were other health programs for children developed in previous studies. The findings of this study indicated that child-friendly childhood obesity prevention program is highly needed as an effort to prevent childhood obesity. These findings were supported by WHO² which stated that early education on diet and physical activity is a good step in preventing childhood obesity. Such health program may assist in producing active, healthy, smart and disease-free children for the future. Additionally, early exposure on health may provide the children with knowledge and practical skills in practicing healthy behaviors such as exercising, eating healthily or to be actively involved in physical activity as part as their daily routine. Studies have shown that routine practice of children's behaviors will become habits when they have grown up¹³. Therefore, early exposure on health and obesity should start in childhood education.

The current researchers discovered that dietary and physical activity modules were the main modules to be included in childhood obesity prevention program.

This is because the main cause of childhood obesity is due to the eating habits and physical activity of the children. Diet and physical activities are some of the needs of the children that need to be fulfilled. Obesity prevention program should be exposed to the children as early as possible in order to reduce the ever increasing statistics of obesity. Therefore, the best way to deal with such issue is to consider the factors contributing towards obesity and to develop a module on dealing with them to prevent obesity. This is essential since the fact stated that children with obesity issue will remain obese when they grow up^{13,30}. In addition, these children are also exposed and have higher risk for chronic illnesses e.g psychosocial problems, high blood pressure, and coronary heart diseases during adolescence and adult years^{6,13}. Based on such phenomena, MyPObes-PaF program which consisted of modules for physical activity and dietary was developed as an effort to prevent childhood obesity as well as to produce healthy and fit generation for the future.

The findings of the study also indicated that child-friendly approach was the best approach that could be implemented in delivering the content of the program. This was agreed by six content experts of MyPObes-PaF. In reality, the nature of children and childhood need to be understood as children live in their own living environment which is easily influenced and reacted to their wants and desires³¹. Therefore, the effort to control the mind of the children through child-friendly approach is seemed as desirable with the purpose for the children to develop and practice health behaviors as expected without being forced by anyone, to be happy with healthy living environment, and to be more motivated to practice health. Educational psychology theory was applied in the development of the program by including educating psychological approaches in the teaching-learning process of the childhood obesity prevention program. The implementation of child-friendly approach was viewed as necessary because it emphasized on cognitive and behavioral approaches psychologically to create meaningful learning experience for the children³². The findings of this study were in line with the study conducted by Broberg, Kytaa, and Fagerholm²⁴ which indicated that the implementation of child-friendly approach enabled majority (80%) of the respondents to learn and acquire the knowledge taught without being forced.

Furthermore, this study discovered that MyPObes-PaF program was a quality program with high content

validity: S-CVI for physical activity component = 0.89, S-CVI for dietary component = 0.90, I-CVI for child-friendly concept = 0.99, ACP = 90% and Cronbach's Alpha for content = 0.87. The results from the analyses conducted concluded that MyPObes-PaF program had high content validity and reliability thus statistically proven that it could be used in order to provide the desired implication to the health level of the children. This finding signified that the development of MyPObes-PaF program was consistent with other health programs which were implemented in Hatyai, New York, Chicago, Massachusetts, and California. Health programs as proposed in the past researchers have proven that they were able to contribute towards the prevention of childhood obesity for children between 1-10 years-old. Thus, the development of MyPObes-PaF with its own strength was hoped to help producing healthy and obese-free children. Additionally, MyPObes-PaF program was similar to the health program developed by past researchers^{18,21}.

All health programs from the past studies contained dietary and physical activity modules as the main modules of the program. Although MyPObes-PaF program had several similarities in the content of the program as other health programs, yet it has its own strength. The content of MyPObes-PaF program and the teaching-learning approach were designed to be child-friendly. This program focuses more on the living environment of the children in order to encourage health behaviors and healthy lifestyle to them without feeling forced to do so. The features of this approach were expected to assist the learning process of the children in mastering the knowledge and practical skills on health and obesity which were stated as challenging due to their nature in preferring to play rather than to sit and listen to such complex topics. Therefore, the implementation of child-friendly approach would assist in mastering the mind, attracting the interest, and motivate the children to learn and practice health²³ in their daily lives after the completion of MyPObes-PaF program.

CONCLUSION

The findings of this study clearly indicated that the development of MyPObes-PaF possessed its own quality and strength that could possibly contribute towards the acquisition of knowledge and practical skills of health behaviors among children and to lead them to be healthy and obese-free. The strength of MyPObes-PaF program

includes the combination of physical activity and dietary modules with child-friendly approach in mastering the mind, motivating, and instilling awareness and meaningful learning experience to the children. Health education program with child-friendly approach such as MyPObes-PaF is a very important program that needs to be emphasized besides the emphasis of other academic learning and to be exposed to children as an effort to prevent childhood obesity. Thus this study proposed for such program to be implemented specifically in kindergarten to enable the children at the age of 1-10 years-old to experience meaningful learning as well as to increase their knowledge on health and healthy behaviors in preventing childhood obesity.

The Use of Plants in Traditional Medicine among the Siamese Community in Kedah

Salmah Omar¹, Rafidah Mohamad Cusairi¹

¹*School of Language, Civilisation and Philosophy, Universiti Utara Malaysia, Sintok, Kedah, Malaysia*

ABSTRACT

Both traditional and modern medicine share the same objective, which is to cure diseases and illnesses through its own way and concept. Similar to other traditional societies, the Siamese community also depends on traditional medicine to overcome health-related problems. The penetration of the modern medicinal elements into the Siamese community, however, does not diminish their knowledge and belief of the traditional medicine system completely. This is partly because traditional medicinal practices are still in much demand and the Siamese people believe that such practices are able to cure and treat diseases that could not be treated through modern medicine and treatment. This article seeks to provide insights into the use of plants in traditional medicine among the Siamese community in the state of Kedah. Discussion will focus on the types of plants used, the treatment methods employed, and the types of diseases treated through the use of traditional medicine by the studied community. Information for this research was obtained through field work, chiefly in the forms of interviews and participant observation, and archive research. In most cases, the plant-based medicine used by the Siamese community has two main functions. Firstly, to cure diseases and secondly, to defend self from being infected/affected by diseases. The research shows that the beliefs, customs, values, knowledge, experiences, and skills inherited from their ancestors have led the Siamese community to the practices of using plants in their traditional medicine until today. The Siamese community's values, beliefs and heritage, where traditional medicine is concerned, are viewed as relevant and enduring irrespective of today's modern lifestyle. The Siamese community medicinal practice is a national cultural heritage that continues to be of great value to the Siamese community.

Keywords: *Culture, traditional medicine, plants, Siamese community*

INTRODUCTION

Traditional medicine is defined as practices, approaches, knowledge and beliefs about health that involves the use of plants, animals, and medicines that are based on minerals, spiritual therapy, manual techniques, as well as exercise that are either specifically applied or combined to treat, diagnose or prevent diseases and maintain any individual's health (Norhalim⁸).

The Siamese community's traditional medicine practice is divided into two types, which are the use of plants such as plant roots and leaves as well as remedies that involve spells and black magic. The plants are commonly used to cure physical diseases such as fever and others. Spells and black magic are used to cure *santau* (Malay supernatural act of curse and poisoning), Malay voodoo and epilepsy. However, the use of spells and black magic depends on the intention of the person

who utilises them. If the intention is good, the outcome would be good, and vice versa (Salmah¹²).

In general, the traditional medicine practiced by the medicine man (bomoh) could be categorised into three basic elements, namely, the material used, what is being done, and what is uttered. The first element refers to the use of plants or tool; the second refers to the rites, and the third element is spells or incantations (Rosnah¹¹).

LITERATURE REVIEW

The arrival and influx of the Siamese people to the Malay Peninsula in the 19th century is not a recent event as the Siamese have begun to reside in Kedah earlier on. It is not known exactly when the Siamese first came to this country. An oral history source confirms that the migration of the Siamese begun as early as 1456. At that time, Kedah served as one of the sub-headquarters, for at

least 15 years long, that collected and distributed food for the Siamese armed force in the Malay Peninsula. Some of the army members remained in Kedah even after the war has ended to work as farmers. It is possible that some of them might have left their descendants through their marriage with local women, which led to the formation of the Siamese minority until present day (Ee Lin⁴).

One of the prominent traits of the Siamese community settlements in Kedah, specifically, and in the Malay Peninsula, generally, is that this community's settlement usually centres at one specific area and region (localised). Almost 95% of them reside at four northern states of Malaysia (Kedah, Perlis, Kelantan, dan Terengganu). A small number of the settlements could be found in Perak and Selangor. What is more unique is that in these four known states, the community is commonly found in areas that are close to the borders or on the Thai borders itself (Asiah Othman³).

Most of the Siamese village settlements in Kedah are in the inland areas, such as Changlun (Kubang Pasu district), Pokok Sena (Padang Terap district), Padang Pusing (Kota Star district), district of Baling and Sik (Abu Hassan, 1976).

The Siamese settlement in Kedah is identifiable through the presence of their Buddhist temples, known as *wat* in Thai language, in their villages. There are some 49 *wat* in Kedah. The *wat* functions as a centre for the Siamese community to conduct social activities, including religious and cultural activities (Meri, 2015).

Politically, the Siamese community is viewed as holding the Bumiputra status. The Bumiputra includes the Malays, the natives of Sabah and Sarawak, the Portuguese community in Malacca and the indigenous people of the Malay Peninsula. The Siamese community has been acknowledged by the Malaysian leaders as the citizens of this country and the Siamese community has been awarded Malaysian citizenship. The Siamese community in Kedah covers some 23, 274 people from the total population of the Siamese community in Malaysia (Laporan Tahunan Jabatan Perangkaan⁶).

The rights and interests of the Siamese people are inserted and documented in the constitutions of Kedah, Perlis, Kelantan, Perak and Terengganu. All these laws employ the term '*Siam*' in documenting the rights and privileges of the Siamese in the state constitutions. *Undang-Undang Tubuh Negeri Perak* also uses the word '*Siam*' where the code provides that the state has

to appoint a chief of a village from amongst the local Siamese community to represent the Siamese community in the area of Pengkalan Hulu (who in turn, represents the Perak Siamese community). In fact, in Kedah and Perlis, there is a document known as *Sijil Pertanian Siam* (Siamese Agricultural Certificate) that is issued out by the state government as a condition to allow the Siamese community in both states to put in application for lands that are gazetted as *Malay Reserved Lands*.

There are two groups of Thai-speaking communities in Kedah. The first is known as the Sam Sam community, while the second is the Buddhist Siamese society (Keiko Kuroda⁵). The Sam Sams were purposely brought into Kedah during the war (Archaimbault²). The Sam Sams are believed to be descendants of the Malay captives who were taken to Thailand during the wars between Kedah and Thailand in the 14th century. The descendants of these Malay captives were taken back to Kedah in the 19th century during the war between Kedah and Thailand in the 19th century. The Sam Sams are mainly Muslim Siamese Malays and regarded as one of the sub-Malay ethnic groups in the 1911 statistics. The Siamese Malay populations only made up of 5 per cent of the entire population at that time. They were called the Sam Sams as they are believed to be of a mixed race of Malay or Chinese blood and Thai. Currently, the Sam Sam community could be found in the areas of Kubang Pasu, Padang Terap, Baling and Kroh (Asiah Othman³).

The Siamese community members still hold strongly to the animistic beliefs, specifically beliefs in the supernatural world and of ghosts that intervene their daily lives. Hence, the medicine man plays central roles in their lives. Animism and Buddhism are blended and practiced together by this community. They believe in the supernatural, demons, ghosts, spirits, ghouls, and hobgoblin. Apart from this, they also observe the etiquette (dos and don'ts) that they inherited from their forefathers. The do's and don'ts were established to teach the community members to practice good values in their lives. They believe that good values are reflected through their actions, specifically by restraining self from doing things that could harm or affect other people's peaceful life. These established ways that are observed by the Siamese community are also one of the means to disperse advice and teachings indirectly so as to avoid offending others. Nevertheless, most of the established ways are perceived traditional inherited beliefs that are irrelevant and illogical these days.

METHOD

The data for this study were obtained through field work conducted in Kedah, mainly via interviews and participant observation (Adlina¹). Interviews were carried out, mostly in the forms of in-depth interviews and focus group interviews (Normadiah⁹). These types of interviews involve many informants to ensure that a phenomenon studied becomes more representative or represents specific society. The interviews were open and unstructured. Several medicine men and midwives (*bidan kampung*) were interviewed to obtain information pertaining to the use of plants in traditional medicine. The information acquired includes how they sought knowledge about the use of the plants, types of plants used, how and when the plants are used, the uses of the plants as well as the effects of the plants to the informants. Participant observation was employed when the researchers went along with the informants to collect plants and observed how the plants were used.

The data obtained were then analysed using the emic and etic perspectives. Emic and etic perspectives refer to the analysis of the agent’s/actor’s perceptions and behaviour in a cultural phenomenon (Harris, 1984). Emic perspective, on one hand, allows observations of an event to be analysed from the studied community’s perspective. Etic perspective, on the other hand, refers to the researcher’s ability to identify the forms, relationship and meaning of an event based on the researcher’s perspective (Nanda & Warms⁷).

Plants and its Uses in Siamese Traditional Medicine: The Siamese community has used various types of plants, since time immemorial, to cure all kinds of diseases, such as hypertension, diabetes, eye problems, black magic,

accidental wounds, fever and stomach ache. Usually, plant-based medicinal knowledge is a public knowledge that is disseminated to all society members. Each household, normally, has a family member, who is in the know of the use and properties of the plants as medicine.

There is a rational behind every single use of plants in medicine. The plants are bitter taste, hot (producing a burning sensation to the tongue), and have the cold and warm elements. Plants that are hot are used to remove fat, while bitter taste plants are usually used to cure wounds. The function of warm plants is usually to increase the heat of diseases considered cold, while cold plants are expected to bring down the temperature of warm diseases. Crab claw herb (*daun ketumpangan air*), for instance is crushed and apply on the forehead of individuals suffering from headaches. This herb is considered cold and cold plants could bring down high temperature.

The parts of the plants commonly used for various remedies are the leaves, stems/stalks, shoots, roots, twigs, fruits, flowers, tree barks and latex. The use of these parts of the plants depends on the types of diseases and types of plants. There are many ways on how the Siamese community uses these plants. The remedies could either be applied, smeared, used as drops, compressed, spit on, or massaged on the affected areas. They are also used in bath and made into amulets or demonifuge. The remedies are applied, rubbed on, smeared, or compressed for external use to dry and reduce the wounds, kill the germs and get rid of gas that might have blocked muscles or veins.

Broadly, the use of medicinal plants among the Siamese community serves two purposes, which are to cure diseases and defend self from being infected/affected by diseases.

Table 1: Various plants and their health benefits

Name of plants/herbs	Part(s) of plants used (twigs, leaves, roots, and others)	How remedies are prepared and used	Purpose	Effects/abstinence ritual
Batawali (Batang Wali/Akar Seruntun) (Siamese language: Khetmun; Thai language: Boraphet) Scientific name: <i>Tinospora tuberculata</i>	Stems	Thinly slice the stem of batawali. Leave it to dry. Boil 2-3 slices of dried batawali in water. Strain the liquid and drink. Thinly slice the stem of batawali, blend and squeeze the liquid. Drink.	Good for health, is used to treat diabetes and hypertension, to treat scalp (dry and dandruff), helps with dehydration, to cool the body and good for fever. To treat wounds	-
		Use the latex from the batawali stem. Rub on wounds.		

Conted...

Betel leaves (Sirih) (Siamese language: Bai phu) Scientific name: Piper betel	Leaves/shoots	The healers usually chew the leaves and spit on the area that is covered with shingles	To treat shingles	The wounds will dry in two or three days. Modern people do not believe in this method as shingles need to be treated in a clean manner
	Leaves	Slice the leaves and mix with cold water. Place the remedy on the patient's head and wipe his/her face	To treat bleeding from the nose (epistaxis)	-
	Leaves		Used in spells/incantations or any purpose in traditional medicine	-
Shoots of Common guava (Pucuk Jambu Batu) (Siamese language: Yort phor/bai falang) Scientific name: Psidium guajava	Shoots/leaves	Crush the shoots with some turmeric and bedak sejuk (traditional powder made from fermented rice). Apply to body and face.	To treat spots caused by measles	-
Cat's whiskers (Misai Kucing) (Siamese language: Thon nuat meaw) Scientific name: Orthosiphon stamineus	Whole plant	Boil the plant in water and drink its liquid.	To treat urinary bladder and kidney problems, to lower high blood pressure, to treat diabetes and sinusitis and prevent gastric.	-
Chamber bitter/ Gripeweed/ (Dukung Anak) (Siamese language: Luk tai bai) Scientific name: Phyllanthus urinaria	Whole plant	Boil the plant in water and drink its liquid.	Good for health, is used to increase appetite, to treat gastric, to lower high blood pressure, to treat malaria, to reduce coughing, to relieve stomach pains.	-
Siamese weed/ (Rumpai Siam/ Rumpai Kapal Terbang) (Siamese language: Bai khi kai) (Thai language: Sap seah) Scientific name: Chromolaena odorata	Leaves	Crush the leaves and mix with water/spit and rub it on wounds/stomach	To treat wounds and relieve bloating	-
		Boil the leaves of Siamese weed in water. Use the water for bathing	To treat bruises	

Conted...

Crab claw herb/ Pepper elder/ (Ketumpangan Air/ Sireh tanah) (Siamese language: Phru dhin) Scientific name: Peperomia pellucia	Leaves and stems	Eat as herbs or could be prepared and consumed as kerabu (Malay salad)	Good for health, to treat glaucoma, headaches, to relieve sore throat and fever, to reduce pimples	-
		Crush and apply on head to reduce fever and headache		
	Roots and stems	Boil the roots and stem in water with some salt	Used to treat short-sightedness (myopia) or long-sightedness (hyperopia)	-
		Boil the roots and stem in water ad mixed with palm sugar	Used to treat haemorrhoid	-
		Ground/crush the roots and stem and apply at the affected rectal area	Used to treat discomfort at rectal area/lumps outside the anal	-
	Place the roots and stems on the pot cover until they become withered and watery. Place some drops of the liquid into the ear that is in pain/infected.	Used to treat infected ear/ earache.	-	
Shameplant (Semalu) (Siamese language: Ragap/Tonmai pak krakshed) Scientific name: Mimosa pudica	Entire plant	Dry the plant, boil in some water, and drink the extract.	Good for health, is used to treat exhaustion, headaches, and diabetes.	-
Tamarind (Asam Jawa) (Siamese language: Som karm) Scientific name: Tamarindus indica	Fruits	Eat together with salt or make some juice according to taste to soothe a sore throat and get rid of phlegm.	Soothes a sore throat and gets rid of phlegm.	-
Lime (Limau) (Siamese language: Look nhau) Scientific name: Citrus aurantiifolia	Fruits	Squeeze some lime and drink its juice	Good for the eyes, skin, and pimples. Helps to reduce headache and nausea. It also helps lower high blood pressure and raise low blood pressure.	-
		Get rid of a cough and phlegm	Squeeze some lime juice and mix with 1 spoon of honey. Drink the concoction.	

Conted...

<p>Ginger (Halia) (Siamese language: Khing) Scientific name: Zingiber officinale</p>	Rhizome	Grind (not too finely, grind to get the fragrant and taste). Boil the ginger in water and drink its juice	Helps to relieve headaches or nausea. It is suitable for patients undergoing chemotherapy treatment.	-
	Rhizome		Helps to get rid of gas in the body, and bloating	-
<p>Aloe vera (Lidah Buaya) (Siamese language: Lin khea/Wan hang chorakin) Scientific name: Aloe vera</p>	Leaves	Apply the gel to wounds	To treat hypothermia, small or minor burns	-
		Cut to extract gel from aloe vera stems	Apply the gel to shingles area	
<p>Asiatic Pennywort/ Gotu kola (Pegaga) (Siamese language: Bai bua bok) Scientific name: Centella asiatica</p>	Leaves	Drink as juice or eat as herbs	Aids in reducing swelling, brings down fever, relieves fever and treats dehydration	-
	Leaves	Mix with some honey or fruits to prepare as juice	To prevent hypertension	-
	All parts	Could be boiled to extract liquid	Cools the body and refreshes the body, internally	-
<p>Roselle (Siamese language: Kachiap) Scientific name: Hibiscus sabdariffa</p>	Leaves and flowers	Could be used in curry or prepare as roselle juice	Leaves could be used to cure trichinosis, cough and removes phlegm. Flowers could be used to prevent gallstone, reduce cholesterol, lose some weight, lower blood pressure, reduces blood viscosity, reduce risk of prostate cancer for men	-
<p>Turmeric (Kunyit) (Siamese language: Kakmin) Scientific name: Curcuma longa</p>	Rhizome		Used to neutralize venom from king cobra	-

Conted...

Devil's backbone (Pokok Lipan) (Siamese language:) Scientific name: Pedilanthus tithymaloides	Entire plant	Crush leaves and apply to areas affected by centipedes bites	-	-
Kratom (Ketum) (Siamese language: Bai Thom) Scientific name: Mitragyna speciosa korth	Leaves	Boil the leaves in water and drink the decoction	Used to treat high blood pressure	-
Lansium (Langsat) (Siamese name: Bai Langsat) Scientific name: Lansium domesticum Jack	Leaves	Finely ground the leaves to extract juice and mix with rough salt	Used to treat fever	-
Papaya (Betik) (Siamese language: Malakor) Scientific name: Carica papaya	Fruits	Drink Chinese tea that is steeped in papaya fruit	Used to treat gout	-
	Papaya seeds	Boil the seeds in water, strain and drink the extract	Used to treat gout	-
Green chiretta (Hempedu bumi) (Siamese language: Fathalai churn) Scientific name: Andrographis paniculata	All parts including the roots	Boil in water, strain and drink the extract	Used to treat high blood pressure	-
Tacca cristata (Belimbing Tanah) (Siamese language: Khuang dhin) Scientific name: Tacca Cristata	Roots	Boil in water	Used to treat high blood pressure	-
Angel's trumpets (Terung pungar) (Siamese language: Ton Lamphong) Scientific name: Brugmansia	Leaves	The leaves are rubbed and applied with slaked lime	Used to treat shingles and to relieve mumps	-

Conted...

Banana (Pisang) (Siamese language: Kluai) Scientific name: Musa	Fruits	To be eaten	To dislodge fish bone stuck in throat	-
Mexican marigold (Pokok Tahi ayam) (Siamese language: Dok Dao Reang) Scientific name: Tagetes erecta L.	Flowers	Boil flowers in water with some salt. Take the decoction and gargle (place in mouth, gargle and spit out)	Used to relieve tooth ache	-
Lemon grass (Serai) (Siamese language: Ton Tak Khrai) Scientific name (botany): Cymbopogon citratus	Stalks and roots	Boil roots and stalks in water. Drink the decoction.	Used to relieve menstrual pain	-
	Stalks	Finely grind the stems of lemon grass. Place the mixture in a piece of cloth and press gently on the swollen area -Boil lemongrass stalks and drink its extract	Aids in getting rid of sweat stains, reduces swelling Aids in reducing body heat due to fever and removes poison in body	
Barringtonia (Pokok Putat) (Siamese language: Yort chik) Scientific name: Barringtonia	Tree barks	Grind the tree barks and mix with clay soil	To treat itchy skin	-
Longevity spinach (Pokok Sambung nyawa) (Siamese language: Hua ra pha) Scientific name: Gynura procumbens	Leaves	Eat one to three leaves as herbs. Boil the leaves in water and drink the decoction three times a day to treat diseases	To treat rheumatoid, viral infection, inflammation, fever, enteric infection, heart/ kidney problem, constipation, and toothache.	
Snake grass (Belalai gajah) (Siamese language: Nguang chang/ phaya yor) Scientific name: Clinacanthus nutans	Leaves	Finely grind the leaves and apply on areas that are affected with shingle or insect bites. Blend three handfuls of snake grass leaves until you get half a litre of juice. Drink the juice.	To treat shingles, skin ulcer, insect bites, swelling, fever and enteric infection. Could be used to cure non-chronic cancer	

Conted...

Piper betel (Kaduk) (Siamese language: Yot cha phru) Scientific name: Piper sarmentosum Roxb	Roots and leaves	Boil the roots with seven leaves and roots of mangosteen until bubbles break continuously on the surface. Drink the decoction.	To treat asthma, diabetes, flatulence, muscle pains, and lower blood pressure	
Spurges (Susu Nabi) (Siamese language: Nam Num Phra In) Scientific name: Euphorbiaceae	Entire plant	Uproot the plant together with its roots and clean it. Place it in drinking water and drink the decoction on daily basis.	To treat gout	
Bitter melon plant (Peria katak) (Siamese language: Phak hai khang khok) Scientific name: Momordica charantia	Leaves and fruits	Boil in water and eat as herbs	To lower blood pressure	

Source: Field work

CONCLUSION

The above discussion has shown that the Siamese community depends heavily on the plants in their traditional medicine practices. They believe that every plant has its own uses that benefit their health in general. The plants are not only utilised to treat and cure diseases, they are also used to prevent diseases. Apart from that, the plants are also good and safe to be used as they are free from chemical products and poisons. The rise of modern medicine cost in current market, has inevitably brought the Siamese community closer to the traditional medicine.

ACKNOWLEDGEMENT

This paper is part of a research project on “The use of plants in traditional medicine and health care of the Siamese community in Kedah” under the Research Acculturation Grant Scheme (RAGS), 1s Phase/2015.

ABSTRACT

The existence of the breeding habitat of *Anopheles spp.* is an indicator that malaria transmission can occur in these locations. Vector-borne disease transmission areas consist of several factors such as zoogeography, altitude, geography, geology and total area. East Nusa Tenggara Province is an archipelago consisting of three large islands; Flores, Sumba and Timor. Timor Island is surrounded by a row of hills and consists of steep slopes. Plains are generally found in the coastal areas and estuaries. Timor Island also has regional savannah and steppes. The purpose of this study was to map the anopheles adult fauna and the larva breeding habitats in various topography of the Timor Island. The method used in this study was observational, with the technique of a cross-sectional survey research. The most commonly documented breeding habit of *Anopheles spp.* on Timor Island was rice fields and rivers. The malaria vector found was *An. barbirostris*. It is necessary to become aware of the spread area of malaria in relation to the pattern of cropping and irrigation patterns, and to increase the early warning system.

Keywords: Vectors, malaria, *Anopheles spp.*, breeding places.

INTRODUCTION

Indonesia with its large and diverse geographic has more than 30 *Anopheles* species and in approximately 25% of the population residing in malaria endemic areas.¹ The existence of a breeding habitat of *Anopheles spp.* is an indicator that the transmission of the disease can occur in the location. However, regarding the flying ability of the mosquito which is a maximum of two kilometres, the location of the breeding habitat will significantly determine the occurrence of *Anopheles spp.* within the same location. The density of certain *Anopheles spp.* is an indicator that the species has the opportunity to become a vector. This is an important factor because it can determine the frequency of malaria cases as well as the intensity of malaria transmission.²

According to the Indonesian Ministry of Health, the location of vector-borne diseases is determined by the topography and the existence of vectors that can adapt to the environment and local people's lifestyle.³ A study also states that effective malaria control and elimination efforts need sufficient understanding on bionomic traits of each vector species with the geographical area.⁴ Indonesia and Papua New Guinea (PNG) Based on the location of the vector-borne disease transmission possibility, it is necessary to pay attention to several aspects, namely zoogeographic division, altitude, geographical location, geological composition and area.⁵

East Nusa Tenggara Province is an archipelago consisting of three major islands; Flores, Sumba and Timor. Timor Island and the surrounding small islands are generally hilly, many of which consist of steep slopes.⁶ Plains are generally only found in the areas near the coast and river mouths. On the island of Timor, there are also vast areas of savannah and steppe.

The purpose of this study was to map the fauna of *Anopheles spp.* adults and larvae from various breeding

habitats according to the topography of Timor Island, where the selection of regions was based on the number of malaria cases found.

MATERIALS AND METHOD

The method was an observational design with a cross-sectional approach. The sample location was chosen by considering the condition of Timor Island, which had limited or no information available about the malaria vectors of *Anopheles spp.* The study was conducted in Kupang and Timor Tengah Utara (TTU). In Kupang, the study took place in the rice field areas, while in TTU the study was conducted in hilly areas. The data was collected over nine months from March to November 2013, where for each location, the samples were taken three times. The variables were the species and the behavior of the vectors, potential breeding habitats of *Anopheles spp.*, and the physical environment. The data analysis was carried out by studying the data phenomenon examined from the results of the measurements, examinations, observations and mapping. The researchers also carried out an identification of the present *Anopheles spp.* species, calculating density, ovarian dissection, vector status checking, mapping breeding habitat locations and *Anopheles spp.* Species present, as well as determining the results of an ELISA test.

RESULTS

- 1. *Anopheles spp.* on Timor Island:** There are eight *Anopheles* species that have been caught on Timor Island, namely *An. macullatus*, *An. barbirostris*, *An. vagus*, *An. anullaris*, *An. tessellatus*, *An. flavirostris*, *An. indefenitus* and *An. aconitus*. In Susulaku B Village and Popnam Village (hilly areas), the researcher found all eight *Anopheles spp.* species. Meanwhile, in Tebatan Village (rice field area), there was no evidence of *An. Aconitus* while in Tuapanaf Village, there was no *An. tesselatus*.
- 2. Bloodsucking activity of *Anopheles spp.*:** The total number of *Anopheles spp.* caught in the study came was 1,448. The most common species caught across the five study locations was *An. vagus* (n=706) while the least caught was *An. tesselatus* (n=7). The highest number of mosquitoes was found in Tesbatan 2 Village (n=342) while the least was in Popnam Village (n=172). In Tesbatan 2, *Anopheles spp.* started biting from the beginning of the night until the morning. The peak of the biting was 7 p.m. to 9 p.m. and in the early morning, from 2 a.m. to 5 a.m. In Tupanaf, the peak started from 11 p.m. through until 4 a.m. Species domination in Kupang (rice field area) was *An. Vagus* (Table 1).

Table 1: The number of *Anopheles spp.* caught in Kupang and TTU in 2013

Species	Kupang		TTU		Total	%
	Tesbatan 2	Tupanaf	Susulaku B	Popnam		
<i>An. maculatus</i>	19	8	32	18	77	5.32
<i>An. barbirostris</i>	1	41	19	40	101	6.98
<i>An. vagus</i>	342	281	29	54	706	48.79
<i>An. anullaris</i>	100	88	106	26	320	22.11
<i>An. tesselatus</i>	1	0	3	3	7	0.48
<i>An. flavirostris</i>	4	2	4	5	15	1.04
<i>An. indefinitus</i>	80	111	2	15	208	14.37
<i>An. aconitus</i>	0	2	1	11	14	0.97
Jumlah	547	533	196	172	1.448	

In Susulaku TTU (hilly area), the peak of the *Anopheles spp.* biting time was 8 p.m. to 9 p.m. as well as 2 a.m. to 4 a.m. 7 p.m. to 8 p.m and 11 p.m. to 12 p.m. were the lowest times for *Anopheles spp.* getting caught. In Popnam, there were three peak times, namely 7 p.m. to 8 p.m., 10 p.m. to 11 p.m. and 3 a.m. to 4 a.m. In TTU Regency, there was some variance in the species caught in one catching site compared to the others. In Susulaku

B, the dominant species was *An. anullaris*, while in Popnam, it was *An. vagus*.

Six out of all 8 *Anopheles spp.* found were dissected. The most dissected species was *An. vagus* (n=405), while the least was *An. tesselatus* (n=1). The parous rate of all *Anopheles spp.* dissected was 65.15%, in which the species with the most parous rate was *An. indefinitus*. The least was *An. maculatus*.

The types and environmental condition of the breeding habitats of *Anopheles spp.* on Timor Island:

The breeding habitat of the malaria vectors found in the rice fields area were fields, rivers, puddles, springs, wells and drains. Breeding habitats found in the hilly areas were rivers, fields, puddles, swamps, pools and springs.

In the rice field area, the *Anopheles spp.* larvae were mostly found in standing water exposed to direct sunlight. Although in the breeding habitat there was a biota of blue panchax fish (*Aplocheilichthys panchax*), mosquito larvae were still found. In the hilly areas, larvae were found most often in the rivers and fields which were exposed to direct sunlight.

The spread of the breeding habitats of *Anopheles spp.* in Kupang were generally on the edge of the residential areas with a radius of 0-200 metres. Meanwhile, in TTU, the spread was in the radius of 500-2,000 metres or more. These breeding habitats were far from the residential areas even though it was still within *Anopheles spp.* flying range, which reached two kilometres.

DISCUSSION

The spreading pattern of malaria and the height of a location has a close relationship. This observed pattern is more widespread in areas that are at an altitude below 1,000 metres above sea level (m.a.s.l.) and less observed at an altitude above 1,000 m.a.s.l. This is caused by the behaviour of the *Anopheles spp.* which likes to live in lowlands.³ The spread of the breeding habitat of *Anopheles spp.* in Kupang was located on the edge of the residential area with a radius of 0-200 metres. In TTU, the radius was 500-2,000 metres or more. These breeding habitats were far from the residential areas even though it was still within the *Anopheles spp.* flying range, which reaches up to two kilometres.

The observations of the breeding habitat of *Anopheles spp.* larvae were carried out at 34 sample points. There were six different types of habitat, namely swamps, puddles, clean water reservoirs, foot sinks, livestock drinking containers and sewers. This finding is in line with the research conducted by Nurhelmi in 2012. It states that the breeding habitats of the *Anopheles* mosquitoes are also varied, with the mosquitoes generally breeding in rice fields, irrigation channels, ponds, protected swamps, low flow rivers, waterways and protected grassy springs.⁷

In general, mosquitoes prefer to live in a place that is shady, moist and safe. However, with further

observation, each species turns out to have different behaviour. For instance, the mosquitoes living in the lowlands only settle in low altitude places such as the ground, and some also land on the rice fields, river banks, swamps, kale ponds, ditches and so on. The behaviour of the mosquitoes based on the location varies greatly as the female *Anopheles spp.* has the ability to choose a breeding place according to their individual preferences and needs⁸. There are some species that likes to live in places that are exposed to direct sunlight and some prefer shady places. Meanwhile, the mosquitoes living in the highlands are commonly found in grasses, forests and also plants that live on steep cliffs.⁹

The most species caught in the five study locations was *An. vagus* and the least was *An. tessellatus*. It corresponds with a study which states that the breeding habitat of *An. vagus* was in rice fields, ponds and plants.¹⁰ Stoops et al. also found that *An. Vagus* lives lowland rice fields and adjacent to human settlements.¹¹

Anopheles barbirostris was found in both the rice fields and hilly areas of Timor Island, in which the *Anopheles* species was a malaria vector in East Nusa Tenggara.¹² In nature, *An. barbirostris* can inhabit larval habitats such as small ponds, swamps and rice fields. In general, the mosquito likes to lay its eggs in fresh clean water with water plants that arise, float or slightly arise on the surface. In Indonesia, the largest population of the mosquito is associated with rice cultivation or rice fields.¹³ Wigati et al. also found *An. barbirostris* in abandoned fish ponds, small puddles near the coast, rice fields, irrigated waterways and water reservoirs from springs. *An. barbirostris* larvae prefer clear water whose water flow is calm or slightly flowing, such as ponds, springs and other places with water accumulation.¹⁰

An. macullatus has been confirmed as a vector on the Java and Sumatra Islands and has an ecological distribution in both plantation and forest areas in valleys or mountains. Another study also found that *An. macullatus* is also found in a singular hilly area in Jambi Province.¹⁴

In Susulaku B Village, TTU Regency (a hilly area), the peak of *Anopheles spp.* biting times was at 8 p.m. to 9 p.m. as well as 2 a.m. to 4 a.m. Meanwhile, 7 p.m. to 8 p.m. and 11 p.m. to 12 p.m. was the lowest time for being bitten by *Anopheles spp.* In Popnam Village, there were three peaks for biting encompassing 7 p.m. to 8 p.m., 10 p.m. to 11 p.m. and 3 a.m. to 4 a.m. According to a study by Santoso conducted in Purwodadi (2012), the biting times of *Anopheles spp.* also varied, ranging from 11:00 p.m. to 12 p.m.¹⁵ while another study conducted in

Ranoketang Tua Village stated that the peaks occurred at 12 p.m. to 1 a.m; 11 p.m. to 12 p.m. was also a lot, but not as significant as one hour afterwards.¹⁶

CONCLUSION

This study has concluded that the main breeding habitat of *Anopheles spp.* in East Nusa Tenggara was in the paddy fields and rivers. In the selected province, the *Anopheles spp.* found were *An. maculatus*, *An. barbirostris*, *An. vagus*, *An. annularis*, *An. tessellatus*, *An. flavirostris*, *An. indefinitus* dan *An. aconitus*. The vectors of malaria found were *An. barbirostris*, confirmed in East Nusa Tenggara and *An. aconitus*, confirmed on Java Island. The spread of the vector of *An. barbirostris* was found in four study places, including Tesbatan, Tuapanaf, Popnam and Susulaku B Villages. Meanwhile, *An. aconitus* was found in three study places; Tuapanaf, Popnam and Susulaku B Villages.

RECOMMENDATION

The control of larvae in the rice field habitat must be undertaken by regulating cropping and irrigation patterns. The malaria control methods must be based on local data and information specific to each region, because the control programs of some regions were less effective compared to other regions. *Anopheles spp.* which was confirmed as a vector in East Nusa Tenggara, has a habitat ranging from coastal lowland to higher altitude areas, therefore early vigilance must be implemented in all places.
