Developing Community Resilience as a Supporting System in the Care of People with Mental Health Problems in Indonesia

Retno Lestari¹, Ah Yusuf²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Nursing, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

People with mental disorders have complex disabilities which make them need other people's assistance in doing their daily living activities. Community resilience is one of the capacities which is needed to make a healthy environment for mental disorder patients. This study aims to describe how community resilience can be a supporting system in the care of people with mental disorders. A literature review was conducted in order to obtain 98 reference sources. Only 15 articles were eligible to be reviewed. The community resilience's supporting system consists of providing social, physical and economical infrastructures through employment opportunities or financial support and a decent life. Interactions between community members and people with mental disorders become a positive relationship, helping people with mental disorders to carry out their activities and to become independent. It also has an impact on decreasing the symptoms of relapse as well as reducing the level of dependency that cause them to continue to be a burden on their families, communities and global society.

Keywords: *community resilience, mental health, supporting system*

INTRODUCTION

The number of people with mental disorders, which is increasing with the years, is becoming a burden for families, communities and the global health care system. In 2016, the prevalence of psychiatric patients in the United States reached around 44.7 million people who were more than 18 years old. This number indicates that 18.3% of Americans suffer from a type of mental disorder.¹ In Indonesia, the prevalence of severe mental disorders, such as schizophrenia, reached around 400,000 people, or as many as 1.7 per 1,000 population. In addition, the prevalence of emotional and mental disorders as indicated by symptoms of depression and anxiety for those aged 15 years old and over reached about 14 million people or 6% population.²

The community is one of the support systems that can facilitate the recovery of mental disorders with the opportunity to live independently, to participate in community activities, to interact with others and to attach themselves to their daily environment. The community has an important role in creating positive support and wide opportunities for people with mental disorders for them to be fully involved in every event in the community.³⁻⁵

Previous studies explain that people with mental disorders also have awareness and the responsibility to deal with reality and to fulfil their actualisation. They understand expectations, goals, and responses to social needs and are able to work independently. They want to be recognised like any other individual who is able to adapt to society, despite experiencing inconsistencies in their way of thinking. If they only live in the hospital, what they see is only a group of people with mental disorders, and they can feel like life has stopped. Thus, support for people with mental disorders is needed, especially from the community around their homes. When they live with healthy individuals, they can plan for a better future.^{6,7}

The treatment of mental disorders requires integration between adequate mental health services and

opportunities for the sufferers to develop themselves. The key points are the provision of information about their conditions, the opportunity to develop themselves, the chance to foster hope of them recovering from their mental disorders and the importance of mental health services' role in the community in providing positive emotional control for people with mental disorders.^{8,9}

The existence of positive support from the community can prompt motivation in the patients for them to get up and recover from mental disorders. The forms of support obtained can be varied, such as the existence of positive assessments, being given the opportunity to tell stories, to be listened to by others and to be able to engage in activities that exist in the community.^{7,10} recovery oriented experiences are required which recognise the holistic and diverse needs of individuals. Aim: The aim of the study was to examine the experiences of people living with a mental illness who participated in a recovery oriented program called Recovery Camp. The study aimed to examine how the program may have related and contributed to their mental health recovery. Methods: A descriptive phenomenological approach guided the study. Consenting participants (n = 5

The discovery of various factors affecting individuals and community mental health shows that people with mental disorders who live in the community can recover with community support. This study has intended to describe how community resilience can be used as a support system in the care of people with mental disorders.

METHOD

This study was a systematic review which used some of the literature from 98 articles obtained from Science Direct, Google Scholar, Proquest Health, Medical Complete, Proquest Nursing, Allied Health Source, Proquest Psychology Journals and Proquest Science Journals dating from 2008 to 2018. The inclusion criteria used were health or related research articles published in the last 10 years, research articles on topics about the community as a support system in the treatment of mental disorders, and research articles discussing the concept of community resilience.

Based on a literature review of 98 articles obtained from the listed databases, there were 50 articles that fulfilled the inclusion criteria. However, there were only

15 articles that discussed in detail about community resilience and the ability of the community to support the care of people with mental disorders.

RESULTS

Gillard et al. states that the care of mental illness sufferers has two main keys; a positive personal relationship (oneself) and wider social interactions (others).¹¹ Self-awareness and positive self-acceptance give the individual the ability to reconcile themselves between the outside world and the internal mind. Self-recovery in mental disorders is the concept of balance between internal and external worlds. Table 1 shows the results of a literature review that discusses community resilience and community capacity in supporting the care of people with mental disorders.

DISCUSSION

Conflicts, stress and exposure to hazards can cause crises in the community system. Resilience is the ability of individuals or groups to react and move away from stress or exposure to stressors. Resilience describes the dynamic process of adapting to the crisis situation faced by the people.¹² Resilience can be analogous to the philosophy of a bamboo plant, in which if it is exposed to the wind then it will bend and move, but in the end, it can return to its original position.¹³

Community resilience is the method or ability of a community to show its resilience when facing existing stresses to restore their productivity through daily activities.¹³ Resilient communities have become the nearest supporting system for people with mental disorders. Nowadays, resilience is defined as a process rather than a result. Resilience is the capacity of the system to face or recover from disturbances as well as changes that threaten adaptation or development functions. There are two stages in which resilience is considered to be a process, namely: 1) the disturbance or stressor that significantly affects the system and 2) the resilience capacity system that shows an ability to adjust and recover from the occurrence of trauma.¹⁴

The mechanism of resilience activation occurs throughout three stages, namely liminal suspension, compassionate witnessing and relational redundancy. Liminal suspension means the time of crisis in which individuals mutually reinforce each other in relation to their interpersonal relationships. Compassionate witnessing means how individuals within the

community are bound together and help to fulfil the needs of one another. Relational redundancy means coordination between the sources of the organisation concerned with strengthening resilience. When a critical situation arises, the group of people will gather, interact and perform in a variety of ways that can enable their existing capacity to survive and achieve resilience.¹⁵

Teo et al. found that the mechanism of resilience activation occurs during an exposure to stressor or crisis events. However, the existence of a stressor can generate resources in the community to strengthen interpersonal relationships, especially helping in the recovery of people with mental disorders in the community.¹⁶

Cohen et al. explained that community resilience involves local organisations and existing policies applied locally and regionally when strengthening resilience. Effective leadership is a leader who is able to interact with other community members and who can meet the needs desired by all members of the community. Community leaders have an important role in improving community resilience, primarily by focusing on the needs and demands of the local community.¹⁷

The involvement of a local government is needed in enhancing community resilience, including the development of access to technology that can support sources of social and economic capital. Increasing the productivity of community members through economics supported by local governments can increase resilience.¹⁸

There are several strategies for the reconstruction and revitalisation of sources of social capital after a crisis, including strengthening social networks and communities, building social organisations, and macro-social policies that can improve people's access to resources and power. In the aspect of social capital, social networks are important aspects that can affect mental well-being.^{3,19-21}

Several previous studies have explained that economic resources are the most significant aspect in relation to building resilience. When individuals have suitable jobs and are in line with local needs, this will also increase the adaptive capacity of the community. A resilient community is a community that has the capacity to innovate and provide mutual support to other members of the community, including making a person with a mental disorder able to engage in productive activities in the community.¹⁰

Community resilience is an important focus of attention which can lead to positive attachments between people with mental and community disorders. Resilient communities are able to provide opportunities for sufferers to live like other individuals, who are able to be independent and work for themselves and others.

CONCLUSIONS

Community resilience is the capacity that is owned by the community that becomes an appropriate supporting system in the care of people with mental disorders living in the community. The increase in the provision of social, physical and economic infrastructure along with the interaction between community members and mental disorder patients is positive; helping people with mental disorders to carry out their daily activities and to become independent. This will also have an impact on decreasing the symptoms of relapse as well as reducing the level of dependency that will continue to be a burden on families, communities, and global society.

Effects of Knowledge of Vitamin D on Attitudes toward Sun Exposure among Middle-Aged and Elderly Indonesian Adults

Rivan Virlando Suryadinata¹, Bambang Wirjatmadi², Merryana Adriani², Sri Sumarmi²

¹Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia, Airlangga University, Surabaya, Department of Public Health Science, College of Medicine, University of Surabaya; ²Faculty of Public Health, Airlangga University, Surabaya

ABSTRACT

Introduction: Vitamin D deficiency may contribute to certain health problems among senior people. Excessive body weight lowers the vitamin D level. Hypovitaminosis D affects older adults, with a greater risk of infection, disease, type 2 diabetes, cardiovascular disease, stroke, and dementia. However, little is known as to what extent the knowledge of vitamin D's benefits contributes to the attitude toward sunlight exposure among people at risk of hypovitaminosis D.

Aim: The objective was to investigate the effect of knowledge of vitamin D on attitudes toward sunlight among 166 middle-aged and elderly people in East Java, Indonesia.

Method: We conducted an observational study using a case control design. The sample was purposively recruited among visitors consulting the geriatric clinic at a community health centre in Sidoarjo, East Java, Indonesia. Each case and control group consisted of 83 men and women aged 46 years old or older. The assignment of subjects to each group was determined based on their body mass index (BMI). A standardised questionnaire was delivered to the study subjects to obtain data on their knowledge and attitudes related to vitamin D. A Chi square test was performed to assess the difference between the obese group and the non-obese group.

Results: Our study found no significant difference in relation to the knowledge of vitamin D between the two groups ($p=0.436$). However, the two groups showed a significant difference in attitude toward sun exposure ($p=0.030$).

Conclusion: No significant effect was found between knowledge of vitamin D and attitude toward sun exposure among the adults.

Keywords: *knowledge, attitude, geriatric, vitamin D, obesity*

INTRODUCTION

Vitamin D deficiency has affected more than one-third of the population worldwide across all ethnic and age groups.¹ It is indicated by a lower 25(OH)D level, of less than 50 nmol/L in the body.^{2,3} Lifestyle and environmental changes are considered to have a significant contribution toward lower vitamin D levels. Lack of vitamin D is an independent factor of the increased mortality caused by non-communicable diseases such as heart disease, osteoporosis, diabetes, autoimmune and cancer.⁴ The high prevalence of vitamin D deficiency has become a public health concern as it relates to the increased risk of various chronic diseases

and the high prevalence of osteoporotic hip fractures among older adults.¹ In addition, excessive body weight increases the risk of vitamin D deficiency which could also negatively affect bone.⁵

Having a vitamin D deficiency increases the risk of frailty among older adults.⁶ Geriatric syndrome and impaired physical activity are usually considered to be multidimensional clinical conditions in the elderly. Geriatric syndrome is characterised by functional decline, low cognitive status, and increased exogenous and endogenous stress.⁷ Functional decline, especially in relation to physical functions, may result in frailty, limited mobility, and death. Although vitamin D can be obtained from food and supplements, having sufficient sun exposure is beneficial in order to stimulate the skin to produce vitamin D.⁴ On the other hand, as the human body ages, the skin's capacity to produce vitamin D3 decreases.⁸ Therefore, the elderly have a higher risk of vitamin D deficiency than younger people.

Lack of knowledge on the importance of sun exposure for vitamin D synthesis in the body may induce an avoidance of sun exposure.^{9,10} Most people prefer to stay, work, and exercise indoors or behind glass that is anti-ultraviolet (UVB) than be directly exposed to sunlight. Wearing closed-off clothing and using regular sunscreen may block the UVB transmission which is intended to prevent sun-related skin aging, reduce the risk of skin cancer, and avoid undue skin discoloration.¹¹ Our study aims to assess the difference between two groups on the knowledge of vitamin D and their attitude toward sunlight exposure.

METHOD

Research design: This study employed an observational research design using a case control method. A structured questionnaire was administered to the study subjects to understand their level of knowledge and attitude relevant to vitamin D.

Population and sample: The population of this study was the visitors of a geriatric consultation clinic at Taman community health centre in Sidoarjo district, in the East Java province of Indonesia. The age of the population was 45 years old or older. The inclusion criteria were no disability, that they were able to read and write, and had no co-morbidity such as cardiovascular disease, stroke,

respiratory disease, or liver disease. The exclusion criteria were that they were unwilling to participate in the study. The participants were recruited using purposive sampling selection. The obese participants were assigned to the case group, while the non-obese participants were assigned to the control group. A threshold body mass index (BMI) level of 27 or higher was set up to classify participants in the obese group. Other male and female participants with lower BMI levels than the threshold were included in the normal weight group. To obtain the BMI level, body weight and height were measured for each participant. The BMI level was calculated through dividing the body weight (kilograms) by the square of the height (meters).

Sample size: To calculate the sample size, we adopted the following formula:

$$n = \frac{N}{1 + N(d^2)}$$

N in a capital letter is the size of the population, while n in a small letter represents the sample size. The confidence level was set at 0.1. The total population in this study was 500 people, based on the average number of monthly visits to the geriatric clinic of the study location in 2017. Therefore, the sample size calculation and the result has been presented in the following equation:

$$n = \frac{500}{1 + 500(0,1^2)} = 83 \text{ orang}$$

The minimum number of study participants for each case and control group was 83 people.

VARIABLES

The study variables were knowledge and attitude. Each variable had an assessment category of poor and good based on the scores obtained from the questionnaire answers. A participant was considered to have good knowledge if his/her total score of knowledge was 6 or higher. A total score below 6 was considered as having poor knowledge. The variable of attitude had 9 questions related to the participant's attitude toward sun exposure. Each item of questions was given a score of 2 for an answer related to a higher risk of vitamin D deficiency. A total score of 10 or higher was marked as having a good attitude, while a lower score than 10 represented a poor attitude.

DATA COLLECTION AND ANALYSIS

Prior to the data collection, the validity and reliability of the standardised questionnaire was tested, involving a convenience sample of 30 homogeneous respondents. To assess the validity of the questionnaire, the Pearson Product Moment Correlation was performed using SPSS software. The test was conducted by correlating the scores of each item of the questionnaire with the total score. Each question with a statistically significant value < 0.05, and count value $r > r$ in the product moment table was concluded as a valid item. The questionnaire reliability was assessed using Cronbach’s coefficient alpha to estimate the internal consistency of the questionnaire items. A minimum Cronbach’s alpha value was determined to be 0.61 to be considered for inclusion in the questionnaire.

The measurement scale used in the present study was ordinal data presented in two categorical variables (poor and good). The data was analysed using the chi-square test to examine the difference between the obese group and the non-obese group on their knowledge of vitamin D deficiency and their attitude toward sun exposure. The difference between the obese and non-obese participants was concluded to be statistically significant when the p-value was 0.05 or less.

RESULTS

Table 1 displays the characteristics of the study participants. Females were the majority in both the obese group (84.3%) and the non-obese group (60.2%). Most of the participants were aged between 56 and 65 years old in both the obese group (45.8%) and the non-obese group (53.0%).

Table 1: The frequency distribution of the participant’s characteristics

Characteristics		Groups	
		Obese n (%)	Non-Obese n (%)
Gender	Female	70 (84.3)	50 (60.2)
	Male	13 (15.7)	33 (39.8)
Age (years)	46-55	29 (34.9)	25 (30.1)
	56-65	38 (45.8)	44 (53.0)
	>65	16 (19.3)	14 (16.9)

Table 2 presents the results of the chi-squared test when analysing the difference in the knowledge score between the obese group and the non-obese group. More

than half of the obese group (57.8%) and the non-obese group (51.8%) have a good knowledge of vitamin D deficiency. The percentage of subjects with a good level of knowledge was slightly higher in the obese group than the non-obese group. The chi-square test generated a p-value of 0.436, indicating that no significant difference between the two groups was observed related to the knowledge of vitamin D deficiency.

Table 2: The chi-squared test results of the knowledge of vitamin D deficiency

Knowledge	Groups		P Value
	Obese n (%)	Non-Obese n (%)	
Good	48 (57.8)	43 (51.8)	0.436
Poor	35 (42.2)	40 (48.2)	
Total	83 (100.0)	88 (100.0)	

The chi-square test on the attitude toward sun exposure has been presented in Table 3. Most of the participants in the obese group showed a poor attitude toward sunlight (57.8%). In the non-obese group, most of the participants had a good attitude toward sun exposure (59.0%). The results of the chi-square test showed a p-value of 0.030, indicating that there is a significant difference between the two groups in relation to their attitude toward sun exposure.

Table 3: The chi-squared test results of the attitude toward sun exposure

Attitude	Groups		P Value
	Obese n (%)	Non-Obese n (%)	
Good	35 (42.2)	49 (59.0)	0.030
Poor	48 (57.8)	34 (41.0)	
Total	83 (100.0)	83 (100.0)	

DISCUSSION

The participants in our study were dominated by those of the female sex whose age was between 56 to 65 years old. The World Health Organisation (WHO) determined 60 years old to be the cut-off standard for the older population.¹² The proportion of middle-aged people in the present study was less than 30% in both groups.

Our study showed no significant difference between the obese group and the non-obese group on the

knowledge of vitamin D deficiency. More than half of the study respondents had a good knowledge score. This result indicates that the importance of having sufficient vitamin D is well understood by both groups. A previous study reported that having a good level of knowledge on vitamin D significantly contributes to the positive behavior in maintaining the vitamin D sufficiency.¹³

Vitamin D has a pivotal role in regulating the absorption of calcium and phosphorus in order to maintain optimum bone mineral density.³ Vitamin D has two forms, namely vitamin D2 and vitamin D3. Vitamin D2 is a 28-carbon molecule derived from ergosterol, which is a component of fungal cell membranes. Vitamin D3 is a 27-carbon derived from cholesterol.¹⁴ Vitamin D3 (cholecalciferol or D3) is synthesised in the skin in response to the effect of sunlight (eUVB) with a wavelength of 295-297 nm.² The UV-B skin irradiation triggers the photolysis of 7-dehydrocholesterol (pro-vitamin D3) to pre-vitamin D3, which is rapidly converted to vitamin D3 at skin temperature.

Vitamin D2 and vitamin D3 are produced from the skin undergo sequential hydroxylation. Hydroxylation firstly occurs in the liver (25 [OH] D) and secondly, takes place in the kidney which leads to the biological form of active 1,25-dihydroxyvitamin D (1.25 [OH] 2D).¹⁵ Furthermore, the 1.25 [OH] 2D will bind to the vitamin D receptor (VDR), which can increase the absorption of calcium and intestinal phosphorus. Vitamin D is also actively involved in bone formation, resorption, mineralisation, and the maintenance of neuromuscular function. In addition, 1.25 [OH] 2D can also inhibit serum parathyroid hormone (PTH) levels through a negative feedback mechanism, by increasing serum calcium levels. This process leads to a regulation of bone metabolism through VDR activation in osteoblast and adult osteoclast formation.¹⁶

In a body with vitamin D deficiency, the small intestine can only absorb approximately 10% -15% of the calcium ingested. In a normal vitamin D level context, the body can absorb 30% - 40% of the calcium from food. Therefore, low levels of vitamin D (25 [OH] D) may hamper calcium absorption, which has some clinical implications, not only in relation to the bone but also some of the major metabolic functions.¹⁵ Vitamin D also has an important function in minimising tissue damage by lowering oxidative stress. Muscles are one of the susceptible tissues easily exposed to free radicals. Muscle tissue is composed of approximately 40% of the total body mass. Various toxicities such as infection,

ischemia, and inflammation may cause further damage to the muscle cells. The damaged muscle cell would release the myoglobin or protein in the muscle into the bloodstream, which is dangerous for the kidneys and may cause kidney failure.¹⁷ A higher amount of free radicals from the muscle damage, more than the antioxidants of the body, would eventually aggravate the organ damage.

Although there was no significant difference regarding the knowledge of vitamin D deficiency, the two groups of this study presented a significant difference in the attitude toward sun exposure. The obese group had a higher proportion of poor attitude, which reflects having less sun exposure than the non-obese group. One possible explanation is that obesity contributes to a low level of participation in physical activity.¹⁸ The elderly with obesity may have a fear of falls and may also have a certain degree of physical immobility that prevents them from taking part in recreational physical activity outdoors¹⁸, thus they have less exposure to sunlight. A previous study reported that the prevalence of vitamin D deficiency is 35% higher among obese people.¹⁹ Poor attitude toward sun exposure to increase the vitamin D sufficiency increases the risk of the elderly with obesity from contracting various non-communicable diseases.

CONCLUSION

Our study presented a non-significant difference in the knowledge of vitamin D deficiency. However, the two groups have a significant difference in their attitude toward sun exposure. Having good knowledge is important to prevent the risk of vitamin D deficiency. However, it may not be sufficient to drive the expected attitude. Therefore, understanding people's constraints in relation to sun exposure is important, and in need of further investigation.

The Effects of Age and Body Mass Index on Blood Glucose, Blood Cholesterol, and Blood Pressure in Adult Women

Riza Fikriana¹, Shrimarti Rukmini Devy²

¹Doctoral Program of Public Health, ²Department of Health Promotion and Behaviour Science, Faculty of Public Health, University of Airlangga, Surabaya, Indonesia

ABSTRACT

Introduction: The risk factors of cardiovascular disease include having a high body mass index, hyperglycemia, hypercholesterolemia and increased blood pressure. The purpose of this study was to analyse the effects of age and body mass index (BMI) on blood glucose, blood cholesterol and blood pressure in adult women.

Method: An analytical observation using a cross-sectional method was employed as the study design. The study recruited 60 women aged between 30 to 60 years old to participate, using a purposive sampling technique. The data was analysed using univariate analysis and path analysis.

Result: Age and BMI showed as having the strongest direct effect on the blood pressure. Age also had a direct effect on blood glucose level and blood cholesterol level. The effect of age on blood glucose and blood cholesterol was also mediated by BMI.

Conclusion: Being of an older age had a direct effect on increased blood glucose, blood cholesterol, and blood pressure, while a higher BMI had a direct effect on increased blood pressure. As women get older, maintaining a normal BMI is beneficial to preventing the increase of their blood glucose, blood cholesterol and blood pressure.

Keywords: age, body mass index, blood glucose, blood cholesterol, blood pressure

INTRODUCTION

Cardiovascular disease is a public health problems and the leading cause of death in both developed and developing countries.^{1,2} Globally, the number of deaths due to cardiovascular disease is estimated to have increased from 16.7 million in 2002 to 23.3 million in 2030.³ In Indonesia, coronary heart disease is the second leading cause of death after stroke, contributing to 12.9% of the overall mortality rate.⁴

Several risk factors have been identified as a contributing factor to cardiovascular disease including

age, increased body mass index, hyperglycemia, hypercholesterolemia and increased blood pressure.^{2, 5-8} The risk of cardiovascular disease in females is greater than in males, with the influence of conventional factors such as high blood pressure, high cholesterol, diabetes, excessive body weight, and factors related to psychosocial condition and socioeconomic status.⁹ In addition, hormonal changes throughout a woman's stages of life that affect the cardiac conduction system and the structure and function of the blood vessels, and systemic inflammation could cause cardiovascular disease.^{10, 11} The purpose of this study was to analyse the effect of age and body mass index (BMI) on blood glucose, blood cholesterol and blood pressure in adult women.

METHOD

Study design, setting, and sample size: This study employed an analytical observational design method with a cross-sectional method. The study was conducted

Corresponding Author:

Riza Fikriana

Doctoral Program of Public Health,
Faculty of Public Health, Universitas Airlangga,
Mulyorejo, Surabaya, Indonesia
Email: riza.fikriana-2017@fkm.unair.ac.id

in Malang district, East Java, Indonesia. Using a purposive sampling method, 60 women aged between 30 to 60 years old were recruited to participate in the study.

Variables and the instrument of the data collection:

There were five variables in the study, including age, BMI, blood glucose, blood cholesterol, and blood pressure as described below.

- a. **Age:** The data of age was obtained from the sociodemographic characteristics of the respondents stated during the data collection. Other sociodemographic data included marital status, employment status and co-morbidity.
- b. **Body mass index (BMI):** The body mass index was obtained from the measurement of body weight (kg) and height (m). The formula to calculate the BMI is as follow: (weight (kg) / weight (m))². BMI was classified as underweight (BMI <20 kg/m², normal (BMI= 20-24.9 kg/m²), overweight (BMI= 25-29.9 kg/m²), and obesity (BMI≥30 kg/m²).⁷
- c. **Blood glucose:** The blood glucose was measured based on the capillary blood glucose level (mg/dl) using a glucose meter. For the purpose of this study, blood glucose was measured from a random glucose test. A blood glucose level of less than 200 mg/dl was categorised as normal and a level of 200 mg/dl or higher was classified as hyperglycemia.
- d. **Blood cholesterol:** Blood cholesterol was measured from the total blood cholesterol level obtained from peripheral blood (mg/dl) using a finger-stick cholesterol test. The blood cholesterol level was considered to be normal at less than 200 mg/dl, and hypocholesteremic at 200 mg/dl or higher.
- e. **Blood pressure:** The blood pressure level was measured using a sphygmomanometer. The results of the Systolic Blood Pressure (SBP) and Diastolic Blood Pressure (DBP) measurements of each study participant were recorded on an observation sheet. Using the Joint National Committee’s 8 guidelines, the blood pressure level was categorised as normal for the SBP < 120 mmHg and DBP < 80 mmHg, pre-hypertension for the SBP 120 – 139 mmHg and DBP 80 – 89 mmHg, hypertension stage 1 for the SBP 140 – 159 mmHg and DBP 90 – 99 mmHg, and hypertension stage 2 for the SBP ≥ 160 mmHg and DBP ≥ 100 mmHg.¹²

Ethical consideration and the data collection: Before the data collection, all of the study participants were provided with information about the study and the right to withdraw at any time. A written informed consent was submitted by participants to indicate agreement to participate in the study. After filling in the questionnaire with their age, marital status, and current employment status, participants were measured for their blood pressure level, blood glucose level and blood cholesterol level.

DATA ANALYSIS

The data was analysed using descriptive analysis to describe the sociodemographic characteristics and the clinical characteristics of the participants. The data was then analysed using path analysis.

RESULTS

Sociodemographic and clinical characteristics of the study participants: As shown in Table 1, more than half of the subjects (63.3%) were aged between 30 to 45 years old. The majority of the women were married (88.3%) and unemployed (68.3%). Based on their clinical status, the majority of them did not have diabetes mellitus as a co-morbidity as indicated by the high percentage of women (91.7%) with normal random blood glucose level. The majority of the subjects had a normal BMI (45%). Most of the study subjects had a normal blood cholesterol level (51.7%), and normal blood pressure (35%).

Table 1: Sociodemographic characteristics and clinical characteristics of the study participants

Characteristics		Total	
		N	%
Socio-demographic characteristics			
Age (years)	30–45	38	63.3
	≥ 46	22	36.7
Marital status	Married	53	88.3
	Single/Divorce/ Widowed	7	11.7
Employment status	Employed	19	31.7
	Unemployed	41	68.3
Clinical characteristic			
Diabetes mellitus as co-morbidity	Yes	5	8.3
	No	55	91.7

Conted...

Body mass index	Underweight	7	11.6
	Normal	27	45.0
	Overweight	15	25.0
	Obesity	11	18.4
Blood glucose	Normal	55	91.7
	Hyperglycemia	5	8.3
Blood cholesterol	Normal	31	51.7
	Hypercholesterolemia	29	48.3
Blood pressure	Normal	21	35.0
	Pre-hypertension	19	31.7
	Hypertension stage 1	14	23.3
	Hypertension stage 2	6	10.0

Path analysis: As shown in Figure 3, the diagram path presented the results of the path analysis on the effects of age and BMI on blood glucose, blood cholesterol and blood pressure among the women participating in the study. There were four paths with significant relationships. The first significant direct effect was in age (X1. Usia) → blood glucose (Y1.GD). The second significant direct effect was age (X1. Usia) → blood

cholesterol (Y2.KD). The third significant direct effect was age (X1. Usia) → blood pressure (Y3.TD). The fourth significant direct effect was shown in BMI (X2. IMT) → blood pressure (Y3.TD).

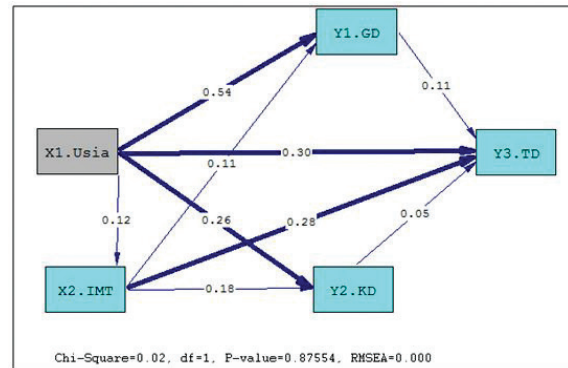

Figure 1: Results of the path analyses with their beta coefficient value

Table 2 presents the results of the path analysis displaying the effect values of age related to blood glucose, blood cholesterol and blood pressure. Each path described the direct or indirect effect of age on blood glucose, blood cholesterol and blood pressure. BMI was entered as the mediating variable.

Table 2: The path effect value of age on blood glucose, blood cholesterol, and blood pressure

No.	Path of variable	Effect value	Total effect
1.	Age → Blood Glucose	0.54	0.553
2.	Age → BMI → Blood Glucose	0.12 x 0.11 = 0.0132	
3.	Age → Blood cholesterol	0.26	0.282
4.	Age → BMI → Blood cholesterol	0.12 x 0.18 = 0.0216	
5.	Age → Blood Pressure	0.30	0.409
6.	Age → Blood Glucose → Blood pressure	0.54 x 0.11 = 0.0594	
7.	Age → Blood cholesterol → Blood Pressure	0.26 x 0.05 = 0.013	
8.	Age → BMI → Blood Cholesterol → Blood Pressure	0.12 x 0.18 x 0.05 = 0.0011	
9.	Age → BMI → Blood Glucose → Blood Pressure	0.12 x 0.11 x 0.11 = 0.0015	
10.	Age → BMI → Blood Pressure	0.28 = 0.034	

The first path showed a direct effect between age (X1) and blood glucose (Y1), while the second path had BMI as the mediator variable (X2). The effect value in the first path was 0.54. The value of this effect was unidirectional. As the women got older, their blood glucose levels tended to increase by 0.54 times. In the second path, the effect value was 0.013. The direction showed an order of effect that indicated that older age with

the BMI increase as the mediation would increase the blood glucose level by 0.013 times. The total effect of the relationship between age and blood glucose was 0.553 times.

The third and fourth paths showed the effect between age (X1) and blood cholesterol (Y2). The third path presented a direct path, while the fourth path had a direction with BMI as the mediating variable (X2). The effect value of the third path was 0.26, while the

fourth path was 0.0216 after being mediated by BMI. The total effect of the relationship between women's age and blood cholesterol level was 0.282. This effect value indicated the unidirectional path which explained that growing older would lead women to have an increased blood cholesterol level by 0.282 times.

The paths from the fifth to the tenth were the pathway between age (X1) and the blood pressure variable (Y3). While the fifth path had a direct line between age and blood pressure level, the sixth path up to the tenth path were each mediated by BMI, blood glucose, and blood cholesterol respectively. The total of the effect value from the fifth to the tenth paths was 0.409. The unidirectional effect value means that the increased age of women would lead to the increasing blood pressure level by 0.409 times.

This finding indicates that the women's age had a strong significant effect on blood glucose, blood pressure, and blood cholesterol respectively. The women's BMI had a significant effect on blood pressure.

DISCUSSION

Age was shown to have a strong effect on blood glucose level, blood pressure level, and blood cholesterol level. The blood glucose level tends to rise along with an increase in age. The results of this study confirmed the findings of previous studies.^{13, 14} Aging has a correlation to the changes in glucose metabolism in the blood system, including insulin resistance and cell dysfunction.^{15, 16} The effectiveness of insulin could be decreasing due to an increase in abdominal fat mass, low physical activity, mitochondrial dysfunction, and hormonal changes.^{17, 18}

The strong effect of age on the women's blood pressure level has been shown in the present study. This finding was consistent with previous studies that reported that increased blood pressure level was significantly associated with increasing age.¹⁹⁻²¹ Aging causes changes in the structure of the arteries, so then the arteries become more rigid.²² The increase in blood pressure may occur due to an unhealthy lifestyle, such as a high salt intake and high sugar consumption.²³ A high level of salt in diet can cause changes in vascular smooth muscle cells, which results in the accumulation of collagen in the walls of the arteries, thus increasing arterial stiffness.²⁴ For women, approaching the menopausal period cause a greater risk of increased

blood pressure level than men. The mechanism of the blood pressure rise involves multiple factors such as decreased oestrogen levels, oxidative stress, endothelial dysfunction, and the influence of the renin angiotensin system and sympathetic activation.²⁵

Another strong effect was also found between the women's age and blood cholesterol level in this study. The aging process results in changes in the cholesterol metabolism of the blood. These changes cause an increase in Low Density Lipoprotein (LDL) cholesterol. The balance between intake, synthesis, absorption, and excretion affects the cholesterol metabolism of the human body.²⁶

Body Mass Index (BMI) affects blood pressure level. This finding supports the results of previous studies that illustrated the significant relationship between BMI and blood pressure.^{19, 23} A high level of BMI affects blood pressure. Practicing a healthy lifestyle and controlling bodily weight should be encouraged in order to prevent an increase in blood pressure.^{25, 27, 28}

CONCLUSION

Age has a significant effect on blood glucose, blood pressure, and blood cholesterol, while BMI has a significant effect on blood pressure. Aging puts women at a greater risk of having an increased level of blood glucose, blood pressure, and blood cholesterol. The risk escalates for older women with a high BMI. To maintain a normal level of blood sugar, blood cholesterol, and blood pressure, the risk factors should be controlled. While aging is inevitable, BMI level can be managed by practicing a healthy lifestyle such as reducing fat, salt, and sugar intake in their diet, promoting physical activity, and maintaining a normal body weight.

The Antioxidant Activity and Organoleptic Properties of Soursop Leaf Tea (*Annona Muricata L.*) and Moringa Leaf (*Moringa Oliefera L.*) in Combination with Guava Leaf (*Psidium Guajava*)

Roy J. Irawan¹, Trias Mahmudiono²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Soursop leaf tea (*Annona muricata L.*) and drumstick tree leaf tea (*Moringa oliefera L.*) in combination with guava leaves (*Psidium guajava*) are innovative herbal drinks from Indonesia. Soursop, drumstick and guava leaves contain antioxidant compounds such as tannin, saponin, flavonoids, alkaloids, triterpene and quercetin. This study aims to compare the antioxidant activity and organoleptic properties between soursop leaf tea and drumstick tree leaf tea in combination with guava leaves. The study was conducted through analysing the production of tea with an overall drying temperature at 50 °C, 55 °C, 60 °C and 65 °C respectively. The antioxidant activity was measured using the UV-Vis spectrophotometric method (λ 517 nm), while the organoleptic properties were measured using the parameters of taste, colour aroma, and viscosity. The highest antioxidant activity was performed at a temperature of 50 °C, which measured the lowest EC50 value while having the lowest level of organoleptic properties.

Keywords: soursop leaf tea, drumstick leaf tea, guava leaf, drying temperature, antioxidant activity and organoleptic properties

INTRODUCTION

Tea is a popular type of beverage in Asia. The tea drinking culture is a socio-cultural function that bring families closer together.¹ Tea is generally made from the young shoots of tea leaves. The tea leaves have undergone the processing of withering, rolling, grinding, enzymatic oxidation and drying. Tea has been widely recognised as having various benefits not limited to being a regular daily drink, but also health benefits including its use as alternative medicine² or as a cancer drug.³

Tea is believed containing flavonoids which have are antioxidants.⁴ Almost every group of flavonoids has the capacity to act as antioxidants. Flavones and

catechins contain flavonoids that can help to protect the body against reactive oxygen species. They are associated with improved pulmonary functions and the reduction of a chronic cough.⁵ Body cells and tissues are continuously threatened by the damage caused by free radicals and reactive oxygen species, which are produced during normal oxygen metabolism or induced by exogenous damage.⁶

The development of health sciences in relation to the tea production has expanded the use of materials to not only from the tea leaves buds but also from other plants such as soursop leaves, drumstick leaves, avocado leaves and guava leaves. Soursop leaves have been widely used as a herbal medicine to treat various diseases including asthma, diabetes and seizures.⁷ The content of the compounds in the soursop leaves includes steroids/terpenoids, flavonoids, coumarins, alkaloids, and tannins. Moringa leaves can be utilised as a nutritious medicinal ingredient because of its flavonoid content, which serve as antioxidants and anti-inflammatories. Flavonoid

Faculty of Public Health, Universitas Airlangga,
Mulyorejo, Surabaya, Indonesia
Email: roy.januardi.awan-2017@fkm.unair.ac.id

compounds are known to work as antioxidants against cancer, anti-microbials, antivirals, photosynthetic regulators, and growth regulators.⁸ Moringa leaves also contain anthraquinones, alkaloids, saponins, terpenoids, anthocyanins, tannins and carotenoids.⁹

The soursop, drumstick and guava leaves can be used as a herbal tea because the dried leaves are better preserved than fresh leaves. In addition, consuming the dried leaves as a herbal tea is also more practical. In the tea factory, the drying process aims to reduce the water level of the fresh tea leaves. The drying process should maintain the drying temperature, so then the active components of the leaves can be preserved. Therefore, it is important to investigate what is the optimum drying temperature in order to produce good quality tea with organoleptic properties. The aim of this study was to compare the antioxidant activity and organoleptic characteristics between soursop leaf (*Annona muricata* L.) and moringa leaf (*Moringa oleifera* L.) in combination with guava leaf (*Psidium guajava*).

MATERIAL AND METHOD

Materials: Soursop leaves, drumstick leaves and guava leaves were collected. Some of the tools and instruments prepared included a water level test (AOAC, 1995), a qualitative test of the phenolic and flavonoids compounds¹⁰, a quantitative test of antioxidant activity using the EC₅₀ method¹¹, and an organoleptic properties test.¹²

Procedure of the sample preparation:

1. Tea Preparation: First, the soursop, drumstick and guava leaves were left to wither for approximately 24 hours. After the withering process, the leaves were divided into four parts with an equal composition of soursop leaves and combined drumstick and guava leaves. Each part was then dried at 50°C, 55°C, 60°C, and 65°C respectively using an oven for 2 hours. Subsequently, the dried leaves of the different drying temperatures were ground to produce the tea powder. The tea powder of the soursop leaves and the drumstick leaves in combination with guava leaves were then weighed. Every 100 mg of tea powder was packed into a labelled dyed bag, and then each tea bag was brewed in 70°C water for 4 minutes.

2. Determination of Phenolic Compound: Each 100 mg tea bag of a different drying temperature

was put into 100ml of hot water and boiled. After boiling, 5 ml of the tea from each tea bag was collected and put into a test tube. Each test tube with a tea solution had 5 drops of 5% FeCl₃ added. The test tube was shaken hard until the colour of the tea solution changed into blackish-blue, indicating the presence of a phenolic compound.

3. Qualitative Determination of Flavonoid Compounds:

Each 5ml tea (soursop leaf tea and the combination of drumstick leaves and guava leaves) solution was put into a test tube, and then 1 ml HCl concentrated powder was added, and 5 ml amyl alcohol. After the solution was shaken hard, the tea colour could turn orange, indicating the presence of flavonoid compounds.

4. Quantitative Determination of Antioxidants:

To determine the antioxidant activity in each tea bag, two methods were used; the α-diphenyl-β-picrylhydrazyl (DPPH) method and Effective Concentration [EC₅₀].¹³ In the DPPH method, the procedure involves a 4 ml DPPH solution of 0.07 mM put into a test tube. This was added to the 50 μl tea solution. Each tea solution was homogenised with a vortex. Another DPPH solution was left without any treatment applied as the control sample. The UV-VIS Spectrophotometer with a 517nm wavelength at 40 minutes operating time was used to measure the solution. EC₍₅₀₎ (concentration required obtaining a 50% antioxidant effect) is a parameter utilised to measure the antioxidant capacity and to compare the activity of the different compounds. Substances that have high antioxidant activity will have a low level of EC₍₅₀₎.¹⁴

5. Organoleptic Properties Using Organoleptic Panel Testing:

The Organoleptic Panel Testing tool¹² was used to determine the organoleptic properties. The parameters for the organoleptic properties consist of taste, colour, aroma and appearance. The panel of 20 tea experts filled out a descriptive qualitative form in order to describe the organoleptic properties of each tea bag, each with a different drying temperature.

RESULTS AND DISCUSSION

The tea made from soursop leaves in combination with drumstick and guava leaves was based on the method developed in a previous study.¹⁵ The operating

condition of the withered leaves referred to the optimum condition of the soursop leaves, drumstick leaves, and guava leaves in this study. This present study used four variations of drying temperature (50°C, 55°C, 60°C, and 65 °C) to find out the antioxidant activity. Tests performed on the tea bags for the soursop leaves tea and the tea bags of the combined drumstick leaves and guava leaves yielded results of the organoleptic properties and the antioxidant activity, which has been described and discussed below.

Organoleptic Properties: After the drying process, the colour of the leaves turned brownish because of the carbonate group Maillard reaction of the glucose reacted with the nucleophilic amine group of proteins, which produced a distinctive brown colour. The drying process caused the leaves to be oxidised.¹⁶

Both the soursop leaf tea and the combined drumstick leaf and guava leaf tea had a bitter taste, which is an indication of antioxidants. The bitterness of the tea is generally attributable to the combination of catechins, saponins, polyphenols and amino acids, which are recognised as the components of antioxidants.¹⁷ Some flavonoids are very bitter, whereas others are not, depending on the type of glycoside chain. Naringin and neohesperidin are very bitter, whereas hesperidin is tasteless.¹⁸ The bitter taste is also caused by the catechins and tannins, that do not have tanning and clotted proteins.¹⁹

The aroma of the tea was bitter which caused by saponin.²⁰ The components in soursop leaves and combination of drumstick and guava leaves which caused the aroma is the glycosidase enzyme. Based on the results of organoleptic test, all 20 panellists stated that the taste, aroma, colour and viscosity of the soursop leaves tea and the drumstick leaves tea in combination with guava leaves was good. All panellists were generally favourable to consume the soursop leaves tea as well as the drumstick leaves and guava leaves tea.

Antioxidants Activities

1. The phenolic compound of the soursop leaf tea and the combination of drumstick leaf and guava leaf tea.

FeCl₃ reacted with the phenolic groups to form complexes of green, purple and black.²¹ Table 1 displays the presence of phenolic compound in

four different drying temperature teas. The (+) indicates the presence of phenolic compounds in the soursop leaf tea and the combination of drumstick leaf and guava leaf tea.

Table 1: Phenolic compound of the soursop leaf tea and the combination of drumstick leaf and guava leaf tea

No.	Drying Temperature (°C)	Phenolic compound
1.	50	+
2.	55	+
3.	60	+
4.	65	+

2. The flavonoid compound of the soursop leaf tea and the combination of drumstick leaf and guava leaf tea

The flavonoid compounds reacted to the magnesium powder and with the help of concentrated HCl, they formed a complex with green to orange flavonoid groups. The test results were positive when the orange colour emerged from the mahogany flavonoid complex (Robinson, 1995). Table 2 shows the presence of flavonoid compounds in the tested tea. The (+) indicates the presence of phenolic compounds in the soursop leaf tea and the combination drumstick leaf and guava leaf tea.

Table 2: Flavonoid compound of the soursop leaf tea and the combination drumstick leaf and guava leaf tea

No.	Drying Temperature (°C)	Flavonoid compound
1.	50	+
2.	55	+
3.	60	+
4.	65	+

Antioxidants Activity using EC₅₀: The EC₅₀ value is usually used to describe the antioxidant activity of the test material by the DPPH free radical scavenging method.¹³ The EC₅₀ values are inversely proportional to the ability of the antioxidant compounds. The smaller the EC₅₀ value, the stronger the antioxidant ability.¹⁴ The analysis result of the antioxidant activity in the present study showed that the effective concentration

value (EC_{50}) was at the higher drying temperature, so the EC_{50} value was lower. The highest levels of antioxidant activity were 76.06% for the soursop leaf tea and 70.49% for the combination of drumstick leaf and guava leaf tea. The highest level of antioxidant activity for both the soursop leaf tea and the combination of drumstick leaf and guava leaf tea were found from tea bags with a drying temperature of 50°C. Compared to the other drying temperatures of 55, 60, and 65°C, the 50°C drying temperature generated the highest level of antioxidant activity as indicated from the lowest EC_{50} level. However, the soursop leaf tea showed a higher antioxidant activity than the combination drumstick leaf and guava leaf tea. A possible explanation is that the soursop leaf tea has a higher number of phenolic and flavonoid compounds than the combination of drumstick leaves and guava leaves.

CONCLUSION

Drying temperature has a significant influence on determining the antioxidant activity levels of the soursop leaf tea and the combination drumstick leaf and guava leaf tea. The optimal operational drying temperature was 50°C, which produced the highest antioxidant activity and lowest EC_{50} value. The soursop leaf tea has a higher antioxidant level than the combination drumstick leaves and guava leaves at the drying temperature of 50°C. Based on the organoleptic test, the panellists stated that the soursop leaf tea and the combination drumstick leaf and guava leaf tea were both generally good in terms of aroma, colour, taste, and viscosity.

Parent Communication Regarding Sexual and Reproductive Health of Adolescent: A Qualitative Systematic Review

Fransiska Imavike Fevriasanty¹, Oedojo Soedirham²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Parents have significant influence on the sexual and reproductive health of adolescent. This study aimed to describe parents communication related to the sexual and reproductive health of adolescent. This study present a systematic review of articles related to the topic in the last ten years (2008-2018). The review found 155 articles with 10 articles meeting inclusions criteria. There were five main themes including the reason for sexuality communication, discomfort talking about sexuality, communication barriers, intergenerational comparison and parent as a decision maker. It is recommended to reduce barriers, determine the proper reasons to start communication about sexuality and arrange a comfortable environment for adolescents to express their sexual and reproductive health needs to parents.

Keywords: *parenting, communication, adolescence, sexual health*

INTRODUCTION

The sexual and reproductive health of adolescent attracts global attention as the number of sexually active adolescents has been increasing in these recent years.¹ The population of adolescent was estimated to increase from 1.2 billion to 1.3 billion during 2010 and 2030, and become 18% and 15% of total world population respectively.² The teenagers tend to try new sexual experience as the manifestation of their puberty period. The age of sexual intercourse for the first time can also influence the decision of adolescents to use contraception that triggers sexual debut during his lifetime where sexual debut early in adolescence increases the risk of mouth STIs and unwanted pregnancies.^{2,3} but little is known about its effects beyond adolescence. This study examines the relationship between the age at first intercourse and subsequent contraceptive gaps.

METHODS We identified 3538 sexually active, fertile women participants from the 2006-2008 National Survey of Family Growth. Women were classified as consistent contraceptive users or inconsistent/nonusers. Age at first intercourse with a man was determined by self-report and categorized as <15, 15-17, and ≥18 years. **RESULTS** Twenty-three percent reported gaps in contraceptive use in the year prior to interview. Compared with women who were 18 or older at first intercourse, women who were <15 years of age at the time of first intercourse were nearly two times as likely to report a gap in contraceptive use (adjusted odds ratio: 1.93; 95% confidence interval: 1.23-3.00). A study stated that 33.5% of the adolescents had ever had sexual intercourse while as many as 32.5% had more than one sexual partners and only 26.2% stated that used condom in their last intercourse.⁴

Parental engagement still become an important factor to protect their children to have a negative sexual behaviors, especially in this internet era.⁵ The role of the family is very important to prevent risky sexual behavior in adolescents such as premarital sexual behavior.⁵ Some previous studies stated that adolescents who engage in premarital sex usually come from divorced families or teenagers who lived with his parents where a family function does not run properly⁶⁻⁹. One factor that causes poor family function is due to the lack of communication between parents and teenagers¹⁰.

The few studies that reviewed qualitative studies especially those related to family experiences in communicating with adolescents related to sexual and reproductive health were the hallmarks of this study. The purpose of this current study was to describe results of a qualitative systematic review of parent communication regarding the sexual and reproductive health of adolescent.

METHOD

The study used several approaches qualitative systematic review. The most important of qualitative systematic reviews is the aim to answer research questions about participants' feelings and perceptions so that a detailed process was needed to achieve them.¹¹ The first stage that must be passed from this study is to determine the topic and purpose of the article review. The next step is to determine keywords to search for articles where in this study we use the "word parenting", "family communication", "parent-adolescent relationship", "sexual health", "sexuality", and "qualitative". Further, we determined the inclusion criteria which included 1) research participants were parents, both mother and father and teenager, male or female; 2) age for adolescent participants between 11-20 years; 3) research topics around family experiences and perspectives on adolescence sexual health; and 4) qualitative studies. The topic of LGBT was excluded from this study. Literature collected using data sources: Google Scholar, Science Direct, Proquest Health and Medical Complete, Psychology Journals Proquest, Proquest Science Journals and PubMed, during ten years from 2008 to 2018. Of the 155 papers identified, 58 articles were excluded due to duplication. As many as 20 articles met the inclusion criteria and were re-identified for eligibility until finally ten papers were found for review. The next important step is data extraction and synthesis data from the 10 papers reviewed.

RESULTS

Of the ten research articles reviewed, seven articles discussed parent communication, an article about father involvement in the reproductive health intervention, an article about puberty and an article about the role of parents in child development. In terms of research participants, three studies used mothers as participants in one study using fathers as informants. Five studies used parents

and teenage children as participants and only one study explored the experiences of young women. Regarding the data collection, four studies used focus group discussions, two studies conducted in-depth interviews, while the other studies applied narrative interviews, telephones interviews, audio recorded conversations and combination of written and group discussions.

Bello et al. has assessed the reactions of adolescents and their parents to puberty in urban poor settings in two African countries and compared to the experiences of current adolescents to their parents' generation. The participants was 66 boys and girls (aged 11-13 years) and their parents. The study was conducted by narrative interviews. The themes identified were adolescents' reaction to reviews their pubertal body changes, parental reactions to adolescent pubertal changes, pubertal intergenerational comparison of adolescent behavior.¹²

Cox et al. determined the content that should be included in a Web-based intervention that specifically targets improved mother-child communication with 24 mothers of sixth to eighth-grade students as participants. The focus group interview was used and the theme found were discomfort discussing sex with male children, the influence of mothers' belief, the need for developmentally appropriate information.¹³

Crichton et al. explored the quality of mother-daughter communication about sexual maturation, abstinence and unintended pregnancy in Nairobi, Kenya. A total of 87 girls (aged 12-17 years) and 37 mothers of teenage girls were included. The theme found were Mothers 'and daughters' views and preferences about communication , Mothers 'and Daughters' experiences: facilitators and barriers to communication , message content, how messages are conveyed, the impacts of context on communication.¹⁴

Francis et al. examined women 's attitude, knowledge, beliefs about HPV and cervical cancer prevention, vaccine awareness, and acceptance, and maternal - child communication about STDs and sexual health within an urban community in Johannesburg. This study included 24 women who have at least one child. The themes were maternal-child communication and sexuality, healthcare decision-making and gender roles, understanding of HPV and cervical cancer, vaccine acceptance.¹⁵

Grossman, Jenkins, and Richer gave a unique long examination of parents' perceptions of continuity and

change in middle-school communication from middle school to high school. As many as 23 parents (20 mothers, 3 fathers) were included for interview. The theme found were reason for sexuality communication, comfort talking about sex, talk about dating and relationships, talk about readiness for sex, and talk about sexual risk and protection.¹⁶

Guilamo-Ramos et al. identified and characterized fathers' role in shaping Latino adolescent sexual behavior and the feasibility and acceptability of a father-son intervention. As many as 30 fathers-son dyads were included for in-dept interview. The theme found wer fathers matter latino and can shape adolescent male sexual decision making, Latino fathers influence their sons through specific paternal parenting processes, and a Latino father-son approach is acceptable and feasible.¹⁷

Hutchinson and Cederbaum tried to understand adolescent females' perceptions about how their fathers contributed to their sexual socialization. The total of 234 females' adolescent (aged 19-21 years) were included. Telephone interview (35-55 minutes) was conducted as part of the larger quantitative study. The themes were how fathers were contributed to their daughters 'sexual socialization, how fathers could have had their daughters' sexual socialization, and barriers.¹⁸

Nurachmah et al. investigated parents and their female adolescent communication patterns of sexual and reproductive health in West Kalimantan, Indonesia. As many as 15 adolescent girls (aged 13-15 years) and 14 mothers were included in a focus group discussion. The findings were infrequent mother-daughter communication about sexuality, mothers tend to avoid discussing srh or feel ashamed and that it is not culturally acceptable to talk about sexual matters, topic about body change during puberty as the content of the mother-daughter communication, and both mother and daughters need adequate information about SRH.¹⁹it appears to be inadequately practiced in Indonesia. Given that female adolescents in Indonesia are faced with increased sex-related risks, it is important to understand, from parents and adolescents' perspectives, how parents communicate about SRH to their adolescents. This study was designed to investigate parents and their female adolescent children's patterns of SRH communication in West Kalimantan, Indonesia. A total of 15 adolescent girls (ages 13-15

Ramchandani et al. characterized the messages mothers communicate to young adolescents regarding

abstinence. As many as 15 mother-daughter dyads and 6 mother-son dyads were involved. The findings were that the children need to know what abstinence is, the needs for setting boundaries for abstinence, abstinence is best considering the risks, and suggestion to come to talk to the partents.²⁰

Worthman, Tomlinson, and Rotheram-Borus tried to understand parent ethnotheories about child developmental needs, appropriate parenting and effects of quality of early childcare. As many as 38 mothers were involve to complete written task and group discussion. It was found that early childhood as a crucial, sensitive period. The focus of parental concern and effort were danger, monitor/control, puberty, reproductive risk, peer influence, morality, teachable, inform/advice, and risk-taking.

From the results of the data synthesis of 10 papers, reviewers have identified **five main** theme related parent communication regarding adolescent sexual and reproductive health that is the reason for sexuality communication, discomfort talking about sexuality, barriers of communication, intergenerational comparison and parent as a decision maker. The main theme is presented in Table 1.

Table 1: Data synthesis of papers reviewed

Themes	Papers
Reason for sexuality communication	Francis et al. (2011) ¹⁵ Grossman, Jenkins and Richer (2018) ¹⁶ Ramchandani et al. (2017) ²⁰ Worthman, Tomlinson and Rotheram Borus (2016) ²¹
Discomfort talking about sexuality	Cox et al. (2010) ¹³ Nurachmah et al. (2018) ¹⁹
Barriers of communication	Crichton et al. (2012) ¹⁴ Hutchinson and Cederbaum (2011) ¹⁸
Intergenerational comparison	Bello et al. (2017) ¹²
Parent as decision maker	Guilamo-Ramos et al. (2018) ¹⁷ Ramchandani et al. (2017) ²⁰

DISCUSSION

After the data extraction process and synthetic data, the researchers had identified five main themes contained in the parents' experience of communicating with

teenagers on the topic of sexual and reproductive health. All of these themes reflect the answers to the objectives of this study, namely parents communication regarding the sexual and reproductive health of the adolescent. Communication has an important role in keeping the family functioning properly, as well as the physical and mental health of family members. Communication also plays an important role in the process of making decisions in families. Most problems that arise in the family are because there is a problem in communication between couple²². When communication with a partner does not go well, the child will be affected.

In children with adolescence, communication between parents and adolescents will lead adolescents to improve social and health behavior, in this case sexual and reproductive health. Young women are usually more comfortable talking about privacy about sexuality with mothers than with fathers¹⁰, this is because mothers know more about a woman's body parts and have experienced the same things as young women feel¹⁶.

Regarding the barrier in communication, parents feel insecure about discussing sexuality with adolescents due to the lack of information they have and lack of skill of doing sex al content communication.²³ In terms of generational differences between parents and adolescents, the rapid advancement of technology and the ease of internet access make teenagers prefer to seek information related to sexual and reproductive health through internet media rather than asking parents, even though this phenomenon was not found when the parents were still small first.^{23,24} However, parents are still looking for a decision maker when teenagers experience problems related to sexual and reproductive health.^{17,20}

CONCLUSIONS

The study of qualitative systematic review concludes that parent-adolescent communication about sexual and reproductive health is very important for the adolescents wellness; by reducing the communication barriers, setting the right reasons for initiating communication about sexual topic and arranging a comfortable environment for teenagers to express their sexual and reproductive health needs to parents.

Five Types of Personality and the Locus of Internal Control in relation to Preeclampsia Pregnancy

Lusiana Meinawati¹, Kusnanto Kusnanto², Oedojo Soedirham³

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Nursing, ³Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Preeclampsia is one of the highest mortality factors for pregnant women. Hypertension, one of the main characteristics of preeclampsia, is the second main causes of maternal mortality at 27.1%. During pregnancy, they will face physical and psychological stressors. One of the factors related to stress management is the woman's characteristics and the locus of control. This study aims to identify the relationship between the five types of personality and the locus of internal control in relation to preeclampsia in pregnancy. This study used a cross-sectional design. The population of this study consisted of pregnant women with preeclampsia who came to the independent midwifery practices in Jombang; 135 women total. The sample was selected using the total sampling method. The data was analysed by regression analysis. The independent variables related to preeclampsia included neuroticism ($p=0.003$; $\text{Exp}(B)=11.234$) and the negative internal locus of control ($p=0.000$; $\text{Exp}(B)=11.387$). It is expected that midwifery professionals can provide counselling services effectively and efficiently in relation to performing antenatal care services.

Keywords: *personality, locus of control internal, pregnancy, preeclampsia.*

INTRODUCTION

Preeclampsia is one of the highest mortality factors for pregnant women¹. Hypertension, one of the main characteristics of preeclampsia, is the second main cause of maternal mortality at 27.1%, after haemorrhage (30.3%) and before infection (7.3%)². According to the data of *Survey Demografi Kesehatan Indonesia (SDKI)* in 2007 and 2012, the Maternal Mortality Rate (MMR) in Indonesia was still high, by as many as 228 and 359 per-100,000 live births respectively. This number is still far from the target of the Millennium Development Goals (MDGs) 2015, which aims for 102 per-100,000 live births³.

According to the health profile of Indonesia's East Java Province in 2012 and 2013, the mortality rate was

97.43 per-100,000 live births and 97.13 per-100,000 live births respectively⁴. In Jombang City in 2017, there were 28 maternal deaths following live births. The number increased from 2016, with 17 deaths. The 28 deaths in 2017 were caused by preeclampsia (5 cases), haemorrhage post-partum (4 cases), eclampsia (3 cases), amniotic embolism (2 cases) and an ante-partum bleeding case, while the other 13 was caused by other co-morbidities. These cases must be considered to devise more effective initial assessments and interventions in order to decrease the maternal mortality rate caused by preeclampsia and eclampsia.

Pregnant women are one of the most vulnerable members of a community. During pregnancy, they will face physical and psychological stressors. Good stress management determines the success of the pregnancy. One of the factors related to stress management is the woman's characteristics and how far the woman can control her emotions in relation to overcoming the stress related to the physical alterations caused by pregnancy and for other reasons.

There are five basic personalities according to Goldberg, encompassing openness to experience,

conscientiousness, extraversion, agreeableness and neuroticism, which affects people in the context of solving their problems⁵ The locus of internal control also influences the pregnant women’s condition their commitments are influenced by their personality traits, as they are also known as emotional labour. The purpose of this study is to investigate the dominant personality traits in the company based on the Big Five Personality theory, to assess the level of employees’ commitment to service quality (quality pledge. This study aimed to identify the relationship between the five types of personality and the locus of internal control with preeclampsia pregnancy.

METHOD

This study used a cross-sectional design. The study was conducted in Jombang Regency, from July to September 2016. The population of this study were all of the pregnant women with preeclampsia who came to the selected independent midwifery practices in Jombang, totalling 135 women. The sample was selected using the total sampling method. The instrument used was a questionnaire with a Cronbach’s Alpha value of 0.862. The data was analysed using regression analysis.

RESULTS

Table 1: Demographic characteristics of the respondents (n = 135)

Characteristics	Parameters	n	%
Age (years old)	18-35	73	54.0
	> 35	62	46.0
Pregnancy	Primigravida	44	33.0
	Multigravida	91	67.0
Occupation	Housemaid	27	20
	Factory workers	53	39
	Teacher	55	41
Education	Senior High School	116	86
	College	19	14
Locus Internal Control	Positive	53	39
	Negative	82	61
Personality	Openness to experience	12	8
	Conscientiousness	18	13
	Extraversion	7	5
	Agreeableness	30	22
	Neuroticism	68	52

Table 2: Results of logistic regression analysis

Variable	B	S.E.	Sig.	Exp (B)	95%CI
Neuroticism	2.897	0.432	0.003	11.234	2.899< OR < 43.587
Negative ILC	1.143	0.458	0.000	11.387	1.897< OR < 23.426

Table 1 shows that most of the respondents were 18-35 years old (54%). Most of the women had multigravida (67%). Regarding occupation, most were factory workers (395) and had a senior high school level of education (86%). The most common locus of control had was negative, and the most common personality was neuroticism (52%).

Table 2 shows that the independent variables related to preeclampsia included the personality of neuroticism (p=0.003; Exp(B)=11.234) and the negative internal locus of control (p=0.000; Exp(B)=11.387).

DISCUSSION

- 1. Age:** Based on age, the respondent’s characteristics showed that the majority of the respondents were 18-35 years old. Age is a determinant factor influencing the health status of pregnant women. However, in preeclampsia cases, the mother’s age does not influence occurrence. Instead, it is affected by other factors encompassing the environment, health record, parity, metabolism disorders, psychological conditions, and social-economic status⁷. The many occurrences of preeclampsia at a healthy age are due to most pregnancy and childbirth cases occurring between the ages of 18 and 35 years old. According to the Indonesian Ministry of Health, the age of pregnant women who are at the highest level of risk is mothers who are too young (<20 years) or too old (> 35 years).
- 2. Pregnancy:** The characteristics of the respondents based on their pregnancy showed that most of the respondents had multigravida pregnancy. Cunningham (2014) stated that the risk factors for preeclampsia are nullipara, the environment, socioeconomic conditions, seasonal influences, obesity, gemelli pregnancy, maternal age, impaired metabolism and a family history of

preeclampsia or previous history of preeclampsia. A study conducted by Hindun (2015) showed that primigravida has a greater chance of developing by 2.875 times into preeclampsia compared with non-primigravida.

3. Occupation: The characteristics of the respondents based on their work indicated that most of the pregnant women work as factory workers. The risk factors for preeclampsia include their socioeconomic condition, in which one of the supporting factors is employment⁷. Work as a factory worker is an activity that involves physical activity. In a factory, the conditions are always pressured, which is a factor that causes psychological disorders that affect maternal pregnancy. A study mentioned that mothers who work in the formal sector have better access to information about their health, more actively have a positive attitude and more independently take care actions⁸.

4. Education: The characteristics of the respondents based on education level was that the majority of respondents had a high school level of education. A person's level of education influences how a person makes decisions on the health problems that they experience. The lower the mother's education level, the less the mother has the desire to use health services. A study mentioned that mothers with a higher education level have better access to information about health. It makes them have a better decision-making process related to determining care planning for the duration of their pregnancy⁸.

5. Personality and Locus of Control: The regression analysis results showed that the independent variable allegedly related to the preeclampsia cases was the personality of neuroticism with $\text{Exp}(B)=11.234$. It means that pregnant women with a neurotic personality are 11.387 times more likely to get preeclampsia. The negative ILC has a relationship with preeclampsia with $\text{Exp}(B)$ 11.387. This means that pregnant women with a negative ILC have 11.387 times the probability of having preeclampsia.

Neuroticism is a personality in which a person can evaluate their ability to handle pressure or stress⁹. The positive characteristic of neuroticism is emotional stability. Individuals with emotional stability tend to be calm in facing problems, have self-confidence and firm principles. However, the negative characteristics

of neuroticism are being easily nervous, depressed, not confident and easily changing their mind⁵. A study proved that there is an influence between stress and the occurrence of hypertension in pregnant women¹⁰. This is because they are unable to overcome the problems faced by their mental, physical and emotional health.

The negative attributes of neuroticism as mentioned above show that the pregnant women were not ready to adapt to the physical and psychological alterations of pregnancy. It influences their mental and emotional health, and can affect their cardiovascular condition, increasing their blood pressure and thus, leading to preeclampsia¹¹ who were matched for age and date of delivery. The incidences of diabetes, dyslipidemia, hypertension and cardiovascular events after pregnancy were identified from medical records after the date of delivery to the date of an event or the end of the study.

RESULTS

The median follow-up duration was 9.8 years (interquartile 5.1–12.7 years).

The study showed that there was a relationship between negative locus of control and the incidence rate of preeclampsia. Locus of control is a condition where a person can control him/herself against the problem at hand. When a pregnant woman is unable to adapt to a problem, it means that the pregnant woman has a negative locus of control. The risk factors for preeclampsia are nullipara, the environment, socioeconomic conditions, seasonal influences, obesity, gemelli pregnancy, maternal age, impaired metabolism and a family history of preeclampsia or a history of previous preeclampsia, as well as psychological factors^{7,12}.

CONCLUSION

Based on the results of the study, it showed that out of the five major properties of personality, neuroticism and having a negative internal locus of control were the variables most associated with the incidence rate of preeclampsia. It is expected that a midwifery professional can provide counselling services effectively and efficiently in relation to performing antenatal care services.

Conflict of Interest: None.

Ethical Clearance: The study passed ethical clearance from Ethical Committee of the Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia.

Source of Funding: This study is self-funded by the researchers.

The Effect of Diabetes Self-Management Education, Based on The Health Belief Model, on the Psychosocial Outcome of Type 2 Diabetic Patients in Indonesia

Rondhianto¹, Kusnanto², Soenarnatalina Melaniani³

¹Doctoral Program of Public Health, Universitas Airlangga, Faculty of Nursing, Universitas Jember;

²Faculty of Nursing; ³Department Biostatistics and Population Study, Faculty of Public Health, Universitas Airlangga

ABSTRACT

Lack of knowledge on disease management may distress type 2 diabetic patients, which could negatively affect their quality of life. The health belief model has been widely used to improve the patient's knowledge, skill, and abilities in relation to self-care. The study aimed to examine the effect of diabetes self-management education, based on the Health Belief Model (HBM), on the psychosocial outcome (self-efficacy, self-care behaviour, distress, and quality of life), and glycemic control (measured by their blood glucose level). A randomised control trial was employed, using a pre-test-post-test design. Our study recruited 120 type 2 diabetic patients who were equally assigned to the intervention group (n= 60) and the control group (n=60). The data was analysed using an independent t test with a significance level of 0.05. After the intervention, the intervention group and control group showed significantly different scores in self-efficacy, self-care behaviour, diabetes distress, quality of life, and blood glucose level. Diabetes self-management education based on the HBM had a significant effect on the psychosocial outcome of patients with type 2 diabetes.

Keywords: health education, health belief model, type 2 diabetes, psychosocial outcome, glycemic control.

INTRODUCTION

Diabetes Mellitus (DM) is a major chronic disease in the world which can cause heart disease, blindness, renal failure and lower extremity amputations.^{1, 2} Globally, the number of people living with type 2 DM was approximately 424.9 million people in 2017.² Type 2 diabetes affected almost 6.7% of the Indonesia population, approximately 10.3 million people, in 2017.² Worldwide, Indonesia is ranked 6th among countries with a high percentage of the population with type 2 DM, after China, India, the United States, Brazil and Mexico.² Diabetes type 2 is the third leading cause of death in Indonesia after stroke (21.1%) and coronary heart disease (12.9%).³

Living with diabetes can be difficult for patients and their families. Diabetic patients can show negative psychological responses, including feeling guilty and hopeless, losing confidence, having a low self-image, and becoming anxious and angry.^{4, 5} Diabetes distress is an additional burden for patients and their families, as a result of the cost incurred due to long-term care and treatments. Appropriate treatment is required to prevent disability, poor productivity, low quality of life and increased mortality.⁶ Patients and their families should acquire the knowledge, skills and self-efficacy related to the proper self-management of DM for successful treatment.^{7, 8} The Health Belief Model (HBM) is a constructed model that has been widely used to predict adherence to self-care behaviour.⁹ It consists of five core components, including perceived severity, perceived susceptibility, cues to action, perceived benefits and perceived barriers. Perceived severity relates to beliefs on the severity level of the disease and the consequences relevant to the illness. Perceived susceptibility represents to what extent the person perceives their risk of having the illness. Cues to action reflects the internal or external

Doctoral Program of Public Health,
Faculty of Public Health, Universitas Airlangga
Faculty of Nursing, Universitas Jember
Email: rondhianto-2017@fkm.unair.ac.id

indications such as physical symptoms (internal) and medication reminders (external). Perceived benefits involves the individual's perception toward the advantages and accessibility of the actions that they are to take. Perceived barriers includes the negative consequences from the actions taken.⁹ The study aimed to examine the effect of diabetes self-management education, based on HBM, on psychosocial outcome (self-efficacy, self-care behaviour, distress and quality of life), and glycemic control.

METHOD

The study employed a randomised control trial with a pre-test- post-test design. The study population was made up of 382 patients with type 2 DM attending the Patrang community health center (CHC) in Jember district, East Java in Indonesia. The inclusion criteria was that the patients had been diagnosed with type 2 DM within the last six months, who showed compos mentis mindfulness and were generally in good condition. Their age should have been between 40 and 65 years old, they lived within the Patrang CHC service area, and expressed a willingness to participate in the study. Patients with a cognitive impairment (dementia and active psychosis) were excluded. 260 patients met the inclusion and exclusion criteria.

Using the 95% confidence interval ($\alpha = 0.05$) and a statistical power of 80% ($\beta = 0.20$), the sample size for the intervention group and control group was 55 subjects each. To anticipate the participants dropping out, an additional 10% was determined, resulting in 60 subjects recruited for each group. Simple random sampling was applied in order to select the study participants.

The intervention group received a six-week educational program using the HBM approach over six sessions. The control group received their usual daily care. Every educational session lasted for approximately 120 minutes. The intervention group received knowledge about diabetes and self-management activities based on the four main sources of self-efficacy including performance accomplishment, vicarious experience, verbal persuasion, and physiological and emotional arousal. The six intervention sessions were divided into two home visit sessions (sessions 1 and 6) and four group sessions (sessions 2-5). The educational program was prepared based on the national standard for diabetes self-management education and support, and the management and prevention of type 2 DM from

the Indonesian Endocrinology Association (PERKENI). Additional information was obtained from the American Diabetes Association (ADA). The pre-test was conducted before the intervention started, while the post-test was conducted three months after the intervention.

The pre-test and post-test questionnaires used four scales to measure the psychosocial outcome, including the diabetes management self-efficacy scale (DMSES), the diabetes distress scale (DDS), the summary of diabetes self-care activities (SDSCA), and the diabetes quality of life scale (DQOL), in addition to the glycemic control test tool. The DMSES questionnaire used was a modified version by Shi, Ostwald, & Wang (2010) from the van der Bijl instrument.¹⁰ The DMSES questionnaire consisted of 20 items with a Likert scale of 1-5. The results of the validity test showed an r-value of 0.658, and reliability test of $\alpha = 0.975$. The DDS questionnaire of 17 items was adopted from the instrument developed by Polonsky, et al. (2005).¹¹ The results of the DDS validity test showed an r-value that was larger than 0.537, with a reliability test of $\alpha = 0.874$. The SDSCA questionnaire consisted of 12 items with a scoring system of 0 – 7, using the Wu modified version (2009) from the Toobert SDSCA instrument.¹² The SDCA validity test result was $r = 0.632$, with the reliability test being $\alpha = 0.923$. The DQOL questionnaire had 30 items with multiple selection available, scored using the Likert scale. The DQOL result of the validity was $r > 0.36$, and the reliability test $\alpha = 0.956$. The data analysis used an independent t-test to examine the group differences with a significance p-value of $\alpha \leq 0.05$.

RESULTS

Table 1 shows the mean of patient age was 57.60 years. Most of the patients were female (65%), employed (65%), and had an education level of junior high school (41.67%). The average duration of illness among the patients was 45.07 months. The patient characteristics showed no significant difference between the intervention group and the control group. Table 1 displays the baseline score of self-efficacy, self-care behaviour, diabetes distress, quality of life and blood glucose level. The mean scores for self-efficacy, self-care behaviour, diabetes distress, and quality of life were 41.63, 15.13, 39.00, and 65.77 respectively, with no significant difference between the intervention group and the control group. Likewise, the average blood glucose level was 207.62 mg/dl, and no significant difference was observed between the intervention group and the control group.

Table 1: Baseline characteristics of all patients (n = 120) in the intervention group and the control group (n = 60/group)

Variable	All patients (n, %) or mean \pm SD	Intervention group (n, %) or mean \pm SD	Control group (n, %) or mean \pm SD	P-value
Age (years)	57.60 \pm 6.25	57.50 \pm 6.83	57.70 \pm 5.65	0.862
Gender				
Female	76 (63.33%)	42 (70%)	34 (56.67%)	0.132
Male	44 (36.67 %)	18 (30%)	26 (43.33%)	
Employment				
Employed	78 (65%)	38 (63.33%)	40 (66.67%)	0.718
Unemployed/retired/house- wife	42 (35%)	22(36.67%)	20 (33.33%)	
Duration of illness	45.07 \pm 33.05	45.33 \pm 37.45	44.80 \pm 28.28	0.930
Level of education				
Elementary school	39 (32.5%)	18 (30%)	21 (35%)	0.769
Junior high school	50 (41.67%)	24 (40%)	26(43.33%)	
Senior high school	23 (19.17%)	12 (20%)	11 (18.33%)	
Higher education	8 (6.67%)	6 (10%)	2 (3.33%)	
Self-efficacy score	41.63 \pm 8.75	41.83 \pm 9.67	41.43 \pm 7.80	0.803
Self-care behaviour score	15.13 \pm 4.86	14.93 \pm 4.64	15.33 \pm 5.10	0.654
Diabetes distress score	39.00 \pm 6.11	39.33 \pm 6.87	38.67 \pm 5.28	0.552
Quality of life score	65.77 \pm 15.37	66.03 \pm 17.09	65.50 \pm 13.57	0.850
Blood glucose level (mg/dl)	207.62 \pm 63.69	207.62 \pm 63.69	197.37 \pm 65.91	0.078

Table 2 shows that both groups had increased scores for self-efficacy, self-care, and quality of life from the baseline. The diabetes distress score and blood glucose level were reduced in both groups after the intervention. The post-test results show a statistically significant difference in each score of the psychosocial outcome between the intervention group and the control group. A more significant improvement in psychosocial outcome was experienced by the intervention group than the control group, indicating the positive effect of diabetes self-management education using the HBM approach.

Table 2: Comparison of the pre- and post-intervention variables of each group and the results of the independent t-test after the intervention

Variable*	Intervention group (n = 60)		Control group (n = 60)		F	p-value	t	p-value
	Pre	Post	Pre	Post

*data expressed as mean \pm standard deviation

DISCUSSION

Characteristics of the study participants: The average age of the diabetic patients was 57.6 years old, confirming the previous study stating that insulin retention tends to increase by the age of 45 years old or older.⁴ Individuals older than 45 years old have an increased risk of developing type 2 diabetes by almost 15 times compared to younger individuals.³ Most of the patients with type 2 diabetes in this study were female, again confirming the results of previous studies.^{7, 13} Elderly women may have a higher LDL cholesterol and triglycerida level than men, which affects the decreasing level of their insulin sensitivity.¹⁴ The average duration of illness among the diabetic patients in the present study was 45.07 months, or almost four years. The risk of macrovascular complication from diabetes increased in the fifth year since the diabetes was first diagnosed.¹⁵

In our study, most of the participants in both groups had completed junior high school and were employed. Level of education may influence the individual's acceptance of information and their capacity to manage stressors.^{16,17} Being employed could increase the individual's self-confidence in relation to problem solving, as having a source of income which enable them to access information, appropriate care and better treatment.^{18,19}

Self-efficacy before and after the intervention: The results of the data analysis showed that there was a significant difference in the self-efficacy between the groups after the intervention. Perceived self-efficacy affects the way that someone understands, feels, senses, drives their self-motivation, and takes action, which can generate effects through cognitive, motivational, affective and selection processes.²⁰ Improving the patient's perception of their vulnerability and the disease severity during the health education intervention could help patients to manage the disease, which increases their self-efficacy.^{21, 22}

Self-care behaviour before and after the intervention: The results showed that there were significant differences related to self-care behaviour between the intervention group and the control group. The acquisition of knowledge about the disease and care management of the disease is crucial in helping diabetic patients perform the proper self-care behaviour.⁸ Self-care depends on the patient's ability to make decisions and

daily assessments in order to implement comprehensive diabetes management.¹² Diabetes patients with a good self-care ability can control their blood sugar levels by changing to a healthier lifestyle.²³

Diabetes Distress before and after intervention: The intervention group experienced a more significant decrease in their diabetes distress score than the control group after the educational intervention. Having proper health education can help them to gain self-control so then the patient can maintain an ideal health condition and reduce stress.¹⁹ Acquiring coping strategies to reduce stress could encourage diabetic patients to seek social support from their family, friends, neighbours and co-workers.²⁴ Having cognitive skills would increase the patient's understanding and acceptance of their condition, so as to reduce the level of stress.¹⁹

Quality of life before and after the intervention: An essential key to the quality of life assessment was the satisfaction of self-care. Health workers have an important role in providing proper health education to patients and their families in promoting the self-care of diabetes with complications, in order to achieve an optimal quality of life.^{7,25} The ability to perform self-care and knowing how to reduce the risk of complications could improve quality of life.¹

Glycemic control: The intervention group had a more significantly reduced level of blood sugar than the control group after the HBM educational intervention. Knowledge about diabetes helped the patient to control the disease and to reduce the risk of disability.^{15, 22} The diabetes self-management education (DSME) significantly reduced the patient's fasting blood glucose level, improved their diabetes knowledge, self-management skill and self-efficacy.²⁶

CONCLUSION

This study has highlighted the importance of health education in improving the patient's psychosocial outcome. This educational intervention, along with the HBM approach, has significantly improved self-efficacy, self-care behaviour and quality of life, as well as reducing the level of diabetes distress and their blood glucose level. The diabetes self-management education based on the Health Belief Model is recommended to be used as a health education intervention for patients with type 2 diabetes.

How does the Dayak Ngaju Community Treat Malaria? A Qualitative Study on the Use of Traditional Medicine in Central Kalimantan Province, Indonesia

Trilianty Lestaris¹, Soedjajadi Keman²

¹Doctoral Program of Public Health, ²Department of Environmental Health, Faculty of Public Health,
Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Background: Malaria is an endemic disease present in most tropical countries, including Indonesia. The elimination of Malaria has been among the strategies used to improve the health status of the community. However, most traditional tribes in Indonesia who live in remote areas may opt to use traditional medicine instead of the biomedical services available in health facilities. This study aimed to shed a light on the use of traditional medicine for treating malaria within the Dayak Ngaju community.

Method: This research was designed using a qualitative approach. Five respondents, consisting of a community leader and traditional healers, agreed to participate in the study. The interviews were conducted in the interviewee's house in Gunung Mas district, Central Kalimantan province. Descriptive analysis was employed to explain the phenomena of the use of traditional medicine within the study community.

Results: Three themes emerged as the result of the study, including 1) the community perception of malaria, 2) familial influence on the use of traditional medicine, and 3) access to public health facilities for malaria treatment. People consider malaria to be a mild disease that the traditional healer has adequate knowledge of and capacity to cure. The family has the role of encouraging and deciding on the use of traditional medicine. Despite the use of traditional medicine, Dayak Ngaju community use the biomedical health services when they are accessible.

Conclusion: Traditional medicine is considered to be the first option for seeking care among the Dayak Ngaju community. Providing access to health facilities will promote the use of said facilities and biomedical services for malaria treatment.

Keywords: *Dayak Ngaju, traditional medicine, malaria, qualitative study*

INTRODUCTION

Malaria is an endemic disease in tropical countries, including Indonesia. The physical environment such as air temperature, humidity, sunlight, rain, and water currents are the contributing factors of the breeding habitat for mosquitoes, including *Anopheles* sp, the

host of malaria parasites.¹ According to the World Health Organisation (WHO), approximately 212 million malaria cases occurred in 2015, claiming the lives of 429,000 people worldwide.² Approximately half of all Indonesians live in malaria endemic areas.² The national Annual Parasite Incidence (API) in Indonesia was approximately 0.85 per 1000 population in 2015.³

Central Kalimantan is an endemic area of malaria in Indonesia. Although the Malaria API of Central Kalimantan was approximately 0.42 per 1000 population in 2017, certain areas had a higher API than the national rate.^{3, 4} Malaria cases were particularly found in some districts in Central Kalimantan province, including Gunung Mas, Kapuas, Katingan and Seruyan which

especially affect the indigenous population. Their economic activities are mostly related to agriculture, plantations and mining, which leads to various environmental changes and the migration of the population from other provinces or islands of Indonesia. Gunung Mas's topography consist of rivers, tropical forest, and swamp which are an ideal habitat for the *Anopheles sp* mosquito.⁵ The population of Gunung Mas district is dominated by the Dayak ethnic. Dayak Ngaju are one of the Dayak ethnicities that still practice their traditional beliefs in relation to the treatment of infectious disease, including malaria.

With the rapid development of medical science and technology, traditional medicine has also received attention when developing new drugs.⁶ Traditional medicine is still believed to have a strong efficacy in association with recovering from ill health among the Dayak Ngaju community. Some community members would use modern medical treatment, however the isolation and remote location of the Dayak Ngaju community causes most people to rely on traditional medicine for treating communicable diseases.⁵ Remote areas in Indonesia are often underprivileged, in relation to medical and other health staffs.⁷ Therefore, it is common for indigenous people to utilise traditional medicine.⁸ Maintaining cultural beliefs through the use of traditional medicine has received attention for its potential success, acceptability and accessibility.⁶ In the Dayak Ngaju community, the treatment ritual of a certain disease is usually performed by the traditional healer, locally known as the *tabib* or *lasang* or *bahtra*, at the residence of the sick man.

Traditional medicine has been seen by the Dayak Ngaju community as the primary treatment before utilising modern medicine in district hospitals or other modern health facilities. For this community, illness is not only viewed as a symptom of individual biology, but is holistically related to the nature, humanity and God. Therefore, to gain good health when seeking treatment, people should not only use drugs as the treatment but also practice certain traditional rituals involving ancient mantras (*Sangiang* language).⁹ Therefore, the healing process for a disease does not only deal with the biological aspects of the patient, but also the socio-cultural and spiritual aspects.⁹ This research aims to elucidate the beliefs and practices of the Dayak Ngaju community in relation to using traditional medicine as an alternative to malaria treatment.

MATERIAL AND METHOD

A qualitative study design was employed using in-depth unstructured interviews. The researcher (TL) was the research instrument who conducted the interview. The Dayak Ngaju community leader in Kualakurun sub-district was approached by the researcher and was asked to recommend four other key informants to participate in the study. The five respondents consisted of the community leader and four traditional healers (*Bahtra*). The interview was conducted in the Dayak language. The researcher was a native to speaking the language, therefore no language barrier was experienced during the interview. The key informants were asked several questions including: 'What is the concept of health and disease within the Dayak Ngaju Community?' 'How do people perceive the malaria disease?' 'How the traditional medicine is delivered?' and 'What treatment options are used by the Dayak Ngaju community?' Each interview was recorded using an audio-tape and lasted approximately an hour. Each interview was conducted separately at the interviewee's house to ensure that all of the interviewees felt relaxed in telling their experience. The researcher also took brief notes during the interview. The audio records were textually transcribed in the Dayak language and then translated into Bahasa Indonesia (the national language). The data analysis process included listening carefully to the records and reading the interview transcripts repeatedly in order to understand the content. The researchers read the translated interview transcripts separately. Key statements were extracted and highlighted to grasp the meanings. The meanings were consolidated by the researchers in order to produce the themes.

RESULTS

From the data analysis, three themes emerged on the belief and practice of traditional medicine for treating malaria: 1) Dayak Ngaju community perception of malaria, 2) family influence on the use of traditional medicine, and 3) access to public health facilities for malaria treatment.

Dayak Ngaju community perception of Malaria: The Dayak Ngaju community believe that being healthy or ill (*barigas* dan *haban*) is determined by the combined factors of nature/the environment, humanity and spirits. The occurrence of a disease is not only biologically caused by the natural or human factor. It may also affect someone because of supernatural power. Therefore, in

order to cure the disease, it would not only involve herbs and other materials as medicine, but also traditional rituals to satisfy the spirits.

Knowledge of disease is a crucial competency of the traditional healer (*bahtra*) in order to determine the illness and the medication required for the ill person. The competency is obtained usually from knowledge passed down from generation to generation within the *bahtra* family. In the Dayak Ngaju language, malaria is termed “*Sahangen*”, a disease that is considered mild and not dangerous with some common symptoms including fever, bone pain and a prolonged headache. An interviewee, a *bahtra*, said that there is “nothing to worry about malaria. It is *Sahangen*, not dangerous. Everyone can get it including my own children. Especially for elderly, sometimes having fever is just normal. Death is destiny” (P2). Malaria is also considered to be a disease that is necessary for a person to grow in maturity, as an interviewee pointed out: “So somebody gets this malaria. It means (that) he is experiencing *Sahangen*. This is a process toward a person’s maturity. A process of becoming a better human being.” (P5).

The Dayak Ngaju community trust the *bahtra* and their knowledge of malaria. Often, they consider visiting a traditional healer first in order to have an opinion on the severity of the disease and to utilise traditional medicine, as well as the ritual required for healing. They may use this to see whether or not the patient requires going to a modern health facility. Therefore, the traditional healer has a central role in treating malaria. As informed by the community leader, “people go to the *bahtra* when they felt fever and headache. If the *bahtra* says that the person has malaria and assures the patient to use only traditional medicine and a ritual because of the mild condition, then people follow this.” (P1)

Family influences on the use of traditional medicine: Family is very influential in relation to utilising traditional medicine. This is also part of the local wisdom that continues to use a certain plant to treat malaria. Although some people in the family may not fully believe in the use of traditional medicine for various reasons, they would be obliged to obey the decision made by the oldest or the most respected member of the family. The ritual done while providing the traditional medicine also involves the family member with guidance from the *bahtra*. One of the *bahtra* respondents recalled that “some younger people think that using traditional medicine and practices is useless. But what they can do, if the elders say otherwise. We should maintain our tradition, because this is our roots” (P4).

In practice, the traditional medicine of the Dayak Ngaju community involves a ritual of *Sahangen*, or malaria treatment. The patient would be laid down in the living room near to the house entrance. The first cousin of the patient would be requested to burn leaves from any green plants found in the yard, and blow the smoke toward the patient’s body. This practice should be conducted three times a day, in the morning, afternoon and evening. The patient would also be given a drink of medicated water. The medicated water was boiling water, with a special river stone soaked inside. Finally, the traditional healer also applied oil rubbed over the patient’s body.

Access to public health facilities for malaria treatment:

Although the Dayak Ngaju community would go first to the traditional healer for treating malaria, more people now also use the modern medicine available in the community health centre and village health posts. The traditional healers also recognise this phenomenon, and one said that “of course some people would still need to go to community health centre if their fever gets worse. But for people living a distance from the facility, we, the *bahtra*, were always the first to provide help” (P3).

The traditional healer expects that community would preserve the traditional practices as they are inherited from their ancestors. In addition, some of the community still live separately in remote locations which are far from the modern health facility. Encouraging them to solely use modern medicine without considering the traditional practices would put people’s health at risk.

DISCUSSION

To this date, traditional medicine is still a popular option to cure both communicable and non-communicable disease in many countries.^{6, 10, 11} For the Dayak Ngaju community, the use of traditional medicine for curing malaria is rooted in the concept of health and disease, which is a combination of the factors of nature/the environment, humanity, and spirits/God. The concept has continuously evolved over generations, which motivates them to preserve the use of traditional medicine. A similar concept of health and disease was also described in a previous qualitative study about the use of traditional medicine and practices among postpartum women in China.¹² The role of the traditional healer is prominent in diagnosing the patient’s illness. Traditional healers also help the patient’s family in implementing coping strategies during the loss of a patient’s life.

Family also plays a crucial role in preserving traditions and beliefs. Support from the family is a beneficial factor related to seeking care.¹³ The family influence the decision related to selecting between traditional and modern medication and treatment for malaria. The family can understand and work with the traditional healer to encourage the patient to receive the treatment and to do the ritual. The traditional ritual carried out by the family has also been believed to satisfy supernatural powers and help in the recovery from illness, as seen in a previous study.¹¹

Traditional medicine has been the first choice for the Dayak Ngaju community when seeking treatment. The Dayak Ngaju community believe that selecting the treatment of malaria or other illness should relate to the disease's aetiology, which is a combination of natural and personal causes. However, the choice of treatment is influenced by not only the traditional beliefs, but also the availability and accessibility of modern health facilities. According to Notoatmojo (2003), the attitude to take action in relation to health care depends on other supporting factors and conditions, such as the availability of nearby health facilities and support from their family and other parties.¹⁴ Therefore, people eventually go to health facilities to seek malaria treatment, because of the influential support from their family as well as their access to the health facility.

CONCLUSIONS

The concept of health and disease among the Dayak Ngaju community is determined by the traditional belief that illness is caused by the factors of nature, man and spirits. Therefore, a traditional healer is seen as a prominent figure providing first aid, including to treat malaria. Family is a crucial factor in determining the care that is sought. Preserving the culture of using traditional medicine and related practices among people with malaria is also influenced by the decision of the eldest member of the family. Most people of the Dayak Ngaju community also believe that the biomedical health services can be used jointly with traditional medicine. Therefore, access to a modern health facility for this remote population is urgently required.

The Effect of Young Coconut Water against Morning Sickness among Women in the First Trimester of Pregnancy

Tri Ratna Ariestini¹, Windhu Purnomo²

¹Doctoral Program of Public Health, ²Department Biostatistics, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Introduction: Morning sickness is experienced by approximately 70% to 90% of women in their first trimester of pregnancy. The slowing motility of the gastric muscles due to the influence of pregnancy hormones causes an increase in the amount of stomach acid that irritates the gastric mucosa. Pregnant women experience nausea, vomiting, bloating, frequent burping, sour taste, bitterness, loss of appetite, and discomfort which causes the loss of fluids and some essential minerals, such as sodium, potassium, calcium, and magnesium.

Method: Using a randomized control trial with pretest posttest method, we employed a total of 74 women in the first trimester pregnancy complaining of nausea and vomiting. The intervention group received a daily dose of young coconut water of 300 ml for a week. The control group received 300 ml of mineral water with added sugar for a week. The morning sickness scores before and after the treatment were analyzed statistically using the independent t-test.

Results: The provision of young coconut water reduces the morning sickness scores at an average of 11.19 in the intervention group, while the control group only have a slide reduction of the average morning sickness score at 20.00. The treatment of the intervention group who consumed young coconut water had a significant effect at p -value = 0.042.

Conclusion: Consuming young coconut water provides a significant effect on decreasing symptoms of morning sickness in the first trimester of pregnancy.

Keywords: young coconut water, morning sickness, the first trimester pregnancy

INTRODUCTION

Morning sickness refers to a condition of nausea, with or without vomiting, which usually affects women during the first trimester of pregnancy.¹ This condition affects about 70% to 90% of pregnant women during the early weeks of pregnancy. Approximately 80% of pregnant women experience nausea, and about 50% had nausea and vomiting.² About 0.3% to 3.6% of pregnant women may develop a severe and excessive nausea and vomiting termed as hyperemesis gravidarum.³

Morning sickness occurs due to the increased production of pregnancy hormones including estrogen, progesterone, and chorionic gonadotropin (HCG) hormone.⁴ Pregnancy hormones affect physiological changes, such as the slowdown of gastrointestinal motility.⁴ The slowdown of gastrointestinal motility results in an increased amount of gastric acid and irritates the gastric mucosa resulting in nausea, vomiting, bloating, and frequent burping, due to the perceived sourness, bitterness, loss of appetite, and discomfort.³ The effect is worse in the presence of heartburn and chest pain with an infection from *helicobacter pylori* in the injured stomach that leads to inflammation of the oesophagus.³ This condition is referred to as gastroesophageal reflux disease (GERD) which influences the poor absorption of water and nutrients from food.⁵ To reduce the symptoms of GERD, various

Email: tri.ratna.ariestini-2017@fkm.unair.ac.id

treatments have been applied to pregnant women such as antimietic medication, accrupressure, accupuncture, vitamin B6, and ginger consumption.^{1,6}

Another alternative treatment is the consumption of young coconut water as a medical prevention for conditions similar to morning sickness.⁷ Young coconut water contains potassium that is capable of neutralizing gastric acid reactions and improves muscular motility of the stomach.^{8,9} However, the evidence is scarce on the benefits of using young coconut water to reduce morning sickness in early weeks of pregnancy. Therefore, this study aims to examine the influence of young coconut water in reducing morning sickness among pregnant women during the first trimester of pregnancy.

MATERIALS AND METHOD

This study employed an experimental research design using a pretest-posttest of the randomized control trial method. The research was conducted in Palangka Raya city, Central Kalimantan Indonesia. The study population was first-trimester pregnant women who visited the community health centre between May and November 2016 with complaints of nausea and vomiting. The inclusion criteria was women who were pregnant for 1 – 10 weeks with morning sickness complaints, had a clear residential address, had no history of multiple gestation, and were willing to participate in the study. The exclusion criteria was pregnant women with a history of abortive outcome, absence from the intervention of more than one day, moving out to another city, being hospitalized, and having hyperemesis gravidarum.

The sample size formula is calculated as follows:

$$n = \frac{2(Z_{\alpha} + Z_{1-\beta})^{2\alpha 2}}{\Delta^2}$$

We calculated our sample size based on the results of a previous study on the effect of acupressure treatment on morning sickness among pregnant women, with the mean difference of symptoms between before and after intervention, $\Delta = 0.25$, error type 1 $Z_{\alpha}(5\%) = 1.96$, error type 2 $Z_{1-\beta} = 0.842$.¹⁰ The sample size obtained was 34 subjects for each group. To anticipate the drop out, an additional 10% was applied and 37 subjects were recruited for each group. The study subjects were selected using a simple random sampling method. The intervention group were given a treatment of young coconut water. Young coconut water was collected from green-skinned coconuts

aged 6-8 months, calculated from flowering. Each woman in the intervention group consumed 300 ml of young coconut water every day for seven days. The control group consumed mineral water with one teaspoon of sugar added. To measure the morning sickness score, we used instruments of the *Pregnancy-Unique Quantification of Emesis and Nausea* (PUQE) questionnaire and the *Rodhes Nausea, vomiting, and retching* (RNVR) questionnaire.^{11,12} The anxiety was measured using the *Hamilton Anxiety Rating Scale questionnaire* (HARS).¹³ Other information including the number of pregnancy (gravida) and the history of gastritis during a one year period prior to the pregnancy were collected at the beginning of the research. All pregnant women participating in both groups also consumed a daily intake of vitamin B6 and vitamin B complex provided by the community health centre.

The morning sickness scores from the pretest and posttest were analyzed using the paired t-test. The instrument assesses compliance using an evaluation sheet. The difference of morning sickness scores between the intervention group and the control group were analyzed using the independent t-test.

RESULTS

Characteristics of the research subjects are described in Table 1. The majority of women had a moderate level of anxiety (64.9%) and were in their first pregnancy (64.9%). Most of the women completed senior high school (51.4%), had no history of gastritis (78.4%), and had no paid employment (51.4%).

Table 1: Characteristics of research subjects

No.	Variables Catagory	n	%
1.	Anxiety		
	Not present	2	2.7
	Mild	12	16.2
	Moderate	48	64.9
	Severe/very severe	12	16.2
2.	Number of pregnancy		
	Primigravida	48	64.9
	Multigravida	26	35.1
3.	Level of education		
	Elementary	6	8.1
	Junior high school	18	24.3
	Senior high school	38	51.4
	Higher education	12	16.2

Conted...

4.	History of gastritis		
	Yes	16	21.6
	No	58	78.4
5.	Employment		
	Unemployed/housewife	38	51.4
	Private business	24	32.4
	Government office	12	16.2

The mean difference of morning sickness before and after treatment in each group is presented in table 2. The morning sickness scores in the intervention group showed a higher reduction compared to the control group. Both groups showed a significant difference between the pretest and posttest scores (p -value < 0.05).

Table 2: Morning sickness scores of pretest and posttest using the paired t-test analysis

Group	Measurement		Mean difference (95% CI)	t	r
	Pretest	Posttest			
	Mean (SD)	Mean (SD)			
Intervention	22.76 (1.935)	11.19 (2.665)	11.57 (10.716-12.420)	27.535	0.0000
Control	22.11 (1.505)	20.00 (2.028)	2.11 (1.343-2.873)	5.588	0.0000

The magnitude effect of the treatment is shown in Table 3. The treatment received by the control group and the intervention group in reducing the morning sickness score showed a significant difference. The treatment of the intervention group who consumed young coconut water had a significant effect at p -value = 0.042. Consuming young coconut water provided a significant effect on decreasing symptoms of morning sickness in the first trimester of pregnancy.

Table 3: Effect of treatment on reducing morning sickness score using the independent t-test

Group	Mean (SD)	Mean difference (95%CI)	Statistics	
			t	p
Intervention	11.19 (2.665)	-8.81 [(-9.908) - (-7.713)]	-16.005	0.042
Control	20.00 (2.028)			

To assess the efficacy of the young coconut water compared to the placebo (mineral water with added sugar), we conducted a Man-Whitney test on variables of the anxiety score, the number of pregnancies, and the history of gastritis with the results shown in Table 4. No significant difference was found on the level of anxiety, number of pregnancies, and the history of gastritis among women with morning sickness.

Table 4: The result of Man-Whitney test on variables of the anxiety score, the number of pregnancy, and the history of gastritis on women with morning sickness

Yes	16	40.53	0.523
No	58	36.66	

DISCUSSION

In our study, most of the women completed a secondary level of education and unemployed. A previous study in

Indonesia using the nationwide data also reported the similar characteristics of women who attended maternal health services,¹⁴ suggesting the representativeness of the study subjects. Most of the women in the present study were in their first pregnancy with a moderate level of anxiety. During the early weeks of pregnancy, women who experienced pregnancy for the first time may have a higher level of anxiety due to changes in their life.¹⁵ The increase of the estrogen, progesterone and chorionic gonadotropin during the first trimester of pregnancy reduces the motility of the stomach muscles and secretes more gastric acid. The gastric acid contains hydrochloric acid (HCL) that has a corrosive nature. The volume of HCL may increase every 4 hours resulting in the stomach power of hydrogen (pH) at 3.5, which may irritate the gastric mucosa. As a result pregnant women may feel symptoms of nausea, vomiting, bloating, discomfort in the stomach and no appetite, especially in the morning when the stomach is empty.^{2,4}

The increase in hormones leading to morning sickness has been suggested as the mechanism to protect the mother and the fetus from toxins which results in nausea, vomiting, loss of appetite and being sensitive to odors.¹⁶ Nausea and vomiting may reduce the level of potassium in the body.² Hypokalemia affects approximately 4.6% to 19.7% of pregnant women.² Hypokalemia may cause glucose intolerance, the functional disorder of heart, kidneys, and neurological interference, and the most severe cases may result in death.

Irritated, injured and inflamed gastric walls would hamper the absorption of water and sugar from food and cause the loss of fluids and some essential minerals, such as sodium, potassium, calcium, and magnesium. Losing fluids and electrolytes may cause headaches, foot cramps, and oedema among pregnant women. Severe dehydration due to lack of food absorption may cause impaired fetal growth, low birth weight (LBW) and even miscarriage.¹⁷

The results of our study showed the effectiveness of consuming young coconut water to reduce the symptoms of morning sickness. Young coconut water contains potassium at amounts of 7300 mg/l, which is sufficient for pregnant mothers who require 4700mg/hr.⁹ Potassium in water becomes a strong base of potassium hydroxide (KOH) when encountered with HCL, then form a neutralizing reaction which produces potassium chloride (KCL) salt and water.¹⁸ Since the potassium chloride salt is derived from strong acids and strong bases, the potassium chloride salt formed is neutral.

The neutralizing reaction will relieve the symptoms of nausea, vomiting, bloating and discomfort.¹⁸ About 98% of potassium is in the intra-cell fluid which is important for muscle activity.¹⁹ Lack of potassium in the body would affect the neo-muscular strength.¹⁹ As the potassium regulates muscle contraction, the motility of the stomach muscles could be maintained by consuming sufficient water containing potassium.⁹ Therefore, young coconut water, which is rich in potassium, has the potential to prevent the symptoms of nausea and vomiting among pregnant women.¹⁷

Young coconut water contains bioactive phytochemicals including tannin, which is a polyphenol compound with the capability of protecting proteins from degradation and from unsaturated fatty acids in the digestive system.²⁰ Tannin is an antidote substance that could break down toxins in the body. It also serves as an anti-bacterial agent which can eliminate *Helicobacter pylori* in the stomach that causes inflammation and chronic ulcers.²⁰ This substance is also known as an anti-inflammatory that reduces inflammation and the burning sensation in the stomach.^{20,21} Other than that, young coconut water also contains five important electrolytes such as sodium, potassium, chloride, calcium and magnesium. These electrolytes play an important role in protecting the body from dehydration and maintaining the electrolyte balance in the body. Drinking young coconut water can quickly restore lost body electrolytes.^{8,9} Therefore, the consumption of young coconut water for pregnant women is not only useful to reduce symptoms of morning sickness, but also helps to prevent dehydration.²²

CONCLUSION

Morning sickness is common during the first trimester of pregnancy. Consumption of young coconut water showed a significant effect in reducing the symptoms of morning sickness among women in the intervention group. Young coconut water could be used as an alternative to the chemical drug in minimizing the nausea and vomiting among pregnant women.

Factors Affecting the Incidence of Chronic Energy Deficiency among Pregnant Women Attending the Pulubala Community Health Centre

Zuriati Muhamad¹, Sri Sumarmi²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Introduction: Chronic Energy Deficiency (CED) is an indirect cause of maternal death which affects pregnant women in developing countries. The low nutritional status of pregnant women may result in a poor birth outcome. The purpose of this study is to analyse the factors that influence CED incidences in pregnant women.

Material and Method: This quantitative research employed a cross sectional design using a questionnaire, as well as the measurement of mid-upper arm circumference (MUAC) for the data collection methods. Fifty respondents attending the Pulubala community health centre in the Gorontalo district of Eastern Indonesia were recruited to participate.

Results: Most respondents were at the age where there was only a low risk of pregnancy complications, in addition to having poor nutritional knowledge, no previous experience with infectious disease, and having CED. Maternal age and knowledge of nutrition were significantly associated with CED. History of infectious disease had no statistical relationship with CED.

Conclusion: Pregnant women should be provided with nutritional education and micronutrient supplementation in order to improve their nutritional status.

Keywords: *chronic energy deficiency, pregnancy, Indonesia*

INTRODUCTION

Malnutrition affects physical activity and increases the risk of infection among pregnant women, which may result in a poor maternal outcome.¹ According to the World Health Organisation (WHO), worldwide, 30% of women of reproductive age suffered from anaemia, 50% had iron deficiency, and about 20% to 39% of women in low income countries had a low body mass index (<18.5 kg/m²) in 2011.¹ Mid-upper-arm circumference

(MUAC) has been used in various developing countries to identify malnutrition status due to the simplicity of the measurement method and its strong relationship to the low birth weight.² MUAC has also been used as an indicator to determine chronic energy deficiency (CED).

CED reflects poor nutritional status among pregnant women due to a lack of nutrient consumption. CED is considered to be the indirect cause of maternal death.³ In Indonesia, the prevalence of CED among pregnant women aged 15 – 49 years old, as measured in mid-upper-arm circumference, has increased from 33.5% in 2010 to 38.5% in 2013.^{4,5} Similarly, the CED prevalence has also increased among women of reproductive age who are not pregnant from 30.9% in 2010 to 46.6% in 2013.^{4,5} In Gorontalo, a province located in eastern Indonesia, the prevalence of CED was approximately 13.6% in 2017.⁶

There are various factors influencing the nutritional status of pregnant women, such as dietary intake, physical workload, access to health services, metabolic system, parity, the use of oral contraceptives, household income and breastfeeding.^{7,8} Several changes occur in the body during pregnancy, including an increase in metabolism which requires various nutrients to help the growth of the fetus. Malnutrition may increase the risk of maternal complications among pregnant women including anemia, bleeding, low maternal weight, and susceptibility to infectious diseases due to having a low immune system.^{1,9} CED in pregnancy may affect the healthy development of the fetus and result in congenital defects, low birth weight, being stillborn, and higher infant mortality.¹⁰

To prevent CED among pregnant women, the consumption of a healthy and balanced diet is crucial. Women should be encouraged to consume foods containing adequate protein, iron and calories. Women should be provided with proper knowledge of CED and the nutrition required for pregnancy using the communication of information, education method. The provision of supplementary food including iron tablets, iodine supplements and other vitamins would help to promote healthy pregnancies. The present study aims to examine the effects of maternal age, knowledge on nutrition, and history of infectious disease with the presence of CED.

MATERIAL AND METHOD

The present research employed a cross-sectional design. The selection of subjects as the study sample was conducted using simple random sampling. A total of 50 respondents were recruited among the women attending pregnancy check-ups at the Pulubala community health centre in Gorontalo province. This health facility was selected due to having the highest prevalence of CED compared to other facilities within Gorontalo district. The inclusion criterion was that the participants were pregnant women willing to participate in the study. The data collection was conducted from October to December 2017.

CED was measured based on the MUAC values being lower than 23.5 cm, as suggested by a previous study for Africa and Asian setting.² The data of maternal age, level of knowledge, and history of infectious disease was

obtained from the questionnaire. The data was analysed using descriptive statistics and bivariate analysis.

RESULTS

As presented in Table 1, most of respondents aged between 20 – 35 years old (90%) which was considered to be the range of maternal age with a low risk of pregnancy complications. Most of the respondents had poor knowledge of nutrition (62%), and had no history of infectious disease (90%). The history of infectious disease describes whether the subject ever suffered from tuberculosis (TBC), diarrhea, or both. The majority of pregnant women in this study experienced CED, as indicated by a mid-upper arm circumference higher than 23.5 cm (72.0%).

Table 1: Characteristics of the study subjects

Variables	Number (%)
Maternal age (years)	
High risk (< 20, >35)	5 (10.0)
Low risk (20–35)	45 (90.0)
Knowledge on nutrition	
Poor	31 (62.0)
Good	19 (38.0)
History of infectious disease	
Yes	5 (10.0)
No	45 (90.0)
CED	
Yes (MUAC <23.5 cm)	36 (72.0)
No (MUAC > 23.5 cm)	14 (28.0)

Bivariate analysis was performed to describe the relationship between maternal age, knowledge of nutrition, and history of infectious disease and CED as shown in Table 2. Maternal age and knowledge on nutrition were significantly associated with CED (p-value < 0.001). History of the infectious disease was not significantly associated with CED. The presence of CED among pregnant women in the present study was influenced by maternal age and knowledge of nutrition. Among women with CED, the majority of them were at the age where there is a lower risk of pregnancy complications (100%), had poor knowledge on nutrition (83.3%), and had no previous experience of infectious disease (TBC and diarrhea) during pregnancy (88.9%).

Table 2: The relationship between maternal age, knowledge of nutrition, and history of infectious disease and CED

Variables	CED		X ² count	X ² table	p-value
	Yes (n, %)	No (n, %)			
Maternal age (years)					
Low risk (20 – 35)	36 (100.0)	9 (64.3)	14.286	3.84	0.000
High risk (< 20, >35)	0 (0.0)	5 (35.7)			
Knowledge of nutrition					
Poor	30 (83.3)	1 (7.1)	24.836	3.84	0.00 0
Good	6 (16.7)	13 (92.9)			
History of infectious disease					
No	32 (88.9)	13 (92.9)	0.176	3.84	0.675
Yes	4 (11.1)	1 (7.1)			

DISCUSSION

In our study, although most of the pregnant women were in the low risk maternal age group, (20 – 35 years old) most of them experienced CED. Our study subjects were dominated by those with poor nutritional knowledge. Most of them reported having no previous experience with TBC or diarrhea.

Age has been recognised as a crucial factor of CED.⁹ Based on the results of our study, the high prevalence of CED among women of the appropriate maternal age might relate to other socioeconomic factors¹¹ which were not investigated in the present study. Women from poor households and those with a low level of education would increase the risk of having poor nutritional status. Previous studies also highlighted the importance of maternal age for a positive pregnancy outcome.^{12,13} Being of a younger age than 20 years old or being older than 35 years old was also associated with poor maternal outcome.¹⁴ Age was associated with the use of maternal health care services.¹⁵ Women who had their first child at the age of 19 years old or older would be more likely to use health facilities.¹⁵ Therefore, despite having CED, the appropriate maternal age of the respondents may reduce the risk of them having a poor maternal outcome. For CED reduction, these women should be encouraged to regularly attend their scheduled antenatal care visits and receive all necessary and available supplementary nutritious food.

Knowledge on nutrition is a significant factor in relation to CED, as shown in the bivariate analysis results of the present study. The majority of women with CED had poor knowledge of nutrition. CED was

significantly related to the poor capacity to acquire knowledge due having a low level of education.¹¹ According to Notoatmodjo (2010), knowledge is the result of knowing and occurs after sensing a particular object.¹⁶ By having good knowledge of nutrition, pregnant women may consider selecting more healthy and nutritious food to consume. Knowledgeable women would be more obliged to take the supplements suggested by health workers and be more determined to deliver a healthy baby.¹⁷ As reported in a previous study, providing pregnant women with nutritional education statistically increased the gestational weight by 0.45 kg and lowered the risk of iron deficiency by 30%.¹⁷ Providing supplementary micronutrients and nutritious food, along with the nutritional education, statistically reduced the risk of preterm birth by 19% and increased birthweight by 105 g.¹⁷ Improving the nutritional status of pregnant women with CED, therefore, should adopt a strategy of delivering proper nutritional knowledge to the pregnant women and their families, as well as providing the essential micronutrients supplements and nutritious food. Pregnant women should be educated to select the most nutritious food from the locally available food supply.

Experience with infectious disease among the pregnant women making up the population was not significantly associated with CED, as suggested by our bivariate analysis. In the present study, women with CED reported having no previous experience with infectious disease, especially TBC and diarrhea, which therefore had no significant association with CED. However, previous studies suggested that there was a strong relationship between infectious disease and

malnutrition.^{18,19} Other studies highlighted the significant relationship between infectious disease, including hepatitis virus and tripanosoma cruzi infection, and poor birth outcome.^{20,21}

On the other hand, infection and malnutrition has a complicated interaction, as infectious diseases such as diarrhoea, AIDS and malaria may also cause malnutrition.¹⁹ Poor nutritional status has become the major cause of immunodeficiency due to being underweight, increasing susceptibility to infections. Despite strong evidence from the previous study, a significant relationship between infectious disease and CED did not present itself in the results of this study. A possible explanation for this is the small sample size within a single setting (Pulubala community health centre), which may contribute to this result. Due to the nature of our questionnaire, which only asked about their history of infectious disease in relation to TBC and diarrhoea, the pregnant women joining this study might have had other infectious disease but did not report it. Additionally, the pregnant women might not remember having diarrhoea.

CONCLUSION

Maternal age is a significant factor of CED. Most women of maternal age with low risk of pregnancy complications were reported to have CED. Other socioeconomic factors may confound this result. Knowledge of nutrition was also a significant factor related to CED. Pregnant women and their families should receive more sufficient information about nutrition, including the importance of micronutrient supplementation to generate a positive pregnancy outcome. In addition, upon the provision of nutritional education, women with CED should be provided with nutritious food to encourage them to consume a healthy diet. Although infectious disease was found to be an insignificant factor in this study, as most women reported having no history of TBC and/or diarrhoea, the existing high prevalence of CED in the study setting should be taken into account. Improving the nutritional status of pregnant women with CED would prevent the women from having maternal complications due to infectious disease.

Implementation of Birth Preparedness and Complication Readiness (BPCR) in High Risk Pregnancies

Ika Mardiyanti¹, Nursalam², Arief Wibowo³

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Nursing, ³Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Introduction: Birth Preparedness and Complication Readiness (BPCR) is the Indonesia government program aimed at reducing the Maternal Mortality Rate (MMR) and Infant Mortality Rate (IMR). The program requires the active participation of pregnant women and their families, as well as the community. Health cadres are recruited from the community to help pregnant women and their families in monitoring their health status and recognising the early signs of pregnancy complications. Therefore, this study aimed to examine the effect of the factors related to the health cadre's perception and BPCR implementation in high risk pregnancies.

Method: The study employed an observational analysis with a cross sectional approach. 126 health cadres in Surabaya, Indonesia, were recruited as the study subjects. The data collection was carried out through interviews and observations using a structured questionnaire. The data analysis was conducted using univariate, bivariate and multivariate analysis.

Results: Based on the health cadre's perception, the implementation of BPCR was moderately satisfactory (52.4%). Most of respondents had a moderate understanding of the standard procedure and policy targets (48.4%). Most of the respondents selected moderate when rating the resource's availability (72.2%), interpersonal communication (85.7%), technical support (58.7%) and the attitude of the BPCR implementer (92.1%). From the path analysis, the BPCR implementation was significantly affected by the understanding of the standard procedures and policy targets, the technical support from the public health centres, the interpersonal/organisational communication, the attitude of the implementers, and the availability of resources.

Conclusions: The public health centre should provide a clear standard procedure and effectively communicate the BPCR program to the health cadres, pregnant women and their families, as well as to the community.

Keywords: *birth preparedness and complication readiness, health cadre, high risk pregnancy*

INTRODUCTION

Worldwide, about 20% of pregnancies have the risk of complications.¹ Similarly, the Indonesia Ministry of Health also estimated that approximately 15% of pregnancies in Indonesia have maternal complications ranging from mild to high severity level.² Since 1991, the Maternal mortality

rate (MMR) in Indonesia has decreased from 390 per 100,000 live births to 228 per 100,000 live births in 2007, but then made another increase to 359 per 100,000 live births in 2012.³ East Java is among the provinces in Indonesia with the highest MMR.⁴ Most of the maternal deaths in East Java were caused by eclampsia (31%), bleeding (25%), heart disease (12%), infection (6%) and for other reasons (26%).⁵

Most maternal deaths are preventable.⁶ To reduce maternal mortality, the Indonesia Ministry of Health (MoH) launched the Birth Preparedness and Complication Readiness (BPCR) program. This program aims to improve awareness on the risk of pregnancy complications and was designed for pregnant

women and their families, health cadres, and health care workers.⁷ Using the BPCR sticker, every pregnant woman is monitored for their health status. The health care worker also provides health counseling and makes a childbirth plan with the expectant mother, their family and the community to improve both maternal and infant health.⁷ The involvement of the family, especially the husband in the maternal health program, significantly influenced the increased use of antenatal care.⁸

Through BPCR, health care workers can detect a high risk pregnancy complication early and suggest a safe childbirth plan to prevent poor maternal and newborn outcomes.⁹ The BPCR strategy has been adopted in various developing countries. Previous studies in Ethiopia, Nigeria, and Nepal have highlighted some factors influencing the success of BPCR implementation.¹⁰⁻¹² Place of living, distance to a health facility, level of education, level of income, knowledge of pregnancy complication signs, employment, attitude and number of antenatal care visits were among factors associated with the implementation of BPCR.¹²⁻¹⁴ In relation to the BPCR implementation in Indonesia, our study was conducted in order to analyse the factors influencing the BPCR in association with high risk pregnancies in Surabaya, Indonesia.

METHOD

This study employed an observational design with a cross sectional approach. The study population was drawn from health cadres in Wonokromo and Sawahan sub-districts in Surabaya, Indonesia. The recruitment of the study subjects was conducted through stratified proportional random sampling. 126 health cadres were invited to participate. The independent variables selected for this study were based on issues collected during the initial survey of BPCR program implementers in Surabaya, including the interpersonal communication between public health centres and the community-based health initiative, resource availability, technical support and training, the attitude of the BPCR implementers, and the understanding of the standard procedures and policy targets. The dependent variable was the implementation of BPCR among women with high-risk pregnancies.

The data was collected using a structured questionnaire and observation sheet. The structured questionnaire used close-ended questions, each with five scales ranging from very poor to excellent, while the observation sheet included a checklist sheet to measure the resource variables of facilities and infrastructure. The

data analysis was carried out using univariate, bivariate and multivariate analyses. The association between the independent and dependent variables was tested using the Chi Square correlation test. Path analysis was performed to assess the effect of the independent variables on the implementation of BPCR.

RESULTS

As shown in Table 1, most of the respondents had a moderate understanding of the standard procedure and policy targets (48.4%). Most of the respondents selected moderate when rating the resource availability (72.2%), interpersonal communication (85.7%), technical support (58.7%), the attitude of the BPCR implementer (92.1%) and BPCR implementation (52.4%).

Table 1: The frequency distribution of the variables of the respondents' perception on the factors influencing BPCR

Variables	Scale	Frequency	Percent (%)
Understanding the standard procedure and policy targets	Very poor	0	0
	Poor	11	8.7
	Moderate	61	48.4
	Good	54	42.9
	Excellent	0	0
	Total	126	100.0
Resource availability	Very poor	0	0
	Poor	35	27.8
	Moderate	91	72.2
	Good	0	0
	Excellent	0	0
	Total	126	100.0
Interpersonal/organisational communication	Very poor	5	4.0
	Poor	5	4.0
	Moderate	108	85.7
	Good	8	6.3
	Excellent	0	0
	Total	126	100.0
Technical support	Very poor	5	4.0
	Poor	47	37.3
	Moderate	74	58.7
	Good	0	0
	Excellent	0	0
	Total	126	100.0

Conted...

Attitude of the BPCR implementers	Very poor	0	0
	Poor	10	7.9
	Moderate	116	92.1
	Good	0	0
	Excellent	0	0
	Total	126	100.0
BPCR implementation	Very poor	8	6.3
	Poor	2	1.6
	Moderate	66	52.4
	Good	50	39.7
	Excellent	0	0
	Total	126	100.0

A bivariate analysis was performed to assess the correlation between the independent variables and the

dependent variables (table is not shown). An understanding of the standard procedure and policy targets was not associated with BPCR implementation ($p\text{-value}=0.529 > \alpha=0.05$). The availability of resources was associated with BPCR implementation ($p\text{-value} = 0.046 < \alpha = 0.05$). Interpersonal/organisational communication was associated with BPCR implementation ($p\text{-value}= 0.000 < \alpha = 0.05$). Technical support was not associated with BPCR implementation ($p\text{-value}=0.263 > \alpha = 0.05$). The attitude of the BPCR implementer was associated with BPCR implementation ($p\text{-value}= 0.000 < \alpha = 0.05$).

The pathway model of the BPCR implementation was employed to assess the effect of each direction of the relationship. Several goodness of fit tests were conducted, and the results suggested that the model fit the data, as presented in Table 2.

Table 2: Results of the Goodness of Fit tests

Goodness of fit test	Index criteria	Value obtained	Remark
Chi Square (X^2)	Count value $X^2 < \text{table value } X^2_{(5\%;1)}$	5,15 < 5,99	Model fit
Significance Probability	$\geq 0,05$	0,076 \geq 0,05	Model fit
Root Mean Square Error of Approximation (RMSEA)	$\leq 0,05$	0,042 \leq 0,05	Model fit
The goodness of fit index (GFI)	$\geq 0,90$	0,987 \geq 0,90	Model fit
The adjusted goodness of fit index (AGFI)	$\geq 0,90$	0,910 \geq 0,90	Model fit
Confirmatory Fit Index (CFI)	$\geq 0,90$	0,982 \geq 0,90	Model fit

The path diagram described the BPCR implementation in Figure 1, regarding implementation. BPCR implementation (Y) had a direct influence on the technical support of the public health centre (X4.support), the attitude of the BPCR implementers (X5.attitude), and had an indirect influence on the understanding of the standard procedures and policy targets (X1.standard), resource availability (X2.resource), and interpersonal/organisational communication (X3.communication). As seen in Figure 1, there are four pathways with significant relationships (as shown by the thick lines), including 1) X1.Standard \rightarrow X4.support \rightarrow Y; 2) X1.Standard \rightarrow Y. Implementation; 3) X1.Standard \rightarrow X3.Communication \rightarrow X4.support \rightarrow Y. Implementation; 4) X5.attitude \rightarrow Y. The pathway from X1.standard to Y had a total effect value of 3.93 and was unidirectional. The pathway from X2.resource to Y had a total effect value of 0.14 and was unidirectional. The pathway from X3.communication to Y had the total effect value of 0.57 and was unidirectional. The pathway from X4.support to Y had a total effect

value of 1.84 and was unidirectional. The pathway from X5.attitude to Y had a total effect value of 1.15 and was unidirectional.

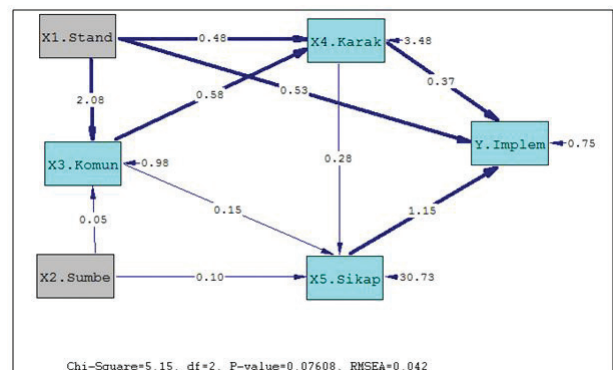

Figure 1: The pathway diagram of the effect value (pathway coefficient)

DISCUSSION

Our results showed that some of the factors describing the cadre’s perception on understanding the standard

procedures and policy targets, the technical support from the public health centre, the interpersonal/organisational communication, the attitude of BPCR implementers and the resource availability was significant in relation to BPCR implementation.

In this study, the interpersonal/organisational communication and the attitude of the BPCR implementers improved BPCR's implementation. According to Azwar (2010), communication in program implementation is crucial, as the extent of the communication received would influence the implementer in decision-making and in creating a conducive working atmosphere.¹⁵ Effective communication is the first step for successful policy implementation.¹⁶ A previous study also suggested that the program policies should be clearly communicated and socialised to the health cadres as the front-line staff, so then they can understand and actively help monitor women with high risk pregnancies.¹⁷ Having a poor understanding of the program could demotivate the program implementer in relation to good performance.¹⁸ Implementers that shown a good attitude would result in good performance, in relation to the program implementation.¹⁹

Communication is also influential to form the attitude of the implementers, as shown in their enthusiasm related to carrying out the needed tasks. Therefore, communication is not just an information delivery activity, but also an attempt to influence and strengthen the target's perceptions and attitude as desired. Good communication will increase the participation of pregnant women, increasing the early detection of a high risk to the pregnancy and preparing for a safe delivery.²⁰

To improve BPCR implementation, the health cadres require good technical support from the public health centre, as shown in the study results. This support can be in the form of formal or non-formal support. Formal support can be obtained from regular supervision via the public health centre, while informal support can be obtained from the daily interaction between the cadres and the village midwives.⁷ Supervision from a technical advisor would improve the implementation performance, as the technical advisor would have the opportunity to do a direct observation while the implementer would have a chance to provide a face to face consultation.¹⁵ Clear standard procedures and policy targets are a strong stimulus for successful policy implementation, leading

to the acceptance and willingness of the implementer to carry out the program.²¹

The resource availability in terms of health workforce and financial support is significant in relation to BPCR implementation in this study. The health workforce is central in implementing the health care program. Therefore, the availability, accessibility, acceptability, and affordability of the health workforce is crucial in promoting the success of the program.²² Sufficient and competent human resources, funds and the infrastructure facilities that are used optimally can facilitate the implementation process.¹¹ Resources such the workforce, finances, facilities, and infrastructure must be made available and sustainable in order to generate the expected outcome.¹⁶ This issue has been well-recognized by the Government of Indonesia who continuously strengthen the health workforce system at all levels with other sectors.²³

BPCR implementation involves activities that require the active participation of husbands, families and cadres (community) in planning safe deliveries and understanding the danger signs of pregnancy complications.²⁴ In Indonesia, the husband's participation as an alert husband or *Suami Siaga* in the safe motherhood program has improved antenatal care attendance and planning for delivery in a health facility.⁸

CONCLUSION

Based on the perception of health cadres on BPCR implementation, several factors including understanding the standard procedures and policy targets, the resource availability, the interpersonal/organisational communication, the technical support from the public health centre, and the attitude of the BPCR implementer has a significant effect on the success of BPCR implementation. The public health centre has a central role in providing and delivering clear procedure and policy targets within and for the BPCR program. Building effective communication between the health cadres and health workers in the public health centre, including the village midwives, can improve the attitude of the program implementers which leads to improved BPCR implementation. However, optimum BPCR implementation is impossible to achieve without sufficient resource availability, especially in relation to the health workforce and financial support.

Ethical Clearance: Ethical approval was granted by the School of Public Health in Airlangga University, Surabaya.

Access to Healthcare Facilities in Poor and Underdeveloped Areas in Nusa Tenggara Timur Province

Yendris Krisno Syamruth¹, H. Kuntoro¹

¹Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga

ABSTRACT

Background: The equality of access to healthcare facilities corresponds to the degree of public health. The degree of public health in underdeveloped areas and borders is still far behind other regions, one of the provinces which has many underdeveloped regencies is the province of Nusa Tenggara Timur.

Purpose: This study aims to give an overview of access to healthcare facilities from the perspective of resources and community capacity in Nusa Tenggara Timur Province (NTT) by using the perspective of supply and demand.

Method: This study is based on secondary data, which is the 2013 Basic Health Research conducted by the Health Research and Development Agency of the Ministry of Health of Republic of Indonesia. This uses the total population of all households in NTT with multi-stage and clusters sampling techniques, with 10,747 households sampled, which were selected based on the block census of the Central Statistics Agency (BPS).

Result: The most popular healthcare facility among the households is Puskesmas, with a proportion of 86.4%, and the least popular is Poskesdes with a proportion of 5.8%, while public knowledge on Puskesmas or Pustu nationally is 89.8%. The type of transportation that is most often used to go to the Puskesmas is motorbikes, with a percentage of 39% and the lowest is bicycles with 0.1%, but if the healthcare provider is a hospital, the type of transportation that is most often used is public transport, the furthest healthcare provider with travel time > 60 minutes is the hospital and the shortest is < 16 minutes which is Posyandu, while the transportation cost to the healthcare facility is Posyandu, with the cost of < Rp 10.000.

Conclusion: The location of healthcare providers relatively far from households contributes to the knowledge about the availability of health care providers, the travel time, the alternative modes of transportation used, and the costs incurred to reach the healthcare provider. Puskesmas and Posyandu are still the most popular healthcare facilities because they are well-known, cheaper and closer.

Keywords: *accessibility, equity, underdeveloped area, poor area, healthcare facility*

INTRODUCTION

The facts show that Nusa Tenggara Timur Province is one of the underdeveloped provinces, with many poor people, of more than one million, in 2016 (22.10%) and they live in the border and remote islands that have difficulty in getting their rights to health. System-oriented healthcare development is expected to prevent geographical imbalances in order to ensure quality and access to health services in the era of National Health Insurance. In addition, the basic need for a fair and excellent healthcare provider (preventing, promoting, curative, and rehabilitating) can be realized and finally it will enhance the quality of human resources in NTT.

Corresponding Author:

Yendris Krisno Syamruth

Universitas Airlangga Surabaya,
Jl Mulyorejo kampus C Unair Surabaya, Indonesia
Email: yendris.krisno.syamruth-2017@fkm.unair.ac.id

In order to develop people who live in bucolic and underdeveloped areas, solid support is needed, not only in one aspect, but the support must be integrated with financial support, planning, evaluation, exchange of information and coordination, technology, promotion, and extension of liability in terms of healthcare¹.

The key to development is the degree of public health care, the higher the public health status, the better the development. Nusa Tenggara Timur Province faces some health issues which contribute to the degree of public health, such as the reach of health care for poor and risky people (pregnant women, babies and toddlers) in NTT which is still low, the number of mortality of mother (192 cases), babies (1450 cases) and toddlers (1717 case) is high, the proportion of babies with severe malnutrition and lack of nutrition, including the phenomenon of “*stunting*”, and the increasing trends of non-infectious and infectious diseases (*double burden of diseases*). Life Expectancy in NTT (67.73 years old) is still below the national standard (70,81) in 2017. Generally, all these problems have an impact on NTT’s low quality of human resources development. It is reflected from the Human Development Index (IPM). IPM is an indicator of development in the field of economics, education and health which is calculated based on the rate of life expectancy, average time of education, literacy rate and per capita expenditure. Currently, the IPM of Nusa Tenggara Timur Province is increasing, where in 2009 the IPM is 67,26 and in 2017 the IPM increase to 67,73. In other words, the IPM increase 0,47 within 8 years. The increase of IPM that has been accomplished cannot reach the national average which is 70,81 in 2017. Based on the national data, since 2015 until 2017, NTT still hold on in the 31st position. Access to healthcare facilities in NTT is a crucial factor which needs to be improved.

This study illustrates a basic portrait of the ability of the community to access healthcare facilities that belong to their rights so that basic information can be leveraged.

RESOURCES AND METHOD

This study refers to the results of the 2013 Basic Health Research conducted by the Research and Development Agency of Indonesian Ministry of Health². The sampling technique used is a gradual and cluster with cross-sectional analytic observational survey approaches with selected variables related to community

accessibility to health services and resources that capture the condition of the community in reaching government-owned health facilities. The population in this study is all households in NTT Province and samples are taken from BPS Census Block with a total sample of 10,747 households. The NTT Province in this study was chosen with the consideration of regions that have high lagging, border and archipelago areas compared to other provinces, as well as the front porch of the Republic of Indonesia. At this time a descriptive analysis was carried out to obtain a special description of service accessibility in the district in NTT Province.

RESULTS

Access to healthcare facilities is described in 2 aspects, namely (1) community/household knowledge about the availability of health facilities (public hospitals, private hospitals, Puskesmas or supporting Puskesmas, doctor or clinic, midwife clinic or maternity clinic, Posyandu, and Poskesdes or Poskestren), and (2) affordability of healthcare facilities. Based on the results of Riskesdas 2013, it is known that NTT Province occupies the lowest position in Indonesia in terms of knowledge of the availability of health facilities, as presented in Figure 1.

Figure 1: Proportion of Household with knowledge of the availability of Government and Private-owned Hospital based on Province of 2013

Meanwhile, the most popular healthcare facility at Regency level in NTT is Puskesmas/Pustu (86,4 %) ranges from 64,6% in Kabupaten Sikka to 99,6% in Lembata. While the least famous healthcare facility in entire NTT province is Poskesdes/Poskestren (5,8%) ranging from 0% in Timor Tengah Selatan and Sabu Raijua to 23,6% in Manggarai. More detailed information can be found in table 1.

Table 1: Proportion of Household Knowledge on the availability of healthcare facilities based on Regency/ City, Nusa Tenggara Timur, Riskesdas 2013

Kota Kupang	86,7	63,5	91,4	56,9	44,6	60,8	6,7	6,6
Nusa Tenggara Timur	42,8	23,7	86,4	22,8	10,3	42,1	5,8	21,8

Overview on the access to healthcare facility based on the transportation mode can be found in table 2.

Table 2: Percentage of Transportation Modes that are Used by the Households to Go to Healthcare Facility in Nusa Tenggara Timur, Riskesdas 2013

Healthcare Facility	Transportation Modes								
	Private car	Public transport	On foot	Motor cycle	Bicycle	Boat	Air transport	Others	More than one transport mode
Public hospital	2,3	41,6	1,6	39,9	-	0,3	0,0	0,3	13,9
Private hospital	2,3	39,5	3,9	39,4	-	0,2	0,2	0,2	14,4
Puskesmas/Pustu	1,1	23,6	28,8	39,4	-	0,2		0,1	6,8
Doctor/Clinic	3,5	28,9	7,4	52,1	-	0,1	0,0	0,0	7,9
Midwife/maternity clinic	2,4	30,7	17,7	43,6	-	-	-	0,1	5,5
Posyandu	0,6	3,9	78,0	14,2	-	-	-	0,1	3,2
Poskesdes/ Poskestren	0,5	3,9	80,1	13,1	-	0,2	-	-	2,3
Polindes	0,4	8,5	73,0	15,5	0,1	-	-	0,2	2,2

The table above indicates that the transportation mode that is mostly used by the households in Nusa Tenggara Timur to go to public hospital is public transport (41,6%), and the least used is bicycles, boats, air transport and “others” (each has a percentage of < 0,5%). Most of the 41,6 % respondents who use public transport are from Manggarai Timur dan, while only a few of them come from Kabupaten Kupang (14,1%).

Figure 2: The Percentage of Travel Time of the Household to Go To Healthcare Facilities in Nusa Tenggara Timur, Riskesdas 2013

The above figure indicates that most of people who go to Posyandu (71%) have to travel for ≤ 15 minutes, while those who go to public hospital in Nusa Tenggara Province (29%) have the longest travel time, namely >60 minutes. Most of those who go to the hospital come from Manggarai Timur (96,3%) Regency and only a few of them who come from Alor (3,8%).

Among four categories of travel time to Poskesdes/ Poskestren and Polindes in the entire Nusa Tenggara Timur Province, the dominant category is the category of travel time of ≤15 minutes. The data concerning the accessibility of health care services based on the transport cost can be found in Table 3.

Table 3: Percentage of the Transportation Cost that Incurred by the Households to Go to Public hospital based on Regency/City, Nusa Tenggara Timur, Riskesdas 2013

Healthcare facility	Transport cost (rupiah)			
	10.000 ∨	10.000 ∧	50.000 ∧	200.000 ∧
Public hospital	57,7	37,5	4,1	0,7
Private hospital	65,2	31,2	3,0	0,6

Conted...

Puskesmas/Pustu	92,7	7,1	0,1	0,1
Docter/Clinic	77,9	20,5	1,4	0,2
Midwife/Maternity clinic	80,0	19,2	0,5	0,3
Posyandu	97,2	2,7	0	0,1
Poskesdes/Poskestren	92,1	5,3	0	2,6
Polindes	96,0	2,9	0,1	1,0

The above table shows that more than half of the respondents (57,7%) incur travel costs of Rp. < 10.000,- to go to public hospital. The higher the transportation cost, the fewer people who choose such a transportation mode.

ANALYSIS

Access to healthcare facilities is the ability of each individual to seek health services that she/he needs. The healthcare facilities are generally established in a central regional position with consideration that it is easily accessible to most people. Thabrany, et.al. state that the travel time and distance to the healthcare facilities contributes significantly to the utilization of health funds³. Public accessibility to health services is affected by many factors that are very multidimensional. Accessibility is not only influenced by supply factors, such as the availability of health workers and facilities, but it is also affected by several factors such as geographical conditions and the scope of health insurance availability. These factors can be an obstacle if they are not managed and anticipated properly. Access to health services must be determined by the actual needs (demand) of health services rather than just the ability to pay or geographical location⁴. Formal health services are not enough. Communities in need must have access to health services available within a reasonable period of time. In addition, pursuing equity must go beyond access to medication and treatment, but also must examine variations in health status in different groups in society^{4,5}. Most of the regencies in NTT Province are situated in underdeveloped area, and the rest are situated at the border or remote island, such as Rote Ndao regency, Sumba regency, Belu regency and Alor regency. Some of the factors which hamper the accessibility of the community to fulfill their health rights are the location of the house, economic capacity, the availability of the road network, and modes of transportation which cause intrinsically and extrinsically minimal in service accessibility. These factors, according to Kumar, can affect the degree of public health^{6,7}.

The transportation mode that is mostly used is public transportation, although it is not available at all the time. As an alternative, other transportation modes such as motorbikes are used, considering the limited access of roads and house location⁷⁻⁹. In some cases, sick people who want to find medical treatment have to use any available transportation means^{7,10,11}. The government is still working on the improvement of infrastructure and bridges which are intended to refine access and shorten the travel time which can be achieved, at least in terms of supply^{5,12}.

In order to increase access, an intensive dissemination of information on the availability of healthcare facilities and its utilization must be delivered to the society to satisfy their health needs. In addition, the referral system must be improved, not only at the site of this study. Strengthening the referral system must be carried out through developing several hospitals in several regions in East Nusa Tenggara based on the proximity of the archipelago and keep accelerating Puskesmas accreditation in relatively isolated districts and increasing community participation in services at the Posyandu level. The majority of the respondents chose Puskesmas and Polindes because they are the closest to the respondent's residence. The choice of these two health facilities is related to the economic background of the respondent, the distance to the place of residence, and the availability of transportation in the village.

CONCLUSION

The highest percentage of public knowledge on the availability of government-owned healthcare facilities such as hospital and Puskesmas can be found in Kabupaten Sumba Barat, while the lowest percentage can be found in Manggarai Barat, in the entire NTT province, only 42,8% of the respondents who have knowledge of the availability of healthcare facilities such as hospitals, but 86,4% of the respondents were aware of the availability of Puskesmas, such as knowledge on the availability of healthcare facilities caused by the lack of information and geographical position of the existing healthcare facilities. Such limited knowledge contributes to the choice of transportation mode, which is mostly used to go to the healthcare facility, namely motorbike and public transport, while there are also some respondents who walk to healthcare facilities. The travel time that is spent by the household to get to the government-owned

healthcare facilities is relatively long and therefore, many people go to Posyandu instead (71%) because it is closer than the hospital or Puskesmas. Such choices contribute to the transportation cost which is the cheapest option of transportation cost incurred by most people to go to healthcare facilities. Thus, the lack of knowledge contributes to the type of healthcare facility chosen and which corresponds to the travel time and the cost incurred.

The Effect of Doctor Professionalism on the Quality of Medical Services at a First Level Health Facility

Febri Endra B. S.¹, Stefanus Supriyanto², Rubayat Indradi³, Aditya Rizka R⁴

¹Doctoral Student, Faculty of Public Health, ²Professor, Department of Health Administration and Policy, Faculty of Public Health, Universitas Airlangga Surabaya, Jl Mulyorejo kampus C Unair Surabaya, Indonesia; ³Family and Industrial Medicine Division, ⁴Doctor Profession Program, Faculty of Medicine, University of Muhammadiyah Malang

ABSTRACT

Introduction: Professionalism is part of the Indonesian Code of Medical Ethics. Doctor professionalism can be achieved through mastering competencies that refer to the Standard Competency of Indonesian Doctor (SKDI). Competency is closely related to the quality of service. Service quality can be measured using the SERVQUAL method. Indonesia is currently implementing National Health Insurance where health services are carried out at first level of health facilities (FKTP) and FKRTL with a tiered referral pattern. This study aims to determine the effect of doctor professionalism on the quality of medical services in an FKTP-category clinic.

Method: This study is an analytic observational study with a cross-sectional study design. The population is from one of the FKTP-category clinics in Malang Regency with total sample of 234 people selected through systematic random sampling. The respondent is a patient who has been treated 3 times in selected FKTP. Data analysis is using Somers' d correlation test and linear regression test.

Result: From Somers' d test obtained value of $r=0.317$. The equality value of the quality of medical services obtained $Y=-1.515+X_1 0.187+X_2 0.197+X_3 0.179+X_4 0.216+X_5 0.172$. The equality value of doctor professionalism obtained $Y=-3.275+X_1 0.216+X_2 0.107+X_3 0.123+X_4 0.182+X_5 0.288+X_6 0.174+X_7 0.306$. It is apparent from these equations that professionalism of doctor affected the quality of medical services.

Discussion and Conclusion: The quality of health services refers to the appearance of health services, known as output, which is the final result of doctor and other professional personnel's actions on patients, in the sense of changes in health status and satisfaction both are positive and vice versa. Competency influences job satisfaction of service providers so that it will affect the service quality. Patients feel comfortable and calm when the doctor pays them attention and can answer patients' questions. Further emphasize on the assurance dimension and also the competency area of effective communication may need to be considered.

Keywords: Professionalism, competency, quality of medical service, SERVQUAL

INTRODUCTION

Professionalism is the attitude of a professional, and professional means doing something as a main job called a profession, meaning that the job is not a spare time filler or a mere hobby¹. Professionalism is a part of

the Indonesian Code of Medical Ethics (2012). An article regarding professionalism is contained in the Indonesian Code of Medical Ethics Article 8 "A doctor is obliged, in every medical practice, to provide competent services with full technical and moral freedom, accompanied by compassion and respect for human dignity". Assessment of doctor's professionalism can be done based on the points of view of doctors, patients, and nurses, where doctors assess their level of professionalism as lower than the assessment given by patients².

Arnold (2006) states that doctor's professionalism is demonstrated through clinical competence,

communication skills, understanding of ethics and law that are built in the hope to implement the principles of professionalism³. Doctor competency in Indonesia refers to Indonesian Doctor Competency Standards, where doctors must understand and master seven areas of competence, namely: 1) Noble professionalism; 2) Self-awareness and self-development; 3) Effective communication; 4) Management of information; 5) Scientific foundation of medical science; 6) Clinical skills; and 7) Management of health problems. Good competence achievement is expected to provide satisfaction to patients through high-quality health services. High quality of health services is a must to get satisfaction from health service users. For health service users, the quality of health services and their satisfaction is formed from structured activities, not only performance or product quality, but also provides an overall organized image⁴.

The quality of health services needs to be maintained which generally can be stated that what is meant by the quality of health services refers to the level of perfection of health services. On one hand it can cause satisfaction to the patient, meanwhile on the other hand the procedure must be in accordance with the established code of ethics of professional standards⁵. Parasuraman, Zeithmal and Berry in Lupiyoadi (2001) concluded that there are five dimensions of service quality called SERVQUAL which consists of Reliability, Assurance, Tangibles, Empathy, and Responsiveness⁶.

Based on Law No. 40 of 2004, it is stated that every person has the right to social security to be able to fulfill a decent life, have basic needs fulfilled, and upgrade his dignity towards the realization of a prosperous, just, and wealthy Indonesian society. For this reason, based on Law No. 24 of 2011, formed a Social Security Administrative Body (BPJS) which in the health

sector formed Healthcare and Social Security Agency (Healthcare BPJS). The Minister of Health Regulation No. 71 of 2013 states that health service providers in the JKN program are in the form of First Level Health Facilities (FKTP) and Advanced Referral Health Facilities (FKRTL).

RESEARCH METHOD

Research Design: This study is an analytic observational study with a cross-sectional study design. The research was done at FKTP of “X” Clinic in Malang Regency in January - March 2018.

Research Population and Sample: The population and sample of this study were Healthcare BPJS members registered at FKTP “X” Clinic in Malang Regency. The calculation of sample size used the formula of the cross-sectional research sample, the population is known:

$$n = \frac{Z_{1-\alpha/2}^2 p(1-p)N}{d^2(N-1) + Z_{1-\alpha/2}^2 p(1-p)}$$

The sampling technique used systematic random sampling, where there were 234 samples. Selected samples are BPJS members registered at FKTP of “X” Clinic in Malang Regency who have used FKTP at least 3 times.

ANALYSIS OF RESEARCH RESULTS

In this study, data were obtained from interview results based on questionnaires conducted on the Healthcare BPJS members registered at FKTP “X” Clinic in Malang Regency. The data obtained from respondents’ answers will be processed, tabulated, presented in table form and then performed using the Somers’ d correlation test and linear regression test.

RESEARCH RESULTS

The results of the study can be described as follows:

Table 1: Distribution and level of Medical Services Quality at FKTP of “X” Clinic in Malang Regency

Service Quality	n	%
Less qualify	2	0.9
Qualify	184	78.6
Highly qualify	48	20.5
Total	234	100.0

Competency Area 1	Average value of each statement	Average value of competency area 1
Doctors give greetings, are friendly and treat patients well	3.927	3.953
Doctors value patients' religion, age and physical condition	3.910	
Doctors are calm and able to communicate with other health workers	4.021	
Competency Area 2	Average value of each statement	Average value of competency area 2
Doctors appreciate other treatment methods	4.043	4.021
Doctors give a positive response to patient's opinion	3.979	
Doctors are aware of their own shortcomings	4.043	
Competency Area 3	Average value of each statement	Average value of competency area 3
Doctors can communicate with a language that is understood by patients	4.137	4.137
Doctors can convey information clearly	4.179	
Doctors deliver counseling in polite language	4.094	
Competency Area 4	Average value of each statement	Average value of competency area 4
Doctors are skilled in managing information from patients	4.081	4.079
Doctors are skilled at using IT devices	4.077	
Competency Area 5	Average value of each statement	Average value of competency area 5
Doctors possess knowledge on health problems related to patient complaints	4.047	4.073
Doctors are able to decide the necessary supporting examinations	4.064	
Doctors are able to determine the prognosis	4.120	
Doctors consider patient's ability to make decisions	4.060	
Competency Area 6	Average value of each statement	Average value of competency area 6
Doctors are skilled in carrying out anamnesis process	4.115	4.097
Doctors are skilled in carrying out physical examinations	4.077	
Doctors can decide a rational supporting examination	4.098	
Competency Area 7	Average value of each statement	Average value of competency area 7
Doctors are able to do IEC related to health promotion suitable for patient's condition	4.081	4.022
Doctors are able to do IEC related to health prevention suitable for patient's condition	4.077	
Doctors are able to do a fast and correct treatment	4.047	
Doctors are able to do IEC related to rehabilitation suitable to patient's condition	4.047	
Doctors make instructions that are easy to understand	3.859	

The five dimensions of SERVQUAL namely RATER have a significant effect on the quality of medical services. This is obtained by the result of regression equation $Y = -1.515 + X_1 0.187 + X_2 0.197 + X_3 0.179 + X_4 0.216 + X_5 0.172$. The professionalism of doctor is influenced by the seven areas of doctor's competency and obtained result of the regression equation $Y = -3.275 + X_1 0.216 + X_2 0.107 + X_3 0.123 + X_4 0.182 + X_5 0.288 + X_6 0.174 + X_7 0.306$.

The result of the Somers' d test showed significant result ($p=0.000$) that professionalism of doctor affected the quality of medical services at FKTP of "X" Clinic in Malang Regency with a value of $r=0.317$.

DISCUSSION

In table 1 it is known that most (78.6%) Healthcare BPJS members at FKTP of "X" Clinic in Malang Regency stated that medical services were already high in quality. Table 1 also shows that the five dimensions of quality have a high average value (3.880–3.950) with the highest average value on assurance dimension (assurance of service quality) with an average value of 3.950 (based on 5 categories of Likert scale).

This study is different from Aida's (2017) study of health services quality in a community health center, where only 58.5% of patients stated that the highest quality of service and the highest SERVQUAL dimension are empathy and tangible dimensions⁷. The result of medical services quality in this study was still higher than Ika's (2012) study which showed 64%-71% of PKMS outpatients stated that services in General Polyclinic of Surakarta Regional Public Hospital were good in quality, with the highest quality of service in the dimensions of responsiveness and empathy⁸.

Quality is the actual proper value of certain service units, both from the technical aspects (knowledge, skills, and medical or health technology) and interpersonal, which is the doctor-patient relationship: communication, empathy and patient satisfaction⁹. Doctors certainly will not be able to provide information related to patient health problems if they do not master the competencies. Mastery of competence in this study is based on the Standard for Indonesian Doctor's Competencies (SKDI) determined by the Indonesian Medical Council in 2012¹⁰.

Based on table 2 it is known that there were no patients at FKTP of "X" Clinic in Malang Regency

who stated that doctors were not professional, 37.6% of patients stated that medical services were carried out very professionally. This professional medical service is certainly supported by a fairly good mastery of competence. In this study the area of competence that was most mastered by doctors in area 3 based on SKDI is the competency area of effective communication, with an average value of 4.137 (based on a 5 category Likert scale). This is in accordance with patient assessment related to the quality of medical services, where the highest mean value is in the assurance dimension, meaning that doctors are able to develop good communication with patients so that they can understand the doctor's explanation, where in the end they will be able to decide the next management step based on previous explanations given by the doctor.

Ina's study (2012) on HR competency with hospital service quality states that positive responses from patients to the quality of doctor services can be known through the statement: "Patients feel comfortable and calm when doctors give their interest and ability to answer patient's questions"¹¹.

Tati's study (2016) of the effect of doctor service quality on patient loyalty states that doctors' technical ability is considered good by patients with a counted mean of technical ability of 38.84 with an ideal average of 27.00¹². This study is in line with Alit's study (2014) which states that 96% of patients assess the competence of doctors as good¹³. Competency influences job satisfaction of service providers so that later it will also affect the quality of service.

The results of the regression test revealed that all dimensions (RATER) had significant roles in the quality of medical services at FKTP of "X" Clinic in Malang Regency. In the regression test result it is known that each SERVQUAL dimension has an equal effect. The result of the Somers' d test revealed that doctor's professionalism has a moderate influence on the quality of medical services at FKTP of "X" Clinic in Malang Regency. This is in line with Alit's study (2014) that competence has a significant relationship with service quality¹³.

CONCLUSION

Doctors' professionalism provides a significant influence on the quality of medical services at FKTP of "X" Clinic in Malang Regency. The dimension that has

the highest influence on the quality of medical services is the assurance dimension (assurance of medical services). The competency area of effective communication has the highest influence on doctor professionalism in providing medical services to patients at FKTP of "X" Clinic in Malang Regency.

Self-Help Group Therapy: The Enhancement of Self-Care Ability and Quality of Life Among the Elderly in Bali, Indonesia

I Wayan Suardana¹, Ah Yusuf², Windhu Purnomo³

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Nursing, ³Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Worldwide, the number of people aged 60 years and over has rapidly increased along with the increase in life expectancy. An aging population faces challenges in relation to improving self-care ability and quality of life. This study has aimed to identify the influence of self-help group therapy on the self-care ability and quality of life of elderly people in Bali, Indonesia. We employed a quasi experimental analysis using a pre-test and post-test. A total of 25 retired military officers participated in the study. Two questionnaires (WHO-BREF and WHOQOL-OLD) were adopted to compare the self-care ability and the quality of life results before and after the self-help group therapy was implemented. The data was analysed using an independent t-test. The results showed that the self-help group therapy had a significant effect on the improved self-care ability among the elderly with a mean difference of 0.2, $t = 2.449$ and p-value of 0.02. The self-help group therapy also significantly improved quality of life with a mean difference of 11.7, $t = -8.476$, and p-value of 0.00. Empowering the elderly and their families as well as the community is strongly recommended in order to establish effective self-help group therapy for the elderly.

Keywords: *Self-help group therapy, elderly, self-care, quality of life*

INTRODUCTION

After six decades, the number of people aged 60 years or older has increased fourfold from 205 million in 1950 to 810 million in 2012.¹ Almost two in every three elderly people in the world live in developing countries.¹ Based on the 2010 national census, approximately 18 million or 7.6% of the Indonesian population is aged 60 years old or over. This was projected to reach 12.7% by 2050.² The increased elderly population is related to the increased life expectancy.² However, longer life expectancy has been challenged by health problems, primarily chronic non-communicable diseases.³ Various sociodemographic factors and shifts in disease burden from communicable to non-communicable disease has influenced strategies to improve the health of older adults.

According to the World Health Organization (WHO), improving the health status of the elderly is aimed to promote quality of life, which can be measured through physical health, psychological health and social and environmental relations.³ Promoting the quality of life among the elderly is conducted by empowering older adults with the capability to execute self-care and to maintain healthy daily life activities. A self-help group is a strategy that can be used to empower the elderly, to optimise the role of the elderly in providing mutual support and to share overcoming life problems.⁴ Empowering through creating activities in a group can boost self-confidence and self-esteem, as well as increasing the self-abilities of the elderly.⁵ By joining a self-help group, elderly women can learn skills to carry on their daily activities independently and adopt a healthy lifestyle which lead to an improved quality of life (QOL).⁶

In Indonesia, self-help groups for the elderly are established through a community-based activity for sharing problems and encouragement among members of the group. The integrated coaching post, or *Posbindu*, as one of the community health-based activities for

Corresponding Author:

Doctoral Program of Public Health,
Faculty of Public Health, Universitas Airlangga,
Mulyorejo, Surabaya, Indonesia
Email: suardanawayan@yahoo.com

monitoring non-communicable disease has been utilised to support the elderly in maintaining their health status and performing self-care.⁷ However, only the elderly who are physically active can attend the integrated coaching post. For the adults who stay alone at home and are unable to perform activities of daily living (ADL) independently, they cannot attend without support from other people. Therefore, this study aims to assess the effect of the self-help group on enhancing self-capability and quality of life among the elderly.

METHOD

To support the study aim, we conducted a quantitative study using a quasi-experimental research design with a pre-test and post-test. The sample of population studied was retired military officers aged 60 years or older who lived in Kuta Utara sub-district in Badung district, Bali, Indonesia. Selecting the retired military officers was based on the assumption that the elderly people would have a better physical condition than another group of people. A simple random sampling method was applied in selecting the study sample, resulting in 25 people recruited to participate in the study.

The data was collected for the pre-test and the post-test using two questionnaires, including the independence scale of Activity Daily Living (ADL) as measured by the Katz index, and quality of life as measured by a combination of the World Health Organisation Quality of Life Assessment (WHOQOL-BREF)⁸ and the WHOQOL older adults module (WHOQOL-OLD).⁹ The data analysis was performed using an independent t-test.

RESULTS

The majority of the study subjects were female (60%), with the mean of the respondent’s age being 73.6 years old. This finding confirmed the results of many reports that females have a longer life expectancy than males. The average age among the study respondents was higher than the current Bali life expectancy at birth which is 72.1 years old.¹⁰ Most of the respondents in our study were widows or widowers (62%). As our respondents were retirees, all of them were no longer engaged in active employment. Most of them lived with their extended families (72%). Most of the respondents had a secondary educational level (76%), while the remaining respondents had a higher education level (24%).

Based on the respondent’s answers to the WHOQOL-BREF and WHOQOL-OLD questionnaires during the pre-test and post-test, the scores of self-care skills and quality of life were analysed using the independent t-test and displayed in Table 1 and 2. A higher self-care score indicated that more self-care skills were unable to be conducted. Before the self-help group therapy, the mean of the self-care scores was 2.52, as shown in Table 1. After the therapy, the mean of the self-care scores was 2.32.

Table 1: The self-skill scores before and after the self-help group therapy

Self-care score	Before		After	
	f	fx score	f	fx score
2.00	17	34	18	36
3.00	3	9	6	18
4.00	5	20	1	4
Total	25	63	25	58
Mean score		2.52		2.32

From Table 2, the mean score of the quality of life increased from 73.2 before to 84.9 after the respondents joined the self-help group therapy. On average, the QOL scores increased by 1.7 points after the self-help group therapy was implemented.

Table 2: The scores for quality of life before and after the self-help group therapy

Quality of life score	Before	After
Minimum score	62	75
Maximum score	90	97
Average score	73.2	84.9

Table 3 shows that the mean change in self-care skills before and after the self-help group therapy was 0.2 with a standard deviation of 0.4 and a standard error of 0.8. The t value was 2.449 on the degree of freedom of 24. The significance level showed a p-value of 0.02, smaller than 0.05. This result explained that Ho was rejected and suggested the significant effect of the self-help group therapy on the ability of the respondents in performing self-care. The significant reduction of self-care therapy after the implementation of the self-help group therapy suggested the effectiveness of the therapy in promoting the respondents’ self-care skills.

Table 3: The results of the t-test analysis on the effect of self-help group therapy on self-care skills

X	SD	SE	t	df	Sig 2 tailed 95 %
0.2	0.40	0.8	2.449	24	0.02

Self-reliance and self-care capability reflects someone’s ability to meet the needs of self-care as shown by their ability to perform daily activities. Activity of Daily Living (ADL) is a routine activity performed by humans. However, due to the aging process, the elderly often experience a decrease in their ADL ability.¹¹ ADL includes self-care such as bathing, dressing, toileting, transferring, continence and feeding.

Table 4 shows that the QOL mean score results had changed by -11.7 after the self-help group therapy, with a standard deviation of 6.91 and standard error of 1.38. The t value was -8.476 on the degree of freedom of 24. Further analysis yielded a p-value of 0.00 ($\alpha < 0.05$). This result concluded that H_a was accepted and H_o was rejected. There was a significant influence from the self-help group therapy on improving the respondent’s QOL. A higher QOL score indicates an improved QOL. The mean change of the ADL score after the self-help group therapy was 0.2, reflecting the awareness among the members of the elderly group to share motivation and to educate one another in order to promote abilities related to self-care and quality of life. The self-help group therapy was effective in improving the respondent’s QOL. Therefore, the activities of the self-help group among the elderly with impaired self-care compliance was very helpful in improving their ADL abilities.

Table 4: The results of the t-test analysis on the effect of the self-help group therapy on quality of life

X	SD	SE	t	df	Sig 2 tail 95 %

DISCUSSION

Most of our study participants were women and widows who lived with their extended families. According to Miller, losing a partner increases the risk of an elderly person experiencing more physical and psychological problems than those who still have a partner.¹² As a result, having no partner increases the

risk of illness and impaired self-care ability, which leads to a low quality of life.¹² Living in an extended family also increases the risk of stress, which also leads to a lower quality of life.¹³ On the other hand, ageing often brings in the consequence of declined anatomy and body functions, which affects self-care ability.¹² Improving the self-care ability would be beneficial for the elderly which also reduces the risk of having further chronic diseases.

Our results showed that the self-care score indicated an improvement of the elderly individual’s ability to do self-care after the self-help group therapy. This result confirmed the results of some of the previous studies on the effectiveness of self-help group therapy on improve the elderly participant’s ability to perform self-care.^{14,15} Caregivers have a potential role in improving the ability of the elderly to perform self-care through various interventions, such as family counselling, emotional support, education, skills training, communication, and self-reliance.¹⁶ A self-care intervention by caregivers who are non-nursing or medical professionals is sufficient to improve the elderly ability to perform self-care.¹⁶

The results of our study also showed that the respondent’s quality of life status had significantly increased after the self-help group therapy, from an average score of 73.2 up to 84.9. A previous study among breast cancer survivors in Iran also reported the significant effect of peer support on improving quality of life.¹⁷ Optimum quality of life among the elderly can be interpreted as having an optimum functional condition which enables them to enjoy a meaningful, valuable, useful and happy life.¹⁸ Having an optimum quality of life can be achieved by providing the elderly with the ability to adjust and accept changes, adapt to functional declines due to ageing, to build a respectful environment, to ensure the rights of the elderly for a fair treatment, and to understand the physiological and psychological needs of the elderly by providing the opportunity and facilities for them to actualise their potential and abilities.¹⁸ Support from their family and close friends can help an elderly person to better adjust and accept their successes or failures in life.

Some suggested development tasks which support the improvement of the elderly’s quality of life includes 1) adjusting to physical decline, 2) adjusting to retirement, 3) adjusting to the death of their spouse, 4) self-acceptance as an elderly individual, 5) maintaining life-satisfaction, 6) redefining the relationship between children and

family, and 7) finding ways to maintain their quality of life.¹⁹ Although this developmental task is common for the elderly, the capability of the elderly in adjusting to changes in their life differs from individual to individual. Self-help group therapy can facilitate the elderly in bettering adjusting to and accepting their condition.¹⁴

The aging process may cause some vulnerable elderly people to experience various physical complaints.¹² Their perception toward the pain feeling also affects their decrease in activity participation and their sleep quality. Sleep disorders were among the conditions complained about by the elderly in this study. A reduction in the number of neurons in the nervous system due to the ageing process causes changes in function, including the sleep cycle regulation. Sleep disorders among the elderly might be exacerbated by the shortening sleep cycle, medication effects, frequent bladder emptying, pain or psychological disorders.¹⁹ Without minimising the importance of medication to help the elderly reduce their physiological and psychological problems, self-help group therapy can be useful in reducing complaints related to the ageing process.¹⁴

CONCLUSION

The declining ADL and quality of life among the elderly with limited mobility affects the ability of the elderly to adjust and accept life changes due to the ageing process. Lack of access to health workers and low caregiver support increases the risk of the elderly having a lower quality of life. Self-help group therapy has been significantly effective in improving the self-care ability and quality of life of the elderly people in our study. Empowering the elderly and their families, as well as the community, is strongly recommended to establish effective self-help group therapy for the elderly of the population. Despite the significant results, it should be noted that our study has some limitations including the small sample size and the limited study setting. Further study is recommended in a more extensive study setting and with a bigger sample size.

Healthy Nurses for a Quality Health Care Service: A Literature Review

Dodi Wijaya¹, Nyoman Anita Damayanti²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Public Health,
Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Healthy nurses are a key component when providing quality health care. This paper aims to review the factors that may relate to the physical and spiritual health status of nurses, and the extent to which health affects the work productivity of nurses which ultimately, has an impact on the quality of health services. We conducted a literature search via an online database and found 92 articles with keywords related to this topic. After the inclusion and exclusion criteria were applied, 15 articles were included in the analysis. Implementing a health promotion model is beneficial to encourage nurses practicing a healthy lifestyle behaviour and improve their health status. This includes creating a healthy work environment, physical activity, having regular meals as part of a balanced nutritional diet, having sufficient rest, and practising stress management.

Keywords: *healthy nurses, quality health services, health promotion*

INTRODUCTION

The nursing workforce contributes the largest portion to health professionals globally. The important role of nursing workforce in improving health outcomes has been widely recognised.¹ According to the International Council of Nurses (ICN), the nursing workforce is an integral part of the health system, therefore maintaining a sufficient number of nurses is a prerequisite for quality of care.² Nurses should actively focus on creating and maintaining a balance of physical, intellectual, emotional and social welfare, as well as professional and personal synergism in order to provide quality nursing care.³ However, the provision of quality nursing care has been challenged by the poor working environment, long working hours, workplace stress and unhealthy life style of nurses.⁴

Nurses have voiced their frustration at the high demand of quality nursing care when there is a staff shortage.⁵ The workforce shortage including nursing is a common problem in Indonesian public health facilities.⁶ According to the Indonesian Ministry of Health (MoH), as of December 2016, approximately 601,228 health workers including physicians, medical specialists, dentists, nurses, midwives, and pharmaceutical workers work in 15,263 health facilities throughout Indonesia.⁷ Although the nursing workforce is the largest proportion out of the health professionals (49%), the current nursing ratio is 113.4 nurses per 100,000 population.⁷ The nursing workforce density is still far below the national target of 180 nurses per 100,000 population, set for 2019.⁸ Working in a facility with poor staffing could leave the nurses exhausted, which impacts on nursing quality.⁵

The quality of the nurse is determined by the nurse's health status as has an impact on the nurse's productivity when providing health services. Several factors influence the reduction of employee productivity, including education level, physical and spiritual health status, the work environment, leadership, motivation and the equipment utilised.⁹ Poor physical and mental health status, as well as poor working conditions, have been shown to reduce nursing productivity in previous

studies.^{10,11} This study aims to review the factors that may relate to the physical and spiritual health status of nurses, that in turn affect their work and productivity which ultimately has an impact on the quality of the health services that they provide.

METHOD

We searched for articles on online databases including Science Direct, Google Scholar, Proquest Health and Medical Complete, Proquest Nursing and Allied Health Source, Proquest Psychology Journals and Proquest Science Journals. We used keywords such as healthy nurse, quality of nursing care, and nursing productivity. The search engines generated a total of 92 articles. The following inclusion criteria were used to select the articles:

- Articles published in the last 10 years
- The topics relevant to the health of nurses as a support system in the quality of health services.
- Articles published in English or Bahasa Indonesian

After applying the inclusion criteria, 45 articles were selected. However, after studying the content, only 15 articles with a more detail discussion about the healthy behaviour of nurses related to supporting the quality of the provided health services were included in this literature review.

RESULTS

Four studies focused on the health status of nurses in relation to their behaviour in the work place. Eleven studies were concerned with the demographic characteristics and self-perception that influence lifestyle behaviour.

Health Status: Henwood, Tuckett & Turner (2012) conducted a cohort study involving 2,264 nurses in Australia and New Zealand in order to investigate the different effects from the physical activity of nurses in the workplace and their leisure time on their health status. Their study found that compared to nurses with normal working hours and leisure time, the nurses who worked longer with less leisure time were more likely to have a higher body mass index and took more days off due to sickness. They were also more likely to experience sleep problems, depression and anxiety.¹²

Schluter et al. (2011) described the demographics and health condition of 6,308 nurses and midwives in Australia and New Zealand. Their study revealed that approximately 30% of nurses and midwives had never had a health check-up within the last two years. The nurses and midwives also experienced sleep disorder (35.2%), severe depression (22%) and had upper back, neck and lower back pain (26.3%).¹³

Similarly, a study among hospital staff in South Africa reported that about 73% of health workers were obese and half of them had never made effort to reduce their weight. No significant difference of body mass index was found between the medical and non-medical staff members. About one third of the participating health workers had obesity-related non-communicable diseases and stress.¹⁴

A qualitative study of hospital nurses in South Africa reported that night shift nurses complained about being overweight and contracting non-communicable diseases as their main health problems. The nurses also complained about work-related problems such as back pain, exposure to tuberculosis and a stressful work environment. Being too exhausted was the main reason of the nurses for being unable to prepare healthy food and do physical activity.¹⁵

Lifestyle behaviour: Three studies have explored the lifestyle behaviour of nurses using the Pender health promotion model.¹⁶⁻¹⁸ McElligott et al (2009) observed certain weaknesses in relation to managing stress and physical activity among nurses. They found no significant difference between units of care, and demographic characteristics in the nurse's lifestyle and behaviour. The health promotion scores were significantly higher among the critical-care nurses than the medical-surgical nurses.¹⁶ Al-Qahtani (2014) conducted a study in Saudi Arabia which found that the majority of nurses were non-Saudis (98%) with approximately 5 to 10 years of working experience (38%). In assessing the nurse's lifestyle, they found that spiritual needs had the highest average score, while physical activity had the lowest average score.¹⁷ Another study by Nahm et al (2012) found that despite being at a higher risk of health problems such as being overweight/obesity due to the working environment, this issue was rarely addressed by the nurses.¹⁸

A study by Zapka et al (2009) examined the lifestyle of hospital nurses and their bodyweight. They found that

most of the nurses in their study were either overweight or obese, and did not apply weight management behavior. There was a significant relationship between demographic characteristics (age, gender, marital status, education, and history of hypertension), the self-perception of body weight and diet and physical activity behaviours.¹⁹

Two studies examined the relationship between the nurses' personal health practices and the perception of the self as a role model in health promotion. Hurley et al (2017), adopting the Miller and Dollard Social Cognitive theory, used the Self as a Role Model of Health Promotion (SARMHEP) questionnaire. Their study found a significant correlation between practicing a healthy lifestyle and the nurses' perception of self as the role model for health promotion.²⁰ Another study by Bakhshi et al (2015) reported that almost half of the study subjects promoted physical activity in their clinical practice. Perceived health status, the length of their clinical practice experience, clinical specialisation, and actual body weight were significantly associated with physical activity practices. On the other hand, in another study, the nurses described the obstacles preventing them from doing physical activity such as time, cost, exhaustion, low self-efficacy, and a lack of social support. However, the performance level and absenteeism showed no significant difference between nurses who actively did sports and those who did not.²¹

A study by Blake & Harrison (2013) explored the health behaviour of nurses and their attitude related to promoting health. Their study found that nurses with a normal body weight were more likely to achieve the recommended level of physical activity than the underweight or overweight nurses. Most of the respondents (79.1%) confirmed that nurses should be a role model in relation to health behaviour.²² Similarly, another study also found a significant high score in the general perception of health among healthy nurses rather than unhealthy nurses.²³

Malik, Blake, & Batt (2015) conducted a study to compare between registered nurses (RN) and pre-registered nurses (PRN) as health promoters in transforming their knowledge of healthy lifestyle into their attitude, in order to develop interventions for their patients. The RN group significantly had a healthier lifestyle than the PRN group. However, almost half of nurses in the both groups did not meet the recommended

level of physical activity, while about two thirds did not meet the recommended daily consumption of fruit and vegetables.²⁴

Hensel (2011) investigated the relationship between having a healthy lifestyle and self-concept among hospital nurses using the Nurse Self-Concept Questionnaire (NSCQ) and the Health Promoting Lifestyle Profile (HPLP II). The study found that each aspect of the nurse's self-concept was significantly related to the nurse's lifestyle. Communication and leadership were significantly associated with the nurses' health status.²⁵

DISCUSSION

Provision of health care service has the ultimate goal of improving the health status of the population. Satisfactory health care is achieved by the interrelatedness of the fulfilment of community needs and expectations (consumer satisfaction), what should be effectively delivered by the service providers (provider satisfaction) and efficiently organised by the service institution (institutional satisfaction).²⁶ A robust health care system require support from quality nursing care, which can only be delivered by healthy nurses. Healthy nurses represent a level of quality of nursing staff that can be measured in their physical, mental, social and spiritual abilities when providing quality health services.

From the studies reviewed, healthy nurses can be achieved by applying a holistic approach to health and organisational management. A holistic approach of the health promotion model for nurses can be used improve the healthy lifestyle behaviours. It also includes the establishment of a healthy work environment, opportunities to do sufficient physical activity, a regular and balanced diet, sufficient resting time, and stress management. A healthy work environment has a positive impacts on nurses such as increased work productivity, a lower rate of absenteeism, and improved organisational outcomes.^{10,12}

During working hours, nurses carry out physical activities including visiting patients, lifting patients and performing general nursing care which is assumed to be equal to moderate physical activity for 30 minutes.¹² However, the study results showed that the health outcome of nurses doing physical activity only during their working hours was worse compared to nurses who

did physical activity during their leisure time.¹² Some barriers for nurses to doing physical activity during their leisure time included a lack of time due to long working hours, and changes in their shifts.^{12,18} Nurses may also put in less effort to have or maintain the exercise habit.¹⁸ Poor eating habits among nurses in Saudi Arabia was related to being on the night shift rotation and facing high stress due to the high workload.²⁷

Having a sleep disorder may affect the health of the nurses which results in increased medical errors during their working hours at the cost of the patient's safety as well as burnout.²⁸ Nursing care requires a high quality of performance regardless of the long and irregular working hours involved, which causes an increased level of stress.¹³ High psychological demands, low decision authority, and low social support are the predictors of poor health among nurses working in hospitals.²⁹ High workload and staff shortages were the factors related to psychological disorders which were represented by a high rate of absenteeism among nurses.³⁰

CONCLUSIONS

Healthy nurses are crucial in increasing nursing care productivity in order to support a strong health care system. Promoting the health of nurses can be done by implementing a holistic approach to health and organizational management, including providing healthy work environment which enable nurses to adopt healthy lifestyle behavior. Nursing managers play a pivotal role to address these issues in the workplace.

In Indonesia, despite the long standing issue of staff shortage, adopting strategies related to a healthy work environment should be conducted by policy makers, hospital managers and nurse managers. A health promotion strategy should also be conducted in order to encourage the health behaviour of nurses, including doing physical activity, having regular meals with a balanced diet, having sufficient rest and practising stress management.

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Psychology, ³Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; ⁴Lecturer, ⁵Student, Politeknik Kesehatan Kementerian Kesehatan, Surabaya

ABSTRACT

Autism Spectrum Disorder (ASD) cases have increased worldwide. The family supports are crucial for the development of children with ASD. This study aimed to identify the support from the family toward children with ASD. A descriptive study was conducted involving 14 family members who had children with ASD. The variables of this research included informational, judgmental, instrumental and emotional support. The informational (92.8%), emotional (85.7%), judgmental (57.1%) and instrumental (85.7%) supports from families to children with ASD were good. Future research should undertake the study with a larger sample and examine them using different variables.

Keywords: *autism spectrum disorder; family support*

INTRODUCTION

It is predicted worldwide that 1 out of 160 children suffers from Autism Spectrum Disorder (ASD)¹. This prediction represents the average number and prevalence reported, as it has varied substantially across the total relevant research. A number of corresponding research studies have reported an ultimately higher number². Based on the studies of epidemiology conducted in the last 50 years, the prevalence of ASD appears to have soared globally. Over 1.5% of children were identified with ASD based on an extensive search in 11 different communities across the United States (Arizona, Arkansas, Colorado, Georgia, Maryland, Missouri, New Jersey, North Carolina, South Carolina, Utah, and Wisconsin) in 2012³.

There is no official survey on the number of children with ASD in Indonesia. However, in 2013, the

Indonesian Ministry of Health has presumed that the number of children with autism was over 112 thousand, with an age interval of 5 to 19 years old. This number was generated based on the calculation of autism prevalence being over 1.68 per 1,000 children under 15 years of age⁴. With the overall amount of children aged 5-19 years in Indonesia being over 66 million according to Indonesia's Central Bureau of Statistic in 2010, it generated the aforementioned number of 112 thousand. In 2015, it was expected that there were 12,000 children with autism or 134.000 persons on the autism spectrum in Indonesia⁴.

Based on the criteria of the Diagnostic Statistical Manual III-R of the World Health Organisation (DSM III-R WHO) in 2009, there were no less than 4.000 citizens of Surabaya city identified as suffering from autism⁵. In one of the Schools for Exceptional Children in the city of Surabaya, Galuh Handayani Elementary School in the 2016/2017, it was found that there were 27 students who had been considered as having autism.

Children with ASD require normal treatment, guidance, and individual orientation in order to learn how to socialize and play with their friends. This is so then they can adhere to acceptable age-appropriate behavior in order to not block their development. The growth of

children is influenced by their surrounding environment, particularly their family, school and the society where they live through socialization⁶. The life of children is significantly determined by the support of their family. If the supports are good, their growth and development will be relatively stable. On the other hand, if the support is non-existent, their children will experience significant retardation which may impair their mental⁷.

The support of the family is an integral part of social support which categorized into four types, including informational, judgemental, instrumental and emotional⁸. Informational support can be instrumented in the form of the family seeking information regarding the child's health and training the child to study in their daily life. Judgmental support can be realized in the form of the family giving the child the opportunity to do the activities that they find joyful. Instrumental support can be delivered in the form of the family to provide transportation and medication fees, with the family preparing for all of their daily needs. Emotional support can be realized through the family motivating the children to communicate with their friends and caring for their child with affections.

Positive support from their family may help to recover the social function of children with autism⁹. On the contrary, negative support from their family will result in unmanageable children who are unable to be properly orientated, educated and empowered which may result in unwanted behaviors. Unsupported children with autism will also experience a major drawback in achieving their tasks.

This study aimed to identify the support from the family toward children with ASD in Galuh Handayani Elementary School, Surabaya.

METHODS

This study was descriptive research, focused on describing the familial support of children with ASD in Galuh Handayani Elementary School, Surabaya. The process of the data collection was through observations of families with children with ASD. The participants in this research were parents whose children had ASD in grades 1-3 in the academic term of 2017/2018. Fourteen parents of 14 children were involved. The variables of this research included informational, judgmental, instrumental and emotional support.

The instrument of the data collection was a questionnaire with 24 different statements consisting of 6 statements for informational support, 7 statements for emotional support, 5 statements for judgmental support and 6 statements for instrumental support. The assessment method used a Likert scale modified through the following categories: "always" scored 3, "often" scored 2, and "sometimes" scored 1 and "never" scored 0. Later on, the accumulative score was converted into a percentage and interpreted as follows: good 76-100%, enough 56-75% and deficient <56%¹⁰.

The data was processed, tabulated, and analyzed in a descriptive manner. The data was served in the form of frequency distribution table and narrative in order to describe the visualization of familial supports to the children with ASD.

RESULTS

Table 1: Demographic data of family of children with ASD

Demographic Data	n	%
Age		
30-39	8	57.1
40-49	4	28.6
50-59	2	14.3
Sex		
Male	6	42.9
Female	8	57.1
Education		
College	12	85.7
Senior high school	2	14.3
Occupation		
Civil servant	4	28.6
Private employee	3	21.4
Entrepreneur	2	14.3
Unemployed	5	35.7
Sex of child		
Male	10	71.4
Female	4	28.6

As described in Table 1, most of the respondents were aged 30-39 years old (57.1%). The respondents' sexes were mostly female but almost equal to the male with 57.1% and 42.9% respectively. Almost all the respondents graduated from college (85.7%). Also,

unemployed become the most occupation with 35.7%. Meanwhile, the sex of the children was mostly male (71.4%).

Table 2: Family support of children with ASD

Family support	n	%
Informational support		
Enough	1	7.2
Good	13	92.8
Emotional support		
Enough	2	14.3
Good	12	85.7
Judgemental support		
Poor	2	14.3
Enough	4	28.6
Good	8	57.1
Instrumental support		
Enough	2	14.3
Good	12	85.7

Based on Table 2, most of the family provided good informational, emotional, and instrumental supports to their children with 92.8%, 85.7%, and 85.7% respectively. However, in the judgemental support, the good support was still dominant (57.1%), but there was 14.3% poor support which absent in the other three kinds of supports.

DISCUSSION

1. Informational Support: Informational support is comprised of advice, orientation, suggestion or judgment over how an individual performs something¹¹. One of the support given by the family for the growth of the child is to deliver guidance in them developing proper behavior¹².

In this research, it was discovered that almost all of the children with ASD (93%) were equipped with the favorable informational support. The support given by their parents towards the growth of the children with ASD has been visualized in the form of proper behavioral guidance through appropriate orientation and the advice given to them. This was realized by the family by seeking information related to the child’s health, educating the child and training them to deal with their daily activities such as learning how to eat and dress

themselves. This result is in line with research which shows that informational support was in the high category (52.1%)¹³. The particular research identified the connection between familial support and the behavior of children with autism. Out of 23 children with autism with low informational support, 60.9% behaved hyperactively¹³.

Social and informational support, which were both provided by the parental support cluster, were the most frequently reported necessities according to the parents of adolescents with growth disorders¹⁴. This informational support includes the search for information regarding the child’s issue by the parents so then it can be delivered to the right person. This also allows them to give advice so then the impact gained by the parents means that they are able to control the negative behavior of their children.

The family has to deliver it by simplifying sentences that are understandable and not confuse them. Because communication disorders are commonly experienced by children with autism¹⁵. The informational support can also be delivered by giving them the right advice on the subject of their language so then the children favorably understand the advice given to them. This particular pattern implies that the support delivered by the parents guides them to the right behavior through orientation and the advice addressed to them¹⁶.

2. Emotional Support: Emotional support consisted of various expressive forms such as attention, empathy and the feeling of concern towards somebody¹¹. The form of emotional support was giving attention to them, such as greeting them, asking them about their condition, approaching and paying them a visit when the person is in need, asking about the condition of someone’s feeling, listening to their grievances and also understanding and accepting the condition of someone as they are.

It was discovered that almost the entire children with ASD (86%) were provided with good emotional support. This result is can be observed from the approval of the family including the parents. The approval can be contextualized in the form of attention given by the parents to their ASD affected children including by prioritizing

the preparation of food for the children with ASD instead of their siblings who are non-sufferer to ASD and motivate the children upon lack of appetite. This result is against research which showed that the majority (56.25%) the emotional support given to the children with autism was situated in the low category¹³.

The emotional support can be identified by how far the attention is given by each parent boosts the confidence of the children, so the children do not feel inferior while performing social interactions and the family accept the children as they are¹⁶. The approval was in the form of more attention and affection toward them in comparison to other children. The emotional support would cause the supported recipient to feel comfortable due to the assistance that is apparent in the form of motivation, personal tenderness, and love¹¹. These emotions are what the parents perform on a daily basis, by assisting their children during home studying and asking them about their feelings.

3. Judgmental Support: Judgmental support influences the receiving individual to develop feelings of self-appreciation, confidence, and worthiness. The distribution of judgmental support from the parents can leverage the confidence within the children so that then children would not feel inferior upon staying outside of their home. It was identified that the majority of children with ASD (57%) in Galuh Handayani Elementary School are provided with good judgmental support. This result is in line with a study which pointed out that the majority (68.75%) of judgmental support from parents to their children with autism was in the high category¹³.

The parents are entitled to taking on full responsibility for the child's social progress¹⁷. The parents should start trusting their children and not limiting them in performing various things such as dining, showering, and dressing. These particular treats are aimed to enhancing their self-confidence so then they are capable of undertaking bigger tasks. Judgmental support can also be performed through attention and motivating judgment, which may support them in their jobs and tasks, achievements and attitude. As an example, the parents would allow them to participate in

activities that the children find joyful, including swimming and horse-riding, and embarking to school by themselves¹⁶. This judgmental support will be essential when the children are stressed, such as when the tasks that they endure are bigger than their natural abilities¹¹.

4. Instrumental Support: Instrumental support is performed by becoming the person whose help is expected when solving the problem that the children are facing steps forward, which is especially related to adapting to life¹². For example, when the parents provide instrumental support in the form of physiological fulfillment, the children will be motivated while studying at school¹⁸. It was discovered that almost the entire sample population of children with ASD (86%) in Galuh Handayani Elementary School were provided with favorable instrumental support. This result goes against a study which showed that the majority (52.1%) of instrumental support from the parents to their autistic children was situated in the low category¹³. The parents have the responsibility to act as an advocate, which means that the parent has the responsibility to support and advocate for their children's best interests unconditionally¹⁷. The variety of support which may be given by the parents including providing various types of treatment, encouraging them to exercise as part of a routine, and introducing as early as possible to transportation access and public spaces¹⁹. Through the aforementioned support, the aim is to assist in lessening the burden of the child by helping them to undertake particular activities such as studying and performing their daily habitual activities¹⁶. This is so then the parents of children with ASD are able to provide proper assistance to their children to help them to develop an adaptive attitude that is acceptable in the wider social sphere. The parents should be trained to use precise coping strategies which gives them the required coping skills to execute this effectively²⁰.

CONCLUSION

The conclusion of this research is that the informational, emotional, judgmental and instrumental supports from families to children with ASD in Galuh Handayani Elementary School were favorable. Future research should undertake the study with a larger sample and examine them using different variables.

Conflict of Interest: None.

Ethical Clearance: The study passed ethical clearance from the Ethical Committee of the Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia.

Abstract

Introduction: Pulmonary TB is an infectious disease caused by *Mycobacterium Tuberculosis*. The physical and psychological changes in patients with pulmonary TB can affect the patients's quality of life. The family is a key factor in relation to supporting successful treatment and recovery. This study aims to analyse the factors related to pulmonary TB patients quality of life.

Method: This research used an analytic observational design with a cross-sectional approach. A total of 73 respondents were recruited via the family members of patients with pulmonary TB using a simple random sampling technique. The data was collected using several questionnaires on the sociodemographic characteristics, family development stage, family stress & coping, environmental data and WHOQOL-BREF. The data analysis was performed using a Chi Square test.

Result: The results of this study showed that family factors significantly influence the quality of life of patients with Pulmonary TB, including the type of family ($p=0.000$), their level of education ($p=0.000$), employment ($p=0.001$) and monthly income ($p=0.002$). Other factors including the level of stress and coping and environmental health (healthy housing) were also significantly associated with quality of life ($p < 0.01$). Only the family development stage had no significant relationship with quality of life.

Conclusion: The significant family factors influence the quality of life among pulmonary TB patients, which reflects the need to strengthen the role of the family in promoting successful treatment. A family with social support from the community would help to improve the quality of life of pulmonary TB patients.

Keywords: family, pulmonary TB patients, quality of life, Indonesia

INTRODUCTION

Tuberculosis (TB) is a major communicable disease that claims 100,000 lives worldwide annually.¹ In 2017, Indonesia was ranked the third among listed countries with the highest TB burden.¹ The TB prevalence in Indonesia was estimated to be 600,000 cases with approximately 430,000 new cases per year.² The East Java Province was the top second highest district regarding the number of TB cases with a total number

of 21,606 cases in 2016.² Pulmonary TB is an infectious disease caused by rod-shaped bacteria (basil) known as *Mycobacterium Tuberculosis*.¹ Poor immune system, malnutrition, and HIV positive are among the risk factors of pulmonary TB.² According to the Indonesia Ministry of Health (MoH), the highest prevalence of pulmonary TB is among people older than 45 years old, who have a low level of education, and who are unemployed.³

TB easily infects other individuals through direct contact, coughing, sneezing, and sputum (droplet nuclei) from TB patients. As a result of living closely to TB patients, their families run the risk of TB infection. Because of worries from getting infected, the other family members may limit their contact with the TB patient which results in the individual feeling isolated, depressed and neglected.⁴ TB patients are often socially stigmatised which may affect their adherence to

effective treatment.⁴ This psychological problem would increase the patient’s stress, which affect their quality of life. The physiological changes experienced by TB patients affects their physical abilities and deteriorates their quality of life.¹ The World Health Organisation Quality of Life (WHOQOL) defines quality of life as an individual’s perception of life in society in the context of the existing culture and value system, related to their goals, expectations, standards, and concerns.⁵ Quality of life is a very broad concept that is influenced by the physical condition of the individual, their psychological state, level of independence, social relations and environmental condition.⁵

Family factors are significant in relation to the TB cases. A previous study reported the significant association between TB and family-related factors, such as the number of adults in the household, having a single marital status, having a family history of TB, and living in a rented house.⁶ Understanding the family factors affecting the TB cases would improve the support and interventions required in order to promote the successful treatment of pulmonary TB. Therefore, this study aimed to investigate the relationship between family-related factors and quality of life among pulmonary TB patients.

MATERIAL AND METHOD

We employed an analytical observational design with a cross-sectional approach to investigate the relationship between family factors and the quality of life of patients with pulmonary tuberculosis in Surabaya city. This was a preliminary study carried out from March to July 2017. The study population was made up of the families of TB patients who accompanied the patient to the Perak Timur community health centre, Surabaya city, during the study period. The sampling technique used in this research was non-probability sampling using a simple random sampling technique. A total of 89 people attending the community health centre had a TB positive test. 73 people who had a family member with pulmonary TB were selected and agreed to participate in the study.

The questionnaire regarding sociodemographics, family development stage, family stress and coping, environmental data, and the WHOQOL-BREF instrument was used for the data collection. A bivariate analysis using a chi-square test was applied to test the relationship between the independent variables and quality of life.

RESULTS

The sociodemographic characteristics of the respondents have been presented in Table 1. The majority of the respondents were from a traditional family (86.3%). A traditional family, in this study, represents a nuclear family consisting of two parents and their children, while a non-traditional family reflects a single parent family or extended family.⁷ High school was the highest level of education attained by most of the respondents (39.7%). Most of the respondents worked as labourers or factory workers (65.8%), with a monthly income below IDR 1,000,000.

Table 1: Sociodemographic characteristics of the study participants, N = 73

Variables	N (%)
Type of family	
Traditional	63 (86.3)
Non traditional	10 (13.7)
Level of Education	
No schooling	6 (8.2)
Elementary	15 (20.5)
Junior school	14 (19.2)
High school	29 (39.7)
Higher education	9 (12.3)
Employment	
Factory workers	48 (65.8)
Self employed	10 (13.7)
Others	15 (20.5)
Monthly income (IDR)	
< 1,000,000	38 (52.1)
2,000,000-3,000,000	29 (39.7)
> 3,000,000	6 (8.2)

According to Duvall and Milller (1985), family life consists of eight stages, namely 1) new couple, 2) first child birth family, 3) family with pre-school children, 4) family with school children, 5) family with teenage children, 6) family with adult children, 7) middle age family, and 8) elderly family.⁸ As displayed in Table 2, most of the respondents were in the fourth family development stage (19.2%) and the fifth stage (17.8%) respectively. From their answers to the questions related to the level of stress, most of respondents had only a mild level of stress (69.9%), and none of the respondents indicated themselves as having a severe level of stress. The majority of the respondents lived in unhealthy houses (65.8%), but reported having a good quality of life (71.2%).

Table 2: Characteristics of the Respondents Based on the Family Development Stage, Level of Stress, Environmental Health and Quality of Life

Variable	N (%)
Family development stage	
Stage 1	6 (8.2)
Stage 2	3 (4.1)
Stage 3	5 (6.8)
Stage 4	14 (19.2)
Stage 5	13 (17.8)
Stage 6	12 (16.4)
Stage 7	10 (13.7)
Stage 8	10 (13.7)
Level of stress	
Mild	51 (69.9)
Moderate	22 (30.1)
High	0 (0.0)
Environmental health	
Healthy house	25 (34.2)
Unhealthy house	48 (65.8)
Quality of Life	
Poor	21 (28.8)
Good	52 (71.2)

We assessed the family-related variables including the type of family, level of education, employment, monthly income, family development stage, level of stress, and environmental health in relation to quality of life using the chi-square test. From the analysis results shown in Table 3, we found that the type of family, level of education, and monthly income were significantly associated with quality of life. No association was found between the family development stage and quality of life ($\rho= 0.328$). Both the level of stress and the environmental health variables showed a significant association with the quality of life of TB patients.

Table 3: Bivariate analysis of the sociodemographic characteristics, family development stage, level of stress, environmental health, and quality of life

Variables	Quality of Life		p-value
	Poor (n; %)	Good (n; %)

Healthy house	1 (4.0)	24 (96.0)	0.001
Unhealthy house	20 (41.7)	28 (58.3)	

DISCUSSION

In our study, several factors including the type of family, level of education, employment, monthly income, level of stress, and environmental health were significantly associated with the quality of life of pulmonary TB patients. Chronic disease affected the physical and mental health, which in turn decreased their quality of life.⁹ The quality of life decreased along with the emergence of the general symptoms of pulmonary TB such as coughing, fever with the exertion of sputum and mucus, and weight loss but improved after the

first month of treatment.² Therefore, the family has an important role to the patients' adherence to the whole TB treatment.

The type of family is significant in relation to the quality of life among patients with TB. A traditional family is founded based on the union of parents with or without children. Support from a spouse or children may increase the motivation of pulmonary TB patients to comply the treatment. The spouse can monitor the patients in taking their medication correctly and accompany them to the health facility in order to get their disease checked. In line with our study results, a previous study found that being single parent increased the odds of TB cases by 63% compared to being in a married family.⁶ The risk of TB cases also increased along with the increased number of adults in the household. Having more than 10 adults in the household increased the risk of TB cases by 2.67%.⁶

Level of education was also a significant factor related to the quality of life among TB patients. This result supported the findings of previous studies stating that level of education had a significant relationship with quality of life among patients with TB.^{10,11} Employment is significantly associated with quality of life among the TB patients in our study. Similarly, a previous study in India reported there to be a significant relationship between employment and the quality of life scores of active TB patients after a year of successful treatment.¹² Another factor of income level was significantly related to the quality of life level. In the same vein, a previous study also reported that TB patients considered the level of income as being an important factor in improving quality of life.¹³ These two factors are relevant, as having employment would enable the family of the TB patients to receive a certain level income as a form of sustainable financial support. Having a low income constrains some families in being able to afford enough food for the whole family. Moreover, a low income household only has a limited number of choices when fulfilling the nutritional needs of the family. Lack of nutrition affects the immune system, which increases the risk of having an infectious disease.¹⁴

According to Antonovsky (1979), stress is a response or a mental state from experiencing tension caused by a stressor or unresolved circumstances.¹⁵ Having social support from the social environment would prevent the TB patients from feeling isolated and

lower their level of stress.¹⁵ Quality of life has increased in line with the decreasing of the physical symptoms of TB patients. Stress from a chronic disease is not only experienced by patients with active TB, but also patients with latent TB.¹⁶ In latent TB, the TB symptoms are not visible, so the patients tend to be stressed and anxious about the given diagnosis.¹⁶ The results of a previous study in Indonesia also showed a significant relationship between social support and quality of life as reflected in the decreasing of life satisfaction felt not during the initial diagnosis, but after when undergoing the intensive phase of treatment.¹⁷

A healthy house represents good environmental health. A healthy house has an integrated physical, chemical, biological condition that enables the residents to attain optimal health.¹⁸ Therefore, a healthy house should meet requirements such as to fulfil physiological and psychological needs, and to prevent the transmission of diseases as well as accidents.¹⁸ A healthy house should have adequate lighting, either from natural or artificial light, adequate ventilation for fresh air circulation, and should enable the family members to feel comfort. It also should have a disposal system for garbage and household waste, as well as safe water and food that prevents disease transmission. Having a TB patient in the house increases the risk of TB transmission to other residents. Therefore, having a healthy house would minimise this risk. As reported by a previous study, poor housing conditions significantly reduce the level of quality of life among patients with TB and their families.¹

CONCLUSION

Our study results yielded a significant relationship between all of the family related factors and the quality of life among pulmonary TB patients. The type of family significantly affects quality of life. Being educated and engaged in paid employment was significantly associated with quality of life, as was the family level of stress and coping. However the family development stage showed no association with quality of life. Poor housing condition also affects the quality of life of patients with pulmonary TB. Considering the significant family factors, several strategies to improve the quality of life among these patients and their families should be implemented.

First, the patients should have an adequate level of knowledge and understanding about the disease and

the transmission of TB bacteria, so then they follow the treatment procedures and prevent further transmission. Second, the family should continuously provide a supportive environment with the community to help the patients recover from and fight TB transmission. This effort will minimise the stigma felt by the patients and increase their self-confidence. Community social support is very important in speeding up the healing process, and will increase the dignity of the patients and their families living within the community.

³Faculty of Medicine, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Child feeding disorders affect the child's developmental growth due to malnutrition. This study aimed to explore the mother's experience of having children with a feeding disorder in relation to their knowledge and attitude about child feeding. We conducted an observational study with in-depth interviews. Seven mothers of toddlers with eating disorders but without neurological delays agreed to participate. The mothers reported that their children started to have an eating disorder approximately from the age of 2 up to 6 months, and then the disorder worsened by the age of 12 months. Lack of knowledge about the development of child eating behaviour was observed among the mothers. Mothers expressed having anxiety and feeling stressed during feeding times.

Keywords: *child feeding disorder, eating behaviour, personal mastery, mother-child attachment*

INTRODUCTION

Feeding disorders are a common problem during infancy and the early childhood period that can lead to malnutrition and can be potentially life threatening in severe circumstances. This problem has been experienced by parents worldwide, and can cause stress and depression, especially for the mothers. Approximately half of the observed mothers reported having at least one child with a feeding disorder.¹ Feeding disorders affect approximately 20-30% of children with normal development and 80% of children with developmental delays.^{1,2} Vomiting food, eating non-nutritive substances, and food rejection are among the symptoms of feeding disorders in childhood and infancy.³ The disorders have a broad spectrum, ranging from a mild degree such as picky eating and food neophobia to a severe level of disorder as seen in children with autism.¹

Most parents consider that eating is a normal physiological process, but some children may have eating problems. Parents recognise eating in the simple context of the process of ingesting food individually, but they do not include feeding in a specific context that involves the relationship between the child and the adult who feeds them as well as the influence from the family and the surrounding communities.^{4,5} Eating in the feeding context involves several aspects including: 1) the swallowing reflexes and the adequate neurological function to regulate food boluses (solid or liquid) in the oral cavity; 2) tone, control and coordination of muscles during the feeding process; 3) the development of oro-motor functions and skills from the sucking stage to the chewing stage; and 4) the happy feeling and comfortable condition between the child and the adult who is feeding them.⁵

Children with feeding disorders are generally taken to the doctor at preschool age (2-3 years old), with the most complaints being focused on difficulty eating, picky eating (only eating a little and rejecting most types of food) or neophobia (fear of trying new foods).⁶ By the age of 2 years, children begin to reject foods that were previously acceptable because they prefer foods that are physically more attractive, both in colour and texture.⁷ The incidence rate of neophobia is the lowest in

the infant period (4-7 months), but then increases rapidly in the age range of 2 to 6 years, especially in relation to the consumption of fruits, vegetables and meat.⁸ Feeding disorders for older children (age 8-11 years old) usually involve emotional eating, because eating is driven by an emotion but not hunger, which leads to excessive eating with a high consumption of sugar, fat, and energy.⁹

Some recent studies have reported that children with picky eating showed a negative reactions related to sensory food, especially related to the texture and aroma.^{7,8} Influences from their family and the environment form the children's taste for certain types of food and eating behaviour.¹⁰ Advertisements on food on the TV also influence the food preferences of children aged 5-7 years old.¹¹ Most of the food rejection cases among children were influenced by the lack of knowledge among their parents that the development of eating behaviour is crucial during the first three years of the child's life.¹⁰

Parenting style affects feeding style and feeding practices in the aspects of demandingness and responsiveness.¹² The parent's knowledge of the child's development is crucial in establishing the self-efficacy and competency of the parent, especially the mother.¹³ Personal mastery is obtained through a continuing learning process and comprised of the ability (skill) and the spiritual condition which forms a creative tension to combine expectations and reality to achieve a solution.¹⁴ Our study aimed to observe the mother's experience of having a child with a feeding disorder in relation to their knowledge of and attitude toward child feeding.

MATERIALS AND METHOD

The present study employed a qualitative method using a structured in-depth interview. The researcher, as the research instrument, asked the respondents the following questions: 1) what is the kind of food and how do you feed your child?; 2) Who has taken care of your child since your baby was born and who feeds him/her (including preparing formula milk or breastmilk); 3) When did you start training your child to eat? How do you know when your baby or child is hungry and full?; 4) When did you realise that your child had a feeding disorder?; 5) What are the signs of a feeding disorder that you noticed in your child? and 6) What do you do and feel when you encounter difficulties related to your child's feeding disorder? Some probing questions included problems during the eating process and the child's reactions during feeding time.

The study participants were recruited from a private health clinic in Surabaya, Indonesia using a purposive sampling. The inclusion criteria were women having a minimum of 1 (one) child under five years old with a feeding disorder within the year before the interview. The exclusion criteria were the mothers of children with neurological developmental and anatomic disorders, and other congenital abnormalities. Prior to the interview, the researcher explained about the study, the data protection, and the right to withdraw from the study. Written informed consent forms were submitted from the participants and their spouses. The interview was conducted either face to face or over the telephone based on the preferences of the participants. The mother's age ranged between 28 and 35 years old. The children's feeding disorders were perceived by the mother. Four participants were full-time housewives, one participant had a small home based business with her husband, one participant worked freelance, and one participant worked full time at a government office. All of the interviews were conducted in Bahasa Indonesian for approximately 60 minutes. The interviews were audiotaped and transcribed for the data analysis.

RESULTS

Based on the analysis of the interview transcripts, three themes emerged, including 1) selecting food and the feeding practice, 2) parenting and caring for the child, and 3) recognising and overcoming the feeding disorder.

Selecting food and the feeding practice: Three women reported providing exclusive breastfeeding (6 months of breastfeeding without other supplementary food). Three women reported feeding their babies by combining breastmilk and formula milk. Only one woman did not breastfeed due to problems with breastmilk production. According to the mothers who exclusively breastfed, their babies were fed regularly every 1.5 up to 2.5 hours. They fed based on what they understood as being the baby's need (crying as a sign of hunger). Some mothers explained that they combined breastmilk and formula milk because of their low production of breastmilk. One woman described that the stressful situation during the first week having the baby was due to difficulties breastfeeding and the inability of the baby to receive bottled milk. All of the mothers stated that 6 months old was the right time for their babies to learn about eating

food other than milk. They continued their belief that a baby crying was a sign asking for food while the baby's refusal of food would mean that they were full. For them, eating is a basic necessity and is a natural process for a human being without the need for learning.

Parenting and caring for the child: The exclusive breastfeeding mothers explained that they care for their babies by themselves without receiving help from other family members. Two women received help from their mothers, especially during their difficulties with child feeding. One woman received help from a competent baby sitter. One woman who fed her baby with formula milk received help from two housemaids.

With current advanced technology, the mothers described the use of smartphones or similar gadgets to help comfort their younger children during feeding time. A woman explained that "every time my baby makes a fuss during meal time, I would let her watch a video from my phone. She would stay calm and open her mouth." Another woman described that meal time was often like "a battle" to get their child eating, and considered that the smartphone was a "master weapon" used to win the battle. One woman said that she had not set up a regular meal time for her child and depended on her child's need. When her child refused to eat her meal, she would let her eat any of her favourite snacks to fill her child's stomach. She considered that the snacks also have "nutrition value", just like a regular meal.

Recognising and overcoming the child's feeding disorder: Almost all of the mothers stated that they recognised the feeding disorder when they started to introduce solid food at age 6 months. Their babies refused to open their mouths during feeding time, and only wanted to have milk. Two women said that they realised her child's feeding disorder as early as the age of 2 years old. Their children refused to eat, or they did not swallow food and quickly regurgitated it instead. Some mothers said that their children only wanted certain foods such as chicken nuggets and instant noodles, or other delicious snacks with a low nutritional value. At first, the mothers assumed that the refusal of food was merely due to learning to adapt to new food. The mothers started to feel stressed out when their children continued this behaviour and their body weight reduced.

To improve their children's appetite and willingness to eat, the mothers used various fun and interesting

ways to distract their children during meal times. The mothers gave them toys to play with, let their children watch cartoons on television, or took their children to eat outside the house. However, the mothers did not try to receive professional help and considered that having a feeding disorder was normal and that it would be over after their child started elementary school.

DISCUSSION

From the themes that emerged in our study, the mothers started to give solid food after the age of 6 months, reflecting their knowledge of the feeding development stages. However, they also emphasised that eating is an automatic process generated by the feeling of hunger due to the basic human need for food. In this case, the mothers interpreted the process of eating in children as "eating" and not "feeding", which does not realise the reciprocal interaction during the feeding process.⁵ Therefore, the mothers did not consider the crucial issue in recognising their baby's cues of hunger or full, and the concept of autonomy and individuality formed by the age of 6 months through to 3 years.² Due to autonomy and individuality, a 6-month-old baby refused to open his mouth when being fed¹⁵, selected certain foods by the age of 18 months (picky eating)^{7,8}, was only interested in advertised foods at the age of 5 – 7 years old¹¹, and had emotional eating by the age of 8-11 years.⁹

The authoritative parenting style is the most appropriate parenting style to prevent inappropriate practices that negatively affect the physiological and psychological health of the child.¹⁶ The occurrence of feeding disorders among children under five is influenced by the parenting style, including the mother-child attachment and personal mastery. In the concept of attachment, being physically close is not enough. In this study, some of the mothers received help in caring for their children either from their relatives or other helpers. According to the Bowlby concept of the Internal Working Model (IWM), the childhood experience with a parent (especially with mother) will affect a person's abilities and sensitivity in relation to caring for a child.¹⁷ The failure to thrive is more influenced by behavioural problems (eating behaviours) than a lack of food, child abuse, and neglect.¹⁷ Less sensitivity among the mothers in this study was observed from the beliefs of the mothers that an interactive relationship between mother and child would only happen after the child developed the ability

of verbal communication. Waiting until after the child can communicate verbally is considered to be too late because the autonomy and individuality of the child has formed at an earlier stage.¹⁷

Because of the lack of understanding and mental unpreparedness, mothers consider caring for their child to be tiring.¹⁸ Moreover, having a child with a feeding disorder causes the mother to feel tired, stressed and depressed.¹⁸ Mothers felt incompetent, desperate, and ashamed, which indicated a lack of self-efficacy.⁴ Feeling incompetent is common among mothers who have little knowledge about child development.¹³ In dealing with child feeding disorders, mothers give up and let their children have foods with a high glucose/salt /fat /calorie content.¹⁸ The importance of the mother's personal mastery was reflected in this study. Most of the mothers in our study had a limited understanding of the development stages of feeding, but did not seek further help or trusted information to overcome the problem. Instead, the mothers let their children shape their own eating behaviour as an automatic process. The mothers were unaware that they are the first teacher for their children to learn life skills from, including eating behaviour.¹⁹ Personal mastery is not just obtained from birth itself, but involves a learning process throughout life.¹⁴

CONCLUSION

Child feeding disorders occur as early as when the child is introduced to solid food. Children should be taught about eating behaviour as early as possible, by recognising the signs of hunger and fullness through reciprocal interactions between the parent or the caregiver and the child. The parent should have an understanding of the concept of personal mastery and the parent-child attachment in order to show compassionate caring toward their children. The parenting style influences the child's eating behaviour, therefore teaching the child appropriate eating behaviours since birth would minimise the occurrence of child feeding disorder. The reciprocal interactions during the first 3 years of life is crucial, including during the feeding time itself. Further research is recommended involving a more diverse population to gain more of an understanding about parenting style in relation to child feeding disorders.

Factors Associated with Onset to Hospital Delay among Stroke Patients in the Emergency Department

Abdulloh Machin¹, Muhammad Hamdan¹

¹Departement Neurology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo General Hospital;
Universitas Airlangga Hospital

ABSTRACT

Ischemic stroke is the most common neuro-emergency in the world. The only treatment approved for an acute stroke is thrombolysis, which has a narrow window. Thrombolysis to treat acute ischemic stroke is under-utilised. There are many factors associated with delays in treatment. In Indonesia, thrombolysis is not commonly used for acute stroke treatment. The study aimed to know what time is needed from the onset of the stroke condition to the Emergency Department in a stroke patient and the factors associated with the hospital delays. All stroke patients admitted to Dr. Soetomo General Hospital and Universitas Airlangga Hospital between October 2016–March 2017, who agree to participate in the research and were aged >18 y.o. are included. We reviewed all of the subjects for the demographic characteristics, distance to hospital, stroke risk factors and clinical data. All of the subjects will be asked for the time of stroke onset and the time when the patient arrived at the emergency department. We will also measure the stroke using a specialised scale.

Results: There were 107 subjects included in this research. The data was inadequate in 4 subjects. The mean age was 55.97±11.9 years, and there were more women (54.2%) than men. The distance from the patient's home to the hospital was mostly <15 km (65.1%). 63.6% of the subjects were referred from other hospital or clinic. Most of the patients had hypertension (71.4%) and diabetes (31.7%). Onset from the ictus of the stroke to the Emergency Department was 712.3±1324.6 minutes. A factor associated with the delay was the medical services accessed before the patient was referred to the hospital (0.215; p=0.026) and their pre-admission score (0.242; p=0.012)

Conclusion: Time from onset to the Emergency Department was longer than the treatment time window for thrombolysis. The factors associated with the onset of hospital delays was primary medical services and the pre-mRS score.

Keywords: Acute stroke, thrombolysis, hospital delays

INTRODUCTION

Ischemic stroke is the most common neurological emergency in the world ¹. In 2008, stroke was the third leading cause of death ². In the US, there are 780.000 cases of stroke every year, and the cost of stroke treatment in 2008 was an estimated \$65.5 billion ¹. An estimated 88% of stroke patients have an ischemic stroke³. There are many stroke patients who remain functionally dependent after a stroke, although around 50-70% return to their previous functional status. There is a susceptibility to an increased mortality and morbidity after having a stroke¹. Stroke is also the leading cause of morbidity among adults. About 30% of stroke patients need assistance

Universitas Airlangga Hospital
Email: dr.machin95@gmail.com

during their daily activities, and 16% need long-term hospital or home care ^{1,3}.

Thrombolysis using r-TPA is the only drug approved by the FDA for ischemic acute stroke treatment for all patients who meet the inclusion and exclusion criteria ³⁻⁷ by 30 days, 33 (14.7%. There is a strong correlation between arterial recanalisation and the improvement of neurological status in an ischemic stroke patient ¹. Iv-rTPA is recommended to be given within 3 hours of onset according to the NINDS criteria ⁸. Pool analysis from a NINDS-rTPA study concluded that earlier treatment with iv-rTPA correlates with a better outcome. According to the NNT ratio, iv-rTPA will benefit 8 patients out of 15, and for every 15 patients treated with iv-rTPA, only 1 patient will suffer an intracranial haemorrhage ⁴.

Although iv-rTPA is effective as a treatment for acute ischemic stroke, thrombolysis for acute stroke is still under-utilised; especially as there are many patients coming to the hospital beyond the treatment period. There is also the complexity of hospital bureaucracy involved^{1,9,10} in our tertiary care center, the time intervals preceding intra-arterial thrombolysis in order to accelerate and optimize the management of acute strokes. METHODS: Between January 1, 2000, and April 30, 2002, 597 patients with acute stroke were admitted to our stroke center. One hundred forty-eight patients underwent diagnostic arteriography, and 100 (16.8%. Chen et al. revealed that the factors associated with a delay in the community included a referral from another health facility, waking up with a stroke, having a stroke while having sex, the patient's address, transportation, history of stroke or coronary artery disease and the NIHSS score in the emergency department all had no predictive value ¹¹. Tan, et al. conducted a prospective study on 789 stroke patients and revealed that 26% of them had come within 2 hours of onset. A factor associated with hospital delays was a referral from another hospital, the stroke location, the onset of the stroke, the treatment in outpatient clinics and a lack of concern related to seeking help for stroke symptoms¹². Herlitz et al. reviewed existing stroke studies and acute myocardial infarction studies and showed that the onset of symptoms through to treatment for an acute stroke was longer than that for a myocardial infarction¹³ resulting in an infarction. Depending on the extent of the infarction, loss of organ function varies considerably. In both conditions, it is possible to limit

the extent of infarction with early intervention. In both conditions, minutes count. This article aims to describe differences and similarities with regard to the way patients, bystanders and health care providers act in the acute phase of the two diseases with the emphasis on the pre-hospital phase. METHOD: A literature search was performed on the PubMed, Embase (Ovid SP).

The chain of hospital services will prompt a good outcome in stroke patients, beginning with knowledge of stroke symptoms. The CASPR (the California Acute Stroke Pilot Registry) study showed that there was an increase in patients receiving thrombolysis from 4.3% to 28.6% ^{2,14}

Acute stroke services in the emergency department should be conducted in Triage with the same priority as a myocardial infarction or traumatic brain injury regardless of the neurological deficit severity. Service standards for acute stroke care according to the AHA/ASA guidelines are: from ER to meeting a medical doctor is less than 10 minutes; ER to meeting the stroke team is less than 15 minutes; ER to performing a CT scan is less than 25 minutes; ER to CT interpretation is less than 45 minutes; ER to thrombolysis is less than 60 minutes; and ER to admission to a stroke unit is less than 3 hours.

Thrombolysis in Indonesia is less frequently performed because there was no data available to determine the factors causing the ER admission delay in stroke patients. This study aimed to know the average time is from onset to ER admission in acute stroke patients.

METHOD

From October 2016 to March 2017, all acute stroke patients in Dr. Soetomo General Hospital and Airlangga University Hospital who were admitted to the ER were observed. All stroke patients older than 18 years old were included in this study. Stroke patients with mimicking conditions and who had a subdural haematoma were excluded. All patient data was collected including demographic data, the onset of the stroke, the duration of attack in order to know whether the patient had a stroke or a TIA, the distance from the patient's address to the hospital, the medical care received before the patient came to the ER, who was a witness to the stroke ictus, the response of patient after the stroke symptom onset, the patient or witness's knowledge about stroke attacks, the mode of transportation that patients used and the time taken to get

from the patient's home to the ER. We also collected their history of past illness, the NIHSS score when they were admitted to the ER, their pre-mRS (The modified Rankin Scale), mRS and the type of stroke. All of the data was analysed statistically to determine the mean, SD and normality, and we conducted correlational analysis.

RESULTS

We included 107 subjects from the period of November 2016 – March 2017. The mean age of this research was 55.97 ± 11.9 . All of the demographic characteristics have been shown in Table 1. There were more women (54.2%) in this research, most of patients were from Dr Soetomo General Hospital (98%) and most of patients had a low income (89%). Our subjects mostly had a level of education of senior high school level (34%). Most of the patients had an address distance that was less than 15 km (64.5%) from the ER.

Table 1: Demographic characteristics

Variable	n	%
Sex		
Male	49	45.8
Female	58	54.2
Hospital		
Airlangga University Hospital	2	1.9
Dr. Soetomo General Hospital	105	98.1
Income		
< 5 million rupiah	96	89.7
>5-10 million rupiah	8	7.5
>10-20 million rupiah	2	1.9
Education		
No education	11	10.3
Elementary school	27	25.2
Junior High School	22	20.6
Senior High School	34	31.8
Diploma - degree	11	10.3
Post Graduate education	2	1.9
Hospital Distance from Subject home		
<15 km	69	65.1
>15 km	37	35.5
Medical care before ER		
Hospital or outpatients clinics	68	63.6
Home	37	34.6
Unknown	2	1.8

Hypertension was a common risk factor (74.8%) in our research, followed by diabetes (29.9%) and history of acute cerebrovascular accidents (25.5%) (Table 2). We decided that the time taken to come to the ER was less than 15 minutes, 15-29 minutes, 30-60 minutes and more than 60 minutes for the respective groups. The most common time taken to get to the ER was 15-29 minutes. Although most of the patients came to the ER around 15-29 minutes, the mean time needed to get to the ER was 712.12 ± 1324.6 . This means that more patients were actually in the group of over 60 minutes. Some of the patients got to the ER 2-3 days after the stroke attack.

Table 2: Stroke Risk Factors

Variable	n	%
Hypertension	76	71.4
Diabetes Mellitus	33	31.7
TIA	4	3.7
Stroke	27	25.2
Jantung	11	10.3

We used statistical analysis to determine the correlation between the time needed to get to ER and the factors such as age and stroke type. There was the NIHSS score, pre-mRS score, mRS Score, the patient's income, their education level, the distance from the patient's home to the Emergency Department and also the medical care that the patient got before patient arrived at the ER. We used Spearman's correlation to analyse the variables. We found that the variables associated with ictus to hospital delays were pre-mRS Score ($r=0.242$; $p=0.012$), distance from the patient's home $r=0.195$ ($p=0.045$) and medical care before ER ($r=215$; $p=0.026$).

Table 3: Time needed to ER

Variable	Mean \pm SD	p
Onset to ER	712.12 ± 1324.6	0.00
Time needed at ER	239.5 ± 151.3	0.00

Table 4: Correlation between the factors associated with time to ER

Variable	r	p
Age	-0.065	0.51
Stroke type	0.162	0.1
NIHSS 1	0.045	0.649

Conted...

Pre-mRS	0.242	0.012*
mRS	0.034	0.731
Income	0.051	0.605
Education	0.105	0.284
Distance	0.195	0.045*
Medical care before ER	0.215	0.026*

DISCUSSION

Our research showed that women were more common than men, so our data is different to that from the previous research which concluded men suffer stroke attacks more than women^{9,15-17}. Gender is one of the unmodified risk factors for stroke. Our study showed that women are more common. We used a hospital-based study and we recruited our subjects using consecutive sampling. Most of the patients in our study were referred from another hospital, so our patients were selected from other hospitals or clinics. Data from the Ministry of Health in Indonesia also showed that men more commonly suffer a stroke than women¹⁸, but because of the referral system in Indonesia, the patients should go to primary care before being referred to secondary or tertiary care.

The mean age of our subjects was 55.97±11.9, so our subjects were younger than those of Chen, et. The most common stroke patient age was >65 years old. Our data showed that there is a trend for stroke patients to be of a younger age in Indonesia compared with other countries.

The income of our subjects was consistently less than 5 million rupias. This data shows that most of our subjects had a lower income, although the income of the subject didn't correlate with time to ER. Our subject's education mostly was of a lower education level that will affect their awareness of stroke signs and symptoms, also affect their awareness of needing to seek help at a hospital.

The risk factors in our study included hypertension, diabetes, TIA, stroke, and a history of coronary artery disease. Our results are similar to those of another study^{17,19,20}.

The time from ictus to the Emergency Department was 712.12 ± 1324.6. This data shows that our subjects, on average, came to the Emergency Department beyond time window needed for thrombolysis. This delay can be the result of the referral system in our country. The

factors associated with time to ER was only significant in relation to the Pre-mRS score ($r=0.242$; $p=0.012$). This shows that the status before ictus affected the patient coming to the hospital earlier. Another factor associated with time to ER was the medical care received before the patient came to the ER (0.215 $p=0.026$). This result shows that our subject maybe had an awareness about stroke and so they came to the primary medical services, but the referral system also delayed the subject coming to thrombolysis-ready hospitals. Chen et al. found that sex, the subject's address, mode of transportation and history of stroke didn't have a significant association with time to hospital¹¹. This result is similar to our results, although the distance from the patient's home was significant in our study. The distance from the patient's home could significantly shorten the time taken to get to the hospital, but this does not affect anything clinically because the average of our study showed that the time taken to get to the hospital was consistently beyond the thrombolysis time window.

CONCLUSION

We conclude that the time taken to get to the Emergency Department is longer than the thrombolysis treatment window and that the only variables affecting the time taken to get to the ER was the Pre-mRS and the medical care accessed before the Emergency Department. Our study had limitations as it was performed at the tertiary hospital using consecutive sampling. The intervention was performed before thrombolysis became commonly performed in Indonesia.

Conflict of Interest: None.

ABSTRACT

The quality of nursing care services in Indonesia need to be improved particularly in caring behavior aspect. One cause for this factor is a lack of caring behaviour. Caring behavior as a form of nursing care toward the patient is described as an act that cares for or respects humanity in relation to those who are unable to meet their needs. This was an observational study with a cross-sectional design. Four inpatient rooms were utilized in this study, and each inpatient room was represented by the head nurse and associate nurse. The data obtained using the questionnaire instrument was analysed using Multinomial Logistic Regression ($\alpha = 0,05$). The results showed that the majority of the Head nurses of the inpatient rooms (37.5%) applying the selling leadership style. The nurse associate's maturity level was M3 (42.5%) and M2 (32.5%). Caring behaviour was mostly moderate (45%). The selling leadership style is the most applied leadership style conducted by the head nurse. The head nurses are less appropriate when it comes to applying the leadership style as it is related to the maturity level of the associate nurses, M3. A good level of caring behaviour is influenced by the leadership. The caring behaviour of the associate nurses can be improved by changing the style of the selling leadership into a participating leadership style, which is more appropriate when paired the maturity level of the nurse associate.

Keywords: *leadership style, nurse maturity level, caring behavior, nurse.*

INTRODUCTION

Quality of health services is the degree of perfection of health that fits with professional and service standards by using the available resources in the hospital in a reasonable, efficient, and effective manner. The services should also be safe and satisfactorily provided, based on norms, ethics, law and the local socio-culture with attention paid to the limitations and capabilities of the government, as well as society¹. The World Health Organisation (WHO) in 2006 launched Quality of Care: "a Process for Making Strategic Choices in the Health

System". The World Health Organisation states that there are six dimensions of health service quality that must be actualised by all countries, namely that health services must be effective, efficient, easily accessible, safe, timely and prioritise patients.

The quality of nursing care services in Indonesia is still unsatisfactory. This can be caused by several factors, among others being organisational factors and the nurse factors themselves in that they show less attention, less caring, are less responsive to the patient's complaints, are less motivating and pay less attention to the therapeutic attitude that would be beneficial for the patients. Caring behaviour as a form of concern from nurses to patients is described as an action that pays attention to or respects fellow human beings who are unable to meet their needs². Caring behaviour is a universal phenomenon that affects the way that humans think, feel and have relationships with others³.

Leadership style is important due to its role in the organisation because the leader's behaviour will strongly influence changes and maintain the culture within the organisation⁴. Situational leadership style focuses on the relationship of leadership behaviour with the employees and was developed from a leadership concept that is oriented to focus on the leader and employee relationship. According to Hersey (1986), there are four styles: telling style, telling style, participating style and delegating style. Employees are a key factor in the organisation because their performance and behaviour will affect on the success or failure of the organization itself⁵. Low maturity level (M1) indicates that the person is unable, unwilling and also not confident. Maturity level M2 indicates being unable but there is a willingness and confidence. Maturity level M3 is being able but unwilling, and not confident. Maturity level M4 is being able, willing and confident.

Nurse's caring behaviour is still widely studied because there is still a high level of patient dissatisfaction related to the services of nurses who work in hospitals. The following is a preliminary survey showing the number of nurses who have not yet applied caring behaviour at X Hospital. The results of the preliminary survey in X Hospital Surabaya in its ICU inpatient room, maternal inpatient room, 3rd Floor inpatient room, and 4th Floor inpatient room showed that the nurse's caring behavior is still low.

METHOD

This study was an analytical observational study with a cross-sectional approach, using a questionnaire as the study tool. The variables studied were leadership style, employee maturity level and associate nurse caring behaviour while the respondents were all Head nurses, all associate nurses and all patients who had been hospitalised for 2 x 24 hours in 4 units of the ICU patient room, maternal hospitalisation, adult hospitalisation and children hospitalisation as well as being able communicate well. This study was conducted in 4 Units of the Inpatient Room at X Hospital in April 2018.

RESULTS

The age of the Head Nurses was all between the ages of 26 years - 30 years old (50%) and ≤ 25 years old (50%). The Head Nurses' age was in early adulthood, meaning that their attitude and behaviour was in a warm,

close and communicative relationship stage according to Erickson (Monk, 2001). This period is a period of transition related to physical, intellectual and social roles. The ages of the Associate Nurses was between 26 years - 30 years old (72.5%) and ≤ 25 years old (27.5%).

The education level of all Head Nurses (ICU room, adult hospitalisation, child hospitalisation and Head of Midwifery) was an associate degree or D3 (100%). Most of the Head Nurses at X Hospital had served as Heads for between 1-2 years (75%). All Head Nurses in the ICU, maternal hospitalisation, adult hospitalisation and child hospitalisation units of X Hospital were female (100%). The leadership style of the Head Nurses based on the Hersey-Blanchard approach showed that almost all of them had Selling (S2) as their leadership style (75%). The level of maturity of the Associate nurses in the four inpatient rooms of X Hospital showed a medium maturity level of M2 (75%). Most of the caring behaviour of the Associate nurses at X Hospital was at the level of moderate caring behaviour (45%). The influence of the Head nurses' leadership style based on the Hersey-Blanchard approach consisted of leadership style (Telling-Directing, Selling-Coaching, Participating and Delegating) on the caring behaviour of the Associate nurses in the 4 inpatient rooms of X Hospital via the following: telling in the 'less' category (50%), the selling leadership style influences the caring behaviour in the 'good' category (70.37%) and the participating leadership style influences the caring behaviour of Associate Nurses in the 'moderate' category (42.86%). The leadership style of the Head Nurses based on the Hersey-Blanchard approach had a significant effect on the Associate Nurses' caring behaviour with a 'good' category of 70.37% ($p = 0.004$), with particularly the selling leadership style having a significant effect on the Associate Nurses' caring behaviour with a 'good' category 38.7 times greater than telling, selling and participating leadership style.

The medium maturity level of the associate Nurses (M2) had more of an impact on the Selling leadership style (40%), the high maturity level of the Associate Nurses (M3) had more of an impact on the Participating leadership style (61.54%) and the very high maturity level of the associate Nurses (M4) had more of an impact on the Delegating leadership style (66.67%). The Associate Nurse maturity level, which included M2, M3 and M4, significantly influenced the Hersey & Blanchard leadership styles by 48.7% ($P=0.002$). The maturity level

of the medium category for the Associate Nurses (M2) influenced Selling leadership style 8.8 times greater than the Participating and Telling leadership style. The high maturity level of the Associate Nurses (M3) had an influence that was 19.8 times greater than the Selling, Telling and Participating leadership styles.

DISCUSSION

The characteristics of the Head Nurses is closely related to their choice of leadership style and is one of the important aspects that plays a role in shaping the behaviour and personality of the Head Nurses leading the inpatient units at X Hospital in achieving their goals. The description of the characteristics of the Head Nurses in this study included age, gender, length of work period and education level. The majority of the Head Nurses in this study were in the age group of < 30 years old. Head Nurses with an age < 30 years old were the early adult age group, and the attitude and behaviour of the Head Nurses was in a warm, close and communicative relationship stage according to Erickson. The education level of the Head Nurses in the 4 inpatient rooms (ICU, maternal, adult and child hospitalisation) was that the majority had a D3 education level (100%). The level of education of a leader will affect their ability to lead a unit in the hospital. If the level of education, experiences, and skills of the Head Nurse exceed those of the associate Nurses, then it is hoped that she will be able to provide guidance and motivate the associate Nurses⁶. The time serving as a Head Nurse in this study included the category of serving for 1-2 years as the majority. A Head Nurse who has served as a Head for a long time will certainly have more experience in leading her subordinates associate and her ability to manage an inpatient unit will be better compared with other who have not served as a Head Nurse for long. An experienced Head Nurse will certainly not experience difficulties leading an inpatient unit compared to nurses who have never previously served as a Head Nurses. The gender of the Head Nurses was all female (100%). Leaders of a different gender, male and female, will certainly have a different fundamental nature. Up to now, there is still a stereotype that a woman is considered to be less capable of being a leader^{7,8}. Female leaders will tend to use their feelings and act gently, while on the contrary, male leaders will tend to use their ability to think and act tougher. Female leaders can act as an agent who bring in changes⁹.

Situational leadership style based on approach of Hersey & Blanchard leadership style theory can be seen from the perception of the associate Nurses and the Head Nurse. The interactions within the same environment between the associate Nurses and Head Nurse will create the perception of the Head Nurse's leadership style on her behaviour. The majority of the Head Nurses in the 4 inpatient rooms of X Hospital use the Selling leadership style. The Selling leadership style applied by the Head Nurse is an appropriate leadership style when applied to employees who have lesser abilities but a high willingness to complete a task, which shows they are an employee with a medium maturity level (M2). The Selling leadership style influences individual performance, which will impact on organisational performance¹¹⁻¹³. In this study, leadership style based on Hersey & Blanchard significantly influences the caring behaviour of the Associate Nurses, but the effect is not as great as the influence of the Associate Nurses' maturity level. Selling leadership style applied by the Head Nurse is in accordance with the maturity level of the nurses in the 4 inpatient rooms of X Hospital. This means that it is consistent with Hersey & Blanchard's leadership style theory¹⁴.

The high maturity level of the Associate Nurses (M3) is more related to the participating leadership style, and the medium maturity level of the Associate Nurses (M2) is more related to the Selling leadership style. There is a match between applied leadership style with the level of employee maturity, which will make it easier to achieve any organisational goals, which also supports Hersey & Blanchard's leadership style theory¹⁴. The Head Nurse, as an effective leader in this theory, must be able to understand the situational dynamics and adjust her capabilities to the existing situation. The adjustment of the leadership style is the ability to determine the leadership style and behaviour needed when leading her subordinates based on a certain situation. The Head Nurse, as a leader in her unit, must be able to identify the maturity level of her subordinate Associate Nurses and have a high level of adaptability when observing a situation^{15,16}.

Based on the results of this study, it is known that the maturity level of the associate Nurses in the 4 inpatient rooms of X Hospital was of the medium maturity level (M2). The employee maturity level in this study also influenced the leadership style, as based on Hersey & Blanchard. According to Hersey & Blanchard, a leader

needs to understand her employees' level of maturity so then the leader will not apply the wrong leadership style in order to improve organisational performance¹⁷. To maximise the relationship of the Head Nurse as the leader with her subordinate associate Nurses, the Head Nurse must clearly determine the outcome, objectives, sub-tasks, and other specific tasks that will be completed by the associate Nurse. Without this clarity, the Head Nurse will find there to be difficulties related to determining the Associate Nurse's maturity level or the leadership style that must be applied to that maturity level. The caring behavior of the associate nurses in 4 inpatient rooms of X Hospital is more influenced by the leadership style rather than the maturity level of associate nurses. This explains the important meaning of head nurse's role as a leader in her unit to be able to influence the performance of associate nurses based on the leadership style that is matching the maturity level of associate nurses. The leadership style of the Head Nurse influences the caring behaviour of the Associate Nurses which is in accordance with the previous research conducted by Sfantou et al.,¹⁸. When leading subordinate associate Nurses, a Head Nurse must be able to distinguish the role between manager and actual leader because it is very contradictory¹⁹.

CONCLUSIONS

Hersey & Blanchard's leadership style has more of an influence on the caring behaviour of the associate Nurses than the maturity level of the Associate Nurses. The maturity level of the employee influences Hersey & Blanchard's leadership style. The higher the employee's maturity level, the more that the delegating leadership style becomes the most appropriate leadership style. Providing training on leadership style, supervising and evaluating performance periodically, providing guidance and support to the Head Nurse in relation to guiding and fostering the Associate Nurses in their role. Therefore, the skills and abilities, and the Associate Nurses' maturity can be improved.

The Relationship of Socio-Economic and Genetic Factors with Toddler Stunting at Kenjeran Public Health Center Surabaya

Dwi Ernawati¹, Puji Hastuti¹, Dhian Satya Rachmawati¹, Ari Susanti¹, Christina Yuliasuti¹,
Merina Widyastuti¹, Mieke Izzatul Mahmudah¹

¹School of Health Sciences Hang Tuah, Surabaya, Indonesia; Jl. Gadung No.1, Surabaya, Indonesia

ABSTRACT

Introduction: Stunting is a chronic nutritional problem arising from a malnourished condition that accumulates over a long period of time with a z-score of less than -2 SD. The incidence rate of stunting in Indonesia year to year has increased. The purpose of this study was to analyse the correlation of socioeconomic and genetic factors with the incidence rate of toddlers stunting.

Method: This research used a cross-sectional approach. The study population amounted to 568 toddlers. The sample technique using stratified random sampling and obtained 145 toddlers as the sample. The independent variables were socioeconomic and genetic factors via the questionnaire instrument. The dependent variable was the incidence rate of toddler stunting using the microtoise instrument. Data analysis was conducted using the Spearman rho test. The results of this study indicate that socioeconomic and genetic factors are related to the incidence rate of toddler stunting.

Results and Analysis: The results of the factors are; father's education analysis to stunting toddler $p = 0,002 < \alpha = 0,05$, mother's education to stunting toddler $p = 0,001 < \alpha = 0,05$, father's job to stunting toddler $p = 0,000 < \alpha = 0,05$, mother's activity to stunting toddler $p = 0,013 < \alpha = 0,05$, family income to stunting toddler $p = 0,002 < \alpha = 0,05$ and genetics to stunting toddler incidence $p = 0,000 < \alpha = 0,05$. The implication of this research is that the prevention of toddler stunting can be achieved by giving information about nutritious food with a low price and a method of processing food well that is affordable.

Keywords: *Toddler with stunting, Genetic Factor, Social Economy.*

INTRODUCTION

Stunting is a chronic nutritional problem, arising from a malnourished condition that accumulates over a long period of time¹. Stunting, according to the WHO Child Growth Standard, is based on the length-for-age (L/A) or height-for-age (H/A) index with a limit (z-score) less than -2 SD. Stunting is associated with an increased risk of morbidity and mortality, and stunted growth². Nutritional deficiencies that have received a lot of attention lately include a chronic nutritional problem in the form of short children (stunting).

Based on a preliminary study conducted by the researchers via an interview in February 2018, it showed that the residents around the Kenjeran Public Health Centre have been given counselling about the practice of providing nutritious food for children via an Integrated Service Post by the health workers. However, parents still do not apply the practice of giving healthy or nutritious food to their children correctly. Parents only provide side dishes in the form of tofu and tempeh. The incidence of stunting in toddlers in Indonesia is still very high, which was 35.6% (18.5% very short and 17.1% short) in 2010 and increased in 2013 to 37.2% (18.0% very short and 19.2% short) for those who experienced stunting. According to the results from Basic Health Research 2010, East Java was one of the provinces with a high stunting prevalence of 35.8% (20.9% very short and 14.9% short). The same thing was also shown in the results of the Basic Health Research in 2013, where the prevalence of stunted toddlers in the province of East

Java was included in the high group, which was between 30-39%³. The results of the preliminary study conducted at Kenjeran Public Health Centre Surabaya on February 15th, 2018 found that the results of stunting children in 2016 had a prevalence rate of 430 toddlers, or 14.78% (0.52% very short and 14.26% short).

One of the causes of stunting is socio-economic, where the family income influences the fulfilment of nutritional adequacy in toddlers which indirectly has an impact on their nutritional growth. Stunted children experience more disruption in carrying out their daily activities compared to children who are not stunted. Stunted children come from families with a low socio-economic status. Being of a low economic status is considered to have a significant impact on the possibility of children being thin and short⁴. Families with a good economic status can get access to better public services such as education, health services, and others so then they can affect the nutritional status of their children. In addition, the family’s purchasing power is increased, so then the family access to food will be better⁵.

A nurse acts as an educator to the parents about the risk factors that causes the incidence of stunting in children, so it can minimise the incidence rate.

METHOD

This study used a non-experimental research design with an analytic observational study type which aimed to determine the relationship between the variables and to explain the relationships found with the cross-sectional approach. This is a type of research that emphasises on the measurement or observation of the independent and dependent variables one at a time, with a follow-up. The instrument used a questionnaire for the socio-economic data and a data questionnaire for the genetic factors related to the incidence rate of toddler stunting. The sampling technique used in this study was probability sampling via the stratified random sampling approach. The study was conducted at Kenjeran Public Health Centre, Surabaya.

RESULTS

The relationship of the socio-economic and genetic factors with toddler stunting at Kenjeran Public Health Centre, Surabaya, as shown in the table 1 below.

Table 1: Characteristic demography of respondents

Father’s Education	Stunting Toddler Category				Total	
	Very Short		Short		N	%
	f	%	f	%		
Low (Junior High School and below)	34	45.3	41	54.6	75	100
Moderate (Senior High School)	15	25.4	44	74.6	59	100

Private	3	25	9	75	12	100
Other	0	0	1	100	1	100
Total	50	34.5	95	65.5	145	100
The value of Spearman's rho statistic test was 0.013 ($p = 0.05$)						
Family Income	Stunting Toddler Category				Total	
	Very Short		Short			
	f	%	f	%	n	%
Low < 2,500,000	43	42.6	58	57.4	101	100
Middle 2,500,000-3,500,000	5	14.3	30	85.7	35	100
High > 3.500.000	2	22.2	7	77.7	9	100
Total	50	34.5	95	65.5	145	100
The value of Spearman's rho statistic test was 0.002 ($p = 0.05$)						
Genetic Factors	Stunting Toddler Category				Total	
	Very Short		Short			
	f	%	f	%	n	%
Normal Parents	22	68.8	10	31.3	32	100
Genetic history of stunting family	15	35.7	27	64.3	42	100
Genetic history of stunting mother	4	11.4	31	88.6	35	100
Genetic history of stunting father	9	25	27	75	36	100
Total	50	34.5	95	65.5	145	100
The value of Spearman's rho statistic test was 0.001 ($p = 0.05$)						

Based on the results of the Spearman rho test, there was a significance value of $p = 0.002$ with a significance level of 0.01 ($p < 0.05$). It can be concluded that there is a relationship between the father's education, mother's education, father's occupation, mother's occupation, family income and genetic factors and the incidence rate of stunted toddlers at Kenjeran Public Health Centre, Surabaya (Table 1).

DISCUSSION

Malnutrition can result in a failure to thrive and stunting in children. It also increases morbidity and mortality, especially in vulnerable to nutrition and disease age groups, which is children under five (toddler). This is the group that suffers the most from malnutrition and the number in the overall population is quite large. Various factors that influence the nutritional status of toddlers includes a lack of food supply, poor quality in the environment, socio-economic conditions (income, level of education, and employment) and family culture, such as family upbringing, as well as knowledge ⁶.

Socio-economy is sub-divided into three; namely education, employment, and family income which will be discussed as follows. The high education level of the parents can change a person's diet, which ultimately affects the nutritional status of the family, including the children⁴. The level of formal education is a factor that determines whether or not someone easily absorbs and pursues the acquired knowledge⁷. This study is in line with the study of Aramico, Sudargo and Susilo (2013), which states that there is a relationship between the father's education and stunting ($p < 0.001$) and OR 3.37. The high education level of the parents can change a person's diet, which ultimately affects the nutritional status of the family. Researchers assume that a low level for the father's education, those who graduated from junior high school or below, can affect nutritional status.

Level of education will affect the knowledge that is possessed by someone. The low level of the mother's education will have an impact on her limited knowledge about a healthy lifestyle and the importance of nutrients for the health and nutritional status of their child⁸. The education of the parents will have a direct influence on childcare patterns, which will then affect the child's food intake. Parents with a better education tend to have the knowledge and ability to implement better knowledge than parents with a low level of education². These results are supported by Medhin's study (2010 in, Ngaisyah and Septriana, 2016) which stated that the mother's education level affects the incidence rate of stunting, showing that there is a significant relationship ($p = 0.000$) and OR 4.06. The level of education will make it easier for a person or society to absorb information and to implement it in their daily behaviour and lifestyle.

A job is work, namely a series of tasks, that generates money for someone⁹. The household's economic status

can be determined by the work performed by the head of the household. The type of work done by the head of the household will determine how much of the household finances will be used to meet the needs of the family¹⁰. Researchers assume that those with jobs that generate less money can cause the household's children to experience a nutritional imbalance. The father's occupation status can also reduce the time spent together with the child, so the attention paid to the child's growth and development will decrease.

The quality of the mother's service in the family is determined by the mastery of information and the factor of adequate time availability. These two factors can be determined by the level of education, social interaction and occupation⁷. Changes in modernity can affect the family institution. The number of women who work outside home is increasing, both for self-actualisation and to meet the household's economic needs¹¹. Researchers assume that mothers who are staying at home and not working can take care and pay attention to the health and needs of their toddlers, which can support their growth better. Meanwhile, mothers who work have less time to pay attention to the growth of their children, so they are at a risk of malnutrition. The lack of nutrition needed by these toddlers is due to the business of the parents and their focus on their work; the attention to their children is thus reduced. A good nutritional intake often cannot be fulfilled by the child because of the family's economic crisis factor¹².

An adequate family income will support the child's growth and development because the parents can provide for their children's needs, both primary and secondary⁷. This study is also in line with the study of Aramico, Sudargo and Susilo (2013) which showed the significant relationship between family income and nutritional status ($p < 0.05$). The value of OR=3.5 95% indicates that families with a low economic status have a 3.5 times greater chance of their child suffering from malnutrition than families with a high economic status. Other studies that are in line with this result explained that the low socio-economic status (household assets) of the respondents has a 21 times greater risk of causing stunting compared to those with a high socio-economic status. Researchers assume that a family income that is below the District/City Minimum Wage has an impact on the growth of the toddler. This leads to the inability of the head of the family to meet the nutritional adequacy of their toddler.

The parents' height is associated with the physical growth of the children. A mother with a short body is one of the factors associated with the incidence rate of stunting. In toddlers, height is influenced by genetic and environmental factors during the growth period¹³. This result is in line with the study conducted by Hanum et al (2014, in Aulia, 2016) which showed that more stunted children have mothers of a short height compared to mothers of a normal height. Researchers assume that the parents' height is related to the incidence rate of stunting.

However, there are still many environmental factors that affect a child's height. In addition, several other studies have shown that the factors of education and work are related to the characteristics of parents, which is a cause of the high number of problems encountered by short toddlers. This study was supported by Mulvani (in Miko and Al-Rahmad, 2017), in that people with a high level of education generally pay more attention to their health problems.

CONCLUSION

Based on the findings in this study and testing the results, it can be concluded that socio-economic and genetic factors have a relationship with the incidence of stunting at Kenjeran Public Health Centre, Surabaya. This research is expected to provide information on the minimum family income required without reducing the supply of balanced nutrition in children. Cheap nutritious food and a good method of food processing is important. In addition, people can understand the incidence rate of stunting experienced by their children and become able to apply good nutrition to their children in an effort to minimise the number of stunting incidences.

Cultural Religiosity as the Determinant Factor of a Successful Healthy City in South Kalimantan, Indonesia

Herawati¹, Shrimarti R. Devy²

¹Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia, School of Nursing, Universitas Lambung Mangkurat; ²Department of Health Promotion & Health Behaviour, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

The concept and processes of a healthy city vary depends on the region. Each city should be allowed to develop and adapt to the uniqueness, culture and value of the respective society. This study aimed to explore the culture of community in Banjar, South Kalimantan, which related to realize healthy city. Qualitative research was conducted through community observation in the form of a documentation study, including an in-depth interview with several people and the respective community leaders. The data was analysed using the Miles and Huberman Model, including data reduction, data presentation and conclusion. There is the existence of a religious culture of the Banjar people of South Kalimantan. Religious cultures can be integrated into people's lives such as in the execution of healthy behaviour, which can be a determinant of a successful healthy city program.

Keywords: cultural religiosity, healthy city, Indonesia

INTRODUCTION

Health issue is significantly relevance to urban planning. Healthy urban planning could shape healthy social and environmental circumstances and vice versa, poor urban planning may contribute to the eruption of various diseases in the inhabitants within an urban area ¹. Urban issues do not only impact health and environment problems, but also be the key to achieve Sustainable Development Goals (SDGs) of creating favourable, safe and sustainable cities and residences (goal 11) ².

To overcome this health problem, a specific program is required. Public health programs, which maintain various relations between health services, residents and the urban area, are often not executed at a sufficient level. One of the programs initiated by the WHO was the "Healthy City Project" in 1986. This project was later spread, swiftly covering more than

7,500 cities around the world and more than 1,200 cities in Europe have come to the same perspective in order to revitalise the approach to health issues in urban life ^{3,4}pleasant, and green built environment, but also one that creates and sustains health by addressing social, economic, and political conditions. It describes collaborations between city planning and public health creating a contemporary concept of urban governance? a democratically-informed process that embraces values like equity. Models, critiques, and global examples illustrate institutional change, community input, targeted assessment, and other means of addressing longstanding sources of urban health challenges. In these ambitious pages, healthy cities are rooted firmly in the worldwide movement toward balanced and sustainable urbanization, developed not to disguise or displace entrenched health and social problems, but to encourage and foster solutions. Included in the coverage: Towards healthy urban governance in the century of the city Healthy cities emerge: Toronto, Ottawa, Copenhagen The role of policy coalitions in understanding community participation in healthy cities projects Health impact assessment at the local level The logic of method for evaluating healthy cities Plus: extended reports on healthy cities and communities in North and Latin

America, Africa, Europe, Asia, Oceania, and the Middle East Healthy Cities will interest and inspire community leaders, activists, politicians, and entrepreneurs working to improve health and well-being at the local level, as well as public health and urban development scholars and professionals. Part I: Foundations and Historical Backdrop -- Introduction: Aims and Objectives of this Book -- Paleo-Epidemiology, Nomadism and Sedentism: Health and the City -- Urbanisation and Public Health -- Health in Canada in the 1970s and 1980s: Hotbed of Innovation -- Healthy Cities Emerge: Toronto -- Ottawa -- Copenhagen -- Healthy Cities Grow: Development of International, National, Regional, Linguistic Networks -- Eleven Qualities a City Should Strive to Provide (1986).

The concept of a healthy city is both an old-fashioned and new concept. "Old-fashioned" means that human beings have attempted to create healthier cities since the earliest periods of urban civilization. "New" is manifested as the primary medium of health promotion – new public health – in the search of health for all ⁵. Healthy city approaches have long been known as the most popular approach in the promotion of health ⁴.

A healthy city is an operational measure from a social model which aims to overcome negative health determinants ⁶. Health determinants are an important or essential factor used to increase health performance ^{7,8}. The WHO European Healthy Cities Network has from its inception aimed at tackling inequalities in health. In carrying out an evaluation of Phase V of the project (2009-13). The WHO mentioned that a health determinant consists of the following: the social and economic environment and the physical and mental characteristics of the individual ⁹.

The Human Development Index (HDI) data from the district of Banjar in 2015 was situated at rank 9 out of the 13 districts/cities existing in the province of South Kalimantan, and in 2016, the value of the HDI had relatively increased ¹⁰. However, the rank slightly dropped to 10th. One of the primary causes was the health issue present, aside from education and the economy. In 2016, the achievement target of a sanitary and healthy lifestyle in the level of household was still stood in the percentage of 47.6% from the overall amount of 39.765 households observed ¹⁰. Individual behaviour is shaped by culture ¹¹.

Further, every city has the possibility to develop respective parameters in accordance with the situational

uniqueness, culture and values ¹². Nevertheless, the research in this field is exceptionally limited, primarily in the context of the local government ¹. Due to the concept of health, ill perceptions are deeply attached to the concept of culture, and so this pushes researchers to dive further into societal culture, particularly in relation to a healthy attitude in order to realise a healthy city in the District of Banjar, South Kalimantan Province. Through comprehending the particular societal culture of the city in question, it is further expected that precise interventions can be delivered to achieve an optimal level of health ^{13,14}.

Thus, this study aimed to explore the culture of community in Banjar, South Kalimantan, which related to realize healthy city.

METHOD

Observation over the behaviour of society and in-depth interviews with the citizens and public figures of Banjar were conducted. The interviewed public figures consisted of chief of sub-divisions in municipal public health office of Banjar, director of a *pesantren* (Islamic Boarding School), chief-deputy of Healthy City Forum and chief of working cluster of Indrasari Urban Village. The interview was also conducted within wider society amounted to 15 individuals.

The questions prepared for this survey were open-ended. If the participants encountered difficulty when answering the questions or responded only briefly, then the researcher tried to deepen or follow up the information by requesting a further explanation about the participant's previous comment or requesting the participant to provide evidence from what they meant on the first occasion. The frequency and duration of interviews were in accordance with the initial commitment; around 60 to 90 minutes. However, it was limitless and manageable according to the situation and condition of the participants.

An unstructured passive participative observation was performed. The study did not use a default or systematically prepared instrument. A behavioural observation of the society and the condition of the physical environment were also conducted. Through observations, the researcher was equipped with a deeper knowledge in order to comprehend the data context across the entire social situation in order to be equipped with a holistic

and thorough perspective. The data was analysed using the Miles and Huberman Model, including data reduction, data presentation and conclusion.

RESULTS

The study was located in Banjar, one of the regencies in South Kalimantan. The Banjar lays claim to a popular designation called “The Piazza of Mecca”. The district has been visited by numerous scholars and the territory has been dominated by Muslims. However, there are a number of worshippers from various beliefs although on a lesser scale. In 2016, the citizens were made up of 99.20% Muslims, 0.27% followed Protestant Christianity, 0.25% followed Hinduism, and the rest followed Catholic Christianity and Buddhism/Animism with the percentage being 0.12% and 0.07% respectively and with other beliefs being 0.10%.

In 1835, during the government of Sultan Adam Alwasiqubillah, for the first time a sharia law was implemented in the sultanate of Banjar. Nowadays, Banjar has 19 sub-districts with 29 villages or urban villages situated in the city of Martapura. The motto of Banjar contains three key words of *baiman* (have religious atmosphere), *bauntung* (blessed by the God), and *batuah* (have noble characters).

The results show that the society of Banjar has a cultural uniqueness with a depth focused on religious values. In several areas in Banjar district territory, there were a number of Islamic boarding school. The other unique factor of this district was the written Arabic texts in the naming of public offices. This is supported by the result of an interview with one of the public figures in the society who said that:

“Banjar society tends to choose religious education such as in pesantren (Islamic boarding school), which commences from elementary level. The schools become the favourite of Banjar society, as it includes the subject of Arabic”.

Another similar statement came from another public figure, as follows:

“Banjar society views that formal school does not guarantee a wealthy life. It is different when it comes to learning religious subjects, hence worldly matters shall follow. This is a lead into a rewarding life. There are tons of people

in Banjar who did not go to formal school but they were able to become rich or sufficient economically”

South Kalimantan is popularly known as the city of a thousand rivers. One of the rivers is Sungai Barito, which passes through several areas in Banjar. From the observations, the particular river has been frequently used by the society as a means of transportation as well as in the fulfilment of their daily needs such as bathing, laundry washing, and defecating. Numerous people have been misusing it for unwise and deteriorating activities, such as disposing their trash in the river. Based on the results of a series of interviews from a number of informants from the civil sector of society, they revealed that the attitude of using the river for a variety of needs or to dispose of trash has been habituated and committed to over generations and therefore it is difficult to be corrected, primarily for those living in the periphery of the river. These facts can be identified from the account made by an informant from the civil section of society as follows:

“How about it? It has been habituated for so long, therefore it is difficult to be eliminated.”

Meanwhile, what has been conveyed by the public figure is not significantly different. The statement is as follows:

“Well... actually based on our perspective in our religion (Islam), it is crystal clear and comprehensive in detailing the ideas about health. In our culture, there is a saying that relates to ‘cleaning up’. However, because society preserves the river, there are still many people using the river to defecate in.”

Later on, from another public figure (religious), they revealed that among other things:

“There are have been so many students (santri) bathing in the river. Truly it is because such local culture has been difficult to change and eliminate.”

In relation to the previous efforts made by public figures and the local government, this matter has been conveyed by the municipal public health office.

“Truly, it is because socialisation has not been delivered intensively, so it is normal if the participation of society is still lacking due to the minimum level of understanding. The program of a ‘Healthy City’ originally belonged to society,

and the public health office as the authority should only act as a facilitator. The point is how it changes the behaviour of the society, whereas changing the attitude is not so simple.”

There is a willingness and hope from the religious public figures on this matter that the figures are able to assist in transforming society’s attitude to better behaviour as follows:

“Well, our hope is that we are going to be involved because for the time being, there are no invitations from the public health centres, the public health office and the other stakeholders to prompt discussion. If we are being involved, we will be forever grateful to be able to help. Hence, if our students are well-informed on health matters, they will extend this knowledge to others. That way, once they return home, they will be the role model in their villages and of course, be heard by their fellow villagers.”

DISCUSSION

The study discovered that the culture and religious values has been developed and dominated the structure of Banjar society. However, the religious values have not yet impacted holistically on their lives, including on the matter of health.

The pendulum definition or healthy statement has moved away from the medical model and returned to the social model which is not only focuses on individual but also considers the result of social, economic and cultural factors related to society^{15,16}. Many scholars had comprehended the prominence of culture to later on combine cultural content in the public health services¹⁷. According to Leininger, if the cultures of society do not fit with the health discourse, then the culture should be a subject for negotiation and need to be eliminated. However, if it is appropriate and able to support the health problems, then the particular culture should be preserved¹³.

Culture is a pattern of meaning. It is similar to the symbols that are historically distributed; a system of legacy that is consolidated, preserved, and developed by human-beings in the form of knowledge and attitude in their lives which is historically transmitted. One of the manifestations of culture can be contextualised in religion^{18,19}.

Religion is seen of as a structure of various beliefs and the implementation of custom which is integrated into the cultural life of society. It is a working framework used to comprehend and create decisions. Religion can be defined as a system of rational belief through practices and/or as a set of beliefs, rituals and morals^{20,21}. Religion can also be beneficial as a source of power to be abided by in the context of values and attitude. The majority of religions are equipped with a tradition involving certain beliefs and practices related to the afterlife and life attitude, either well or ill^{18,22}.

Islam is a religion which highly encourages human-beings to maintain cleanliness in life, to be healthy and to be environmentally-friendly. There are a number of verses in the Quran and Hadiths of the prophet, which contain various messages related to the encouragements. Health, with its respective paradigm, can be applied when disseminating information regarding the application of Islamic values, hence, there is no gap between the holiness of Islamic teaching with daily life attitude from the perspective of health²³.

CONCLUSION

There is a major power possessed by society, which is the capacity of social capital through culture in form of religious values. This particular matter can support and act as a determinant to actualise a healthy city if the society is capable of realising the particular values involved in the transformation of a healthy lifestyle and the existence of a favourable partnership between society and public figures.

Conflict of Interest: None.

Ethical Clearance: The study passed ethical clearance from Ethical Committee of the Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia.

Source of Funding: Self-funded.

The Relationship between Response Time and Patient Survival with Emergency Treatment by the Code Blue Team

Al Afik

Nursing Programme, Faculty of Medicine and Health Sciences, Universitas Muhammadiyah Yogyakarta

ABSTRACT

Introduction: Code blue has a considerably prominent role in the management of emergency situations in the hospital setting. Rapid and appropriate management will affect the morbidity and mortality rate of patients during an emergency situation. This study aimed at analysing the relationship between time response and the survival of the patients who received emergency treatment by the code blue team in hospital.

Method: This research used a correlational design with a cross-sectional study approach. The sample of this study was 74 patients who received emergency treatment by the code blue team in RS PKU Muhammadiyah Yogyakarta within the period November 2015 - July 2017. The data was generated from secondary data. The analysis test of the data was undertaken by using a Spearman rank test with a 5% significance level.

Results: The average response time performed by the code blue team in emergency call management was 6.09 minutes and the survival of patients after obtaining the management of the code blue team was that 82.4% died and 17.6% were treated in an intensive room. The result of the Spearman test showed that there is a relationship between the response time and the survival of patients who received emergency management by the blue code team (p-value: 0.04).

Conclusion: The speed response of the code blue team in providing emergency management corresponds to the patient's survival. The faster the patient received treatment, so would the mortality rate decrease.

INTRODUCTION

A patient's heartbeat stopping is one emergency situation which requires immediate treatment. It is expected that heartbeat cessation in the United States that occurred in the hospital setting ranged roughly between 250,000 to 750,000 cases per-annum with the percentage of successful resuscitation action between 0% - 59%¹. A delay in the treatment for heartbeat cessation patients will reduce the number of living patients² the average call rate was only 9.8 calls/ 1000 admissions. Anecdotal

feedback and a group-administered questionnaire conducted in July 2003 demonstrated a number of obstacles to initiating calls and the system was modified in October 2004. Specifically, emergency response calls were separated into Code Blue calls (for cardiorespiratory arrests. Factors which influence the level of successful resuscitation in a case of heartbeat cessation include the early detection ability, the arrival of the emergency group, the immediate activation of Cardiopulmonary Resuscitation treatment (CPR), the distribution of early-stage medication, the time-space between the heartbeat cessation moment and the distribution of defibrillation, the capacity of the emergency team, as well as the experience of team participation on related training courses¹. The outcome of this research unveiled that the time when heartbeat cessation occurs determines the level of sustainable living of the patient. Patients who experience heartbeat cessation on the evening or during the weekend have a lower living sustainability level, except for when in the emergency department and other

intensive units (ICU, ICCU, HCU, PICCU, NICU) due to the constant presence of medical officers. Henceforth, the presence of the Code Blue team becomes important when in charge of emergency treatment across the hospital environment. In the presence of the Code Blue team, it is expected that the team can contribute to the enhancement of the patient's living sustainability in an emergency³. The Code Blue team is a group of individuals assigned to perform first hand treatment and precautionary measures on patients who experience heartbeat cessation or breathing disorders in the hospital environment⁴.

The Code Blue Team performs emergency action treatment by involving medical personnel from multi-disciplinary backgrounds. It requires fine coordination and partnership as well as a singularity of perception during the treatment in order to attain maximum results⁵.

MATERIAL AND METHOD

This research was included in the category of quantitative research with a descriptive and correlational study approach which describes the relationship between response time and the patient's survival ability in those who attained emergency treatment from the Code Blue team. The approach of this research was a cross-sectional study. The collection of the research data was performed using secondary data collected from the Code Blue's medical record data in RS PKU Muhammadiyah Yogyakarta. The secondary data was generated from all patients whose received treatment from the Code Blue team between November 2015 to July 2017, amounting to 74 patients. The generated data included their identity, the status of the patient's health, response time and the patient's survival ability after receiving treatment from the Code Blue team. Response time is the time space between the relief request being made to the Code Blue team up to the commencement of the patient's handling in order for them to receive treatment. Survival is the patient's condition after receiving emergency treatment by the Code Blue team, including whether the patient is dead or alive (treated in an intensive care unit). Moreover, characteristic data collection was also performed by the Code Blue team whose personnel were standing by in the hospital. Data analysis was performed by analysing the relationship between response time and the patient's survival ability through the Spearman Rho test with a level of significance of 95%.

RESULTS

The analysis results of the response time and emergency treatment success performed by the Code Blue team is shown in Table 1 below.

Table 1: The Average Response Time and Patient Survival Ability

No.	Variable	Result
1.	Response Time Average	6.09 minutes
2.	Patient's survival after receiving emergency treatment by Code Blue	
	Died	82.4 %
	Treated in an intensive unit	17.6 %

DISCUSSION

Code Blue is one of the emergency services available in a medical hospital, established as an effort and strategy for the prevention of heartbeat cessation incidents, including the activation of the emergency system as well as the delivery of resuscitation actions during an emergency incident. In the enforcement of its system, Code Blue involves a variety of components which consist of human resources including medical and non-medical personnel, favourable facilities and an infrastructure including medical tools and medical drugs, the delivery system of Code Blue which consists of a Standard Operational Procedure as well as control and evaluation mechanisms. During its implementation, emergency activation in a medical hospital will be connected to a medical team assigned to commence with immediate basic and further assistance⁶. The purpose of the Code Blue system is to intercept the occurrence of heartbeat cessation in hospital, to guarantee basic and further living assistance support swiftly and effectively as well as performing post-heartbeat cessation medical treatment in an optimal manner⁷.

An emergency situation is a condition which threatens the life of a person and requires immediate relief. Swift and precise handling will be able to increase the living sustainability of a person, hence able to decrease the rate of mortality. The result of this research unveiled that there is a relationship between response time with the survival ability of patients who received emergency treatment from the Code Blue team. This is in line with the results of the previous research which

stated that response time is considerably influential on the living sustainability of patients who experience an emergency situation⁸ translated by some EMS operations into a goal of a response time of 8 minutes or less for advanced life support (ALS). Emergency calls with a response time of less than five minutes will increase the living sustainability of patients compared to a response time of more than five minutes⁹ this remains speculative and unreported. **OBJECTIVE** To determine the effect of current RTs on survival in an urban EMS system. **METHODS** The study was conducted in a metropolitan county (population 620,000). A response time of less than five minutes will prevent the occurrence of *brain damage*, hence, patients with heartbeat cessation will not experience physical defects, or death. The result of this research shows that early initiation by intervening through Basic Life Support and Advance Cardiac Life Support will repair the survival rate of the patient. Therefore, a delay in performing treatment will lead to a negative effect related to the survival ability of the patient^{10,11}.

The standard response time has not yet determined. However, a recommendation of response time has been delivered among other things; in four minutes, the patient has to be treated by CPR accompanied by the activation of *Automatic External Defibrillation*. Furthermore, in eight minutes, the patient has to receive definitive treatment and other supporting treatment which may elevate the living sustainability of the patient^{12,13}. The enhancement of response time is expected to increase the living sustainability of a patient by as much as 24%¹⁴. A response time with a duration of four minutes is connected to the refinement of Return of Spontaneous Circulation (ROSC)¹⁵. The patient's condition after the resuscitation measure can attain a minimum systolic pressure of 60 mm Hg and with palpability of the carotid pulse without CPR, although there are lethal arrhythmias; Ventricular Fibrillation (VF), Ventricular Tachycardia (VT), Asystole (AS), and Pulseless Electrical Activity (PEA) and the existence of electrical activity that is not palpable by pulse¹⁶. RISC after VF/VT, which is important to take into account, is the condition of hypoxemia and hypotension, as well as immediate diagnosis including medication due to the presence of ST – *Elevasi Myocard Infark* (STEMI). ROSC after PEA/AS, taking into account the condition of hypoxemia and hypotension, makes it necessary to perform therapy on the root cause of cardiac arrest¹⁷. Observations are

required after ROSC in order to determine several supporting aspects that will be physiologically able to preserve the circulation within the body.

The swift handling of a situation by the Code Blue team is influential towards life sustainability for the patient. It requires the favourable partnership of and coordination among the team members in order for the patient's treatment to perform as expected. The result of this research showed that there is no difference within the perception of each Code Blue team member toward the applied Code Blue system. The existence of difference was identified in matters connected to leadership, and the role and responsibility of each discipline of knowledge, experience as a team member of Code Blue, as well as the duration of being certified as Advance Cardiac Life Support (ACLS) personnel. Therefore, the effort of refinement related to providing sustainable training for the Code Blue team becomes significantly important in order to lift up the level of effectiveness and to refine the quality of the team⁵. In a number of hospitals, the performance of Code Blue is rare to be observed and evaluated. The composition of the Code Blue team is often interchangeable based on scheduling and rotation, hence, this enables the probability of a lack of partnership among the team members¹. In reality, coordination and partnership among the team members is one of the most prominent aspects to be undertaken in managing patients, giving favourable result as expected.

CONCLUSION

It was discovered that there is a relationship between response time and the survival of patients who received emergency treatment from the Code Blue team. Treatments for patients who experience an emergency situation should be performed immediately and precisely in order for the success rate of the treatment to be larger. This will impact on the patient's mortality rate

The Influence of Nurse's Knowledge Level on Behaviour Changes, Attitude and 5 Moments of Hand Hygiene Compliance

Danoe Soesanto

*Department of Public Health and Humaniora, Universitas Ciputra Surabaya, Indonesia,
UC Town Citraland, Surabaya, Indonesia*

ABSTRACT

Introduction: The five moments of handwashing, established by the World Health Organisation (WHO), are important to break the chain of transmission of disease. Human behaviour is influenced by two factors, namely behavioural factors and factors related to outside behaviour. Behaviour is formed from three factors: predisposing factors (knowledge, attitudes, beliefs and values), supporting factors (physical environment, availability or absence of health facilities) and reinforcing factors (in the form of the nurses' attitude and behaviour). This study aims to determine the effect of the level of knowledge of nurses in nursing homes on their attitude, behaviour and adherence related to the 5 moments of hand hygiene.

Method: This study used a questionnaire to measure the level of knowledge, attitude, behaviour and level of adherence of the nurses concerning the 5 moments of hand hygiene. The research design used an analytic cross-sectional approach. The respondents were all nurses at Panti Werdha Surya, and the sampling technique used was purposive sampling. The study was conducted between January and April 2018.

Results and Analysis: The data was analysed using a multinomial regression test. The results showed the influence of nurses' level of knowledge on attitudinal changes ($p = 0,000$). There was an influence from the nurses' level of knowledge on behavioural change and there was influence from the nurses' level of knowledge on compliance with the 5 moments of hand hygiene ($p = 0,000$) in an effort to prevent the transmission of shingles in nursing homes.

Conclusion: The level of knowledge of nurses needs to be improved continuously, so then changes in attitude, behaviour and adherence take place concerning the 5 moments of hand hygiene. This is as well as providing hand washing and rubbing facilities at each door within the nursing home.

Keywords: *Level of Knowledge, Attitudes, Behaviour, Compliance, Nursing home*

INTRODUCTION

An elderly individual, according to Article 1 number 2-3 Law Number 13 Year 1998 about the Prosperity of the Elderly, is a person who has reached the age of 60. Community groups including the elderly mostly now live in nursing homes, and there is a trend that society is continuously increasing in relation to life expectancy.

The elderly who live in a nursing home are susceptible to contracting infectious disease. This can be caused by the prevalence of organ function decline, the existence of dementia and incontinence, poor oral hygiene, and trouble swallowing¹.

Infectious diseases that commonly affect the elderly in nursing homes include pneumonia, urinary tract infections and skin and soft tissue infections. Pneumonia is still the main cause of morbidity and mortality in adults who are older, and, with an increase in age, it becomes the cause of almost half of all hospitalisations and related deaths^{2,3}. A population census from a statistics agency in 2010 showed that the elderly in Indonesia were counted as being 18,043,712; in other words, 7.68% of 237 million Indonesian citizens were elderly⁴.

Hand hygiene is a main and important factor related to preventing the spread of pathogens and antibiotic resistance, whether in hospitals or in nursing homes, because the number of infections that can be transmitted through the hands of a caretaker is vast. Hand hygiene can prevent Health Care Associated Infections (HAIs) and increase the health of the elderly. Hand hygiene is a part of standard care that can decrease infections in the health team and also in the patients⁵. Washing of the hands is one of the effective steps undertaken to break the chain of infection transmission, hence the number of incidences of nosocomial infections and Health Care Associated Infections can be reduced⁶. Research results shows that effective education programs can increase knowledge, positive behaviour, the right practices when conducting prevention policies and infection control⁷. Non-compliance when concerning hand hygiene is a bad behaviour and one that can be controlled during training⁸. Health workers need more information and education on the prevention and control of infection, especially in relation to hand hygiene to increase the quality of the offered health services⁹. There is a relationship between the knowledge of a nurse regarding nosocomial infection with washing of the hands, as observed at the Inpatient installation in Dharmais Cancer Hospital in Jakarta¹⁰. Knowledge and behaviour are factors that relate to nursing practices and the prevention of nosocomial infections in phlebitis events in RSUD, Semarang¹¹.

The knowledge of a nurse about the 5 moments of handwashing is very influential and related directly the practice of handwashing. In the previous research, the knowledge of nurses on hand washing was still categorised as not good according to the results (70.5%)¹². The five moments of handwashing are not implemented well by nurses. This is supported by the research of Koeswo dan Pratama (2015), where it was shown that nurses do not wash their hands in the first moment by 52%, 50% in the second moment, 75% in the third moment, 69% in the fourth moment and 78% in the fifth moment. Previous research done by Pateda dan Rabbani (2013) showed the results that 16.7% of hand washing behaviour was in the good category, 24.4% was in the less good category and 59% was in the bad category. Supporting factors including physical environment and the available health facilities for hand washing that, when realised optimally, can ease the realisation of the positive attitude and behaviour of the health worker when it comes to doing the 5 moments

hand Hygiene¹³. The purpose of this research in general was to acknowledge the impact of the level of education of nurses on the attitude, behaviour and obedience of nurses in Surya Surabaya nursing home concerning the practice of the 5 moments of Hand Hygiene.

METHOD

The research design used was analytical and observational, using a cross-sectional approach. The population in this research included all executive nurse in Surya Nursing Home who had worked there for at least 2 years. The technique used to take samples was saturated sampling, where all the available population became the sample of the research. This research was conducted between January and April 2018. The data was taken using a research instrument in the form of a questionnaire about the characteristics of the nurse, and their level of knowledge, attitude, behaviour and obedience using a Likert scale model (5). Before we did the main body of the research itself, we conducted a validity test and questionnaire about the reliability beforehand. We then analysed the data obtained using a multinomial logistic regression test.

In Table 1, the respondents were categorised based on their sex, age, level of education and working time ($n = 22$). All of the respondents were female (100%), and almost all of the executive nurses were aged between 31 years old – 40 years old (81.82%). The level of knowledge of almost all of the executive nurses was that of high school (77.27%) and most of the executive nurse had worked for 6-8 years.

Based on Table 1, we can see that almost all of the nurse's had a level of knowledge about the 5 moments of hand hygiene in the bad category (86.36%), and that only a few of the executive nurses had good knowledge (4.55%). Meanwhile the attitude of the nurses about hand hygiene being able to prevent the transmission of disease showed that most of them stated Agree (72.73%), and only a few of the executive nurses stated Strongly Agree (4.55%). The behaviour of the executive nurses in the context of supporting hand hygiene to prevent the transmission of disease showed that almost all of them stated Average (77.72%), and only a few stated Very Supportive (9.09%). The level of Obedience of the nurses in doing the 5 moments of hand hygiene found that most of them stated Disobedient (54.55%), and only a few stated Obedient (4.55%). This research shows that there is a meaningful

and positive correlation between the level of knowledge of the nurse about the 5 moments of hand hygiene and the obedience of physically doing the 5 moments of hand hygiene, with a strong level of correlation ($r=0,701$; $p=0,021$). This means that the lower the knowledge of the nurse about the 5 moments of hand hygiene, the worse the obedience of the nurse when it comes to doing the 5 moments of hand hygiene. The results of the multinomial logistic regression test showed that the level of knowledge of the nurses about the 5 moments of hand hygiene can only explain the quality change in the level of obedience but also that the impact of knowledge level is significant ($p=0,000$). Regarding the attitude of the executive nurses, there is a meaningful correlation between the attitude of the nurse about the 5 moments of hand hygiene and obedience when it comes to physically doing the 5 moments of hand hygiene, and it was shown that the power of the correlation is weak ($r=0,190$; $p=0,031$). This means that the better the attitude of the nurse about the 5 moments of hand hygiene, the better the level of obedience when physically doing the 5 moments of hand hygiene. The results of the multinomial logistic regression showed that the attitude of the nurses about the 5 moments of hand hygiene can be used to explain the impact of the attitude of the nurse about the 5 moments of hand hygiene by 10.7% and that the impact of the attitude of the nurse related to obedience is significant ($p=0,000$). Regarding the behaviour of the executive nurse and obedience when doing the 5 moments of hand hygiene, there was a meaningful correlation between the behaviour of the nurse and obedience, and the correlation was strong ($r=0,690$; $p=0,001$). This means that the more supporting behaviour that there is from the nurse regarding the 5 moments of hand hygiene, the better the level of obedience. The results of the multinomial logistics regression test showed that the behaviour of the nurses concerning the 5 moments of hand hygiene react with the obedience of the nurse and the 5 moments of hand hygiene by 13.8% and that the impact is significant ($p=0,000$).

DISCUSSION

The respondent's knowledge regarding the 5 moments of hand hygiene is linked to their associated level of obedience ($p=0,000$). The higher the respondent's knowledge about the 5 moments of hand hygiene, the more obedient the nurses were when it came to practising the 5 moments of hand hygiene ($r=0,701$). The impact of the level of knowledge had a big impact

on the obedience of the nurse by 10.1%. This shows that the impact on obedience comes from a different factor other than knowledge (89.9%). The finding of this research supports the previous research done by Al-Khawaldeh, Al-Hussami and Darawad (2015), who stated that education on hand hygiene will affect the knowledge, attitude and behaviour of paediatric nurses and NICUs in Zanjan hospitals¹⁴. Other than that, the awareness of nurses about the right way to wash their hands is a process that pushes them to adhere to hand hygiene situations. Hence, the quality of nursing care is affected by the knowledge, attitude and behaviour of the executive nurses who provide health care. Only a little part of this research was specially related with the nurses, although there is evidence that shows that the obedience of nurses related to doing the 5 moments of hand hygiene can be improved by the application of audits and increased knowledge and supervision, which will cause a change in the culture of the working environment and obedience to promote doing the 5 moments of hygiene the correct way¹⁵.

The research findings show that there is a gap in the level of knowledge of the nurses, which can be overcome with a short and more frequent training system, especially in hospitals. The guidelines on the 5 moments of hand hygiene are well known by nurses and well-promoted in hospitals. This is reflected by the positive attitude of the nurse and non-medical staff. Improving the compliance of the nurses can be done by training continuously¹⁶. The nurses need to remember the lessons from their study experience, because this will be effective at increasing their knowledge and understanding that this will also affect their behavior in a positive way. This means that the importance of the individual's experience has a bigger impact than formal teaching methodology¹⁷.

CONCLUSION

The knowledge, attitude and behaviour of executive nurses has a significant effect on the obedience of executive nurses concerning the 5 moments of hand hygiene. Other than the level of knowledge, attitude and behaviour of the individual nurse, it is suspected that age and working time also affects the obedience of the executive nurse. Training and the periodic delivery of information is needed whether by electronic media or via practice to increase the level of knowledge of nurse is important, so then nurses will be more obedient

at adhering to the 5 moments of hand hygiene. Other things that can increase the obedience of the nurse concerning their adherence to the 5 moments of hand hygiene is by supplying all doors with hand rub to ease the implementation of the 5 moments of hand hygiene.

The Role of Posyandu Cadres in Improving the Growth and Development of Toddlers in RW VII Puskesmas Mojo, Surabaya

Enung Mardiyana Hidayat¹, Rini Ambarwati², Indriatie³

¹Nursing Program, Health Polytechnic of Ministry of Health at Surabaya, Indonesia,
Jl. Pucang Jajar Tengah No.56, Surabaya, Indonesia

ABSTRACT

Introduction: Posyandu cadres have an important role as health care providers who are located near to the targeted Posyandu. When the Posyandu cadre enters information on the KMS (Card Toward Health) is less clear, resulting in the implication of the Posyandu not performing well. The purpose of this research is to analyse the relationship between the Posyandu cadre's role in promoting growth and the development of toddlers in Puskesmas Mojo, Surabaya.

Method: This study used a cross-sectional research design. The population under study in this research were all Posyandu cadres and toddlers registered in the RW VII area, resulting in 38 Posyandu cadres and 38 toddlers. The type of research was analytic, using the Spearman Rank statistical analysis.

Results: The majority of the Posyandu cadres performed well (68.6%), and more than half of the toddlers (71.4%) had good growth based on anthropometric measurements. The majority of the toddlers (74.3%) had normal development in accordance with the pre-screening questionnaire that was developed (KPSP). The statistical test used, the Spearman rank, showed the value of $r = 0.29$, $p = <0.05$, which means that there is a relationship between the role of the cadres and the growth and development of toddlers according to their nutritional status. The role of the cadres with the development of relations based on KPSP was $r = 0.12$, $p = <0.05$, which means that there is a relationship between the role of cadres with the growth and development of toddlers by KPSP. There is a need for sustainable activities by involving the active participation of the parents in the early detection of toddler growth and development. Further studies involving the role of the parents, cadres and toddlers is suggested.

INTRODUCTION

A real form of community empowerment is the presence of various forms of Community-Based Health Service (UBKM) in each working area of Puskesmas. The Community-Based Health Services (UBKM) with

the most tangible role that has been able to develop in the society is Posyandu. Posyandu consists of a 5 priority program (KB, KIA, nutrition, immunisation, and diarrhoea prevention) and has been proven to possess leverage in decreasing the mortality rate of infants and mothers. The development and improvement of the service quality very much depends on the role of the community, which consists of the cadres. Cadres have a very big function in Posyandu, starting from the succession of the Posyandu, mediating with the supporting institution of the Posyandu, serving as an executive planner, and as an advisor along with a trainer to motivate the community who are taking a part in the activities of their local Posyandu.

The success rate of Posyandu goes along with the hard work of the cadres who have volunteered themselves to organise their local Posyandu. The lack of training to improve their sufficient skills has resulted in a lack of knowledge regarding the role of the cadres, a lack of information and no coordination between the officer and cadres in the operating of Posyandu, which might result in a low attendance number of toddlers. This will also lower the scope of early growth detection in toddlers¹. The role of the cadres is very important as they hold the responsibility of implementing the programs of Posyandu. If the cadres are passive, then the implementation of Posyandu will not be able to run smoothly and result in the undetected nutritional status of toddlers. This will indirectly impact the success rate of the Posyandu program, especially in terms of analysing the growth of toddlers.

In 2013, only 40% of at least 250,000 Posyandu in Indonesia were still active and only around 43% of toddlers' health status was analysed. Meanwhile, the number of active cadres in Posyandu was found to be 205,227². The passiveness of the Posyandu cadres is happening in Posyandu Kecamatan Mojo as well. The lack of presence in relation to the Posyandu cadres' role will surely be impactful, whether directly or not. The direct impact to the child will be the insufficient examination of their growth and development which will impact on the unmonitored health status of the child. The indirect impact for the cadres is the unclearness of KMS filling in, and accordingly the implementation of Posyandu will be irrelevant. The goal of this research is to analyse the role of Posyandu cadres in improving the growth and development of toddlers.

METHOD

The type of research used was an analytical correlation with a cross-sectional research design. The population under research was all Posyandu cadres and toddlers registered in the RW VII working area, which was made up of 38 persons and 38 toddlers. The samples were several cadres and toddlers of RW the VII Puskesmas Mojo working area in Surabaya, with the criteria of the sample being that the cadres were willing to participate and that the 2-3 year-old toddlers were willing to be researched. The active cadres in the Posyandu program numbered 35 respondents, gathered using a *simple randomised sampling* technique.

The independent variable is the role of the Posyandu cadres in improving the growth and development of toddlers in the RW VII Puskesmas Mojo working area of Surabaya and the dependent variable is the growth and development of toddlers in the same working area. For the growth category, there was normal nutrition status, lack of nutrition status, and malnutrition status. Meanwhile, for the development category, there was excessive development, normal or relevant development, and a lack of development or deviation. To determine the value of the relationship between the Posyandu cadres and the monitoring of the growth and development of toddlers, we used the statistical correlation test of *Spearman Rank*.

RESULT AND DISCUSSION

Table 1: Frequency distribution of the Posyandu cadres' characteristics in the RW VII Puskesmas Mojo working area in Surabaya in September–October 2017

Age	Number	Percentage
Early Adult (26 – 35 years old)	3	8.6
Late Adult (36 – 45 years old)	14	40

Total	5	14.3	5	14.3	25	71.4	100	100

Table 3: Cross-tabulation of the cadres' role and the development of toddlers in the age range of 1–3 years old based on KPSP in the Posyandu RW VII Puskesmas Mojo working area in Surabaya

Role	Nutrition Status						Total	
	Good		Average		Bad			
Role	n	f	n	f	n	f	n	f
Good	0		1	50	1	50	2	100
Average	1	11.1	4	44.4	4	44.4	9	100
Bad	1	4.2	2	8.3	21	87.5	24	100
Total	2	5.7	7	20	26	74.3	35	100

Based on Table 1, nearly half of the cadres, 14 cadres (40%), were 36 – 55 years old. Nearly half, 16 cadres (48%), were high school graduates and nearly half, 15 cadres (42.9%), had been a cadre for 1 - <5 years.

Nearly all, 26 cadres (74.2%), had never been trained as a Posyandu cadre and nearly all, 25 cadres (71.4%), had a good level of knowledge with regards to understanding and improving the growth and development rate of

toddlers. Based on Table 2, it can be seen that there is a tendency of a good cadre role being associated with the good nutritional status of toddlers and vice versa. The results of the statistical test of Spearman Rank was in the number of $r = 0.029$ with $p = < 0.05$, which means that there is a link between the role of the cadres and the growth and development of toddlers based on their nutrition status. Based on Table 3, it can be seen that there is a tendency for a good cadres' role to be followed by good KPSP in the toddlers, and vice versa. The results of the statistical test of Spearman Rank was in the number of $r = 0.012$ with $p = < 0.05$, which means that there is a relationship between the cadres' role and the growth and development of toddlers based on KPSP.

DISCUSSION

The organisation of the Posyandu cadres consists of equal job distribution between the cadres in relation to preparing and implementing. Meanwhile, the organisation of the cadres in relation to the growth and development of toddlers is the measurement of their weight and the measurement of LILA and KMS filling along with KPSP, which are the activities of the cadres in relation to detecting the growth and development of toddlers. The deviation of the toddlers' weight in those who were not weighed was discontinued if a lack of protein was found. They were given additional food, prevented diarrhoea in the toddlers, made OER and supervised and socialised related to the toddlers' health. The Posyandu cadres are the health provider closest to the Posyandu, and so the frequency of meeting with the cadres is more than meeting with any other health assistant. Therefore, the cadres should be active in many activities, not only in the context of implementation but also in subjects related to the organisation, like event planning, note taking and reporting on the cadres' meetings³.

Based on this study, the results show that there is a significant relevancy between the role of the cadres and the growth of the toddler. The analysis of the relationship between the cadres' role and the nutrition status of the toddler shows $r = 0.029$, meaning that there is a relevancy between the cadres' role and the development of the toddler based on their nutrition status.

According to the research of Purwanti and Rasyid (2014), their study also showed the relevancy between the cadres' role and the nutrition status of the toddlers. This happened because the cadres are volunteers chosen

from and by society to work for the health of society. Nutritional activity in the Posyandu is one of the main activities and generally becomes the priority when implementing the Posyandu's activities. Nutritional service in Posyandu is done by the cadres. This activity includes weighing the individual's body mass, recording the weighing result in KMS for the early detection of growth deviation, nutritional socialisation, PMT and vitamin A supplying. In the Posyandu activities, the cadres have a very important role aside from organising the activities of the Posyandu (administrator) and providing education (educator). The cadres also empower the activeness of mothers who have toddlers, prompting them to come to the Posyandu (motivator). Posyandu cadres are the closest health provider in relation to the Posyandu activities, and seeing the cadres directly is done more frequently than seeing any other health assistant⁴.

The role of the cadres is very important because they are responsible for the implementation of Posyandu activities and programs. If the cadres are passive, then the implementation of the program in Posyandu will also move stagnantly, impacting on the nutrition status of infants and toddlers (below 5 years old) as it cannot be detected properly. The presence of the cadres' role is to be able to facilitate society in decreasing the rate of malnutrition. Moreover, it also contributes to decreasing the mortality of mothers and toddlers by utilising the skills and facilities relevant to the improvement of the nutrition status of toddlers⁵. The role of the cadres impacts on the nutrition status of the toddler, meaning that if the cadres' role is high, so does the negative nutrition status of toddlers decrease.

Based on the statistical Spearman Rank test, the result shows that there is a significant relevancy between the cadres' role and the development of the toddlers. The analysis result of the relevancy between the cadres' role and the toddlers' nutritional status shows $r = 0.012$, meaning that there is a relationship between the cadres' role and the growth and development of toddlers based on KPSP.

The development of the toddler may be impacted by many external factors. For instance, the role of society and the health service. One of the roles of society in relation to health services is through Posyandu⁶. Posyandu also has many important roles in relation to optimising the development of the children, given to the

cadres as part of a strategic institution, since through Posyandu, they encounter many health problems such as nutrition and birth control, including the toddlers bearing developmental disorders⁷. The child's development is related to changes in the children, including changes that are physical, cognitive, emotional and even psychosocial. This development shows the quality of the available human resources (SDM) in relation to the next steps. Accordingly, a child is hoped to be able to reach an age-paralleled development phase⁸. The government has undertaken many attempts in relation to this, including implementing the SDIDTK program. Such a program includes an evaluation of the child's development by using KPSP as an obligatory activity in Posyandu.

CONCLUSION

The results have shown that most Posyandu cadres play a good role in relation to improving the growth and development of the toddlers in the Puskesmas Mojo working area in Surabaya. The growth and development of the toddlers can be seen through their nutrition status and KPSP monitoring, which also experienced an improvement and can be thus categorised as well done. The good role of the Posyandu cadres will impact the growth and development of the toddler based on their age. Thus, it is advised that continuous training and briefing for the cadres needs to be done in order to improve the knowledge of the cadres, especially in relation to early growth detection and the development of the toddlers. For the health cadres, it is hoped for all of them to become active in training and briefing so then there will be an improvement in knowledge overall, especially registering the KMS and KPSP given by the Puskesmas.

Analysis of the Implementation of Pregnancy-related Health Care Services Through the Continuum of Care Approach in Puskesmas Bukittinggi City

Evi Hasnita¹, Armita Sri Azhari¹

¹Master Program of Public Health, STIKes Fort De Kock, Indonesia

ABSTRACT

Introduction: Maternal mortality was related to 303,000 complications in pregnancy and childbirth in 2015. In the City of Bukittinggi, the number of maternal deaths in that year was three people. For 2016 to reduce the mortality rate, the WHO and other organisations in various countries advocate for the Continuum of Care program, which provides care in a sustainable and integrated manner.

Method: This research study was qualitative with a phenomenological approach. This research was carried out in the working area of the Bukittinggi City Health Office with the study time being July - October 2017. The data was obtained from in-depth interviews with two kinds of informants, namely key informants and supporting informants. This interview was conducted semi-structurally (semi-structured interviews). The data analysis used the Collaizi method.

Results: The results of the input, processing and output research showed that the Continuum Of Care program for pregnant women and postpartum mothers in the Bukittinggi city health centre was well-implemented because it was supported by the performance of the health workers and supported by the government. It was concluded that the Continuum of Care program at the city health centre of Bukittinggi was well-implemented.

Keywords: *Continuum Of Care, Maternity Services, Postpartum Maternal Health Services.*

INTRODUCTION

Based on the estimation of the UN Secretary-General, the maternal mortality number has decreased by 44 per cent from 385 to 216 per 100,000 survived childbirth. This means that the yearly average rate has decreased by 2.3 per cent. Less than 5.5. per cent of the yearly rate needed to reach the three per four-fold decreasing of the number of maternal deaths in for 2015 in Millennium Development Goal number 5¹. Almost all of the maternal deaths (99 per cent) happened in developing states².

The concept of Continuum of Care was first established in 1970, stating that the period of pregnancy, maternity, postpartum and through to being elderly are all related to various types of nursing service. The purpose of Continuum of Care is to improve the probability of the mother receiving proper care during labour, in addition to professional nursing care before, during, and after labour so then the risk of death or disability will be suppressed for both the mother and the newborn³.

In the city of Bukittinggi, the maternal mortality rate in 2016 was 3 deaths. This number has decreased from 2015, in which the rate was 7 deaths. The maternal mortality number has had a fluctuated graphic since 2014, with the number of 1 death then increasing rapidly in 2015 to 7 deaths, before decreasing in 2016 to 3 deaths. From January 2017 through to June 2017, 1 death in relation to maternal mortality has been recorded. This is pursuant to the purpose of the 2015 SDGs (*Sustainable Development*

Goals) on the third point, which is to ensure a healthy life and to maintain the prosperity of all persons of all ages. Thus, the approach that uses the *Continuum of Care* will be done⁴. The SPM target (Minimum Standards Services) of Bukittinggi is 95%. Accordingly, the K4 coverage of 2016 still needs to be improved in order to reach this target. The goal of this study is to analyse the implementations of the treatment of mother and child by using the continuum of care approach.

METHOD

This research was a qualitative research on the treatments for pregnant women, mothers in labour and postpartum mothers through the approach of *Continuum of Care* during 2016 through to 2017. This research was conducted in the working area of Bukittinggi Public Health Service, between July and October 2017. The informants in this research consisted of the key informants, who know and possess the basic information needed in the research. The key informants of this research were 1 Head of the Public Health Service and 7 Heads of the local Puskesmas. The main informants were 7 people from each Puskesmas in charge of KIA, and 1 person in charge of KIA. The supporting informants consisted of 7 postpartum mothers.

The instrument of the qualitative research study was the researcher herself. Because the researcher is the main instrument in the research, the relationship between the researcher and the informants is an intensive one. The instruments and the supporting utilities used to collect the data were in the form of an interview guide, document examination list, notation utilities (book and pen), recorder and camera.

RESULTS

From the data analysis, the researcher found there to be 3 theme clusters which explain the problem of the researcher. The first theme cluster was about INPUT (program policies, the availability of the human resources, funding, facilities and infrastructure), the second was about PROCESS (the treatment of pregnant women and the treatment of postpartum mothers) and the third cluster was OUTPUT (coverage of the K1-K4 visit, coverage of the mother/child rights fulfillment, the coverage of labour assistance PN/Non PN and the coverage of KF1-KF3 visits).

Input:

1. Policies: Based on the interviews, it can be concluded that the policies about the health assistance in Bukittinggi refer to the vision and mission of the Mayor of Bukittinggi, as there are no specified policies and all of the indicators need have been stipulated in the form of RPJMF, strategic plans and a work plan. The purpose of the health service policy is to improve access to sufficient health services for everyone at each stage of life with the approach of there being one unity of service (*Continuum Of Care*) through a comprehensive intervention (promotive, preventive, curative and rehabilitative)⁵. The researcher has assumed that the analysis of the health service policy in Bukittinggi is being implemented sufficiently by the leader and the program holder of each health care sector, because each sector of health coverage in Bukittinggi has been fulfilled. It shows that the health workers in Bukittinggi work and provide services to the community, pregnant women and postpartum mothers based on the existing standards and indicators.

2. Human Resources (SDM): Based on the interviews, it can be concluded that the availability of human resources to implement the KIA program in Bukittinggi is enough, whether in the Public Health Service Berdasarkan or in the Puskesmas in Bukittinggi. Health workers are the spearhead of the implementation of the health service program. Accordingly, the placement of health assistants needs to be in a strategic position, which therefore shall be ruled on clearly and assertively. The availability of competent resources is not enough if there is no sufficient support in relation to the proper facilities and infrastructures⁶. Based on the assumptions of the researcher, an analysis of the availability of human resources in implementing the KIA program in the working area of Bukittinggi was enough, and the collected data shows that the amount of resources in the working area of public health service and Puskesmas is sufficient.

3. Funding: Based on the interview, it can be concluded that the source of funding for the implementation of the KIA program in the public health service or the Puskesmas came from

APBD, APBN, BOK and BPJS. Meanwhile, for the KIA program, the source of funding was from DAK. The availability of funding is enough for the public health service and Puskesmas. Based on the assumption of the researcher, the availability of funding for the KIA program is enough when from the government in the form of APBD, APBN, BJPS, JKN or BOK. In this case, the public health services or Puskesmas do not receive any other source of funding, such as from entrepreneurs or the private sector, or from any other non-binding source of funding.

4. Facility and Infrastructure: Based on the interview, it can be concluded that the facilities and infrastructure of the KIA program in Bukittinggi Puskesmas is enough. The organiser of the Puskesmas can handle the existing obstacles swiftly, because the sufficiency of facility and infrastructure in the Puskesmas is one of the requirements accredited to the Puskesmas. Most of the Puskesmas in Bukittinggi have been accredited. The researcher assumed that, based on the interview, the analysis on the sufficiency of the facilities and infrastructure of the Puskesmas in Bukittinggi was enough. This statement is supported by the other informants who explained that there have been no complaints or problems while undergoing treatment in the Puskesmas via the midwives.

Process:

1. Health Care for Pregnant Women: Based on the interview, it can be concluded that the health care for pregnant women in the KIA program of the Puskesmas in Bukittinggi has been implemented and going well. There have been no complaints or problems voiced by the visiting patients or from those who taking medication whether in the health service, via the midwife, or in the Puskesmas in Bukittinggi. Pregnancy assistants prioritise continuous care. (*Continuum of Care*). Based on Mansjoer (2000), routine pregnancy checks will help the mother to monitor the growth of the baby⁷. The mother can do this each month to see whether or not the baby is growing normally and is active in the womb. The researcher assumed that from the interview, the analysis of the status of health care for pregnant women in

the Puskesmas in Bukittinggi has encountered no problems. Healthcare for pregnant women in many Puskesmas in Bukittinggi is considered to be enough to fulfil the coverage of health care for pregnant women, such as the K1-K4 visits. The involvement of the cadres and the activeness of the midwife supports the proper implementation of health care for pregnant women.

2. Health Care for Maternity services: Based on the interview, it can be concluded that the health care for maternal services in Puskesmas Bukittinggi has been implemented properly as there have been no complaints or problems in relation to the treatment from the patients helped by the midwives of Puskesmas or those helped by the private midwives in the working area of Puskesmas Bukittinggi. The researcher has assumed that from the interview, there are no problems in relation to the analysis of the healthcare provided for maternal services in Puskesmas Bukittinggi. Most of the maternity ward patients received more assisted care continuously from the same midwife, but there were also those who received care from different midwives, moving from one to another according to the personal preference of the patient.

3. Health Care for Postpartum Mothers: Based on the interview, it can be concluded that the health care for postpartum mothers in Puskesmas Bukittinggi has been implemented properly as there have been no complaints or problems in relation to the service provided from the patients who were helped by the Puskesmas midwives, or those who were helped by the private midwives in the working area of the Puskesmas in Bukittinggi. The following is based on Kikuchi *et al.* (2015), in their study about the *Continuum Of Care* of mother, infants, and toddlers in Ghana⁸. The postpartum period (the first six weeks after birth), especially the first 48 hours, is very important for the health and survival of the mother and infant. A lack of a skilled health care during this period may cause death or illness. The researcher assumed that from the interview, the analysis of the healthcare for postpartum mothers in Puskesmas Bukittinggi aligned with the healthcare of maternal health services.

Output:

1. K1-K4 Visit Coverage: Based on the interview, it can be concluded that K1-K4 visits in the KIA program in Puskesmas Bukittinggi has been implemented properly, as there have been no complaints or problems from the visiting patients. The interview with the informant showed that most of the K1-K4 visits in Puskesmas Bukittinggi were done on routine. The importance of K1 examination is related to the role of the mother in realising the targets of health development, so there is synergy is in relation to the role of the government in suppressing the Maternal Mortality Rate (MMR) and the Infant Mortality Rate (AKB), which are still considered to be high (Kementerian Kesehatan RI, 2014). Based on the assumption of the researcher from the interview, the K1-K4 visits in Puskesmas Bukittinggi are close to fulfilling the coverage needed. The coverage of K1-K4 visits is a policy from the ANC (treatment during pregnancy) program and each mother receives antenatal care in accordance to the existing standard.

2. Coverage of TT Immunisation: Based on the interview, it was concluded that scope of TT Immunisation for mothers in Puskesmas Bukittinggi is complete; the informants were multiparous pregnant mothers who had completed each course of vaccination. The data from the Health Service stated that the average pregnant mother registered in Puskesmas Bukittinggi had completed their TT vaccinations. According to the WHO (2015), if a woman had never had a tetanus immunisation jab before, then she needs at least two injections during her pregnancy (first during the first antenatal visit, second is 4 weeks later). Based on the assumption of the researcher, the importance of knowing about TT vaccination needs to be understood by the mothers, because even though it may be their second pregnancy, after a two-year gap, the mother needs to be vaccinated again.

3. Scope of Birth Assistance from the Health Workers: Based on the interview, it was concluded that maternal services in Puskesmas Bukittinggi were helped by health workers such as Doctors and midwives. Thus, there was no data or reports detailing health assistance provided by a shaman. Based on the assumption of the researcher,

there are no more shaman birth assistance in Bukittinggi, because the data shows that most labours were assisted by a health assistant, which will help the suppression of AKI in Bukittinggi. Labour assisted by a health assistant is realised in a civilized society.

5. Coverage of KF1-KF3 Visit: Based on the interview, it can be concluded that most of the informants have done postpartum visits as per routine, but there are still some who do not go the postpartum visit routinely. The visits are done at least 3 times during the postpartum period. The activities to be done consist of the early detection, prevention, intervention, and handling of postpartum problems⁶. Based on the assumption of the researcher, the awareness of the Bukittinggi people is already very good, as they have done what they were told to do by the health workers and in accordance with health promotion.

CONCLUSION

Overall, the INPUT (program policies, availability of the human resources, funding, facilities and infrastructures) from this research has been fulfilled well so it sufficiently supports the implementation of PROCESS (treatment of pregnant Women, treatment of the maternal services, and the treatment of postpartum mothers). This efficient implementation has resulted in OUTPUT (coverage of K1-K4 visits, coverage of the mother/child rights fulfilment, the coverage of labour assistance PN/Non PN and the coverage of KF1-KF3 visit) which are in accordance with the existing standards that have ensured the prosperity of the people in proper continuance and within the organisation.

Feeding Care Patterns of Mothers Working as Shellfish Peelers on Children's Nutritional Status at Integrated Health Posts in Coastal Areas

Meiana Harfika¹, Zhakiyah Saraswati¹, Dya Sustrami¹, Lela Nurlela¹

¹School of Health Sciences Hang Tuah, Surabaya, Indonesia, Jl. Gadung No.1, Surabaya, Indonesia

ABSTRACT

Introduction: Working mothers can influence the nutritional status of their children. Nutritional status is a condition that is influenced by the intake of nutrients in food needed by the body. Nutritional status is very important for the process of growth and development in children. The nutritional status of a toddler is influenced by several factors such as parenting.

Method: The research design used an analytical observation with a cross-sectional approach. Samples were taken using a simple random sampling technique obtained as many as 40 respondents in the mother group, where they all worked as shellfish peelers. The instruments of this study were the Feeding Pattern questionnaire and Nutrition Status assessment using the Anthropometry observation sheet. The data was analysed using the Spearman Rho test.

Results: The results showed that there was a relationship between feeding, the parent working as a shellfish peeler and the nutritional status of the child. The Spearman Rho test results were $\rho = 0,000$ ($\rho < 0.05$).

Discussion: The implication of this research is that there is a relationship between the parenting style of the mother working as a shellfish peeler on the nutritional status of the toddler. It is expected that the research respondents can improve the provision of feeding by paying attention to the nutritional needs of their toddlers.

Keywords: *Toddler Nutritional Status, Eating Pattern, Working Mother.*

INTRODUCTION

Regarding nutritional status prevalence according to the WHO in 2013, globally it was estimated that in 101 million children under the age of five (toddlers), 15.7% are underweight and 6.6% are overweight¹. Nationally, in 2013, the underweight prevalence was that 19.6% were severely malnourished and 13.9% were undernourished². Based on the Millennium Development Goals (MDGs) indicator, the number of severely malnourished children that an area of city must achieve by 2015 is 15.5%³. The East Java Province is still categorised as an area with

one of the highest severely malnourished percentages, at 4.8%⁴. In the 2013, the severely malnourished percentage was 19.6%. In 2014, there was a significant increase, up to 14.8%. Sidoarjo Regency's children under five showed a percentage of severely malnourished children with weight in accordance to age being under the red line weight as much as 1.02% (1.072). This is less than what was 1.22% (1,298 children) in 2013. Based on the weighing of children under five done throughout 2013, the number of malnourished or underweight children was 5.25% (weight according to the age Z-score between > -3 year primary school to < 2 year primary school as per the Kartu Menuju Sehat a card used in Indonesia to keep track of a child's growth monthly), which is on the yellow stream above the red line. The results showed that 91.54% were well-nourished (normal weight), 1.98% were over-nourished (overweight) and 1.22% were severely malnourished (very underweight). For the malnourished percentage, 2014 showed a percentage of

Corresponding Author:

Jl. Gadung No.1, Surabaya, Indonesia
Email: meianaharfika@stikeshangtuah-sby.ac.id

4.92% which was less than 2013, which was 5.25%⁵. The researcher's interview with the nutritional staff on the 22nd January 2018 at Sedati Sidoarjo's Integrated Health Post revealed that there were 84 Children Under Five Integrated Health Posts in 16 villages, where 3 children under five suffered from severe malnutrition with comorbidities. There were malnourished children in several other villages. From the interview with the Village Midwife (Bidan Desa) in Gisik Cemandi Village, there were 11 children under five (7.3%) out of 150 children under five that were malnourished. The interview with Belanak and Dorang Gisik Cemandi village Integrated Health Posts group revealed that the total number of mother's working as shellfish peelers and stay at home mothers who had children under five were as many as 88 people, separated into 44 (50%) mothers working as shellfish peelers and 44 (50%) stay at home mothers.

The interaction between being malnourished and infection may cause deadly disease cycles and a worsened nutritional status⁶. One of the ways to increase children under five's nutritional status is by giving supplementary feeding. Supplementary feeding may be given to children under five from 6 months up to 23 months and 29 days with a skinny nutritional status, which is measured based on the weight index according to their height and a minus 3 deviation standard (-3DS) to less than minus 2 deviation standard (<-2DS), for 90 days. Supplementary feeding of skinny children under five may be local supplementary feeding and even factory supplementary feeding in the form of breastfeeding companion biscuits (biscuit MP-ASI). Once their weight has reached normal or in accordance to their height, supplementary feeding will be discontinued. Hereinafter, the children may consume the family's balanced nutrition, which will be done under weight monitoring to avoid the chance of children under five falling back into the skinny nutritional status⁷.

A mother's working status certainly affects their children's growth and development. Mothers who work have many options. There are mothers who choose to work at home and there are mothers who choose to work outside or far from home. The latter must be able to manage their time for their family because a mother's main task is to manage household affairs including looking after, managing and guiding children⁸.

Nutrition in children under five must be fulfilled, because nutrition will affect the toddler's growth in future. Stay at home mothers have more time for their

toddlers than working mothers. This is because working mothers must split their time to play the role of a working mother and a housewife. The solution given by the researcher was to give counselling to mothers working as shellfish peelers and stay at home mothers on the correct feeding care patterns to avoid malnutrition in children under five.

Based on the background description and supported by the preliminary studies which have been done, the writer is interested in doing research on the relationship between the feeding care patterns of mothers working as shellfish peelers on children under-five's nutritional status at integrated health posts in coastal areas.

METHOD

The research design used in this research was an analytical observation that looked for a relationship between the variables with a cross-sectional approach. This kind of research emphasises on the independent and dependent data measurements one at a time.

The population in this research was mothers working as shellfish peelers with children under five at Belanak and Dorang Gisik Cemandi village Integrated Health Posts. The sampling technique used in this research was sampling randomly sampled mothers working as shellfish peelers with children under five, thus fulfilling the inclusion criteria of 40 respondents.

The tools used to collect the data were questionnaires for the demographic data and feeding care patterns along with nutritional status observation focused on children between the ages of 12-60 months using an anthropometrical table. Bivariate data analysis was used to find out the relationship between the feeding care patterns of mothers working as shellfish peelers and the children under five nutritional status. This research used a Spearman Rho statistical test.

DISCUSSION

Based on the data on the feeding care patterns of mothers working as shellfish peelers related to their children's under-five nutritional status at Gisik Cemandi Sedati Sidoarjo Village Coastal Area Integrated Health Posts, as shown in the table above, there were 5 respondents (100.0%) that did not conduct good feeding care patterns, resulting in malnutrition in the respondent's toddler. A further 3 respondents (100.0%) that did enough in relation to the feeding care pattern had well-nourished toddlers, and 1 respondent (3.1%) had a good feeding care pattern that resulted in over-nutrition. Nutritional status is a condition that is caused by a balanced status between nutrient intake and the number of nutrients required by the body for the running of its biological functions such as physical growth, development, activities, health care etc. A toddler's nutritional status is affected by many factors, both direct and indirect. Direct causes that affect nutritional status are nutrition intake and any infections suffered by the toddler. Indirect causes include food availability, while keeping in mind the parent's job and income, parenting and care patterns, the available health services and environmental health. The three indirect causes are related to the level of education, knowledge, and family skill⁹. The researcher argues that a working mother must be wise in relation to time management, because her time will be divided between work, childcare and domestic chores. This case is proven by the research results as shown above, on how the mother's that were working as shellfish peelers had toddlers who were malnourished. The mothers in coastal areas stated that there is difficulty when their role as shellfish peelers made them unable to feed their children on time.

The link between the feeding care pattern of mother's working as shellfish peelers on children under five (toddlers), is as shown in the Spearman Rho statistic test result in Table 13; $\rho = 0,000 < \alpha = 0.05$ as a comparison. The coefficient correlation between the variables gained from the statistics test was 0.771, which means that there is a strong correlation. H1 was therefore accepted, statistically showing that there is a relationship between the feeding care patterns of mothers working as shellfish peelers on their toddler's nutritional status at Gisik Cemandi Sedati Sidoarjo Village Coastal Area's Integrated Health Post.

CONCLUSION

Based on the results of this research, the outcome is that regarding nutritional status, the mothers working as shellfish peelers with toddlers did not do well at taking care of their child's nutrition and they lacked a proper feeding care pattern. The toddlers of mothers working as shellfish peelers suffered from malnutrition because the mother's activities were more important than looking after and paying attention to their toddler's nutritional intake.

The Relationship between Socioeconomic Status and Personality Type with Depression in Adolescents

Oktavianis¹, Rahmi Sari Kasoema¹

¹Midwifery Programme, STIKes Fort De Kock

ABSTRACT

This study aimed to identify the relationship between socio-economic status and personality type in relation to the occurrence of depression in adolescents. The samples of this study were high school students, as many as 248 persons. The study was carried out in six high schools in Bukittinggi City, Indonesia. This study applied a mixed methodology using a sequential exploratory design. The quantitative study was conducted using questionnaires with a correlational design and the cross-sectional approach. The qualitative study used an in-depth interview as the data collection method. The independent variables in this research were the personality type and socio-economic status. Meanwhile, the dependent variable was depression. The data was analysed using Chi-square analysis. The odd ratio was applied to identify the relationship significance of the independent and dependent variables. The results shows that there were significant relationships between socioeconomic status and depression ($p=0.002$; OR 2.241) and between personality type and depression ($p=0.000$; OR=1.935). The incidence rate of depression within adolescents relates closely to the factor of socioeconomic status and personality type. Therefore, adolescents are expected to understand themselves further to not trigger depressive incidents.

Keywords: *depression, personality type, socio-economic status.*

INTRODUCTION

Depression has attracted global concern in recent decades. Depressive people usually have lower productivity. They will have a negative impact on society, the nation, and the country if it is in a developing stage¹. Depression is the primary cause of suicide and it is ranked in 6th position concerning the primary mortality causes in the United States².

On a global scale, depression is the top cause of disease and vulnerability in adolescents aged 10-19 years old³. The World Health Organisation predicted that depression will be second of world health problem in 2020⁴. The prevalence of depressive disorder in

adolescents generally stands at around 3-9% and this rises to 20-25% in the late stage of adolescence⁵. The results of the CDC survey in the United States mentioned that during 2009-2012, the incidences of depression aged between 12-17 years old stood at 7.6%⁶ 2009-2012. During 2009-2012, 7.6% of Americans aged 12 and over had depression (moderate or severe depressive symptoms in the past 2 weeks).

The Indonesian Basic Health Research (2013) unveiled that the percentage of the population who experience a high-level mental disorder (psychosis/schizophrenia) in Indonesia totalled 1,728 individuals. The prevalence of Indonesian citizens with a high-level mental disorder was 1.7 per-mille. In North Sumatra, the prevalence of residents who experienced high-level mental disorders was 1.9 per-mille, higher than national value. Meanwhile, in Bukittinggi, the prevalence of high-level mental disorder incidents was 0.7 per-mille⁷.

In addition, the prevalence of emotional mental disorders in Indonesia in residents aged between 15-24 years old stood at 6%. Meanwhile, for the area of

North Sumatra, for residents aged 15-24 years old who experienced emotional mental disorder in Bukittinggi city, the prevalence was 1.1%⁷.

Emotional mental health of adolescents needs to be taken into attention⁸. Once neglected, it will trigger major vulnerability in relation to stress and life pressure. Henceforth, the adolescents may experience social, emotional and behavioural issues such as depression, learning troubles, adolescent delinquency, and drug addiction⁹.

Depression is a common mental disorder which has the symptoms of sorrow, a loss of interest or joyfulness, guilt, sleep disorders, a decrease or increase of appetite, tiredness, and a loss of concentration⁴. If the symptoms of depression are not identified as early as possible, it will inflict heavier emotional mental problems including social function and quality of life disorders as well as suicide-based mortality¹⁰.

Adolescents who experience depression will continue to suffer repeatedly into their adult life stage if they are not healed. Depression is characterised by chronic symptoms. Major depression disorder or heavy depression is distinguished by symptoms which interrupts the ability of someone to work, sleep, study, eat, and to enjoy delightful activities¹¹.

The research carried out in Turkey unveils that the middle-lower socio-economic group possess a lower depression level significantly compared to the middle-upper class. Mothers with low and high social levels spend less time with their adolescent children¹².

Considering these issues, this study aimed to identify the relationship between socio-economic status and personality type with the occurrence of depression in adolescents.

METHODS

This study applied a mixed methodology with a sequential exploratory design. The quantitative study was conducted using questionnaires with a correlational design and cross-sectional approach. Meanwhile, the qualitative study used an in-depth interview, also known as an informant-based interview. The sample of this research was adolescents residing in Bukittinggi City from six different schools, as many as 248 correspondents. The collection of the data in this research was using questionnaires. The variable of depression was measured using *Inventori Depresi*

Remaja or Adolescence Depression Inventory scale, while personality type was measured using Jung's Type Indicator Test to find extrovert or introvert personalities.

Low	38	30.2	88	69.8	126	100
Total	98		150		248	

3. Multivariate Analysis: Multivariable analysis was used to oversee the relationship between the independent variable and dependent variable

simultaneously, controlled by an external variable with $p=0.25$ toward bivariate analysis. The statistic test applied was logistical regression analysis with a confidence interval (CI) 95%.

Based on the undertaken bivariate analysis, it can be extract the next variable candidate which may be entered into the next phase.

Table 5: Multivariate Variable Candidate

Variable	p-value	Status
Personality type	0.000	Significant
Socio-Economic Status	0.002	Significant

Based on Table 5, the Multivariate Variable Candidate, all of the variables conformed to the p value < 0.25 . After the logistic regression test was undertaken, the results came up as follows:

Table 6: Analysis Results of the Conditional Logistic Regression

Variable	Coefficient	p-value	OR (Lower-Upper)
Personality type	0.628	0.055	1.874 (0.986-3.561)
Socio-Economic Status	0,993	0.003	2.700 (1.411-5.165)
Constant	-2.441	0.000	0.087

DISCUSSION

1. Univariate Analysis: From the results of the research in Table 2, it attained the data which explains that around 150 students (60.5%) experienced depression and 98 students (39.5%) were did not have depression. According to the WHO (2002), children and adolescents were included as being a vulnerable group for depression due to various symptoms caused by internal and external factors¹³.

The most common adolescent's personality types was the extrovert type, amounting to 130 students (52.4%). Those with the introvert personality type made up 118 students (47.6%). Students with an extrovert personality are equipped with openness of the mind and are sociable. This differs to the introvert type of student, who tend to be closed-

off in personality and eschewed from the social environment. Adolescents with an introvert personality encounter difficulty socialising with their friends. They tend to be unconfident when dealing with their friends ¹⁴.

The socio-economic status of students is largely low, amounting to 126 students (50.8%), with those of a high status numbering 122 students (49.2%).

2. Bivariate Analysis: The relationship of Personality Type with Depression

In Table 3 above, it obtained the data that as many as 61 respondents (46%) had an extroverted personality type and were not experiencing depression. In contrast, 81 respondents (68.6%) with introvert personality type experienced depression. The results of the data analysis unveiled a significant relationship between personality type and depression in adolescents. This was obtained from the value of OR=1.935 (CI 95% 1.151-3.254) and $p=0.000$. The introvert personality type had a 1.9 times higher chance of experiencing depression compared to those with an extroverted personality.

This is in line with the research carried out by Sukmana Putra and Alit Ariyani (2011), which obtained the relationship between personality type and stress level ¹⁵. The risk factors related to the occurrence of depression in adolescents may be driven by the adolescent's personality. With an introverted personality, adolescents are unlikely to open up to their parents. Hence, they are more vulnerable to depression ¹⁰. The personality factor is one of the factors which drives depression in adolescents ¹⁶.

From the interview results conducted with high school students in Bukittinggi, it can be inferred that students are unlikely to socialise with their friends and tend to be closed off.

One of the influential factors for the emergence of stress is personality. Personality can be defined as a set of way of thinking, feeling, and attitude which is often performed in the process of continual adaptation to what is occurring in one's life. People with an introverted personality tend to live in their own world. Their interaction with

their external environment is poor, they have a closed personality and find it difficult to socialise with others. Often, they withdraw into themselves within a crowd ¹⁵.

The researcher's assumption implies that adolescents with an introvert personality type are more likely to experience depression compared to those with an extroverted personality. They are more closed-off compared to those who are extroverts. They tend to be ignorant of the outside world. The helplessness of introverted adolescents to adjusting to their environment and friends at school inflicts a pressured feeling. They then withdraw themselves from social circumstances due to their inability to adapt to the demands of the circumstances in which they live. Their discouragement to join the community is based on their self-judgment as a different person. They are scared to misbehave in their group. Adolescents with this type of introverted personality are expected to be able to socialise within their environment. Levelling up the sense of confidence of adolescents may support introverted adolescents in adjusting to their environment as well as transcending negative thoughts such as rejection from their friends. Positive thinking may increase the sense of confidence of adolescents in order for them to be able to socialise with their friends.

In Table 4 above, it obtained data in which 60 respondents (49.2%) with a high socio-economic status were at a low risk of depression. Meanwhile, 88 respondents (69.8%) respondents with a low socio-economic state experienced depression. The results of the data analysis showed a significant relationship between socio-economic status and depression obtained from the value of OR 2,241 (CI 95% 1,332-3,771) and $p=0,002$. Those with a low socio-economic status had a 2.2 times greater chance of developing depression compared to those of a high socio-economic status.

This research is in line with the research carried out by Koster et al (2006), who mentioned that people with a low socio-economic status have a two times greater chance of encountering depression compared to those of a high-level socio-economic status ¹⁷. A research by Lorant et al. (2003) unveiled

that a low level socio-economic status is statistically correlated to depression¹⁸ more disability, and poorer access to health care. Among psychiatric disorders, depression exhibits a more controversial association with SES. The authors carried out a meta-analysis to evaluate the magnitude, shape, and modifiers of such an association. The search found 51 prevalence studies, five incidence studies, and four persistence studies meeting the criteria. A random effects model was applied to the odds ratio of the lowest SES group compared with the highest, and meta-regression was used to assess the dose-response relation and the influence of covariates. Results indicated that low-SES individuals had higher odds of being depressed (odds ratio = 1.81, $p < 0.001$).

The researcher's assumption implies that the condition of socio-economic status is correlated to the depression rate of high school students across Bukittinggi city. This is driven by the unstable economic situation which provokes negative thoughts among adolescents over their lives. Henceforth, when one's desire is unfulfilled, it inflicts depression on the adolescent. There is a high pressure related to education needs and the need for additional tools to accelerate the learning process of students¹⁹. The failure to comply with these needs due to the economic situation of the parents will trigger anxiety in the adolescents over the potency of dropping out of school. Therefore, this feeling will trigger the feeling of being pressured. Moreover, another factor is the demands of the adolescent's lifestyle. Adolescents have the tendency to imitate their friend's lifestyle. They have the tendency to own what is being owned by their friends²⁰. However, the economic condition of their parents makes them unable to fulfil their demands. This unfulfilled desire will inflict a feeling of disappointment in the adolescents hence, they feel ignored and it triggers a sense of depression.

Adolescents are expected to be able to possess a mature way of thinking when dealing with problems. This is primarily related to their parent's financial condition. The adolescent's anxiety toward their financial condition can better be transcended into a wise attitude and having the willingness to support lowering the burden

of their parents, such as by seeking a scholarship. Adolescents are expected to not be desperate when dealing with their problems.

3. Multivariate Analysis: According to Table 5, the multivariate variable candidate of all variables satisfied the value of $p\ value < 0.25$. After the logistic regression test was performed, it obtained the results as follows. In Table 6, the results of the analysis via *conditional logistic regression* obtained that the most influential variable toward the incident rate of student depression was socio-economic status with $p\ value = 0.003$ and an OR value of 2.700. Socio-economic status changed, by 2.7 times, the incidence rate of depression.

Inferred from the results of the analysis, the multivariate variable of socio-economic status has a greater chance in relation to its correlation to depression. According to the researcher's assumptions, economic condition is considerably influential on the psychological condition of an individual. Life demands gradually increase every day. Henceforth, the unfulfilled livelihood provision of a person will affect their psychological condition, primarily in adolescents.

CONCLUSIONS

Based on the results of this research, it was identified that the incident rate of depression in adolescents correlates closely with socio-economic status and personality type. It is suggested that adolescents should be more aware of their self-concept and understand their family economy, while learning to accept the situation.

Conflict of Interest: None.

²Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Softball is a competitive sport which requires the players to have a combination of strength, speed and agility. Nutrition and hydration can have a significant impact on the performance of the softball players. The present study aimed to analyse the relationship between consumption patterns, nutritional knowledge, physical activity, and nutritional adequacy with the nutritional status of softball players. An analytic observation within a cross-sectional study design was employed on a sample of 20 softball players from Surabaya State University. The respondents were recruited through simple random sampling. The research variables included energy intake, eating frequency, vegetarian diet, caffeine or soft drink consumption, fast food consumption, food restrictions, infectious disease, nutritional knowledge, energy adequacy and nutritional status. The anthropometric measurements of the athletes were used including body weight and height, consumption pattern data using the 2x24 hours recall method and a food frequency questionnaire, physical activity data using the IPAQ (International Physical Activity Questionnaire) method, and data on knowledge and infectious diseases using a questionnaire. Energy adequacy was calculated by comparing the average energy consumption with the Nutrition Adequacy Rate. Nutritional status was measured using Body Mass Index (BMI). The data was analysed to examine the relationship between the explanatory variables and the dependent variables using the Spearman Rank Correlation Test. Energy intake, eating frequency, and the knowledge of nutrition had a positive significant correlation with energy adequacy. Physical activity was negatively correlated with energy adequacy. Infectious disease was negatively correlated with nutritional status, while energy adequacy was positively correlated with nutritional status.

Keywords: *consumption pattern, athletes, energy adequacy, nutritional status, Indonesia*

INTRODUCTION

Softball requires athletes to have a combination of strength, speed and agility, in addition to sharp focus, quick reactions and a determination to win. An appropriate dietary intake is crucial for softball players to build their physical strength and to improve their athletic performance.¹ Strategies used to enhance the adequacy

of energy can help to maximise exercise and muscle performance. The nutrient intake required by an athlete is determined by the exercise load, the athlete's specific needs, training objectives, body composition, health and the growth of young athletes.² A balanced nutritional diet in accordance with the exercise requirements is beneficial for softball players. The energy and carbohydrate intake of players should be adjusted with the daily exercise load.

Sources of nutrient intake during softball exercise are recommended to come from highly nutritious foods such as cereals, fruits, vegetables, low-fat dairy products, lean meats and poultry, fish, nuts, seeds, nuts and so on. The consumption of food with a low nutritional value such as soft drinks, snacks, cakes, biscuits, and fried foods should be restricted or limited. Meal timing is the key to success. Portion control and inter-meal intervals can help to improve nutrient absorption and regulate appetite.

To achieve maximum performance in sport, athletes require an optimal training system that includes the availability and adequacy of nutritional intake in accordance with the type of sports being undertaken. An adequate level of nutritional intake is a fundamental prerequisite for athletes, as nutrition and physical exercise result in optimum achievements.³ The present study aimed to analyse the relationship between consumption patterns, knowledge of nutrition, physical activity, and the adequacy of nutritional intake with nutritional status in the context of softball athletes.

METHOD

Our study employed an analytic observational research approach using a cross-sectional design. The population in this study was made up of softball players from the State University of Surabaya. The research sample included 20 active softball players. We applied simple random sampling to recruit the participants.

The variables in this study included energy intake, meal frequency, vegetarian diet, consumption of caffeine/soft drinks, food restrictions, infectious diseases, nutritional knowledge, energy adequacy, and nutritional status. The data of the variables were collected from the measurements of the anthropometric data (body weight and height), consumption pattern data using the 2x24 hours recall method and food frequency questionnaire, physical activity data with the IPAQ (International Physical Activity Questionnaire) method, and questionnaires about their level of nutritional knowledge and history of infectious disease. The level of energy adequacy was calculated by comparing the average energy consumption with the Nutrition Adequacy Rate. Nutritional status was measured using the Body Mass Index (BMI) with the formula weight (kg)/height (m).

The data was analysed using both descriptive and inferential statistics. The Spearman Rank Correlation Test was used to assess the relationship between all of the independent variables and nutritional status. The statistical analysis was done using the SPSS program version 22.

RESULTS

The consumption pattern can be seen using the type of food and eating frequency questionnaire, as shown Table 1. More than half of the respondents (55%) consumed staple food (rice) twice a day. Protein-based foods were meat, poultry or eggs or soya beans in the form of tempeh and tofu consumed twice a day by most of the respondents (60% and 50% respectively). Most of the respondents only ate vegetables once a day (45%).

Most of the respondents consumed fruit twice a week (50%) and milk three times a week (60%).

Table 1: Type of food and eating frequency
n = 20

Type of food	Eating frequency	n (%)
Grains (rice)	2 times a day	11 (55)
	3 times a day	9 (45)
Meat, poultry, eggs	1 time a day	7 (35)
	2 times a day	12 (60)
	3 times a day	1 (5)
Legumes/beans	1 time a day	2 (10)
	2 times a day	10 (50)
	3 times a day	8 (40)
Vegetables	1 time a day	9 (45)
	2 times a day	5 (25)
	3 times a day	6 (30)
Fruits	1 time a day	3 (15)
	2 times a week	10 (50)
	3 times a week	7 (35)
Milk	1 time per day	4 (20)
	3 times a week	12 (60)
	never	4 (20)

Based on the information of the type of food and eating frequency, the researchers calculated the estimated energy intake. Table 2 shows that the average food consumption of the respondents was 2892.25 ± 323.30 kcal with a meal frequency of 1 – 2 times a day. Most respondents rarely had a vegetarian diet (50%) and one focused on fast food (90%), but they often consumed caffeine or soft drinks (50%). Most of them had no dietary restrictions (90%) and had not had any infectious diseases within the last 3 months (65%). The majority of the respondents had good energy adequacy (65%), moderate physical activity (55%), and normal nutritional status (85%).

Table 2: Variables of the respondent’s characteristics

Variables		n (%)	Mean ± SD
Energy intake (food consumption)	2500–2999 kcal	14 (70.0)	2892.25 kcal ± 323.30
	3000–3499 kcal	5 (25.0)	
	3500–4000 kcal	1 (5.0)	

Conted...

Eating frequency	1-2 times a day	11 (55.0)	
	3 times a day	7 (35.0)	
	>3 times a day	2 (10.0)	
Vegetarian diet	Never	7 (35.0)	
	Rarely	10 (50.0)	
	Frequent	3 (15.0)	
Caffeine/soft drink consumption	Never	1 (5.0)	
	Rarely	8 (40.0)	
	Frequent	10 (50.0)	
	Always	1 (5.0)	
Fast food consumption	Rarely	18 (90.0)	
	Frequent	2 (10.0)	
Food restriction	No	18 (90.0)	
	Yes	2 (10.0)	
Infectious diseases	Never	13 (65.0)	
	Rarely	3 (15.0)	
	Frequent	4 (20.0)	
Knowledge of nutrition	Good	12 (60.0)	
	Poor	8 (40.0)	
Energy adequacy	Good	13 (65.0)	
	Poor	7 (35.0)	
Physical activity	low (< 600 MET- minutes a day)	1 (5.0)	
	Moderate (600 - <1500 MET- minutes a day)	11 (55.0)	
	High (1500 - <3000 MET- minutes a day)	8 (40.0)	
Nutritional status	Underweight (BMI: <18.5)	2 (10.0)	
	Normal (BMI: 18.5 - <24.9)	17 (85.0)	
	Overweight (BMI: 25 -<27)	0	
	Obese (BMI ≥27.0)	1 (5.0)	

Remark: MET : Metabolic equivalents; BMI : Body Mass Index

Table 3 shows the relationship between the explanatory variables and energy adequacy. The significant relationship was shown by the p-value <0.05. Each variable of energy intake, eating frequency,

and knowledge of nutrition showed a significant positive correlation coefficient with energy adequacy. Conversely, physical activity had a significant negative correlation coefficient to energy adequacy. A higher level of physical activity will reduce the level of energy adequacy.

Table 3: The relationship between the explanatory variables and energy adequacy

Variables	Correlation Coefficient (r)	p-value
Energy intake	0.619	0.001
Eating frequency	0.736	0.000
Vegetarian dietary	-0.100	0.676
Caffeine/soft drink consumption	0.131	0.582
Fastfood consumption	0.000	1.000
Food restriction	-0.245	0.299
Knowledge of nutrition	0.599	0.005
Physical activity	-0.536	0.015

Table 4 shows that there was a significant negative correlation (p value <0.05) between infectious diseases and energy sufficiency with nutritional status. Getting an infectious disease will lower the participant's nutritional status. The energy adequacy had a positive significant correlation coefficient with the nutritional status. Having better energy adequacy will improve their nutritional status.

Table 4: The relationship between energy adequacy, infectious disease and nutritional status

Variables	Correlation Coefficient (r)	Sig.
Infectious disease	-0.568	0.009
Energy adequacy	0.691	0.001

DISCUSSION

In our study, a higher energy intake, more sufficient eating frequency, and a higher knowledge of nutrition significantly increases the level of energy adequacy. Conversely, a higher physical activity level will lower the level of energy adequacy. This finding signifies the importance of the adequate consumption of nutritious food for softball players. To achieve optimal physical and mental performance, athletes are recommended to consume food with sufficient energy to fulfill their nutritional needs.^{4,5}

Food consumption pattern reflects the quantity and type of food that is commonly consumed in a certain frequency and at particular time intervals.⁶ It relates to the eating habits learned in childhood and tends to remain in adulthood. Selecting foods that are rich in micro nutrients will reduce the risk of nutritional deficiencies that affect health.⁷ The energy required by athletes during exercise can be met through various sources of energy that can be stored in the body from burning carbohydrates and fats with a 5% contribution from protein breakdown.⁸ Carbohydrates can be stored in the muscles and liver as glycogen, which can be used as a source of fuel for the brain and muscles during physical activity.⁹ The right selection of food with fibre, various vitamins and minerals including vitamin B, iron, calcium and folate can help to ensure that the body has enough energy to move and recover from injuries.⁹

Knowledge of nutrition is associated with the consumption of nutritious foods. A previous study reported that good nutritional knowledge was significantly associated with a consumption of a low-fat diet.¹⁰ Another study found that higher nutritional knowledge was strongly associated with reading nutritional information on food products.¹¹ However, parental knowledge about milk products did not predict the amount of milk consumed.¹¹ Nutritional education for school children influenced changes in their dietary behavior after more than 2 years.¹²

Physical activity and exercise contributed to the total daily energy expenditure approximately between 25% and 50%.¹³ Active transportation (walking and cycling) is inversely associated with overweight or obesity.¹⁴ Continuous physical exercise require athletes to maintain a balance between food intake, energy expenditure and additional energy from high physical activity.¹⁵ Specific aspects such as the type of sport, special skills or player position, training schedules and competition calendars, categories and special objectives, which differ from the general population, must be considered when determining the daily energy expenditure.¹⁵

In the second relationship analysis between infectious disease, energy adequacy and nutritional status, both showed a negative and positive relationship respectively. Malnutrition, as well as overnutrition, may affect the immune response to infection.¹⁶ On the other hand, infectious diseases also affect nutritional status, including anorexia, gastrointestinal disease, and other chronic or parasitic infections leading to anemia.¹⁷

Food intake will affect the performance of athletes, where athletes with a poor nutritional status cannot be optimal in their performance.¹⁸ In relation to training, energy adequacy should balance with the increased energy expenditure in order to maintain the athlete's recommended nutritional status.¹⁹ Other physiological conditions that determine the athlete's performance including heart rate, blood pressure, somatotype and hydration status should be taken into account.²⁰⁻²²

Other variables studied in the present research including vegetarianism, caffeine/soft drink consumption, fast food consumption, and food restrictions had no correlation with energy adequacy. However, low vegetable consumption but the high consumption of fast food and caffeine or soft drinks among softball players in the present study should be highlighted. Soft drinks can stimulate the appetite or suppress satiety because of the high glycemic index.²³ A previous study in the United States found a positive relationship between the consumption of soft drinks and energy intake.²⁴ Similarly, fast food has been rapidly accepted, especially among students and young people, due to the convenience, good taste, and quick preparation as well as massive advertisements as reported in studies conducted in India and Australia.^{25,26} Low food intake, an unbalanced household food distribution, and recurrent infections are among the main causes of malnutrition, however, food restriction and poor understanding about food significantly contribute to malnutrition.^{27,28}

CONCLUSION

Softball players are required to achieve optimum performance during both training and competition. A higher energy intake, more sufficient eating frequency, and a higher knowledge of nutrition are significantly correlated with an increased level of energy adequacy. Conversely, a higher level of physical activity will lower the level of energy adequacy. Moreover, suffering from infectious disease as well as having poor energy adequacy is significantly correlated with low nutritional status among softball players. Therefore, managing their consumption patterns and energy adequacy is crucial for softball players.

ABSTRACT

This study aims to describe the compliance to the smoke-free legislation and to identify the associated factors. A cross-sectional study was conducted to assess the compliance at all smoke-free venues. A number of 5,500 smoke-free venues were involved. The data was collected on a six monthly basis through observation and interviews. The study observed 6,670 buildings. The compliance was 11.8% in the second semester of 2013 (1st) as the baseline, which increased to 62.0% in 2015 (5th). Meanwhile, the most common violations of smoke-free legislation were found to be cigarette butts, the provision of ashtrays and smoking. Factors that were associated with compliance were awareness, knowledge and support of the legislation and the presence of internal monitoring. The compliance with Bali's smoke-free legislation remains suboptimal, despite showing increasing trends over time. Hence, continuous education and supervision should be conducted for venue managers to increase compliance.

INTRODUCTION

The tobacco epidemic and its products are one of the biggest challenges to public health in the world. Indonesia is the fourth highest country for the population of smokers in the world¹. The Basic Health Research Data in Indonesia (*Riskesdas*) in 2010 showed that the prevalence of smokers aged ≥ 15 years was 34.7% and this increased significantly in 2013 to 39.5%². According to the WHO's official report, it is estimated that the prevalence of smokers in Indonesia will increase again to 42.7% by 2020, where the prevalence of men is estimated to reach 82.5% and women 3.0%³. Also, the

prevalence of smokers is also high in Bali, which was 24.9% in 2007, which increased to 31.0% in 2010, and slightly decreased to 28% in 2013².

The WHO reported that cigarettes kill more than 7 million people per-year in the world, of which 6 million were active smokers and approximately 890,000 were non-smokers but exposed to second-hand smoke. It shows that the smoke not only endanger smokers, but also non-smokers³. Indonesia is the only country in Asia that has not ratified the WHO's FCTC. Nevertheless, tobacco control efforts have been undertaken and the establishment of smoke-free venues in 2011 was one of the important regulation in Indonesia. The legislation is important to reduce the harm from smoking among non-smokers and to provide healthy air to the community. There are seven venues which ruled as smoke-free: health facilities, schools, places of worship, children's playgrounds, work places, public places and public transportation⁴.

Since 2011, Bali also implemented smoke-free legislation, which was the first smoke-free legislation at the provincial level in Indonesia. After 3 years of

implementation, the legislation has never been evaluated, particularly regarding compliance. Accordingly, this study aimed to describe the compliance to the Bali provincial smoke-free legislation and to identify the associated factors.

METHOD

A cross-sectional study was conducted to assess all smoke-free legislation criterias across five periods, from July 2013 to August 2015. The study was located in Bali, Indonesia, which has more than 14,700 smoke-free venues spread across the nine districts of Badung, Gianyar, Klungkung, Bangli, Karangasem, Tabanan, Jembrana, Buleleng, and Denpasar.

The sample size was determined based on the cluster recommendation ⁶. A total of 5,500 smoke-free venues (1,100 in each period) were included. The sample from each venue was determined by there being 150 schools, 100 health facilities, 400 public places, 100 children’s playground, 150 places of worship, 150 work places, and 50 public transportation vehicles and using systematic random sampling.

The data was collected using a form containing eight indicators: observed smoking (main indicator), the provision of designated smoking venues, the provision of ashtrays, the availability of no-smoking signs, observed cigarette butts, the observed smell of tobacco smoke, observed cigarette selling, and tobacco advertisements, promotions and sponsorships (secondary indicators) ⁶. Smoke-free venues were considered to be compliant if they met the eight compliance indicators, except for public places which were permitted to sell cigarettes and promote them through advertisements. Interviews were conducted with all venue managers. The data was collected by 44 trained enumerators, and was inputted using Epi-Data 3.1, analysed descriptively using STATA-SE 12.1, and tested using the Chi-square test.

RESULTS

Compliance with Smoke-free Legislation in the Provinces and Districts: The study observed 6,670 buildings from within 5,500 non-smoking venues in Bali over five periods. Generally, the surveys indicated an increasing trend of compliance over time, but not all having yet reached the target (80%). For the first period of the survey, compliance remained (11.8%).

However, in the next periods, compliance showed an increasing trend (2nd=17.2%, 3rd=25.9%, 4th=37.8%, and 5th=62.0%). Districts also showed a positive trend in compliance, with the highest being Tabanan (78.3%). There were two districts that showed low compliance; Badung (44.8%) and Gianyar (52.8%). Both districts have more public places such as hotels, restaurants and other public places (Figure 1).

Figure 1: The compliance with smoke-free legislation in Bali by district

Compliance with Smoke-Free Legislation by Venue Type:

Figure 2 shows that the type of venue that has the highest increasing trend of compliance were children playgrounds (6.5%-90%), followed by health facilities (54.2%-88.8%), and education places or schools (12.4%-83.2%). Increased compliance was also shown in public places, although it was not as high as other venues. For example, compliance in restaurants increased from 0.7% in the first survey to 15.6% in the fifth survey. Hotels also showed improved compliance from 0.6% in the first survey to 38.4% in the fifth survey. Traditional markets showed compliance in the fifth survey at 32.3%, while the modern market had the highest compliance among the public places (10.3%-71.7%).

Figure 2: The compliance with smoke-free legislation in Bali by venue

No-Smoking Sign Coverage: In this study, we found that no-smoking sign coverage increased over the five periods of the survey (from 21.2 % to 77.8% respectively). However, compliance had not yet reached the target (100%).

Violations on the Implementation of Smoke-Free Legislation: The violations that were assessed in this study were also based on 8 indicators. The most common 3 violations were the cigarette butts found indoors, the provision of ashtrays and observed smoking indoors. Moreover, no decreasing trend in the violations was found in the five periods of the survey (Figure 3).

Figure 3: Type of Violation and the Smoke-Free Legislation in the Bali Provinces

Factors Associated with Compliance: The results showed that the factors associated with compliance were awareness regarding the presence of the legislation (PR=3.0), knowledge (PR=3.0), support of the legislation (PR=3.0) and the presence of internal monitoring (PR=2.1) (Table 1).

Table 1: Factors associated with the compliance to Bali’s smoke-free legislation

DISCUSSION

The results showed that after three years, the overall compliance in Bali was suboptimal. Bali province is a famous tourist destination. Thousands of public places were built to support tourism. Meanwhile, public places are a very challenging venue in terms of policy implementation. Thus, the study was concerned with public places and workplaces ⁷ in which the low compliance was not only taking place in developing countries ⁸ opinions and compliance related to Uganda’s comprehensive smoke-free law among hospitality venues in Kampala Uganda. DESIGN This multi-method study presents cross-sectional findings of the extent of compliance in the early phase of Uganda’s comprehensive smoke-free law (2 months postimplementation; pre-enforcement, but also in developed countries ⁹.

The type of venues that had better compliance were health facilities, schools and children’s playground. The factors associated with compliance were including were strong commitment from the manager, the presence of an internal monitoring system, and better knowledge of the employees regarding smoking harm as well as concerns over patient safety and disruptions to care ¹⁰.

Compliance in public transportation, workplaces and places of worship showed a significant improvement despite still being below target (80%). It has proven that the awareness of community regarding the legislation has started to increase. Waddell et al emphasised the importance of contextual information for community education efforts on smoke-free legislation ¹¹. It is also necessary to change the individual perception regarding the legislation and the harm of second-hand smoke among community, which can affect the compliance and people’s health status ¹². In some schools, many teachers and administration staff members were found to smoke. This is ironic because they are a role model for the students, even though one study showed that the majority of students disagreed with the teachers’ smoking in the classroom and in their offices ¹³.

The venue that had compliance that was as low as public places was places of worship. In Bali, the places of worship were mosques, churches, monasteries, and pagodas. Temples in Bali are a semi-open venue, and many violations occurred, particularly observations of smoking and cigarette butts. Involving religious leaders and local wisdom could be an appropriate strategy in a social religious community like Indonesia, particularly in Bali ¹⁴.

One of the most important indicators in the policy is the availability of no-smoking sign. A study showed that smoke-free compliance in public places was suboptimal due to the absence of no-smoking signage ¹⁵smoking aids, cigarette butts/bidi ends and smoking smell. Moreover, no-smoking signs being displayed had an effect on curbing smoking behaviour in public places ¹⁶. However, our study showed that the coverage of the signs remains below the target (100%). The absence of no-smoking signs could make visitors not aware of and thus violates the legislation, and indicates the absence of an internal monitoring system. Thus, installing no-smoking signs, removing ashtrays, and sweeping away cigarette butts is important to inform society of the descriptive norm that smoking is not a normal behaviour in the community ¹⁷. Other studies have emphasised that enforcement agencies should focus on the comprehensive removal of ashtray equivalents that could act as cues for smoking within a venue ¹⁸.

The better level of compliance in Denpasar, the capital of Bali, was because of the majority venue type being health facilities and government offices. It indicates that the performance of the tobacco control program in Denpasar was better than in other districts. Moreover, the communities in the urban venues had a better education level, were exposed to updated information, and were relatively more controlled. It corresponds with a study stating that the higher potential exposure to policy, the better the compliance level, because exposure to policy is one of the moderators to compliance ¹⁹. However, other studies showed that rural residents were more likely than those in urban settings to support local smoke-free legislation ²⁰.

Based on the interview, the managers exposed to smoke-free legislation had better knowledge, showed more responsibility and supported the legislation's implementation through an internal monitoring system. The system became the significant factor in increasing

compliance. Thus, it is necessary to strengthen the enforcement infrastructure and efforts as well as investing in minimal but essential enforcement resources ²¹. This finding should be followed by innovative monitoring and an implementation program for each type of venue. Another study also emphasised that the education level of the managers was an important determinant to ensure compliance with the smoke-free legislation ²².

Some of the managers, particularly from hospitality venues, were also worried regarding the economic impact of the smoke-free implementation. It was reasonable despite several studies that showed that banning smoking in the business sector has had no significant negative economic impact ²³. However, a study in the US stated that despite clear public health arguments and strong public support, the passing of smoke-free laws had stagnated and exemptions were being used to weaken the existing laws. Hence, the capability to make both a health and business case in support of smoke-free air laws may also bolster the case for expansion ²⁴.

CONCLUSIONS

The compliance with the local smoke-free legislation in Bali remains suboptimal, despite increasing over time. The suboptimal compliance is associated with education coverage, knowledge and the support of managers as well as their responsibility to conduct internal monitoring. The continuous and appropriate approach of education, supervision and mentoring should be done by and for managers and the community. Each district is recommended to establish an effective tobacco control team, which could educate and provide assistance regarding the implementation of smoke-free legislation in its region.

The association of Pre-Pregnancy Body Mass Index (BMI) and Increased Maternal Weight in the Third Trimester of Pregnancy with Foetal Weight Estimation

Siti Maimuna¹, Andina Firdaus Supriyanto²

¹Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; ^{1,2}Department of D3 Nursing, Surabaya Health Polytechnic of the Ministry of Health, Indonesia

ABSTRACT

Poor nutritional status in pregnancy affects foetal growth, which can lead to low birth weight and subsequently have an impact on intergenerational malnutrition. The purpose of our study was to assess the relationship between pre-pregnancy body mass index (BMI) and increased maternal weight in the third trimester of pregnancy with foetal weight estimation. We employed an analytical observation study with a cross-sectional design. We used a total sample of all third trimester pregnant women in Tanggulangin Community Health Centre (CHC) in Sidoarjo, East Java, with a total of 349 women being recruited. The data was secondary, obtained from the maternal and child health status book of the study subjects and medical records. The data was analysed using the Spearman correlation test. Most women with normal pre-pregnancy BMI were multiparous. Pre-pregnancy BMI was significantly correlated with the foetal weight estimation. Low pre-pregnancy BMI increases the risk of low foetal weight. However, our study did not find a significant correlation between maternal weight gain during the third trimester and foetal weight estimation. Most of our study subjects had maternal weight gain of approximately 0.3 – 0.5 kg/week. Improving the nutritional status of women before and during pregnancy is crucial to achieve the recommended foetal weight.

Keywords: *body mass index, third trimester of pregnancy, maternal weight gain, fetal weight*

INTRODUCTION

Low birth weight (LBW) refers to the baby's weight at birth when it is below 2,500 grams.¹ LBW babies have a higher risk of neonatal mortality and morbidity including the risk of non-communicable diseases when they are older.¹ In 2013, approximately 22 million neonates or 16% of the total babies born globally had a low birth weight.² South Asia has the highest prevalence of LBW; an estimated 28% of the babies in the region.¹

The prevalence of LBW in Indonesia was estimated to be 10.2% in 2013, a decrease from 11.11% in 2010.³ Lack of nutrition before and during pregnancy may affect the incidence rate of LBW.² In line with the LBW incidence rate, the prevalence of Indonesian pregnant women with chronic energy deficiency (CED) was estimated to be 15% in 2013.³

Nutrition is important for pregnant women, not only to maintain their health but also to support foetal growth.⁴ The World Health Organisation (WHO) strongly recommends for pregnant women to take iron tablet, folic acid and calcium supplements to prevent LBW, preterm birth, puerperal sepsis and anaemia related to pregnancy.¹ A recent multi-country study found that some significant determinants of the incidence rate of LBW in developing countries included older maternal age, a lack of antenatal care (ANC), a lack of education, low socioeconomic status, and low body mass index (BMI).⁵ A previous study also reported that a low

Email: siti.maimuna@gmail.com

maternal weight marked by a BMI ≤ 19.8 kg/m² had a correlated increased risk of LBW by 1.8 times (95%CI= 1.1-2.9).⁶ This present study, therefore, aimed to examine the relationship between BMI, the maternal weight in the third trimester of pregnancy, and the estimated birth weight among women of the study setting.

METHOD

This study used an observational analytic research design with a cross-sectional approach. The sample population in this study were all third trimester pregnant women who attended Tanggulangin Community Health Centre (CHC) between March 2016 and April 2017. The selection of this setting was based on the 2015 health report of the Sidoarjo District Health Office, indicating that the LBW prevalence was 3.8%, the second highest in the district.⁷ As we applied total sampling, women who had a normal pregnancy and who had a complete record in the Maternal and Child Health status book and medical database were included in this study. In total, our study included 349 pregnant women. To collect the data, we used secondary data obtained from the MCH handbook and the medical records at the Tanggulangin CHC. The data was analysed using the Spearman Correlation test with the help of SPSS version 22.

RESULTS

As displayed in Table 1, 138 women were in their first pregnancy (primiparous), while 211 women were multiparous. The majority of primiparous women were aged between 21-25 years old (63.0%), while most of the multiparous women were aged between 26-30 years old (38.9%). Most of the primiparous and multiparous women were employed (67.4% and 51.2%, respectively), and had a high level of education (78.3 % and 73.5%, respectively). More than half of the primiparous and multiparous women also had normal pre-pregnancy BMI and had a weekly weight increase that was between 0.3 – 0.5 kg. The estimated foetal weight among the respondents was mostly between 2,500 – 3,500 grams (84.1% and 86.3% for primiparous and multiparous respectively).

Table 1: Characteristics of the respondents based on parity

Variables	Primiparous		Multiparous	
	n	%	n	%
Age (years)				
16-20	27	19.6	1	0.5

Total	138		211	

Table 2 presents the comparison of the respondent’s characteristics based pre-pregnancy BMI, their increased maternal weight and the estimated foetal weight among the age group. Most of the respondents in all age groups had a normal pre-pregnancy BMI. Except for the age group of 16-20 years old, all of the age groups had a weekly maternal weight increase between 0.3 – 0.5 kg. All of the age groups also had an estimated foetal weight between 2,500- 3,000 grams.

Table 2: Pre-pregnancy BMI, increased maternal weight, and the estimated foetal weight based on age group

Variables	Age group (years) n (%)

2,200–2,400	8 (28.6)	13 (10.6)	16 (15.7)	10 (14.1)	3 (14.3)	1 (25.0)
2,500–3,500	20 (71.4)	110 (89.4)	86 (84.3)	61 (85.9)	18 (85.7)	3 (75.0)
Total	28 (8.0)	123 (35.2)	102 (29.2)	71 (20.3)	21 (6.0)	4 (1.1)

In Table 3, pre-pregnancy BMI and increased maternal weight were compared among the groups of women with different estimated foetal weight. Most of the women with LBW (estimated foetal weight between 2200–2400 grams) were underweight (54.9%), while most of the women with a normal estimated foetal weight also had normal pre-pregnancy BMI (57.4%). Most of the women in both estimated LBW and normal foetal weight groups had a weekly maternal weight increase between 0.3–0.5 kg (64.7% and 49.3%, respectively).

Table 3: Pre-pregnancy BMI, increased maternal weight and estimated foetal weight

Variables	Estimated foetal weight			
	2,200-2,400 grams		2,500-3,500 grams	
	n	%	n	%
Pre-pregnancy BMI				
Underweight	28	54.9	57	19.1
Normal	21	41.2	171	57.4
Overweight	2	3.9	51	17.1
Obesity	0	0.0	19	6.4
Increased maternal weight (kg/week)				
0.1–0.29	10	19.6	54	18.1
0.3–0.5	33	64.7	147	49.3
0.6–1.0 kg	8	15.7	97	32.6
	51		298	

We employed the Spearman Correlation test to analyse the correlation between pre-pregnancy BMI and estimated foetal weight as well as the correlation between increased maternal weight and estimated foetal weight. The results showed that the correlation coefficient of pre-

pregnancy BMI and estimated foetal weight was 0.294 (p-value = 0.001). The correlation coefficient value between weekly increased maternal weight in the third trimester and estimated foetal weight was 0.63 (p-value = 0.1). Pre-pregnancy BMI is significantly associated with estimated foetal weight, while increased maternal weight had no association with estimated foetal weight.

DISCUSSION

The results of our study showed that most of the respondents were aged between 21-30 years old, had a high level of education, and were employed. Most of the pregnant women with normal pre-pregnancy BMI were aged between 21-30 years old. Having normal pre-pregnancy BMI in this age range would be more likely to produce positive maternal and neonatal outcomes.⁸ Giving birth below 20 years old or older than 35 years old increases the risk of adverse pregnancy outcomes.⁸ Adolescence pregnancy would increase the risk of maternal and neonatal mortality due to having unstable emotions and a lack of nutrition, while an advanced maternal age of older than 35 years is associated with lower bodily resistance to various communicable and non-communicable diseases.⁹

The results of the present study indicate that most of the multiparous respondents (60.9%) had normal pre-pregnancy BMI. Having a normal BMI is very good for women who are planning for pregnancy.^{10,11} A previous study in Japan reported the increased prevalence of chronic hypertension and hypertension related to pregnancy among women with a BMI that indicated a status of being overweight or obese.¹¹ Women with a higher pre-pregnancy BMI are associated with the onset of pregnancy-induced hypertension.¹¹ Malnourished

pregnant women encounter the risk of LBW and low breastmilk production.¹² In our study, approximately 5.4% of the study subjects were obese before getting pregnant. Obese women in their second pregnancy have a higher risk of preeclampsia, caesarean delivery, and neonatal mortality.¹³

The results of this study indicate that about 65% of multiparous respondents experienced an increase in body weight during the third trimester between 0.3-0.5 kg/week. During the second and third trimesters of pregnancy, normally a woman gains weight by approximately 1 kg/week.¹⁴ Throughout pregnancy, a woman is expected to increase their weight up to 12.5 kg, depending on their pre-pregnancy weight and the type of pregnancy (single or multiple pregnancy).¹⁵ A pregnant woman requires additional calories; 180 kcal in the first trimester, and 300 kcal in the second trimester and third trimester.¹⁶

The results of this study indicated that about 61.1% of the multiparous respondents had an estimated foetal weight of 2500-3500 grams, so normal birth weight can be expected. Similarly, another Indonesian study reported that about 94.8% of pregnant women in their study had an estimated foetal weight of 2500-4000 grams.¹⁷ Foetal weight can be estimated using clinical methods, which is useful for low resource settings.¹⁸ Calculations using the clinical method have been widely used due to simplicity, low cost, and being user friendly. However, it is more suitable for normal pregnancy. To detect abnormalities and the well-being of the foetus, an ultrasound would be required.¹⁸

The Spearman Correlation test yielded a significant association between pre-pregnancy BMI and foetal weight estimation. According to Diouf (2011), pre-gestational BMI is helpful when estimating foetal weight.¹⁹ Women who have a low pre-gestational BMI are more likely to have an incidence of preterm birth by 20% in their first pregnancy and 40% in the second pregnancy.¹³ Pre-pregnancy BMI contributes to the shape of the independent relationship between maternal weight gain and preterm birth.²⁰

Our study did not find a significant correlation between maternal weight gain during the third trimester and foetal weight estimation. However, approximately 81.9% of the study subjects were expected to have normal a foetal weight estimation. Some possible explanations related to this finding were homogeneity or there being less variety in the data. In addition, there

are other external factors that may have influenced the results, such as maternal stress conditions, maternal work, maternal education, maternal age, ANC history, and socioeconomic level.²¹ Low maternal weight gain, especially among underweight women, increased the risk of low birth weight.²¹ Pre-gestational nutritional status and maternal weight gain are closely related to foetal growth and development, and birth weight.²²

Monitoring the nutritional status of pregnant women can be done by regularly measuring the weight gain during pregnancy. Maternal weight gain is used as an indicator to predict maternal and neonatal health outcomes.²³ Women with low maternal weight gain are advised to improve their nutritional intake to achieve a normal weight. Conversely, pregnant women with excessive body weight are recommended to have a balanced diet by reducing their intake of calorific foods and high fat.²¹

CONCLUSION

In our study, most of women were multiparous (n=211). From the characteristics of the study subjects, most of the primiparous women were aged between 21-25 years, while the multiparous women were aged between 26-30 years old. Most of the multiparous women were unemployed (51.2%) and had a high level of education (73.5%). Normal pre-pregnancy BMI was found mostly among the multiparous women (55.5%). Most of the multiparous women had gained weight during the third trimester ranging from 0.3 to 0.5 kg per week and were expected to have a normal foetal weight (2,500-3,500 grams).

Pre-pregnancy BMI showed a significant correlation with the foetal weight estimation, while no correlation was found between increased maternal weight and the foetal weight estimation. Women with normal pre-pregnancy BMI have more chance to have a normal foetal weight than women with lower or higher pre-pregnancy BMI. Therefore, nutritional supplements are highly recommended, not only during the pregnancy period but also during the pregnancy planning stage.

The Effectiveness of Bay Leaf Extract (*Syzygium Polyanthum*) in Inhibiting the Growth of *Candida Albicans*

Suratiah¹, Dewa Ayu Ketut Surinati¹, Dewa Made Ruspawan¹

¹*Polytechnic of Health Denpasar, Indonesia, Jl. Sanitasi No.1 Sidakarya, Denpasar, Indonesia*

ABSTRACT

Introduction: Fluor albus is derived from secretion of a woman's vagina and might be undergone by all women throughout the life cycle. Color and odor changes occur because of pathogenic microorganisms infecting it. The most common pathogenic microorganisms in fluor albus are *Candida albicans*. Bay leaves are easy to obtain and have been reported to contain effective antimold activities to inhibit the growth of *Candida albicans*. This research is aimed to know the effectiveness of bay leaf extract on inhibition of the growth of *Candida albicans* and to know which extract is effective in inhibiting *Candida albicans*.

Method: This research is in vitro experimental research with randomised group design. In this research there were eight kinds of extracts as treatment with three replications. Data were analyzed using ANOVA.

Results: The results showed that extraction with soaking in water for 24 hours had the highest inhibition on *Candida albicans* (12 no), and the young bay leaves extract dissolved by ethanol had the highest antioxidant capacity 11.273.41mg/L GAEdaAC).

Conclusions: Bay leaves have potency as alternative resources to inhibit the growth of microorganism in fluor albus occurrence. It is suggested to test the effectiveness of young bay leaves extracted with ethanol on *Candida albicans* on women with fluor albus.

Keywords: *Bay leaves, Candida albicans.*

INTRODUCTION

Fluor albus, or often referred to as vaginal discharge, is vaginal secretion in women. Leucorrhoea in women is physiological due to an increase in estrogen and progesterone hormones. Leucorrhoea is a thin and white mucus released through the vagina. This vaginal discharge usually comes out more and thicker during before and after menstruation, and when sexually aroused. However, if it is excessive and lacking in cleaning, it causes the area to become moist so that it tends to be attacked by bacteria or fungi. Humid and wet areas tend to be a medium for breeding pathogenic microorganisms.

Nearly 50% of the entire female population is affected by pathological vaginal discharge¹. The results of research conducted by Lingga (2011), stated that 75% of women in the world were affected by vaginal discharge and 45% of them had experienced it twice or more and 75% of Indonesian women experienced a once-in-a-lifetime vaginal discharge².

Leucorrhoea is also the most common complaint expressed by women, where vaginal discharge may be a sign of abnormalities in the female reproductive organs. Leucorrhoea can be divided into two types, namely physiological and pathological. Physiological leucorrhoea is a natural vaginal discharge, which occurs before and after menstruation and when there is an increase in sexual stimulation. Pathological leucorrhoea is a vaginal discharge that occurs continuously accompanied by the presence of odor and discoloration in the liquid.

Color changes and odors smelled are due to the presence of pathogenic microorganisms (bacteria, fungi and viruses) that infect the vaginal discharge. The fungus that is the most common pathogenic microorganism in vaginal discharge is *Candida albicans*. *Candida albicans* is a type of fungus that grows in two forms: stem cells (blastospore) and pseudohyphae. This false hyphae that will continue to grow and multiply so that it will interfere with the organs on which it grows. Pseudohyphae live in groups or colonies which will cause unpleasant odors and give color to leucorrhoea and cause pathogenic or pathological leucorrhoea.

Pathological leucorrhoea will disturb the comfort of women. Itchiness that is felt tends to cause women to be anxious and scratching, which will have an impact on injury or blisters, which results in further infection. This situation results in a woman seeking help in treatment. The usual treatment is antifungals with the class of micostatin. But some practitioners also offer a variety of products to overcome this. Among them are many who use traditional medicine wherein the ingredients are all from nature, such as from growing plants. One of the most convenient and very easy to obtain is bay leaf.

Bay leaf (*Syzygium polyanthum*) is a leaf that is very easy to find by the community and commonly used as a cooking spice. Bay leaves have been shown to have antifungal properties. The content of chemical compounds contained in bay leaves include: flavonoids, tannins, essential oils, citral and eugenol³. Bay leaves are reported to contain antifungals which are very effective for inhibiting the growth of *Candida albicans*.

The formulation of the problem is: Is Bay Leaf Extract effective in inhibiting the growth of *Candida albicans*? The aim was to determine the effectiveness of bay leaf extract in inhibiting the growth of *Candida albicans* by testing the growth inhibition of *Candida albicans* by extracting water solvent, decoction, 95% ethanol and hexane and testing the ability to counteract free radicals with DPPH (2,2-diphenyl-1-picrylhydrazyl). The benefits obtained are in providing scientific information about the advantages of bay leaves in inhibiting the growth of *Candida albicans* fungi and providing information to the public to be able to utilize bay leaves, which are easily accessible, as an antifungal

in inhibiting the growth of *Candida albicans* fungi as a cause of infection in vaginal discharge (Fluor Albus).

METHOD

This research is an experimental laboratories study in vitro with a randomized block design⁴. with eight experimental treatments, namely young bay leaf extract with 24-hours of water immersion (ESAM); young bay leaf extract with boiling for 1 hour (ESRM); young bay leaf extraction with ethanol solvent (ESEM); young bay leaf extraction with hexane solvent (ESHM); old bay leaf extract with 24-hours soaking in water (ESAT); extracting old bay leaves with boiling for 1 hour (ESRT); old bay leaf extract with ethanol solvent (ESET); and old bay leaf extract with hexane solvent (ESHT).

Phase I of the research was conducted at the Food Technology Laboratory of Udayana University Denpasar and the Health Laboratory (Labkes) of Denpasar City. The implementation of this laboratory research was for three months from July to October 2017. The number of samples was determined by the Federer formula: $(t-1)(n-1) \geq 15$, $N = 3$ times replication. So, the number of samples was $8 \times 3 = 24$.

RESULTS AND DISCUSSION

a. Bay Leaf Extract: The making of the bay extract was started by sorting out by separating the old leaves and young leaves and the damaged leaves (dry, discolored or pockmarked). Damaged leaves will be discarded and not used and these are shown in the picture below. Old leaves will look darker and young leaves will look brighter. After being sorted, then washing is done and they are then dried with the aim of removing the water content in the bay leaf.

This drying process was undertaken to make it easier to carry out extraction because the water will interfere with the solvent in dissolving the active compound in the bay leaf; therefore, the water must be evaporated first by drying. After drying, it was then taken to the Udayana University Food Technology laboratory for extraction. The making of bay leaf extract in this study used several solvents including water, ethanol and hexan. The name of the sample along with the type of solvent can be seen in the table below.

Table 1: Name of the sample, type of solvent and solvent properties

No.	Sample name	Solvent	Solvent properties	Sample making method
1	ESAM	Water	Polar	Soak in water for 24 hours and extract.
2	ESRM	Water	Polar	Boil with water for 1 hour and extract.
3	ESEM	Ethanol	Polar	Extract with the addition of ethanol.
4	ESHM	Hexan	Non-polar	Extract with hexane addition.
5	ESAT	Water	Polar	Soak it in water for 24 hours and extract.
6	ESRT	Water	Polar	Boil with water for 1 hour and extract.
7	ESET	Ethanol	Polar	Extract with the addition of Ethanol.
8	ESHT	Hexan	Non-polar	Extract with Hexan addition.

Laboratory Test Results

a. Inhibition of bay leaf extract against

Candida albicans: This study showed that young bay leaf extract with 24-hour immersion treatment (ESAM) had the highest level of inhibition against *Candida albicans* (12mm). Other treatments did not show inhibition of the fungus. The inhibitory power of bay leaf extract against *Candida albicans* fungi can be seen in the table below.

Table 2: Inhibition of bay leaf extract against *Candida albicans*

No.	Sample name	Average inhibitory power (mm) *
1.	ESAM	12
2.	ESRM	0
3.	ESEM	0
4.	ESHM	0
5.	ESAT	0
6.	ESRT	0
7.	ESET	0
8.	ESHT	0
9.	Control	12

Description *): an average of three replications using Sabouroud media dextrose agar.

From the table above, the results can be concluded so that statistical tests are not carried out.

b. Antioxidant capacity: This study showed that young bay leaf extract using ethanol solvent (ESEM) had the highest antioxidant capacity

(11,273.41mg / L GAEAC) followed by old bay leaf extract with ethanol solvent (ESET) of 11,080.32mg / L GAEAC. Young and old bay leaf extracts which were soaked for 24 hours (ESAM and ESAT) had the lowest antioxidant capacity (70.94 and 291.22mg / L GAEAC, respectively). The average antioxidant capacity can be seen in Figure 1.

Figure 1: Antioxidant capacity of bay leaves

Description: GAEAC = Gallic acid equivalent antioxidant capacity

DISCUSSION

Bay leaves (*Syzygium polyanthum*) are rich in tannins, flavonoids and essential oils (0.05%) which consist of eugenol and cytral. The chemical components of the bay leaf have a functional role, including antimicrobial, anti-inflammatory, anti-fungal and analgesic compounds⁵.

Extraction of bay leaves aims to separate the active compounds from their original ingredients so that they have maximum functional activity. The extraction process uses a solvent to dissolve the active compound in the material according to the characteristics of the active compound to be separated. Polar solvents (such as water and ethanol) can separate active compounds in materials that are hydrophilic, while non-polar solvents (such as

hexane) are only able to dissolve active compounds that are hydrophobic. Shriner et al. (1980) state that polar solvents will dissolve polar solutes and non-polar solvents dissolve non-polar solutes or a so-called “like dissolve like” process⁶.

Candida albicans is known as a facultative anaerobic organism (it can live without the need for oxygen). The fungus lives in a fairly large range of pH 4.5 to 6.5, with optimal growth temperatures of 28-37°C. *Candida albicans* fungi can be inhibited by the addition of young bay leaf extract soaked for 24 hours (ESAM). From Table 1 above, ESAM samples (young bay leaf extract soaked with water for 24 hours) showed high inhibitory power against *Candida albicans* by 12mm as well as control inhibitory power (micostatin). Other samples showed no inhibitory power against *Candida albicans*.

This result is very interesting because the simple extraction method is by soaking in water for 24 hours, by which the young bay leaf extract can provide an inhibitory effect on *Candida albicans*. It is suspected that antimicrobial compounds, especially antifungal (*Candida albicans*), have polar (hydrophilic) properties that are easily soluble in water, and are found in young bay leaves. This is in line with research conducted by Hendradjatin (2009) who found soaked bay leaves (infusion of bay leaves) have an inhibitory effect on *V. cholerae* (minimum concentration of 3.12%), and pathogenic *E. coli* (minimum concentration of 12.5%).

Control inhibitory power (micostatin) against *Candida albicans* fungi is also high. Mikostatin is often used to reduce fungal growth. Koneman et al. (1988) revealed that the presence of the inhibition zone showed evidence that these microorganisms were susceptible to the influence of these types of antibiotics⁸. The greater the inhibition zone, the greater the effectiveness of these antibiotics in the treatment of these microorganisms.

The antioxidant capacity of an ingredient is the ability of compounds in these ingredients to reduce free radicals. The ability of these antioxidant compounds is much influenced by the presence of hydroxyl compounds found in these materials, such as phenolic compounds. These components can inhibit oxidation reactions and are able to capture free radicals⁹.

Extraction using ethanol on young and old bay leaves is able to dissolve the antioxidant compounds in bay leaves more optimally than using non-polar hexane

solvents. This shows that most of the antioxidants in bay leaves have high polarity (hydrophilic). The ability of ethanol to dissolve antioxidant compounds in bay leaves is also more optimal than by dissolving with water or boiling. Dissolving antioxidant compounds in bay leaves with water for 24 hours produces very little antioxidant capacity, as well as boiling.

Interestingly, this study shows that the high antioxidant capacity of bay leaf extract samples was not directly proportional to its ability to inhibit *Candida albicans*. ESEM and ESET samples with the highest antioxidant capacity did not have inhibitory power against *Candida albicans*. In contrast, ESAM samples having the lowest antioxidant capacity, actually have inhibitory power against *Candida albicans*.

CONCLUSIONS

Extraction with 24-hour immersion (ESAM) had the highest level of inhibition against *Candida albicans* (12mm). Young bay leaf extract using ethanol (ESEM) solvent had the highest antioxidant capacity (11,273.41mg / L GAEAC). Future studies can continue this research in subsequent clinical trials to see the effectiveness of selected extracts on *Candida albicans* found in women with pathological female vaginal discharge.

The Presenting Symptoms as a Predictor of the Hospital Arrival Time Intervals of Patients with Acute Coronary Syndrome

Tony Suharsono¹, Shynatry Ayu Andhika¹, Ahmad Hasyim Wibisono¹, Tina Handayani¹

¹Department of Nursing, Faculty of Medicine, Universitas Brawijaya, Malang, Indonesia

ABSTRACT

The hospital arrival time intervals of Acute Coronary Syndrome (ACS) patients is calculated from the onset of pain to arriving at the hospital. Various factors may affect the hospital arrival time interval including the presentation of symptoms. The purpose of this study was to analyse the relationship between the variables of presenting symptoms and the hospital arrival time intervals among ACS patients at Karsa Husada Batu Hospital and Dr. Soepraoen hospital in Malang, East Java, Indonesia. The research method employed was an analytical observation with a cross-sectional approach. Using a purposive sampling technique, a total sample of 26 ACS patients were recruited. The study was conducted between February and May 2018 (3 months). The significance of the association was set up as having a p-value of less than 0.05. From the data analysis, we found that the presenting symptom variables of provocation, radiation, severity, accompanying symptoms and time were significantly associated with the hospital arrival time interval. Quality and location were not significantly associated with the hospital arrival time interval. ACS patients who experienced pain symptoms with triggers, felt the pain spreading, had a higher level of severity, had accompanying symptoms, and felt continuous pain might have a shorter hospital arrival time interval than their counterparts. Presenting symptoms is a crucial factor to reduce the hospital arrival time interval. Therefore, patients and their families should recognise all aspects of the ACS symptoms.

Keywords: *Acute coronary syndrome, presenting symptoms, hospital arrival time interval*

INTRODUCTION

Acute coronary syndrome (ACS) is an incident in the coronary arteries caused by thrombosis due to unstable atherosclerotic rupture. It includes ST-segment elevation myocardial infarction (STEMI), non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina (UA). ACS, along with coronary artery disease (CAD), accounted for approximately seven million deaths per year between 1990 and 2010 in the

Asia-Pacific, with more than half of the deaths taking place in less developed countries.¹ In the United States, coronary heart disease (CHD) is the major cause of cardiovascular disease (45.1%) which accounts for one in seven deaths annually or more than 360,000 deaths per year.² By the end of 21st century, the CHD prevalence is estimated to increase by 120% among women and by 137% among men in developing countries.² Among hospitalised patients in Indonesia, cardiovascular disease accounted for the highest proportion of deaths from non-communicable diseases (9.5%) in 2010.³

ACS patients require immediate treatment to avoid further damage to the tissue. However, many patients arrive too late at the hospital or delayed to seek treatment.⁴ Previous studies showed that pre-hospital delays are common around the world. Pre-hospital delays range from approximately under 2 hours in Spain, 2 hours and 10 minutes in China, 2.2 hours in the US, 6 hours in India, and 7.8 hours in Jordan.⁵⁻⁹ The hospital

arrival time interval is calculated from the onset of pain until the patient’s arrival at the hospital.

Presenting symptoms are one of influential factors related to the pre-hospital delay of ACS patients. Public awareness related to the severity and urgency of the presenting symptoms of ACS is generally low.⁸ Nurses and paramedics reported that patients usually confuse the presenting symptoms with digestive disorders or gastrointestinal problems. Additionally, cardiologists viewed that the pre-hospital delay was usually because of the patients’ misinterpretation about the presenting symptoms of ACS, thus only getting the medical examination after the symptoms worsened.⁸ Another study found that patients with a history of severe pain and a history of other diseases were more likely to have a shorter pre-hospital delay.¹⁰ Therefore, our study aimed to explore the relationship between the presenting symptoms and the hospital arrival time of the ACS patients who were hospitalised in two different hospitals in Malang, Indonesia.

METHOD

We applied an analytical observation design with a cross-sectional approach. The sampling technique employed was non-probability sampling in which the study subjects were purposively selected and recruited. The study population was ACS patients who were admitted to the emergency department and hospitalised in Karsa Husada Batu General Hospital and Dr. Soepraoen district hospital in Malang, Indonesia. The data collection was conducted for 3 months starting between February and May 2018. Our study recruited 26 ACS patients. We utilised primary and secondary data for the purpose of this study. The primary data was obtained from structured interviews with the respondents, while the secondary data was generated from medical records. The data was analysed statistically using the Fisher test, except for the presenting symptom variables of quality and severity which were examined using the Chi-square test and the Spearman test respectively. All statistical tests used SPSS 23.0 for the Windows Evaluation Version program. The significance level was set up at 95% (p-value < 0.05).

RESULTS

Table 1 describes the characteristics of the respondents. Most of the respondents were older than 55 (53.8%), male (69.2%) and married (84.6%). More than half of the

respondents had completed their education at elementary or junior school level and worked in the private sector or were self-employed. The majority of respondents were diagnosed with non-ST-segment elevation myocardial infarction (NSTEMI) (84.6%). Health insurance was the major type of hospital payment used by the respondents (73.1%). Most of the patients were on their first attack (73.1%) and were admitted directly to the emergency department without a medical referral (73.1%). At the time of attack, most of the respondents were at home (92.3%) and with their family (84.6%).

Table 1: Characteristics of the study subjects (n= 26)

Variables	n	%

Table 2 presents the distribution of the respondents based on the presenting symptoms. The majority of the respondents reported that the symptoms were without any triggers (53.9%) by feeling a heavy pressure (50.0%) that was substernal (53.8%). The majority of respondents experienced non-spreading symptoms (53.8%) with a severity level between 7 to 10 (57.7%). Most of them reported having no accompanying symptoms (57.7%) with the present symptoms being intermittent (on-off) (53.8%).

Table 2: Distribution based on the presenting symptoms (n=26)

Variables of the Presenting symptoms	n	%

Time		
Continuous	12	46.2
Intermittent	14	53.8

From Table 3, most of the respondents (n=19) had a hospital arrival time of more than 120 minutes. This means that they came to hospital over 2 hours after the feeling of pain began. However, from the raw dataset, it was found that the average time interval was 7.6 hours (not shown in the table). Among the variables of the presenting symptoms, five variables including provocation, radiation, severity, accompanying symptoms, and time showed a significant association with hospital arrival time.

Table 3: The summary of the relationship between the presenting symptoms and the hospital arrival time of the ACS patients

Variables of presenting symptoms	Hospital arrival time		p-value
	<120 minutes n (%)	>120 minutes n (%)

DISCUSSION

From the sociodemographic characteristics of the present study, most of the ACS patients were male,

aged older than 55 years old, educated up to primary school/junior school level, were currently married, and were employed. For the presenting symptoms of ACS, most of the respondents complained about feeling a heavy pressure that occurred substernal but that did not spread to other areas of the body. While most of the respondents reported arriving at the hospital 2 hours after the presentation of symptoms, the average hospital arrival time was 7.6 hours. This high average hospital arrival time is quite alarming for the patient safety. An arrival time of more than 4 hours after the onset of the symptoms delays thrombolytic therapy, which reduces the opportunity for reperfusion.⁴ A study in Ireland reported that the average hospital arrival time of ACS patients was 4.06 hours, ranging from 2.7 hours for STEMI patients, 4.51 hours for N-STEMI patients, and 5.5 hours for AU patients.¹¹

Our study results found that the variables of provocation, radiation, severity, accompanying symptoms, and time were significantly associated with the hospital arrival time. Other variables of location (location of pain) and quality did not show a significant association with hospital arrival time. The variable of provocation reported that most of the respondents (n=14) experienced pain symptoms without a trigger. When the arteries constrict due to atherosclerosis, the heart may still get enough oxygen to pump blood when at rest. On the other hand, exercise increases the work of the heart and the narrowed arteries may not be able to supply enough oxygen to the heart. A person with a narrowed coronary artery may experience unstable angina while exercising or working hard.¹²

Most of the study respondents (n=14) also reported the pain not spreading to other areas around the chest such as the neck, back, arms, and upper arms. Three out of four patients diagnosed with STEMI experienced a spreading of the pain. Ischemic chest pain is classically described as spreading from the chest to one or both arms. A person with the presenting symptom of pain spreading from the chest to the shoulder or both arms is more likely to have ACS by 4 times.¹¹ However, no association was found between the spread of chest pain with hospital arrival time interval.¹¹

In our study, almost half of the respondents experienced pain symptoms on a scale of 7, 8, 9 or 10. A study by O'Donnell et al. found that the faster onset of ACS (marked by the presence of chest pain, symptoms that appear suddenly, persistent symptoms, and symptoms of severe pain) had a shorter hospital

arrival time interval of less than 2 hours.¹⁴ Patients with fast onset ACS are more likely to immediately seek help from the hospital than patients with slow onset ACS.¹⁴ Another study also reported that 20% of ACS patients immediately went to hospital after experiencing an increased level of pain.¹⁰

The presence of accompanying symptoms is associated with the hospital arrival time interval. This finding supports the results of a previous study, stating that ACS patients with accompanying symptoms of chest pain and diaphoresis were more likely to arrive at the hospital faster than those without accompanying symptoms.¹⁵ The sicker patients may seek treatment more quickly than lesser pained patients.

In our study, most of the respondents reported intermittent pain symptoms (n=14). Continuous pain is associated with a shorter hospital arrival time interval. This result confirmed the previous finding that continuous symptoms are significantly associated with shorter delay times related to hospital arrival in all groups (STEMI, NSTEMI, and AU).¹¹ In an ACS patient with typical angina, a feeling of tension is present in the retrosternal area, spreading to the neck, jaw, inter-scapular area, left arm, shoulder or epigastrium.¹⁶ In contrast, non-cardiac chest pain tends to be in the middle or lower abdominal area, in the chest area especially in the left ventricular apex or costochondral meeting and then spreading to the lower extremities.¹⁶

CONCLUSIONS

In this present study, more respondents arrived at the hospital after 120 minutes of presenting symptoms. The average hospital arrival time interval was 7.6 hours after the patients started to feel pain. The presence of triggers, the spreading of pain, the high level of severity, and the accompanying symptoms as well as continuous pain were associated with a shorter hospital arrival time interval. To reduce the hospital arrival time interval, patients and their families should be educated about the presenting symptoms. However, factors other than the presenting symptoms that may affect the hospital arrival time interval should be considered in future studies.

Factors Influencing the Husband's Participation in Pregnancy Care in Surabaya City, Indonesia

Nurul Fitriyah¹, Windhu Purnomo², Noviasari Reksohadi²

¹Doctoral Program of Public Health, ²Department of Biostatistics and Demography, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Pregnancy is an event starting from conception and ending with the onset of labour. To promote the maternal outcome of healthy mothers and babies, husbands are encouraged to increase their participation in pregnancy care. This study aimed to analyse the determinants of the husband's participation in pregnancy care. This study employed an observational analytic research methodology with a cross-sectional design. The study sample size was 20 pregnant women attending Mulyorejo public health centre in Surabaya city, Indonesia. The sample was selected using the random sampling technique. The respondents were the husbands of the recruited pregnant women. The data was collected using a self-reported questionnaire. The statistical test used was multiple logistic regression analysis. The results of the data analysis showed that the knowledge of pregnancy care and level of education were significantly associated with the husband's participation in pregnancy care (OR= 0.014 and OR=0.033, respectively). The variables of level of income and parity had no significant relationship with the husband's participation in pregnancy care. Motivating husbands to increase their support of pregnancy care is crucial to improving the positive maternal and neonatal health status.

Keywords: husband's participation, pregnancy care, antenatal care

INTRODUCTION

By 2012, the Maternal Mortality Rate (MMR) in Indonesia was still high at 359 per 100,000 live births. It decreased to 305 per 100,000 live births in 2015.¹ Meanwhile, the rate of attending the minimum four antenatal care (ANC) visits has decreased from 87.48% in 2013 to 85.35% in 2016.¹ The 2012 Indonesian Demographic and Health Survey (IDHS) reported that approximately 79% of men accompany their pregnant spouses to ANC.² This report also presented that about 68% of pregnant women selected health facilities as their place of delivery.²

To improve maternal and child health status, the Indonesia Ministry of Health (MoH) strongly

recommends a minimum of four ANC check-ups by health professionals.³ During ANC, the health professional measures the body weight and height, blood pressure and mid-upper arm circumference, and fundal height. Pregnant women receive tetanus toxoid immunisation, iron tablet, and health counselling.³ Health professionals provide health education especially related to pregnancy care, danger signs in pregnancy, childbirth preparedness, early breastfeeding initiatives and exclusive breastfeeding, neonatal care, and family planning advice.³ Pregnancy care is intended to help the mother maintain her health and the health of her foetus through promoting self-care behaviour such as bathing, cutting of the nails, cleaning their intimate organs, breast care, brushing their teeth, having the recommended prenatal care, adopting nutrition management, regularly doing pregnancy exercises and adequate rest.^{3,4}

Husbands are advised to accompany their wives during ANC.³ The husband is expected to recognise any signs of pregnancy complications and to actively arrange transport and the place for delivery.⁵ Knowing the danger signs in pregnancy is crucial to obtain immediate treatment and to prevent severe morbidity and mortality.^{6,7} Some studies highlighted the reasons

Email: fitri2111@gmail.com

of maternal death including delays in managing complications during labour due to delays of the husbands in making the decision to seek medical help in a health facility.^{8,9} A lack of communication between the husband and wife also affects the pregnancy outcome.¹⁰ A previous study on *Suami Siaga* or Alert Husband in Indonesia found that husbands who were engaged in discussions to arrange transport, a place of delivery, blood transfusion, and delivery cost were more likely to accompany their wives to ANC and tended to have their wives give birth in a health facility.¹¹

Surabaya is one of the biggest cities in Indonesia, with a population of approximately 2.9 million in 2015.¹² Surabaya has successfully decreased the maternal mortality rate from 119.15 per 100,000 live births in 2013 to 85.72 per 100,000 live births in 2016.¹³ In addition, approximately 96.6% of pregnant mothers had an ANC visit at least once.¹³ This success was partly contributed to by the Surabaya 1000 First Days of Life program, which aimed to educate engaged or newly married couples about reproductive health.¹³ Considering the significant role of the husband in promoting maternal health, the purpose of this study was to examine the determinants of the husband’s participation in pregnancy care in Surabaya city.

METHOD

We employed an observational analytic research study using a cross-sectional design. The study took place in the Mulyorejo sub-district of Surabaya City, East Java between October and November 2017. The sample population was 39 pregnant women attending Mulyorejo public health centre during the study period. Using a random sampling technique, we recruited 20 respondents to participate in the study.

The data collection was conducted using a self-reported questionnaire targeting the husbands of the pregnant women participating in the study. The independent variables included knowledge of pregnancy care, level of education, level of income, and parity. The dependent variable was the husband’s participation in pregnancy care (0=less participate, 1=fully participate). The data was statistically analysed using multiple logistic regression.

RESULTS

As shown in Table 1, most of the husbands fully participated in pregnancy care (65%). Most of them

also had good knowledge of pregnancy care (65%). The majority of husbands had a high level of education or had at least graduated from senior high school (70%) and had a high level of income. Most of them had 1 – 2 children (60%).

Table 1: Characteristics of the husbands

Variable	n	(%)
Husband’s participation		
Full participation	13	(65)
Lesser participation	7	(35)
Knowledge of pregnancy care		
Good	13	(65)
Poor	7	(35)
Level of education		
High education	14	(70)
Low education	6	(30)
Level of income		
High	15	(75)
Low	5	(25)
Parity		
1-2	12	(60)
3-4	8	(40)

Table 2 displays the relationship between the independent variables and the husband’s participation in pregnancy care. Knowledge of pregnancy care and level of education had an inverse association with the husband’s participation in pregnancy care. Husbands with a higher knowledge of pregnancy care were 71 times less likely to participate in pregnancy care (OR=0.014) than husbands with less knowledge of pregnancy care. Husbands with a high level of education were 30 times less likely to participate in pregnancy care (OR=0.033) than those with a low level of education. The other variables of level of income and parity had no significant association with the husband’s participation in pregnancy care.

Table 2: Multiple logistic regression of the husband’s participation in pregnancy care

Variables	Husband’s participation		p-value	OR
	Less participation n (%)	Full participation n (%)		
Knowledge of pregnancy care				
Low	1 (8.0)	12 (92.0)	0.004	0.014
High	6 (86.0)	1 (14.0)		

Conted...

Level of education				
Low	5 (83.0)	1 (17.0)	0.011	0.033

High	4 (27.0)	11 (73.0)		
Parity				
1-2	3 (25.0)	9 (75.0)	0.258	
3-4	4 (50.0)	4 (50.0)		

DISCUSSION

Knowledge of pregnancy care: The results of the logistic regression analysis showed that knowledge of pregnancy care was significantly associated with participation in pregnancy care. However, the higher the knowledge, the less they participated in pregnancy care (OR=0.014). Participation in pregnancy care was measured by the husband’s active support of their wife in maintaining a healthy life style throughout pregnancy, such as taking vitamin A and iron tablets, controlling their sugar and salt intake, eating nutritious food, and accompanying their wives to ANC visits. According to Baston and Jennifer (2012), pregnant women should gain weight, least 11-15 kg throughout pregnancy, eat healthy food, and consume supplementary food such as vitamin A, D, folic acid, and iron tablets.⁵ Pregnant women are restricted when consuming salt, no more than 6 grams a day, > 300 mg of caffeine per day, and no smoking or being exposed to smoke.⁵

Husbands may think that their wives also have good knowledge about pregnancy care, and therefore they expect their wives to know what to do without their involvement. A previous study in Kenya reported that the men’s reluctance to participate in prenatal care was due to the perception about the exclusive female role in pregnancy support.¹⁴ Another previous study in Indonesia reported that the husbands were busy at work, which limited their participation in prenatal care.¹⁵ On the other hand, the husband’s advice for their pregnant wives on not working too much had been considered sufficient participation in pregnancy care.¹⁵

The husband’s participation in pregnancy care may positively influence maternal health. The wives would be emotionally supported and motivated to maintain

their health by undertaking activities that are beneficial for pregnancy.¹⁶ The husband is the closest relative to the wife, and therefore has an important role in helping their wife to manage a healthy pregnancy.¹⁷

Based on this result, to promote the husband’s participation, despite the importance of knowledge in pregnancy care, improving the husband’s motivation to participate in prenatal care should be encouraged. Acquiring knowledge may lead to behaviour change, therefore motivating the husbands to take part in pregnancy care should be promoted.¹⁸

Level of education: Education is a strong predictor of ANC utilisation as reported in many studies.^{11,19,20} In this present study, level of education was significantly associated with the husband’s participation in pregnancy care. A study in Egypt found that the woman’s level of education was significantly associated with an awareness of the danger signs of pregnancy.¹⁹ The higher level of the husband’s education was associated with the provision of financial support to allow them to attend prenatal care as reported by a study in Myanmar (OR= 6.08; 95% CI: 1.48–25.97).²¹

Using the datasets from a nationwide survey, a previous Indonesia study found that a higher level of women’s education increased the chance of delivery in a health facility by 2.6 times (95% CI: 1.4–4.6), however, no significant association was found between the husband’s education level and their presence at ANC.¹¹ However, the results of our study showed that the high level of education reduced the chance of the husbands to participate in pregnancy care. Husbands with a high level of education were those who had completed at least the secondary level of education. This finding suggests that there might be other more influential factors such as culture and belief that affect the willingness of the husband to participate pregnancy care.²² Future studies are recommended to include the aforementioned factors when assessing the husband’s participation in maternal health care.

Other non-significant variables; income level and parity: Previous studies in Indonesia and elsewhere highlighted the significant relationship between level of income and parity with the involvement of the husband being involved in maternal health.^{11,20} Having a higher level of income increased the probability of the likelihood of the husbands participating in ANC

visits. Facility-based delivery decreased along with the increase of parity.¹¹ A study conducted in a sub-district of Sumatra, Indonesia, described the mother's resistance to having an ANC check-up because of being ashamed for having more than three children, being afraid of being scolded by the midwives, and feeling confident from their previous pregnancy.¹⁵ However, the results of our study found there to be an insignificant relationship between the factors of level of income and parity, and the husband's participation in pregnancy care. The small sample recruited in this study may affect this result.

Having more children means that the husbands have more responsibility when it comes to taking care of their families. The husbands may experience stress due to financial problems and were worry about the future and their abilities as the household leader which may affect their relationships with their wives and other family members.²³

In a patriarchal community, a husband as the household leader has the obligation to meet the family's needs, including taking care of his pregnant wife. Despite the insignificant factor of income related to the husband's participation in pregnancy care, the financial aspect is important to ensure the women's access to maternal healthcare. Adequate access to maternal health care is important to achieve positive maternal and neonatal outcomes.²⁴ To support their wives, husbands are expected to ensure that their wives having sufficient nutritional intake and other supplementary food for pregnancy, and have enough exercise and rest. The husbands should also provide their pregnant wives with comfortable clothes and shoes that enable smooth blood circulation.²⁵ Maternal complication may occur from mild to severe.²⁶ Some common complaints of pregnant women include headache, nausea and vomiting, urination, diarrhoea, and stiffness in the hands and feet (swelling and leg cramps). Therefore, the husband's support is important to help the wives feel comfortable and stay healthy.

CONCLUSION

The husband's knowledge of pregnancy care and level of education are significant factors involved in influencing the husband's participation in pregnancy care, as described from the results of our study. However, both level of income and parity were found to have no significant relationship with the husband's participation

in pregnancy care. A good understanding of pregnancy care, however, does not always motivate the husbands to participate. Similarly, a high level of education does not always promote the husband's increased participation in pregnancy care. Other factors of culture and belief may have an important roles in encouraging the husbands to be more attentive to their wives needs during pregnancy.

Health professionals in this area and other similar settings should promote health education and counselling about prenatal care by involving the husbands. Husbands who accompany their wives to a health facility for ANC should be invited to be with their wives during any health examinations. By doing so, the husbands will understand the health status of their pregnant wives and will have the opportunity to discuss with the health professionals about planning the delivery and family planning after childbirth. We recommend for future studies to include the factors of culture, belief, and access to health professionals in examining the husband's factors in association with their participation in pregnancy care.

ABSTRACT

Having the mother diagnosed with breast cancer may create difficulty for the family in relation to accepting it, especially for the daughter who cares for the sick person. This qualitative study aimed to explore the experience of the daughters of women with breast cancer and to understand the meaning of acceptance. The study employed a phenomenological approach by involving eight participants whose mothers were hospitalised with breast cancer in East Java. The data collection was conducted through a semi-structured interview. The data was transcribed verbatim and analysed using the Braun & Clarke method. Two themes emerged, namely (1) feeling the mothers' feelings, and (2) being sincere and surrendering to God. This findings reflect the empathy of the daughters and their faith and cultural background as Javanese Muslims. Health professionals are recommended to provide mental and spiritual support for the daughters to help them in the acceptance process.

Keywords: *acceptance, breast cancer, mother-daughter, feelings*

INTRODUCTION

Breast cancer is one of the leading causes of death among women around the world.¹ Among all cancer cases, breast cancer contributed to 43.3% of new cases and 12.9% of deaths.¹ In Indonesia, the estimated mortality rate of female breast cancer was 41% out of the female breast cancer incidence rate of 48,998 cases in 2012.² According to the Indonesian Ministry of Health (MoH), East Java ranked with the second highest number of breast cancer cases in Indonesia.³

Upon being diagnosed with breast cancer, the patients develop physical and emotional changes which

can affect their family members. Psychological changes also affect the family well-being from providing complex care for the patients with breast cancer.⁴ Providing family support for breast cancer patients includes family attitude, actions and the acceptance of the patient's condition.⁴ Acceptance is the stage when someone accepts the fact that the loved one has physically gone, and acknowledges the reality that is experienced.

Nurses as the professional caregiver have the role of preventing negative internalisation and facilitating the acceptance process.⁵ Nurses may emphasise giving empathy to the patients and their families by looking at the situation from the person's perspective, and adjusting to their diverse responses.⁵ Based on our preliminary study in the chemotherapy room of Dr. Soepraoen's Hospital in Malang, Indonesia, breast cancer accounted for 88% of cancer cases. All cancer patients were accompanied by their adult daughters.

A previous study reported that adult daughters who care for their mothers with cancer experienced active coping adaptations, omission behaviour, self-

blaming behaviour, and difficulties in care.⁶ Their study underscored the need for nurse-adjusted interventions in order to consider the unique psychosocial characteristics of the adult daughters as the primary caregiver for their mothers when fighting breast cancer. Understanding the daughter's acceptance of the mother's condition with breast cancer will help the nurses to make appropriate adjustments in the nursing intervention. Therefore, our study aimed to explore the meaning of the daughter's acceptance from their experience of caring for their mothers with breast cancer.

METHOD

This present study used a phenomenological approach to describe the phenomenon. Eight daughters who cared for their mothers with breast cancer at Dr. Soepraoen Hospital, Malang, Indonesia were recruited. Other inclusion criteria when selecting the study participants included being of an age between 20 to 40 years, living together with the mother, having completed at least a secondary level of education, and having cared for their mothers who had been diagnosed with breast cancer of a minimum stage 2 for at least 2 months. The participants were given information about the study and their right to withdraw from the study at any time. All participants submitted written consents before the interview.

The data collection was conducted using a semi-structured interview with the researchers acting as the main instrument. The interviews were conducted throughout May 2017 at the participants' homes for their convenience. The interviews lasted about 60 minutes each, and they were tape-recorded and transcribed into text. The researcher also made notes to help to complete the data. The data was analysed through several steps as suggested by Braun & Clarke (2013), including getting familiar with the data, coding, selecting the themes, analysing the themes, determining the themes, and formulating the results.⁷ The data was validated by applying the transferability, dependability, confirmability, and credibility as suggested by Lincoln and Guba (1985).⁸

RESULTS

The characteristics of the study participants have been shown in Table 1. Most of the respondents were aged between 26-30 years old (62.5%), had completed senior high school (62.5%), and were housewives

(37.5%). Most of the respondents had not yet married (62.5%) and lived in the Malang district (50.0%).

Table 1: Sociodemographic characteristics of the study participants

Variables		N (%)
Age	– 25	2 (25.0)
	26 – 30	5 (62.5)
	> 31	1 (12.5)
Education	Senior high school	5 (62.5)
	Higher education	3 (37.5)
Employment	Unemployed	2 (25.0)
	Housewife	3 (37.5)
	Self employed	1 (12.5)
	Employed	2 (25.0)
Marital status	Single	5 (62.5)
	Married	3 (37.5)
Place of residence	Malang district	4 (50.0)
	Pasuruan district	1 (12.5)
	Blitar district	1 (12.5)
	Malang city	1 (12.5)
	Probolinggo district	1 (12.5)

As shown in Table 2, most of the mothers of the participants (50%) had been diagnosed with breast cancer for 6 – 12 months. Most of the patients had been undergoing surgery and chemotherapy (87.5%). The majority of the patients relied on medical treatment only (62.5%).

Table 2: Characteristics of the mothers of the study respondents

Variables		N (%)
Duration of the illness since diagnosed (months)	3–6	2 (25.0)
	6–12	4 (50.0)
	>12	2 (25.0)
Stages of cancer	Stage 2	3 (37.5)
	Stage 3	2 (25.0)
	Stage 4	3 (37.5)
Intervention	Chemotherarapy	1 (12.5)
	Chemotherapy and surgery	7 (87.5)
Type of treatment	Medicine only	5(62.5)
	Medicine and alternative	3 (37.5)

From the analysis of the interview transcripts, two themes emerged, namely 1) feeling the mother's feelings, and 2) being sincere and surrendering to God. Each theme had two subthemes, as described below.

Theme 1: Feeling the mother's feelings

Most of the participants revealed that their close relationship with their mother made them feeling their mother's suffering upon being diagnosed with breast cancer. At this point, the daughters expressed their feelings in relation to dealing with the painful reality and their empathy toward their mother's condition.

Subtheme 1: facing the painful reality: Being diagnosed with breast cancer is a painful reality for any woman and their closest relatives. The daughters described their feelings of helplessness, yet they were also trying to endure the suffering. The first category that emerged in this subtheme was unpleasant shocks. The participants felt disbelief after learning that their mothers had developed breast cancer.

"The doctor said (that) my mother had a breast cancer. I was so shocked" (P1, line 49).

"How come my mother can get this disease?" (P7, line 98).

The second category reflects the participants' helplessness at accepting their mother's illness, as represented in the following statement.

"It is hard to accept (this reality), but what can I do?" (P1, line 58).

Subtheme 2: Being empathic to their mother's conditions: In this subtheme, the participants described their feeling of worry over their mother's condition. The first category in this subtheme was being worried about their mother's illness. The participants expressed their worry about their mother's chance of survival.

"I am afraid that my mother will never recover". (P8, lines 33 and 99).

"I can't imagine if she will leave us so soon". (P3, line 77).

In the second category, the participants expressed their extraordinary feeling of empathy for the painful condition that their mothers were suffering from.

"When she complained about the extreme pain, it is hard to tell how much I could feel it". (P 1 line 175)

"I felt (that) I could not see her suffering". (P5, line 150).

The third category in this subtheme was that the participants told the researcher about harbouring their sadness due to their mother's condition.

"I often secretly cried". (P6, line 166)

"I tried to be strong in front of her". (P7, line 118).

Theme 2: being sincere and surrendering to God

The participants described their experience in going through the illness and caring for their mothers with breast cancer with sincerity. The condition also enhanced their faith, as they surrendered to God with hope.

Subtheme 1: going through the illness: In dealing with the reality of their mother's condition, the participants expressed how they tried to accept the illness. They considered that the illness was a part of the life process, and that they must sincerely care for their mothers.

"I tried to accept this with my heart and care for her with sincerity". (P4, line 153)

"Life is like this... just go with it". (P1, line 223; P5, line 252)

Subtheme 2: Surrender to God: In this subtheme, the first category was asking for help from God. They believed that all diseases are from God as a trial in the lives of human beings (P 2). They also believed that all diseases have a cure and that only God can provide the cure.

"*Bismillah* (A Muslim's word which means in the name of God), I give up this fate to God. He create diseases, so He also provides the cure". (P7, line 134, 243, 278).

The participants also stated that they have increased their spirituality as a way of hoping for a miracle cure for their mother's survival, as well as to gain strength when caring for the sick person (P1, P4, and P7).

The second category was patience in caring. In understanding the severity level of the illness and the long clinical course of breast cancer, the participants expressed the need for patience when caring for the mothers.

“We expect the best for her, so we must be patient”. (P2, line 301).

The third and the fourth category in this subtheme was the decision to surrender to God and preparing for the worst. The participants considered that despite all efforts and treatment, anything could happen if God is willing. Therefore, they should prepare themselves to accept whatever situations they face ahead.

“Just surrender, whatever will be...” (P5, line 231; P8, line 255).

“Anytime we can lose her, so just get ready”(P5, line 204).

DISCUSSION

Feeling the mother’s feelings: This theme reflects the inner resistance of the participants in understanding their mother’s breast cancer. This first stage of grieving helps someone to overcome and survive. At this stage, rejection is usually only a temporary defence. Denial helps to accelerate the feelings of sadness.⁹ In the next stage, there is anger. Anger is an emotion that is most often used to manage loss. When diagnosed with a terminal illness, a person may express anger at themselves, their relatives, health workers, and even God.¹⁰ For the family, they feel sad at the possibility of losing their loved ones.¹¹

The daughter of a woman with breast cancer can feel loss due to the mother’s physical changes and the possibility of death.¹² After experiencing the loss, some may develop a stage of depression, and then start to accept the new life condition.^{9,13} Many factors influence the whole process including self-understanding, expectations, environmental barriers, social attitude, emotional stress, advice from others with good self-adjustment, self-perspective, and self-concept.¹⁴ The family’s acceptance influences the self and social adjustment.¹⁵ In social adjustment, in the acceptance stage, the family will be able to accept, pay attention, have feelings of tolerance, show empathy and sympathy and want to help the sick person, which is the beginning of the healing process.¹⁴

Being sincere and surrendering to God: Sincerity, in other words, reflects the nature of being genuine, and letting go, which refers to the process of releasing all forms of feeling. Sincerity is also understood as an acceptance condition.^{16,17} In this study, being sincere

is interpreted as acceptance by the participants. In Javanese culture, the ethnicity of the study participants, sincerity is defined as accepting the conditions with a whole heart.¹⁶ In addition, as Muslims, the participants may also intend to have the pure intention of expecting God’s approval from doing deeds including caring for their sick mothers. This concept is similar to the concept of letting go, as proposed by Corey (2005). Letting go relates to the release of emotions that interferes with one’s social relationships.¹⁸

Surrender was interpreted by the participants in relation to their cultural background as Javanese Muslims. It referred to their helplessness in facing God’s supremacy. In this culture, a human being should submit to God’s rules and decisions.¹⁹ Therefore, a person should worship God and pray when expecting help from God.²⁰

Being sincere and submissive is a mental condition that relates to the ideology of being a servant of God. Developing sincerity and surrendering their hope to God is a spiritual approach that can be used by the daughters to cope with their mother’s condition. Although most people may express their acceptance of the sick person because of the family relationship, the response may be different. This response explains how the pattern of a family can adapt to the different individual’s situation.²¹

Families with a member that has been diagnosed with cancer have an exhaustive experience with many sacrifices from various aspects of life to make.²² This situation demands that the family be prepared for the worst condition, feel frustration, and accept the threat of loss.²³ The acceptance of the family, especially the daughters’ girls, will provide them with the “energy” and confidence to try to improve each of their abilities.^{6,21}

CONCLUSION

Two themes that emerged in this study were (1) feeling the mothers’ feelings and (2) being sincere and surrendering to God, reflecting the participant’s journey when facing the reality of their mothers experience with breast cancer and coping with the conditions. As daughters, the participants feel dreadful upon learning of their mother’s diagnosis of breast cancer but then developed acceptance through their faith in God and their principles related to life in the Javanese culture. Therefore, we suggest that nurses and other health professionals in the hospital should provide mental and spiritual support for the family members, especially the daughters who care for their sick mothers.

Mapping Customers: A Case Study of a University Hospital in Indonesia

Purwaningsih¹, Nyoman Anita Damayanti², Nasronudin³, Thini Nurul Rochmah²

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia

ABSTRACT

Hospitals as health providers seek to understand the customers' needs concerning the healthcare services. The success of the hospital management depends on how the hospitals meet the customer's needs by understanding the situation and conditions of the customers, including knowing where the customer lives. This study aimed to obtain a geographical map of the hospital's customer's residences based on the sub-districts in Surabaya city. A formal survey method was employed by using the secondary data obtained from the Medical Record Unit of Airlangga University Hospital. The sample size of the data was 10% of the number of patients from each year; 2015, 2016, and 2017. Simple random sampling technique was employed by using computer-generated selection. The data was entered into GIS mapping software. The results were shown in the form of a geographical map to observe the customer's distribution. The use of customer mapping is useful to support the leaders of the hospital management in making a business plan, including the expansion of the healthcare services offered and increasing the number of customers from other potential areas of residence.

Keywords: mapping, hospital customers, geographical information system, trade competition

INTRODUCTION

Healthcare service is one of the growing sectors in economy. Despite various negative opinions against free trade in healthcare, liberalisation in the health sector has enabled there to be consequences for national policy makers and health providers when it comes to meeting the population needs.¹ To survive the trade and service competition, health service institutions should understand the customer's needs. Customers are central to the service business and should be involved in the production process.² They have a crucial role in bridging with the providers so then the service product is known and accepted by the wider community.² Likewise, hospital services also depend on the value of

the customers, both internal and external. In general, a customer as defined by the dictionary as a person or an entity who purchases goods or services produced or delivered by a business.

Despite the different conditions that sets them apart from other general customers, patients are the customers of a hospital or given health provider who receive the service after payment. By definition, a patient is a person receiving healthcare and medical treatment under a physician's supervision.³ Patients, as the hospital customers, are different from other business customers because of their diseases or injuries that make them vulnerable, afraid, pained, where they become drug dependence, feel fatigued and experience confusion. On the other hand, in certain circumstances, patients have to make complex decisions about life and death in a short period of time. Buying hospital services is intended to improve their health status. However, in some cases, the outcome of the service is uncertain due to multifactorial influences.

As a business entity and healthcare provider, the hospital should be able to provide the required treatment that is unique for each individual based on the diagnosis

given by the physician. The service starts from the time of the patient's admission, throughout the hospital stay, until their discharge from the hospital. Providing satisfactory healthcare service to the patients leads to higher customer satisfaction which is associated with adherence to the medical treatment provided and the continuity of care.⁴ Therefore, understanding the customers' background and expectations is crucial for the hospital in order to meet their needs and to satisfy their patients. Mapping the patient's location of residence is one way to understand the customer's background. By mapping the patient's location, the hospital will find it easier to observe the distribution of customer territory based on their real situation on a local map. Social mapping is conducted to find information related to the sociodemographic characteristics in a specific area in order to support the decision-making process.

The use of social mapping in decision-making is beneficial to inform individuals of the current position of society and to plan what actions are required. Airlangga University Hospital is a public healthcare entity that provides secondary and tertiary levels of care, established in 2011. It is located at the heart of Surabaya city, the second largest city in Indonesia. The city population was nearly 2.95 million in 2015.⁵ There are 59 hospitals and 103 specialist clinics that provide secondary and tertiary levels of healthcare.⁶ Since the implementation of the national health insurance (NHI) scheme in 2014⁷, other private and public hospitals also affiliate with the NHI agency in order to receive more patients. Other than that, all public and private hospitals are allowed to receive self-payment from patients. Although Airlangga University Hospital is a public entity with a non-profit orientation, the hospital should apply a strategic business plan to provide the customers with excellence and to improve the hospital business performance as indicated by an increased patient volume. Creating a social map of the hospital customers would help the hospital to plan health services that comply with the medical care standards as well as having a better customer orientation. Therefore, this paper aimed to describe the geographical distribution of the hospital's customers through the map-making process and its implications for hospital decision-making.

METHOD

The map-making process was done by using Geographical Information System (GIS) software.

The general purpose of mapping was to obtain a geographical description and to estimate the potential of the region. The hospital customer map allows for there to be observations of the patient volume from each sub-district and the potential services offered by the hospital.

The process was initiated by collecting the secondary data of the patients admitted to Airlangga University Hospital between 2015-2017. The source of the data was the patient's medical records. We generated the data from 10% of the number of patients each year, with an equal composition of patients admitted to the emergency department, outpatient units and inpatient units. The data sampling was done through computerised simple random sampling. As not all of the patient's residence information contains a zip code, the data collected was based on the sub-districts within the administrative territory of Surabaya city.

RESULTS AND DISCUSSION

Surabaya city is administratively divided into 31 sub-districts with a total land area of 350.5 square kilometres.⁵ Airlangga University Hospital is located in Mulyorejo sub-district. In this study, we included the data of 5,647 patients admitted between 2015-2017. The details of the sample size from 2015 to 2017 were 795, 1,735, and 3,117 respectively. From this data, we observed a remarkable annual increase of patient volume by 218% in 2016 and 170% in 2017. Overall, about 89% (n=5,024) of the sample subjects were from Surabaya city, while 11% were patients from other cities.

The hospital customer maps of 2015, 2016, and 2017 from Surabaya city were generated three maps. The legend on the right of the map presents the number of patients from each sub-district. We applied four scale categories based on the number of patients in each sub-district in shades of grey colour, as follows: 1) Very light grey: 0-50 patients; 2) Light grey: 51-150 patients; 3) Dark grey: 151-300 patients; 4. Very dark grey: > 301 patients.

From the first map, two sub-districts contributed 51-150 patients, while five sub-districts contributed 151-300 patients. The largest number of patients was contributed by Mulyorejo and Kenjeran sub-district. This map reflects that in 2015 the major customers of the hospital are the people living nearby to the hospital.

In the second map, there were 3 sub-districts that were light grey, 5 sub-districts that were dark grey, and 1

sub-district that was very dark grey. The largest number of patients were from Mulyorejo sub-district and other nearby sub-districts. The increased number of patients from 2015 to 2016 seems to largely be from the same sub-districts near to the hospital. A significant increase in the number of patients was also observed from Rungkut sub-district.

As shown in the third map, there were 4 sub-districts that were dark grey and 3 sub-districts that were very dark grey. In 2017, most of the customers of the Airlangga University Hospital came from Tambaksari sub-district, Mulyorejo sub-district and Gubeng sub-district. These three sub-districts are among the sub-districts where there is a high proportion of the population from the middle and upper level of income in Surabaya city.⁵ It reflects the increased acceptance of the hospital of patients across all levels of income, which in turn increases the market potential of Airlangga University Hospital.

As shown from the first to third map, the expansion of the utilisation of Airlangga University Hospital was represented by the increased number of patients annually. Within the area of 10 kilometres, there are 10 other government and private hospitals with a bed capacity ranging between 100-600. Most of the hospitals are teaching hospitals which have been operating for 5-30 years. As a business entity, Airlangga University Hospital is competing with those hospitals when it comes to providing a quality healthcare service, especially for the population of Surabaya city itself. In 2015-2016, the branding of Airlangga University Hospital targeted the lower and middle income population. It was expanded to target the upper income population as well in 2017.

According to McCarthy et al. (2016), the benefits of patient mapping are to support the planning of healthcare solutions by the multidisciplinary stakeholders in order to improve the hospital's performance and patient satisfaction, as well as to alleviate the current constraints in the healthcare service.⁸ Mapping involves a simple and appropriate visualisation of information that will help stakeholders to engage in the service, to collectively determine the objective and to monitor progress.⁹ The results of the customer mapping can be used by the executive board of Airlangga University Hospital as a tool to support the development of a marketing strategy plan. The hospital's marketing strategy is useful to determine the customer's needs, which can be implemented through

three stages including the selection of customer targets, the identification of customer expectations and the decisions of the marketing strategies. Based on these strategies, Airlangga University Hospital could prepare specific facilities based on the needs or expectations of the targeted customers. In addition, the hospital also requires applying quality control with a competitive price, while providing a comfortable environment for the patients to improve their experience when using the services of the hospital.

CONCLUSIONS

Customer mapping is important to support the hospital management when developing a business strategic plan. The map contains the geographic distribution of hospital patients, which can visually inform the stakeholders of the situation and condition of the hospital customers. The map is useful to help develop marketing strategies with an ultimate goal to increase patient volume. From the maps generated from the medical record data of 2015-2017, the market share of Airlangga University Hospital has been expanded from the low and middle income communities to the upper income communities as well. From the customer mapping results, Airlangga University Hospital should continue improving their service quality, competitive pricing, and promoting the utilisation of the hospital services while providing a comfortable environment for a better customer experience. This can be achieved by improving the quality of the human resources, providing an efficient and effective care service, and setting a hospitality standard in addition to the standard operating procedures.

Structural Model of the Factors Related to the Family Resilience of Stroke Patients in Indonesia

Nikmatul Fadilah¹, Kusnanto², Nursalam², Minarti³, Asnani³

¹Doctoral Program of Public Health, Faculty of Public Health, ²Faculty of Nursing, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; ³Diploma III Nursing Program Campus Sutopo, Polytechnic of Health, Ministry of Health, Surabaya, Indonesia

ABSTRACT

This study aimed to develop a family resilience model to improve the quality of life of families with stroke patients. A cross-sectional quantitative study was employed to measure the data from 130 families. Structural equation modelling (SEM) was used to examine the relationship between the variables. The analysis method of Partial Least Square (PLS) was used to evaluate if the proposed model is suitable for the data based on goodness-of-fit. The family resilience model focused on the quality of life of a stroke-impaired family has been compiled with the variable modelling comprising of family crisis, stress management, and family resilience. The achievement of high family resilience was followed by improving the quality of family life with stroke in the domains of physical health, psychological, social and environmental. Family health efforts related to primary health care is expected to increase family resilience and quality of life.

Keywords: family resilience, family crisis, post-stroke patient, quality of life

INTRODUCTION

Some sequelae of stroke, such as hemiparesis, lisp, swallowing difficulties, aphasia and confusion, commonly occur in stroke patients. Such alterations can cause stress to the stroke patients and to their family, who will look after them during follow-up care at home. The alteration of the physical condition of post-stroke patients especially that which leads to disability, will cause them to face obstacles in activities of daily living, making them dependent and affecting their quality of life¹.

Basic health research (*Riskesdas*) data from 2013 showed that the prevalence of stroke disease in Indonesia increases with age. The highest number of stroke cases diagnosed was in those aged 75 years old and over (43.1%). The prevalence of stroke based on sex was dominated by men (7.1%) compared to women

(6.8%). Data from the East Java Health Office in 2012 states that the most common in-patient diseases for type A hospitals was stroke with 5,103 people. This was the same with type B, C, and D hospitals with 6,575 people, 3,573 people and 548 people respectively².

Families experienced anxiety and had symptoms of sadness, palpitations and insomnia. Another threatening stressor for the family was the alteration of their economic status³. Bakas et al. states that the family usually ignore their health condition and generally, the health care providers also do not give them too much attention during the treatment⁴. The family should get attention and support from the health care providers regarding their needs in order to keep healthy, so they can give optimum support to their family in terms of information, and emotional support and appreciation⁵.

The family must be prepared from the early acute phase of the disease up to their discharge from hospital, including the follow-up treatment at home. A study concluded that the family will be motivated and ready to provide care at home through discharge planning⁶. In relation to stress management through health education efforts, of which discharge planning is one, it can enhance effective and adaptive coping of the family³. Effective and adaptive coping can lead the

family to achieving strong family resilience and making them feel comfortable.

The purpose of this study was to establish a structural model of the factors related to family resilience in relation to stroke patients in Indonesia.

METHOD

The study used a cross-sectional design. The sample size was 130 family members determined by rule of thumb and Structural Equation Modelling (SEM). The sampling method used multi-stage sampling. The instruments were questionnaires created by the researchers, based on the family adjustment and adaptation response (FAAR) model and the theory of chronic sorrow towards the family crisis in determining the factors related to the family’s resilience to managing their changed quality of life.

Descriptive data analysis was used to identify the factors related to family resilience and quality of life through a distribution table, complete with the frequency and percentage of the measured aspects. Inferential analysis was used to test the empirical model and research hypothesis through SEM, both variance and component-based, namely Partial Least Square (PLS). The structural model was analysed. The variable indicators were stroke patient characteristics (X1), caregiving family member characteristics (X2), health care service facilities (X3), family crisis (X4), family stress management (X5), family resilience (Y1) and family quality of life (Y2). The model analysis was used to identify the value of variation possible in implementation, and the effect of the communal value and the structural equation was also obtained.

RESULTS

Outer Model Analysis

a. Convergent Validity: There are several aspects of the variables which were invalid, including all stroke patients characteristics indicators,

Analysis of the Structural Model (Inner Model)

allfamily characteristics indicators, health care service facility (affordability), and family crisis (stressor and daily conflicts). However, some variables were valid including health care service facility (service quality), family crisis (obstacles, family source, and coping behaviour), as well as all indicators of family stress management, family resilience, and the quality of life.

b. Construct validity and reliability

Table 1: The results of the construct validity and construct reliability test

No.	Variable	AVE	Composite Reliability
1.	Stroke patient characteristics	0.264595	0.426210
2.	Family characteristics	0.277548	0.019303
3.	Health care service facility	0.602949	0.738556
4.	Family crisis	0.355683	0.240245
5.	Family Stress management	0.564901	0.784398
6.	Family resilience	0.668866	0.857929
7.	Quality of life	0.483143	0.778375

Table 2 shows that the AVE value in the variables of family stress management, health care services and family resilience have a value of more than 0.5, while in the variables related to the family characteristics and stroke patient characteristics, family crisis and quality of life have a value of less than 0.5. The table also shows that the construct variable has a composite reliability value greater than 0.7 in the variables of family stress management, health care service, family resilienceandfamily quality of life. The other three, encompassing family characteristics, stroke patient characteristics and family crisis, have a value of less than 0.7.

Table 2: The results of the Structural Model T-test (Inner Model)

Correlations among variables	Original Sample (O)	T Statistics (O/STERR)	Note
Stroke patient characteristics →Family crisis	0.221435	0.813264	No correlation
Family characteristics→Family crisis	0.093529	0.516141	No correlation

Conted...

Health care service facility → Family crisis	0.235837	1.569035	No correlation
Family crisis → Family Stress management	0.598633	2.899285	Significant correlation
Family Stress management → Family resilience	0.834907	22.16833	Significant correlation
Family resilience → Quality of life	0.785455	18.20447	Significant correlation

Goodness of Fit Test

Table 3: R square Value

No.	Relationship among variables	R Square
1.	Stroke patient characteristics, Family characteristics, Health care service facility → Family crisis	0.128
2.	Family crisis → Family stress management	0.358
3.	Family stress management → Family resilience	0.697
4.	Family resilience → Quality of life	0.617
	Q ² = 0.93503	
	GoF = 0.454809 (large)	

Based on the R square values, the biggest value is family stress management towards family resilience with a value of 0.697, while the smallest influence is the stroke patient characteristics, family characteristics and health care facilities towards family crisis with a value of 0.128.

DISCUSSION

Stroke patient characteristics towards family crisis:

The results of the study show that the stroke patient’s characteristics do not affect the family crisis. Inferential analysis concluded that the characteristics of the stroke patients do not affect family crisis. The family has the moral obligation to deliver care to the stroke patient as this gesture reflects the social structure of Asian society, including Indonesia. Xu & Ou stated that Chinese culture determines that the younger family members are responsible for the care of the older ones, particularly the most elderly members⁷. The social and cultural condition of the respondents in this research were almost identical to that of Xu & Ou, whereby the culture of family in Asian society remained solid⁷.

The Characteristics of the Family Towards Family Crisis:

The characteristics of the patient’s family does not affect family crisis. Family, as the patient’s caregiver, sees that the needs and health condition of their stroke-affected family member is to be prioritised over their own needs. The position of wife or daughter guarantees

that they sustain their function as a caregiver to their husband and parents. A study conducted by Cao et al also determined the position of the wife as the primary caregiver for the stroke patient⁸. Also, the respondent’s level of education is therefore quite sufficient for the caregiver to comprehend and execute their role as a caregiver adequately. The supporting statement over such a situation was conveyed by a study that the higher the level of education of the caregivers, the better they can comprehend something including their role as caregiver, as instructed by health officials⁹ understand more about their work conditions, and identify any links to negative outcomes among their senior clients. Ninety-eight paid caregivers (eighty-five female and thirteen male.

Regarding the health problems, the demands of the caregiver to be consistently delivering care to the stroke patient sometimes leads them to pay more attention to their own health situation over the patient’s healthcare needs, or they tend to ignore scheduled visitations to medical officials during the recovery phase of the stroke-affected family⁴.

Healthcare Facility Towards Family Crisis: Families in this research were primarily in an urban society (Surabaya city) with a relatively short mileage involved and reliable access to transportation, widely available to reach out to a medical facility. Similar was also conveyed by a study that families with a stroke patient member had been generating benefits from a nearby health facility in the form of medication and treatment¹⁰ recovering stroke patients (11 male, 8 female.

The families conveyed that the quality of the healthcare service received through medication and the treatment of their family member was favourable (98.5%). Most of the families had been involved during the treatment of their family member with a stroke since hospitalisation, and stated that they received counseling at the hospital. The research of Lutz stated that patients and the family of the strokepatient did not comprehend the role that they were to be charged with after the *discharge planning*¹⁰ *recovering stroke patients (11 male, 8 female)*. A study expressed the distinct condition that *discharge planning* increases the readiness of the family to deliver care at home¹¹.

Family Crisis Toward Family Stress Management:

The outcome of this research shows that family crisis caused by daily conflict was infrequent (86.2%), family hindrance was in the mild category (82.3%), and there was an average level of family stressor (62.3%). The research of Ostwald inferred that a stroke attack was a significant predictor of stress for the stroke patient and their family. The surge of stress was triggered by the malfunction of their family role. The main stressor for stroke patients and their family was the economic factor (100%)³.

Family resource was mostly adequate (81.5%) and the coping behaviour of the family was in both the plausible (50.8%) and sufficient category (45.4%). Family resources can be defined as an economic and psychological power (life motivation). A study carried out in Hong Kong mentioned that religious tradition and the philosophy of the local culture has contributed to the reconstruction of post-stroke life purpose¹² including Hong Kong. The stroke event leaves stroke survivors experiencing great distress as they struggle to regain physical ability and develop a frame of meaning. In a Chinese context, several religious traditions and secular philosophies including Buddhism, Daoism, Christianity, and Confucianism contribute to reconstruction of a meaningful post-stroke self. Symbolic interactionism interpreted by Charmaz (1987). Social resources or the available environmental and spiritual resources will reconnect the richness of spiritual belief and spiritual practice for the stroke patient. The condition of stroke society in this research was identical with the research carried out in Hong Kong. Asian society, including Indonesia and Hong Kong, is deeply attached to culture and spiritual belief, related to caring for a suffering family member, primarily an elderly member as the devotion of the younger to the older member particularly.

Family Stress Management Towards Family Resilience:

The result shows that the stress management of the family influences family resilience. The support of the patient's family was realised through an intense discussion of the patient's disease, transferring support/motivation, constantly caring for the patient and establishing a comfortable environment, as well as complimenting patient's participation during treatment. It corresponds with a study stating the family support during hospitalisation is important for stroke patients. Nevertheless, informational support did not clearly mentioned the actual condition of the stroke severity because the patient was in the acute phase of treatment⁵.

The family data related to facilitating the activities of stroke patients in their neighbourhood was nearly equal with a distribution of less than 36.9%. It requires extra energy for the caregiver and additional facilities, such as a wheelchair, to be able to mobilise a stroke patient with a disorder of the limbs. This condition resembles the findings of Chow and Becker that stroke attack may cause a physical disorder. The development of a change in the patient's life motivation may trigger distress¹² including Hong Kong. The stroke event leaves stroke survivors experiencing great distress as they struggle to regain physical ability and develop a frame of meaning. In a Chinese context, several religious traditions and secular philosophies including Buddhism, Daoism, Christianity, and Confucianism contribute to reconstruction of a meaningful post-stroke self. Symbolic interactionism interpreted by Charmaz (1987).

Family Resilience Towards Quality of Life:

The research outcome pointed out that family resilience is influential towards the quality of the family and made it as the greatest score in comparison to the other domains. This particular condition shows that families have the ability to organise their internal factors maximally. The data from the family with stroke resilience pointed out that psychological resilience was the indicator with the greatest percentage (83.1%). Families who reached a higher resilience had a higher probability of achieving family goals; to be a happy, harmonious, wealthy, and qualified family¹³.

The results of the research into life quality pointed out that almost all of the respondents were equipped with prime psychological health (97.7%), with a major part being prime social relationships (78.5%) and having a supporting environment (66.9%). The lowest percentage

was the physical health of the prime caregiver (58.5%). Psychological health attained by the family at a higher level shows the fact that the family has the ability to manage the patient's emotions to produce positive self concepts and a feeling of satisfaction towards the achieved skills in relation to the fulfilment of the family needs (delivering care to the family member with a stroke). This family satisfaction is actual proof that the family is able to achieve one of the family life goals, which is to care for a family member who has suffered from a stroke.

CONCLUSION

The model of family resilience towards quality of life has been arranged with a constituting model variable consisting of family crisis, stress management, and family resilience. The fine ability to judge if a family crisis has resulted in unfavorable stress management was shown through the ability to respond to physical treatment, deliver internal support, and facilitate the stroke patient's activities in their surroundings. The attainment of family resilience is followed by an increase in life quality for families with stroke in a variety of domains including physical fitness, psychology, social aspects and the environment.

A Gender Analysis of Traditional Contraceptive Use in Sikka District, East Nusa Tenggara, Indonesia

Rut Rosina Riwu¹, Sarci Magdalena Toy¹, Daniela L. A. Boeky¹, Conrad L. H. Folamauk²

¹Faculty of Public Health, ²Faculty of Medicine, University of Nusa Cendana

ABSTRACT

Introduction: This study aimed to describe traditional contraceptive methods and to analyse whether a gender gap exists in the concept of traditional contraceptive use.

Method: This research used a descriptive method by way of an in-depth interview technique. The 10 respondents selected consisted of three *hattra* (traditional contraceptive service providers) and six women and one man as the service recipients. This research was carried out in Talibura, Sikka District. The gender analysis technique used was the *Longwe technique*.

Results: The traditional contraceptive methods available were concoctions and a massage with herb oils to “reverse the womb”. The use of concoctions consisted of a mixture of medicinal herbs and dried ant-lions. It was found that there was no gender gap in the use of traditional contraception as the husband and wife both consume the concoctions given by *hattra*. No side effects were experienced during the use of traditional contraception.

Conclusions: Traditional contraception may be emerging as a new solution to help the government in suppressing population growth, especially in rural areas. A further qualitative research on its effectiveness and community satisfaction is required before introducing this new type of contraception worldwide.

Keywords: *contraception, traditional, method, gender, analysis*

INTRODUCTION

One of the factors that commonly occurs regarding the contraception in remote areas is the difficulty encountered when it comes to accessing health facilities due to their unreachable distance or due to the cultural factor adopted in each region. The deep patriarchal culture in almost every region in Indonesia is often used to treat women badly, as they are the victim of gender disparity. Women tend to be unconditionally obedient to their husbands over the use of contraceptive tools, therefore it is unsurprising if the dominant participants of the family planning programs are women instead of men¹.

The sub-district of Sikka in the East Nusa Tenggara province is an area that is popularly known for its

richness of medicinal herbs that are used in traditional medication. Indigenous people inhabiting the Sikka sub-district in East and Mid Flores are the ones mentioned as an integral part of Mukan ethnicity. There are a number of tribes made up of small ethnic minorities such as Sikka, Krowe, Mukang, and Muhang.

The local society in Talibura District is dominated by the Krowe Muhan ethnic, who to this day, continue to preserve the heritage of their ancestors' traditional medications. There are a variety of plants that are manufactured for concoction, including for abortions. The local community tends to be more in favour of using herb-made contraception. However, regarding the decision-making process, the utilisation of sad herbs is often inseparable from the prevailing gender disparity due to the deep influence of the patriarchal culture.

This qualitative study was aimed at galvanising the existing traditional contraceptive method in Taliburi sub-district, Sikka District and analysing the gender disparity involved in performing the use of traditional contraceptive methods.

METHOD

This qualitative research used the in-depth interview method on two types of informant. The first was the *hattra* of the Krowe Muhang ethnicity as the key informant and the second was the users of the traditional conception, both women and men (participants). The in-depth interview with the *hattra* was aimed at gathering the information on the method of traditional contraception that has been available and provided recently. Meanwhile, the in-depth interview with the participants was aimed at observing whether or not gender disparity exists within the use of traditional contraception.

Longwe's gender analysis framework used in this research was utilised to identify the five different dimensions including control, participation, critical awareness, access, and well-being when using traditional contraception. The more awareness there is of equality over the use of contraception, the more empowered that the women will be within the community¹⁻³.

DATA ANALYSIS

The data regarding the interview outcome was transcribed in the form of an interview transcription which later on was used in the process of the analysis. The framework of qualitative data analysis was used which consisted of five steps, including reading, coding, displaying, reducing and interpreting⁴.

RESULTS

Informant profile: key informant and the method of traditional contraception: The respondents selected consisted of three informants (*hattra* as the traditional contraceptive service providers) and six women and one man as the service recipients. The key informants were aged above 40 years and had undergone traditional medication training and contraceptive practice for more than 15 years. The knowledge and skill related to traditional medication was hereditary from the ancestors of the Krowe Muhang (Table 1).

Table 1: Key informant profile

Characteristics	Informant (Hattra)		
	I	II	III
Gender	Male	Female	Female
Age (years old)	61	61	48

Abstinence	Certain type of fish	Certain type of fish	Contraceptive pill
Side effect	Non-exist	Non-exist	Non-exist, except if had menstruation delay >1 month

Participant's profile: The participants involved in this research were the members of the Krowe Muhangethnicity, categorised as the local society who had known the hatra for a number of years, including having received the traditional medication service. All of the participants aged above 20 were married and had bore children. Nevertheless, there are some respondents with an infertility history but had succeeded at giving birth to children through the use of traditional medication (Table 2).

Table 2: Participant's profile

Traditional contraceptive method	Concoction	Concoction	Concoction	Concoction and rubbing	Concoction	Concoction	Concoction

Gender Analysis

Control: The female participants possessed the control/power to determine the total number of children that they had, selecting and deciding on the use of traditional contraception, as well as determining who had to use it. The decision was made collectively with the husband without one party dominating the other.

"I have eight children, 6 boys and 2 girls. We both want all girls but they are all boys so we will find a way to give birth to girls. This is what we both agreed to before giving birth to a daughter. This is because the one who will

care for us is a daughter. If we fall into sick, our daughter can look after us. Our daughter will look after our house, so once they get married, she won't leave the house. That is our culture here." (YC: age 43 y.o).

"We are both the same. If we have all sons, later on we will live our life in loneliness (me and mama only). We asked for the support from mama and bapak to give us a concoction to have a daughter. Finally, we were blessed with two daughters, and then we stopped" (GG: 48 y.o)

Participation: The dimension of participation in this research unveiled the equal participation of men and

women in determining the amount of children and the usage of traditional contraception. The female participants tend to be given the freedom to choose and to use traditional contraception due to the absence of side effects and easy accessibility.

“For the roots, only my wife consumes it, but the leaves are cooked within porridge and we eat them together. This is not what we agreed upon, but we must eat them together. This is what mama and papa (*hattra*) told us. If only one of us does it, then it is unacceptable.” (GG: 48 y.o)

“I was pregnant long before we were offered the use of contraceptions but I didn’t want to. My husband did not allow me too. Probably because we feared the side effects and whether it is fit or not for us. This is because some other people got side effects (headache).” (VW: 39 y.o)

Critical awareness: There is awareness that when both husband and wife use contraceptive tools, it is due to the economic difficulties of bearing many children. Therefore, both husband and wife decide to postpone pregnancy. The husband appears to be more steady and spirited upon embarking to work. Aside from this, the female participants were also aware of the probability of economic difficulties when it comes to bearing many children. Henceforth, they become proactive when it comes to seeking a traditional contraceptive service.

“We have been husband and wife, but we said ‘wait for a moment’ to secure our economic well-being. When we find it, let’s have children.” (MVU: 24y.o)

“Sometimes, if just one person (wife) asks for the concoction and she does not menstruate or feel well, then both (husband and wife) must come together so then the menstruation may go well. If they use KB, then probably the menstruation will be delayed” (Hattra 1: 61 y.o)

Access: The husband and wife obtained the information regarding traditional contraception conveniently due to the *hattra* who own houses in the same village. This is knowledge that is hereditary over the generations. The participants can also easily visit the houses of the *hattra* due to the affordable distance. Besides this, the *hattra* can be met at any time. The *hattra* have never rejected visiting participants, regardless of the time. The other factor which drives the informants to come to the *hattra* is the absence of a fee or remuneration that must be paid,

but it must be based on sincerity from the service users or participants.

The participants are also free to come to the *hattra* once they need help. This is because the husband tends to be passive in the search for medication, hence the wife usually takes on the initiative when it comes to seeking help.

“I rely on them at times... if it gets painful, then I will just come. We have a lot of *hattra* around, but only mama and papa (*hattra*) do we attend, because even if someone is about to die, they can be cured.” (MG: 26y.o)

“I can also call in the middle of night, if they are all awake. I won’t look at the time, whenever it is, even in the middle of night as they usually go out to collect leaves. I once almost died as the hospitals in Maumere and Kupang rejected me. But I came to papa and mama (*hattra*), and I was cured.” (MAG: 31 y.o)

DISCUSSION

The majority of users are originally from the same village as the *hattra*. However, there were a number of beneficiaries who came from different villages, and even from different cities. Traditional contraceptive methods have been the main ones used in the society’s inhabited remote areas, due to the consideration of the difficult access and unaffordable distance involved when it comes to reaching the health services. Similar results were also illustrated in Yordania. Women who reside in rural areas tend to choose to apply traditional contraception, compared to modern contraception⁵.

The paranoia over the side effects of modern contraception was the most dominant reason reported when it came to avoiding the usage of it. The participants had received the information regarding modern contraception from the medical personnel in their area of residence. However, they decided to refuse to use it. This evidence is in line with the situation in Nigeria, whereby the participants are equipped with the information on modern contraception but refuse to use it⁶. The participants assumed that modern contraception may inflict disease on their reproductive system.

The participants under 30 years preferred to use traditional contraception due to the absence of fertility obstacles once they are ready to reproduce. This was

discovered in Nigeria, whereby the majority of the participants assumed that the methods of modern contraception have made the flow of menstruation somehow agitated, including bleeding, flatulency, being overweight or being underweight. The hindrance of the return of fertility eventually leads them to avoid modern contraception⁷, and the evidence in India was that the participants are avoiding childbirth but refuse the use of modern contraception⁸. Almost half of the female global population requires contraceptive tools but cannot find a suitable modern contraceptive method for themselves⁹ at national and subnational levels to inform the improvement and expansion of programmatic efforts to narrow the gaps in mDFPS coverage. METHODS Analyses were based on Demographic and Health Survey and Multiple Indicator Cluster Survey data. The most recent surveys carried out since 2000 in 77 countries were included in the analysis. We estimated mDFPS among women aged 15-49 years. Subgroups with low coverage (mDFPS below 20%). Therefore, this requires a new contraceptive method which can answer their needs.

Commonly, the process of decision-making in a patriarchal culture leads to the wife being unconditionally obedient, including in terms of contraceptive use¹⁰. The study unveiled that the female participants have been involved in the decision-making process that determines the amount of children that they have and the use of contraception. It can be observed that there is gender equality in the discussion process and in decision-making. However, there is a difference between modern and traditional contraceptive decision-making. During the use of modern contraception, men tend to strictly reject using it. The contrary appears in the method of traditional contraception, whereby the men are willing to consume a contraceptive concoction. Positive female empowerment corresponds to the use of contraception in the recent ages as well as in the future¹¹. This corresponds to the research in Bangladesh which discovered that the decision-making process undertaken related to contraception is done by both parties¹² and that in Pakistan, the wife-husband discussion may implicate the use of contraception for both individuals¹¹.

CONCLUSION

The methods of traditional contraception used by Krowe Muhang ethnicity may be a suitable type of contraception for a society residing in rural areas who

face difficulties accessing modern contraception. This method can also be considered a new type of contraception, advertised as a safe and health-friendly method of contraception. It is suitable for the couples that are willing to limit the number of pregnancies but who are avoidant of modern contraception due to the fear of side effects. Further research is required to assess the effectiveness and substance of the traditional contraception.

Conflict of Interest: None.

Ethical Clearance: The study passed ethical clearance from Ethical Committee of Faculty of Public Health, University of Nusa Cendana, Indonesia.

The Relationship between Sexual Behavior and the Prevalence of HIV/AIDS among Homosexual Men in Bukittinggi City, Indonesia

Nurhayati¹, Wahyu Salendri¹

¹Midwifery Applied Undergraduate Program, Applied Bachelor Degree Program in Midwifery, STIKes Fort de Kock Bukit tinggi

ABSTRACT

Homosexual men contributed to the high prevalence of new cases of HIV/AIDS in Indonesia. Sexual behaviour is a major risk factor for HIV/AIDS transmission. This study aimed to determine the relationship between sexual behaviour and the incidence rate of HIV/ AIDS in homosexual men in Bukittinggi City, Indonesia.

We employed a quantitative research methodology with a cross-sectional design. The sample population was homosexual men who attended the Rasimah Ahmad Public Health Center in Bukittinggi City, West Sumatra, Indonesia. Of the 118 men, we recruited 50 respondents using an accidental sampling technique. The data collection was conducted from January to May 2018, using a structured questionnaire. The independent variables included knowledge, attitude, and practice while the dependent variable was the prevalence of HIV/AIDS. The data was analysed using a Chi-square test.

The results showed that 76% of respondents (n=38) had good knowledge, 74% had a good attitude (n=37), and 66% had safe sexual practices (n=33). There were 10 respondents (20%) who had been diagnosed with HIV positive with or without AIDS. Knowledge was significantly associated with the prevalence of HIV/AIDS (95% CI, OR=8.50). Attitude was significantly associated with the prevalence of HIV/AIDS (95% CI, OR=7.07). Practice was also associated with the prevalence of HIV/AIDS (95% CI, OR=7.00).

Knowledge, attitude, and practice were significant predictors of the prevalence of HIV/AIDS. Therefore, improving knowledge, attitude, and safe sexual practices should be promoted to prevent the incidence of HIV/AIDS among homosexual men and the community in general.

Keywords: Knowledge, Attitude, Action, HIV/AIDS, Homosexual.

INTRODUCTION

Homosexuality refers to sexual practices between same sex individuals. In a more specific context, homosexuality is defined as men who have sex with

men (MSM).¹For some societies, this sexual practice is considered to be a sexual deviation.²However, MSM is been a growing phenomenon in many countries throughout human history since the very beginning.

HIV stands for Human Immunodeficiency Virus, which is a type of virus that attacks the human immune system. AIDS stands for Acquired Immuno-Deficiency Syndrome, which is a collection of symptoms that result from a decrease in immunity caused by HIV.³ Several factors are associated with the risk of HIV infection, including sexual behaviour.⁴According to UNAIDS, there were 36.9 million people living with HIV in 2017.³ The MSM group has a higher risk of HIV infection that is 27 times more than that of other key population.³

The estimated new number of cases of HIV/AIDS is increasing worldwide. In 2017, an average of 1.8 million people were estimated to have become newly infected with HIV.³ In the United States, approximately 67% of the 40,324 new HIV cases were contributed to by the gay and bisexual men in 2016.⁵ In Indonesia, approximately 23.5% of the 71,879 new cases of HIV/AIDS in 2012 was contributed to by the MSM group.⁶ Approximately 77% of HIV/and AIDS transmission occurs through sexual contact.⁶

AIDS is thought to originate from the African continent and is an infectious disease that quickly spread around the world, especially through unprotected sexual intercourse.⁷ The death rate for people with AIDS is very high. Since the beginning of the epidemic, AIDS-related diseases have taken approximately 35.4 million lives.³ A previous longitudinal study in the United States found that the 5-year survival rate of AIDS patients was only 3.4%.⁸

Previous studies have suggested that the factors of knowledge, attitude, and practice affect sexual behavior.^{9,10} The Indonesia Ministry of Health (MoH) has recognised the importance of the factors of knowledge, attitude, and safe sexual practices when it comes to preventing the incidence rate of HIV/AIDS.⁶ The MoH, in collaboration with the National AIDS Commission, has been implementing voluntary HIV counselling and testing (VCT) to prevent the HIV transmission.⁶ Knowledge and attitude of sexual behaviour influenced the sexual practice.¹¹ Risky sexual behaviour can have negative consequences, including unwanted pregnancy and exposure to HIV/AIDS.¹² Engaging in sexual contact with multiple partners and the non-use of condoms are among the risky sexual behaviours which put individuals at a higher risk of HIV infection.¹³

West Sumatera is one of largest provinces in Indonesia. In this province, by 2012, the City of Bukittinggi had the second highest incidence rate of HIV / AIDS after Padang City. The number of people living with HIV/AIDS has been continuously growing and reached 358 people by 2017. The majority of them were male (61.17%).¹⁴ To prevent HIV/AIDS transmission, Bukittinggi city has established VCT service clinics. In 2017, 29.5% of 1,288 people who had attended VCT-HUV in the city were from the MSM group.¹⁴ Therefore, the present study has aimed to determine the relationship between sexual behaviour and the incidence rate of HIV/AIDS in homosexual men.

METHOD

This present research utilised an analytical observational study design with a cross-sectional approach. The study population was MSM, or male homosexuals, attending the Rasimah Ahmad Health Centre, Bukittinggi City, West Sumatera in Indonesia. We obtained the data of 118 patients. The average number of visits per month to the facility was 50 patients. By using the accidental sampling technique, we recruited 50 study participants. The study was conducted from January to May 2018 at Rasimah Ahmad Health Centre, Bukittinggi City. For the purpose of this study, we collected primary and secondary data. The Chi-Square test was used to analyse the data. The significant association between the independent variables and the dependent variable was set up at a significance level of 95% ($\alpha = 0.05$).

RESULTS

Table 1 presents the characteristics of the study respondents. The majority of the respondents were aged between 15 and 24 years old (48%). The majority had good knowledge (76%) and a good attitude (74%) toward sexual behaviour. Most of them (66%) also applied safe sexual practices. The prevalence rate of HIV-positive among the respondents was 20%.

Table 1: Characteristics of the respondents

Variables	n (%)
Age (years)	
15-24	24 (48%)
25-34	23 (46%)
35-44	2 (4%)
45-55	1 (2%)
Knowledge	
Poor	12 (24%)
Good	38 (76%)
Attitude	
Poor	13 (26%)
Good	37 (74%)
Practice	
Unsafe sex	17 (34%)
Safe sex	33 (66%)
HIV prevalence	
HIV positive	
HIV negative	

To meet the study purpose, we conducted a correlation analysis using the Chi-square test. As shown in Table 2, the variables of knowledge, attitude, and practice were significantly associated with the incidence rate of HIV/AIDS. Poor knowledge significantly increased the risk of

HIV/AIDS infection by 8.5 times (95% CI: 1.83-39.42). Poor attitude significantly increased the risk of HIV/AIDS infection by 7.07 times (95% CI: 1.57-31.86). Unsafe sex practices also significantly increased the risk of HIV/AIDS infection by 7.00 times (95% CI: 1.52-32.33).

Table 2: Bivariate analysis of knowledge, attitude and practice of HIV/AIDS infection

Variables	Incidence of HIV/AIDS		p-value	OR (95% CI)
	Positive N (%)	Negative N (%)		
Knowledge				
Poor	6 (60.0)	6 (15.0)	0.007	8.50 (1.83-39.42)
Good	4 (40.0)	34 (85.0)		
Attitude				
Poor	6 (60.0)	7 (17.5)	0.001	7.07 (1.57-31.86)
Good	4 (40.0)	33 (82.5)		
Practice				
Unsafe sex	7 (70.0)	10 (25.0)	0.021	7.00 (1.52-32.33)
Safe sex	3 (30.0)	30 (75.0)		

DISCUSSION

In our study, almost half of the respondents were adolescents and early adults aged between 15-24 years. According to Katra (2014), sexual orientation is shaped in adolescence, which starts before the average initiation of sexual activity between 12-13 years old.¹⁵ A study in Thailand found that approximately 6% of 1,200 high school respondents reported being homosexual or bisexual, and that most of them (93%) had disclosed their sexual orientation before late adolescence.¹⁶

Most of the respondents in the present study also showed that they had good knowledge of sexual behaviour. Knowledge is the result of “knowing”, which occurs after people have sensed a particular object.¹⁷ Knowledge is influenced by internal factors and external factors. The internal factors consist of education, work and age while the external factors consist of the environment and socio-culture.¹⁷ A previous study in China also found that approximately 91.65% of male homosexuals (MSM) had a high level of knowledge about HIV/AIDS.¹⁸ Another study in Indonesia also reported that about 70% of the respondents had a high level of knowledge of HIV/AIDS.¹⁹

Our study described that most of the respondents had a good attitude toward sexual behaviour. A previous study in Indonesia also reported that more than 80% of

the homosexual respondents had a good attitude toward sexual practices.²⁰ Attitude is a predisposition to do or not to do a particular behaviour.¹⁷ It does not only reflect the psychological condition of the individual but also the consciousness process of an individual.¹⁷ Practice related to the process of action starts from knowing about the stimulus or object, making an assessment or judgement on what is known and finally doing the action (practice).¹⁷ In the present study, most of the respondents reported practicing safe sex (66%). Likewise, a previous Indonesian study also reported that about 65% of respondents had safe sex.¹⁹

Our study found that the prevalence of HIV/AIDS among the study subjects was 20%. A study in China reported that the prevalence of HIV/AIDS among high school students was 3%.²¹ The prevalence of being HIV positive among homosexual men and high school students or young adults has raised concerns about HIV positive transmission and prevention. Stigma over different sexual orientations might prevent the homosexual men from disclosing their condition, which becomes a barrier to receiving education about sexual behaviour.²²

Our study confirmed the hypothesis that knowledge is significantly associated with the incidence rate of HIV/AIDS. Knowledge is one of the factors that influences a person’s attitude and behaviour.¹⁷ Acquiring knowledge

on sexual reproductive health can lead to a positive attitude toward sexual behaviour and implementing sexual contact with the proper protection.²² In contrast, poor knowledge of sexual reproductive health increases the risk of the homosexual community (MSM) practicing unsafe sex. In addition, isolating or discriminating against the homosexual community when it comes to accessing health education may result in an increased risk of HIV/AIDS infection.²²

In this study, a negative attitude toward sexual behaviour has also significantly affected the incidence rate of HIV/AIDS. A positive attitude is manifested in an action. In this context, for example, this can be done by disclosing their sexual orientation (overt behaviour).¹⁶ Providing a health facility with VCT service is formal support for the homosexual community, allowing them to acquire a positive attitude from the counselling. However, a positive attitude also requires emotional support from family, relatives, and others.¹⁷

Unsafe sex is the strongest predictor of HIV/AIDS transmission.⁴ In this study, unsafe sex increases the probability of HIV/AIDS infection by 7 times, compared to the safe sex practices among the other homosexual respondents. Safe sex practices have been promoted worldwide under the ABC approach.²³ ABC stands for Abstinence, Being Faithful and Using Condoms. The ABC approach is promoted as a grand strategy in many countries in relation to preventing HIV/AIDS transmission, related to unsafe sexual practices.²³ A previous study in Indonesia revealed that the MSM respondents were at risk of getting HIV/AIDS due to their reluctance to use condoms during sexual intercourse.²⁴ An online survey study involving the MSM community reported that the meeting venue influenced the reasons for not using condoms.²⁵ For MSMs meeting online, their choice of not using condoms related to their individual preferences and mutual agreement. On the other hand, the relationship context was the major reason for not using condoms among men who met offline.²⁵

CONCLUSION

Our study confirmed that knowledge, attitude, and practice were significantly associated with the incidence rate of HIV/AIDS. The likelihood of HIV/AIDS infection was higher among the study subjects who had poor knowledge, a negative attitude, and unsafe sex practices. As the homosexual community is at a higher

risk of HIV/AIDS infection than other key populations, a comprehensive approach to improve their knowledge, education, and practice related to sexual reproductive health is crucial. Health promotion is an important aspect when seeking to increase awareness of HIV/AIDS prevention among the MSM group and the wider community. The VCT and other educational programs on sexual reproductive health as well as HIV/AIDS prevention should be continuously promoted.

ABSTRACT

Food processing can affect the nutritional components within food. This contributes toward the status of nutrition. The objective of this research was to identify the nutritional status of children based on food processing technique. The research was carried out in Kenjeran Urban Village, Bulak Sub-District, Surabaya. The design of this research used a prospective cohort. The overall population amounted to 144 respondents using simple random sampling for the final amount of 105 respondents. The instrument of this research was a questionnaire and nutritional status measurement in accordance with the provision of Ministry of Health, of the Republic of Indonesia. The results of this research showed that there is a relationship between food processing technique and the nutritional status of children. The result of the Spearman Rho correlation analysis was that it obtained a value of $r=0.001$ ($\alpha<0.05$). The value of the absolute coefficient correlation was 0.435 therefore the level of this relationship is an average level relationship. Those with a unfavourable daily food processing technique accounts for 18 individuals (17.1%) and a favourable technique accounts for 87 individuals (82.9%). Food processing can affect the nutritional status of children. However, nutritional status can be influenced by several other factors. The influential factors of nutritional status include the heredity factor and the passive measure of food supply.

Keywords: *food processing technique, nutritional status*

INTRODUCTION

Nutrition is an integral part of the growth and development of an individual. The substances within food have a strong relation with health and brain ingenuity. Once nutrition goes unfulfilled, it will weaken bodily health and ingenuity simultaneously, primarily when concerning the growth and development of children¹. The nutritional necessities for children under five is relatively bigger than when compared to adults, because at this stage, there may soar rapidly. The rapid growth and development periods, such as the prenatal period or adolescence will require a larger amount of calories and protein².

According to the WHO, 42 million children under five suffer from obesity, 156 million children under five are short-bodied, and 50 million children suffer from malnutrition³. The result of the PSG Index BB/U shows that those with favourable nutrition are 79.7%, deficient nutrition is 14.9, malnutrition is 3.8%, and excessive nutrition is 1.5%. The Index TB/U Normal shows that 71% are normal-bodied and those who are short-bodied makes up 29.9%. Using the Index BB/TB Normal index, 82.7% are thin 8.2% are fat and those who are extremely thin make up 3.7%⁴. According to *Riskesdas*, the nutritional status of children under five is deficient by 13.9%, while malnutrition is 5.7%, being short-bodied is 19.2%, extremely short-bodied is 18.0%, thin is 6.8%, extremely thin is 6.8% and fat is 11.9%⁴. In East Java, the number of cases for malnutrition was 6,772⁵. Malnutrition for children under five in Surabaya 282 was male: 127, female: 155⁶. From the research of Melati integrated public health centre (*Posyandu*) in Surabaya, the amount of children under five was 85; there were 2 children with deficient nutrition and two children with excessive nutrition.

To date, the most appropriate food processing method has not yet been determined. The issue of children's nutritional status may be triggered by the ignorance when it comes to comprehending the way to organise food processing, such as organising the menu, selecting the ingredients, maintaining the food and keeping the food in a safe condition. Keeping foods from previous days or boiling vegetables above the normal duration will automatically decrease the amount of nutritious substances within the food.

Carbohydrate consumption deficiency may affect the children's growth and incline them toward being thin-bodied (KEP). If in excess, the children will grow to be fat (obesity). The lack of protein may lead to an abnormal network of growth and development, obstructing physical and mental growth, and an excess of protein will lead to obesity. A lack of fat will lead to a thin body shape while an excess of fat will lead to a fat body shape (obesity)².

Regarding the problems related to food management techniques as above, this will correspond to the growth and development process of the child. These factors influence the nutritional status of children. In this particular problem, in order to maintain the nutritional status of their child, parents should be informed in order to understand the appropriate nutritional fulfilment for children under five for the sake of their individual growth and development. These particular food substances are an integral part of individual growth and development. Through this education, the nutritional status of children can be well-maintained. Through the distribution of health education, it is expected that parents will be able to maintain food properly in order to prevent the nutritional substances within the food being lessened.

METHOD

The type of this research was an observational analytical research through the prospective cohort approach. The data collection method was using simple random sampling and this research was commenced by informing both the personnel of the *Posyandu* (integrated public health post) and the respondents. The inclusion criteria were parents who manage to cook their own food and the children who consume the parent-made food.

This questionnaire was posed to obtain the measurement of nutritional status and body weight according to a body height and distribution questionnaire related to food processing technique.

OBJECTIVE

The general objective of this research was to identify the nutritional status of children aged between 1-3 years old based on the daily food processing technique.

RESULT

1. Univariate Analysis: The respondents obtained in Bulak Urban Village, Kenjeran Sub-District, Surabaya accounted for 105 respondents; 100% were willing to join the research. The results of the univariate analysis in this research were based on the age of the respondents, their last achieved education level, occupation, monthly income, and the gender of their child. Based on the results of this research, it is identified that respondents aged between 20-35 years old amounted to 89 respondents, which is larger than the amount for those aged >35 years old. The respondents from high school level amounted to 50 respondents, larger than those in middle school level. Those with a monthly income that ranged between IDR 1,500,000 – IDR 2,000,000 amounted to 66 respondents, which is higher than those with an income above IDR 2,000,000.

Table 1: Respondent's distribution based on age, education level, occupation and income

Variable	Frequency	(%)
Age (years old)		
<20	1	1.0
20-35	89	84.7
>35	15	14.3
Education		
Elementary	21	20.0
Middle School	32	30.5
High School	50	47.6
Higher Education	2	1.9
Occupation		
Private sector	23	21.9
Entrepreneur	22	21.0
Housewife	60	57.1
Income rate		
500,000-1,000,000	7	6.7
1,000,000- 1,500,000	11	10.5
1,500,000-2,000,000	66	62.9
>2,000,000	21	20.0

2. Bivariate Analysis: This research used a Spearman Rho correlation test which aimed to identify the relationship between the dependent variable and the independent variable. The

identified variables were daily food processing technique and the nutritional status of body weight based on body height.

Table 2: The Relationship between daily food processing technique and the nutritional status of children aged 1- 3 years old

Daily Food Processing Technique	Nutritional Status of Children BB/TB								Total	
	Extremely Thin		Thin		Normal		Fat			
	N	%	N	%	N	%	N	%	N	%
Poor	6	5.7	5	4.8	7	6.7	0	0	18	17.1
Good	3	2.9	9	8.6	68	64.8	7	6.7	87	82.9
Total	9	8.6	14	13.3	75	71.4	7	6.7	105	100

The value of statistic *Spearman Rho* Correlation test ($r=0.001$)

DISCUSSION

Based on Table 2, it can be identified that the respondents with a favourable food processing technique had a nutritional status that was normal, which amounted to 64.8 %. Meanwhile, those who use a poor food processing technique combined with the nutritional status of their child being extremely thin amounted to 5.7%.

The attitude of health is someone's response toward a stimulus or object linked to illness and disease, the health service system, food, beverage and the environment ⁷. The attitude toward the false food processing techniques will influence the substances within daily food ⁸. If the attitude toward the false food processing technique is being maintained continually, then the nutritious substances within the food will be diminished or even dissolved. This factor will affect the health of the person committed to this technique.

The results of the test using the Spearman Rho correlation showed that there is a relationship between daily food processing technique and the nutritional status of children aged 1 -3 years old with a Rho valuation of 0.001 which means that the value of $\alpha < 0.05$. This means that food processing technique will influence the nutritional status of children under five. Therefore if a false food processing technique is performed, then it will affect the containment of nutrition within the particular food ⁹.

Based on the results of Table 2 above, it obtained that 3 out of 9 respondents were equipped with knowledge of favourable food processing techniques, but their children's nutrition and body weight decreased, as shown by an extremely thin body shape. This particular issue may be driven by several factors, including the food

supply factor. If the mother is not supplied properly with food, therefore the foods consumed by those particular children will be decreased. This matter is supported by the research which mentioned that parental food supply will affect the nutritional status of children under five.

CONCLUSION

For the daily food processing technique in Bulak Urban Village, Kenjeran Sub-District, Surabaya, the majority of parents frequently use a favourable food processing technique and only a minority one use a poor daily food processing technique. The nutritional status of children aged between 1–3 in Bulak Urban Village, Kenjeran Sub-District, Surabaya was that the majority of the children have a favourable nutritional status, and that there is a lesser group of children who have a deficient nutritional status. There is a relationship between the daily food processing technique and the nutritional status of children aged between 1 -3 years old in Bulak Urban Village, Kenjeran Sub-District, Surabaya.

It is expected that future research should touch upon the topic of nutritional status, focusing on the relationship between active food supply and the nutritional status of children under five, aged between 1 – 3 years old in Bulak Urban Village, Kenjeran Sub-District, Surabaya.

Conflict of Interest: None.

Ethical Clearance: The study passed ethical clearance from Ethical Committee of Sekolah Tinggi Ilmu Kesehatan Hang Tuah, Surabaya, Indonesia.

Mammae Gland in Supporting the Lactation Process: A Review

Thontowi Djauhari Nur Subchi¹, Merryana Andriani²

¹Student of Doctoral Programe of Public Health, Faculty of Public Health, ²Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia

ABSTRACT

This review is aimed at illustrating the importance of zinc in the formation of breast milk in the mammae gland and the importance of zinc consumption throughout the individual's lifetime. This study was conducted as a literature review concerning the importance of zinc's role. The role of zinc in the mammae gland is multifaceted in nature, due to the mammae gland being a dynamic network which experiences morphological and functional changes dramatically. It requires favourable coordination in order to provide sufficient zinc during the lactation period.

Keywords: *mammae gland, lactation process, zinc consumption*

INTRODUCTION

The supply of exclusive breast milk is defined as the practice of breast milk distribution to infants in the first six months, without other food and water preferences. Breast milk deficiency has a setback influence on infant mortality¹pneumonia, measles, malaria, HIV/AIDS, the underlying cause of undernutrition, and a small group of causes leading to neonatal deaths. We review child survival interventions feasible for delivery at high coverage in low-income settings, and classify these as level 1 (sufficient evidence of effect. The maximal practice of breastfeeding and breastfeeding initiation in the first one hour of an infant's being, as well as two years or more of breastfeeding practice, strengthens the immunity of the infant. The supply of exclusive breast milk also has a protective effect against various disease in the future².

There are numerous measures that can be undertaken in order to supply breast milk during the first six month of an infant's being as part of the norms in feeding infants. It is reported that only 38% of infants aged

between 0 to 6 months enjoyed exclusive breast milk³⁴. Recent analysis has showed there to be a less-optimal breastfeeding practice, including the distribution of non-exclusive breast-milk which has contributed to the mortality of around 11.6% of children under five years old. This is equivalent to 804,000 children mortalities in 2011³. It is reported that there has been a surge of exclusive breast milk distribution between 1985 and 1995. At the global level, the distribution of exclusive breast milk soared by 2.4 percent on average per-annum. This depicts a significant increase from 14 percent to 38 percent over 10 years. It has been reported that 25 countries increased their exclusive breast milk supply by as much as 20 percent or more after 1995, with the aforementioned number driving toward achieving the global target⁵⁶.

The data of Polman⁷ shows that, based on the research of the World Breastfeeding Trends Initiative (2013), only 27.5 percent of mothers in Indonesia succeeded in supplying exclusive breastmilk during the first six months. The Basic Health Research (2013) showed that the coverage of breastmilk in Indonesia stood at 42 percent. From that particular result, Indonesia is ranked 49 out of 51 countries concerning supporting exclusive breast milk supply.

Zinc manages the function of almost 100 different enzymes, DNA and RNA synthetics, carbohydrate metabolism, acid base homeostasis, pholate absorption, vitamin A as well as activating vitamin D and preserving

Faculty of Public Health Universitas Airlangga,
Surabaya, Indonesia
Email: thontowi@yahoo.com

the stability of the cell membranes⁸. The largest source of zinc is shells, meat, egg, grains, ground nut, milk production, wheat, and green vegetables^{8,9}. Grains contain low-level zinc concentration. It is reported that a population that enacts a wheat protein-based diet will experience a zinc deficiency. Zinc plays a pivotal role during pregnancy and breastfeeding, related to the development of the foetus and breast milk secretion. The bioavailability of zinc in the diet is required throughout pregnancy in order to fulfil the mother's physiological needs¹⁰. Further, Zinc manages gene transcription, cell development and apoptosis, which is fundamental to organising lactosite renewal. The development of alveolar cells and their functional differentiation produces breast milk secretion cells, and is arranged by zinc. Zinc is prominent in the structural, catalytic and adjustment activities for the synthesis of and resulting breast milk secretion.¹¹

Prolactin (PRL) is the zinc binder hormone that is generally required for the initiation and preservation of lactogenesis. Zinc plays a prominent role in the synthesising process, including the safekeeping and secretion of PRL from the anterior pituitary gland, starting from gene expression management until the deceleration of the enzyme binder and secretory granules¹². The research of Lorenson et al mentioned that PRL is safekept as a stable oligomer, which contains zinc. The elimination of zinc is required for the conversion of the intermolecular disulfide bond into an intramolecular disulfide bond, as a stepping stone that is required for monomerisation and secretion⁸. The enhancement of zinc availability will decelerate the formation and secretion of PRL monomers from the anterior pituitary. A number of in vitro research studies have reported the effect of zinc concentration on PRL secretion from the anterior pituitary gland.¹³

The body of a human being contains around 2 grams of zinc in total, with 60 percent discovered in the muscles and 30 percent in the bone mass. Aside from this, it is also discovered in the bodily network and fluids. An adult woman requires 12 mg of zinc per day, and a pregnant and breastfeeding woman requires over 14 mg of zinc per-day. This level of zinc consumption is generally unfulfilled in developing countries due to a lack of calories from grains and other primary foods¹⁴. This review is aimed at illustrating the importance of zinc's role in the formation of breast milk in the mammae gland and the importance of zinc consumption throughout an individual's lifetime.

METHOD

This study was a literature review on the importance of zinc. The authors searched the available literature in major research database such as Scopus, PubMed, ScienceDirect, EBSCO and ProQuest. The literature was analysed to determine the study's relevance to the topic. Then, the researchers determined which literature items would be included in the discussion.

RESULTS AND DISCUSSION

Zinc and Mammary Gland: The role of zinc is important in managing the mammae gland, including remodelling, lactation and breast disease¹⁵ including DNA and protein synthesis, enzyme activity, and intracellular signaling. Cellular Zn homeostasis necessitates the compartmentalization of Zn into intracellular organelles, which is tightly regulated through the integration of Zn transporting mechanisms. The pancreas, prostate, and mammary gland are secretory tissues that have unusual Zn requirements and thus must tightly regulate Zn metabolism through integrating Zn import, sequestration, and export mechanisms. Recent findings indicate that these tissues utilize Zn for basic cellular processes but also require Zn for unique cellular needs. In addition, abundant Zn is transported into the secretory pathway and a large amount is subsequently secreted in a tightly regulated manner for unique biological processes. Expression of numerous members of the SLC30A (ZnT). Structurally, the mammae gland consists of an alveolar duct network which ends in the smallest unit known as an acinar. Every acinar is coated with Mammary Epithelium Cell (SEM), which in charge of transferring nutrition to the created breast milk during the lactation period. From this perspective, SEM is at the centre of breast milk production, whereby it manages the function of SEM proliferation, regulation and cell differentiation. Zinc manages cell proliferation, particularly through its role in managing gene expression¹⁶. Therefore, the ineffective arrangement from transcription may impact hyper proliferation or SEM-specific hyper proliferation. There is a limited amount of information regarding the special mechanisms whereby zinc manages mammae gland growth. However, the existing data has pointed out that zinc specifically plays a pivotal role regarding the transcription factor. The localised zinc in the cytoplasm will express itself within the mammae gland, and this expression is limited to the development step of active SEM proliferation and the evolution of the labulo-alveolar gland or acinar gland¹⁷.

A number of research studies have provided structural and functional evidence that the general genetic variant in ZnT2 can impact the main cellular function in SEM. From the research, it was determined that mothers who excessively consumed zinc will express the molecular factor in the mammary gland, which may cause oxidative stress. A molecular disorder can be identified *in vitro* as it indicates the increase of the phosphorylation and mislocalisation of zinc into endoplasmic reticulum and lysosomes, which are connected to oxidative stress, disorders of paracellular function, and the death of cells mediated by lysosomes. The genetic variant of ZnT2 has a consequence on the sub-cellular Zn pools and molecular function of SEM, whereby it may impact mammary gland dysfunction and weak lactation performance. It has been reported that genetic variation may impact on the performance of sub-optimal lactation and future studies should report on the relationship between genetic variation and the function of mammary glands^{18,19}.

Lactation: Zinc is required in the process of metabolism and lactation in the mammary gland in order to supply zinc to infants. The mammary gland imports zinc from the mother's circulation and later on, secretes it into the mammary gland at around 0.5 mg zinc per-day. This process is almost twice the amount of zinc transferred every day from the placenta to the foetus during the third trimester of pregnancy²⁰. The importance of optimal zinc supply during the neonatal period is proven to be related to neonatal mortality, concerning the amount of zinc within breast milk²¹.

Dysregulation also results in a condition called a "lack of temporary neonatal zinc". This results in zinc deficiency and has an impact on the weight of the breastfed infant. A variety of research studies have unveiled that the process of transporting and arranging the transfer of zinc relies on tight integration from the zinc transporting mechanisms, ensuring that zinc is absorbed into the mammary gland and released into the breast milk. The research aimed at identifying a number of zinc transporter roles (Zip1, Zip3, ZnT1, ZnT2, and ZnT4), which have been found to supply the initial information regarding the mechanisms which manage the degree of zinc in the breast milk. A number of research studies were carried out related to breastfeeding mice and the related mammary cell model, which showed that Zip1 is expressed in the mammary gland of the mice, crossing through the luminal membrane from the mammary gland that is integrated in the alveolar lumen¹⁸.

ZnT1 is related to the luminal membrane during the initial lactation detected within mammary cells. ZnT2 is localised in the proximal membrane within the luminal of the epithelial mammary cell²². ZnT2 plays a prominent role in mediating the zinc transfer into breast milk during the process of lactation²³. The expression of ZnT2 is prompted by the lactogenic hormone as the result of the transcription of regulation through the prolactin signalling mechanism². In the mammary gland, ZnT4 is the largest amount of containment within the cell surrounding the alveolar duct²³ and it is situated in the intracellular compartment but not integrated simultaneously with the collection of unstable zinc²⁵. The role of ZnT4 in breast milk is to secrete zinc which is related to the decrease in zinc secretion into breast milk during the lactation period²³.

The mammary gland is a responsive hormonal network that is unique in nature, that possesses specific pre-conditions regarding zinc. This results from the necessity to collect, re-distribute, and release a large amount of zinc into breast milk in order to supply optimal zinc for the newborn infant. Furthermore, the failure of the zinc transporting mechanism within the mammary gland of a non-breastfeeding woman may cause the development of breast cancer²⁴.

The concept of the zinc transportation network is relatively new, dynamic and sustainable. There are 24 acknowledged *transporter Zn* from two different families; Zip and ZnT, commonly referred to as the Zn transporter. There are 14 Zip proteins (Zip1 - Zip14) and 10 ZnT protein (ZnT1 - ZnT10)²⁵ which is transported across the maternal epithelia during lactation. The mechanisms by which zinc becomes a constituent of breast milk have not been elucidated. The function of the zinc transporter ZnT4 in the transport of zinc into milk during lactation was previously demonstrated by studies of a mouse mutant, the 'lethal milk' mouse, where a mutation in the ZnT4 gene decreased the transport of zinc into milk. In the present study, we have investigated the expression of the human orthologue of ZnT4 (hZnT4) whose method of working and expression varies in every level of biological organisation. The mammary gland utilises the majority of zinc transporters in order to maintain a number of important functions. To date, there are only two zinc transporters that have been appointed to maintain a central role in the function of the mammary gland; ZnT2 and ZnT4²⁶ as women with a mutation in the gene encoding ZnT2 (SLC30A2).

ZnT2 is expressed in a number of networks including the mammae gland, prostate, small intestine, liver, kidneys and monocytes²⁷. A number of research studies have showed that ZnT2 is involved directly in the transfer of zinc into breast milk during the lactation period. In the mammary epithelium cells, the two isoforms of ZnT2 are different, localised in the exocytosis vesicles and membrane cell²⁶ as women with a mutation in the gene encoding ZnT2 (SLC30A2, Both transport zinc. The over-expression of ZnT2 in the cells leverages the level of resistance to zinc toxicity. The single and non-identical nucleotide polymorphisms within ZnT2 prompts the secretion of degraded zinc and enhances oxidative stress in the mammary gland epithelial cells²⁸. ZnT2, in transcription, is maintained by the PRL lactogenic hormone, and an overflowing of ZnT2 will increase the amount of zinc four times larger than what is within the mammae gland during the breastfeeding phase compared to the non-lactation network²⁴.

Regarding the condition of the mammae gland, ZnT4 has been localised in the apical membrane of the milk epithelium, and the overbalance of ZnT4 is significantly higher in the mammae gland during the breastfeeding phase compared to the non-breastfeeding phase²⁹. This shows the important role of zinc transportation in breast milk during the lactation period. Aside from that, the amount of ZnT4 will decrease throughout the lactation period, and the concentration of zinc within breast milk will identify the role of ZnT4 in transferring zinc into the breast milk for the infant in the growing phase³⁰ ZnT-1, ZnT-2 and ZnT-4. Physiologically, ZnT4 will increase the production of breast milk therefore the health of infant will simultaneously be enhanced.

CONCLUSION

The mammae gland is the other secretory network that requires zinc for particular biological processes in order to impact on the formation of breast milk. The role of zinc in the mammae gland is multifaceted in nature, due to the mammae gland being a dynamic network which experiences morphological and functional changes. It requires favourable coordination in order to provide sufficient zinc during the lactation period. It can be concluded that zinc plays a role and is in charge of RNA transcription. Henceforth, it impacts on the hyper-proliferation of SEM and is affective on the growth of acinar cells in the production of breast milk.

The Safety and Efficacy of Ligasure using in Radical Cystectomy

Ehab Jasim Mohammad

Department of Surgery, Ibn Sina University of Medical and Pharmaceutical Sciences, Baghdad, Iraq

ABSTRACT

Background: Despite the introduction of minimally invasive surgery, open radical cystectomy remained the gold standard treatment for bladder cancer when indicated. But it has the disadvantages of long operative time and large blood loss.

Aims: To assess the safety and efficacy of the use of ligasure in radical cystectomy.

Patients and method: From June 2015 to February 2018, 72 patients with muscle invasive bladder cancer or Recurrent high grade non muscle invasive cancer who are candidate for open radical cystectomies at Al- Yarmouk teaching hospital were enrolled in this prospective, case control study to compare between the use of traditional suture ligation technique and ligasure for tissue ligation and division. The patients were randomly divided into two equal groups; group A for suture ligation technique and group B for ligasure.

Results: The age of the patients (n=72) in this study was ranged from 50 to 79 years, and the mean age was 64.1±8.4 years in group A and 65.4±8.4 in group B. The characteristics of the two groups were similar, with no statistically significant difference (p value > 0.05), but regarding the duration of surgery, blood loss and the need for blood transfusion and number blood units transfused, the difference was statistically significant (P value <0.05). Pelvic lymphocele was the most common complications in both groups and the incidence of complications in the two groups was comparable with no statistically significant difference (p value > 0.05).

Conclusion: The addition of ligasure use in radical cystectomy was effective in reducing blood loss and in saving time by decreasing the duration of surgery, and also was safe as there was no significant difference in incidence of complications.

Keywords: radical cystectomy, ligasure, bladder cancer

INTRODUCTION

The gold standard for treating muscle invasive bladder cancer is open radical cystectomy with orthotopic neobladder^(1,2) Recently, the minimally invasive surgery was suggested for radical cystectomy in the form of laparoscopic radical cystectomy and robotic radical cystectomy to decrease the postoperative morbidity and give better cosmetic outcome but it needs further evaluation for long-term oncologic implications^(3,4)

The drawbacks of the minimally invasive surgery are steep learning curve, operating time, and cost of the procedure.⁽⁵⁾

More recently, the LigaSure device has been implemented in the performance of variable open and laparoscopic surgical procedures, including radical cystectomy.⁽⁶⁾

The Ligasure vessel sealing system is a heat-sealing device that has been introduced to surgery in 1998. It allows the use of specific amount of bipolar electrothermal energy and pressure to seal off the walls of the blood vessel and a feedback mechanism guarantees that the tissues are not charred by over-coagulation. This device was designed for sealing blood vessels from 1 to 7 mm in diameter.⁽⁷⁻⁹⁾

The morbidity and mortality of radical cystectomy are high and this reflects the fact that the majority of patients undergoing this procedure are elderly patients with multiple comorbidities.^(10, 11) Among the independent predictors of high grade complications is the amount of blood loss.^[12] Duration of surgery of more six hours is also associated with an increased risk of post-operative complication.^[13] So the efforts are necessary

to decrease the blood loss and operative time and for this reason we use the ligasure in the open radical cystectomy in the hope that its use may achieve these aims in reducing the morbidity of open radical cystectomy.

PATIENTS AND METHOD

Seventy two patients with muscle invasive bladder cancer or recurrent high grade non muscle invasive cancer of transitional cell type who are candidate for open radical cystectomies at Al- Yarmouk teaching hospital were enrolled in this prospective, case control study from June 2015 to February 2018, to compare between the use of traditional suture ligation technique and ligasure for tissue ligation and division. The selected patients were divided in random manner into two equal groups; group A for suture ligation technique and group B for ligasure use.

The patient's age, gender, preoperative clinical status and investigations and the indication of radical cystectomy were recorded. The amounts of intraoperative blood loss, units of blood transfused intraoperative and postoperatively were recorded. The operative time was also recorded.

The exclusion criteria were squamous cell carcinoma, significant medical comorbidities, previous radiotherapy and previous pelvic surgery.

The operation done by a vertical midline incision from the symphysis pubis to the umbilicus, the space of Retzius is entered, Blunt dissection is used to release the bladder from the pelvic sidewall attachments on both sides, the peritoneal cavity is entered, and the urachus is identified and divided just below the umbilicus. Bowel mobilization on the right and left side is done to achieve good exposure of the major vessels and the

ureters. Good exposure is done with the use of a self-retaining retractor; both ureters are released from their attachments beginning where they cross the iliac arteries to the level of the bladder. The superior, posterior, and lateral pedicles of the bladder were divided by scissor and ligated using suture ligation in group A. the LigaSure device was used to divide the bladder pedicles in group B; and this step is the only different step in the surgical procedure between the two groups. [14] The type of ligasure used was Covidien ligasure LF420. The follow up of all patients was for six months after surgery.

The data analysis was carried out using statistical package of SPSS-24 (Statistical Packages for Social Sciences- version 24).

The data were presented in simple measures of frequency, percentage, mean, standard deviation, and range. The significance of difference of means was tested using Students-t-test for difference between two independent means. The significance of difference of different percentages was tested using Pearson Chi-square test (χ^2 -test) with application of Yate's correction or Fisher Exact test whenever applicable. Statistical significance was considered when the P value was equal or less than 0.05.

RESULTS

The age of the patients (n = 72) in this study was ranged from 50 to 79 years, with mean age of 64.1 ± 8.4 years in group A and 65.4 ± 8.4 in group B. The characteristics of patients in the two groups were similar, where difference in the age, gender, and indication of surgery and hemoglobin level was not statistically significant and also there was no statistically significant difference in the number of smokers in the two groups (p value > 0.05).

DISCUSSION

The treatment for muscle invasive bladder cancer is radical cystectomy with urinary diversion. Variable ways are used for urinary reconstruction after radical cystectomy, including ileal conduits, cutaneous urinary diversion, and orthotopic neobladder reconstruction.⁽¹⁵⁻¹⁷⁾ so the urologist would always attempt to refine the radical cystectomy procedure and to decrease the intraoperative and postoperative complications, many modifications and new advances have been used to achieve these goals. Hanash *et al* use stapling technique to control the vascular pedicles during radical cystectomy and demonstrated a significant decrease in the intraoperative and postoperative blood loss and decrease in the time of operation.⁽¹⁸⁾

Chang *et al* demonstrated significantly decreased blood loss and the transfusion requirement during radical cystectomy using stapling device.⁽¹⁹⁾ Mandhani *et al* adopted several technical modifications to open radical cystectomy which included Pfannenstiel incision, internal splint, single urethral catheter and extraperitonealization of the orthotopic neobladder and demonstrated that with these modifications the advantages of minimally invasive surgery may be obtained, like early recovery, less need for analgesics, better cosmesis and reduction in length of hospitalization.⁽²⁰⁾

In the present study the use of ligasure as hemostasis maneuver resulted in significant advantages compared to the use of conventional ligature technique including decreased operative time and better hemostasis as reflected

by less amount of blood loss, less need for blood transfusion and fewer number of blood units transfused. Manasia *et al* demonstrated similar results to the present study where they found the use of ligasure was safe and effective in decreasing blood loss and saving the time of surgery.⁽²¹⁾

The complications of surgery reported in the present study were comparable in both groups with no significant difference in incidence of complications, so the use of ligasure was safe.

The limitations of the present study include small sample and short duration of follow up as appearance of late complications may increase with increased period of follow up.

CONCLUSION

The use of ligasure in radical cystectomy was effective in reducing blood loss and in saving time by decreasing the duration of surgery, and also was safe as there was no significant difference in incidence of complications in the two groups.

Ethical Clearance: This study was approved by the ethical committee and the patients of the two groups read and signed an informed consent form according to ministry of health and environment in Iraq.

Tubal Patency and Pregnancy Rate Following Surgical and Medical Treatments of Ectopic Pregnancy

Wassan R. Alkhafajy¹, Firas F. Alyaseen²

¹College of Medicine, ²College of Pharmacy, Thi-Qar University, Iraq

ABSTRACT

Background: Ectopic pregnancy is defined as the implantation of a fertilized ovum outside the endometrial cavity, most commonly in the fallopian tubes. The high incidence of ectopic pregnancies can to some extent be related to the fact that the early diagnosis of pregnancy can be made with the use of β -hCG and ultrasound scans to identify the location of an early pregnancy.

Objectives: current study was conducted to (1) assess tubal patency by using hysterosalpingography following surgical and medical treatments of tubal pregnancy, and (2) to assess pregnancy rates following surgery and medical treatment of patients with ectopic pregnancy. **Methods:** an interventional controlled clinical study involved 300 women diagnosed with ectopic pregnancy at Bint-Alhuda Teaching Hospital in Thi-Qar Governorate, Iraq. They were divided into two groups according to the patients' preference; the first group treated with methotrexate while the second group treated surgically. Hysterosalpingography was done to all patients in both groups after three months of treatment, and both groups were followed up for one year waiting for pregnancy. **Results:** Tubal patency and spontaneous pregnancy rate is higher in the medically-treated group of patients. The contralateral tubal blockage was 11.5% in surgical-treated group, while 5.85% in medical-treated group. The spontaneous pregnancy rate was higher in medical-treated group (81.81%), while (58.66%) in the surgical-treated group. **Conclusions:** Better fertility potential and hysterosalpingography findings have been found after the medical treatment for patients with tubal ectopic pregnancy than those who are treated surgically.

Keywords: ectopic pregnancy, medical, surgical, tubal patency, hysterosalpingography.

INTRODUCTION

Ectopic pregnancy is defined as the implantation of a fertilized ovum outside the endometrial cavity, most commonly in the fallopian tubes [1]. The incidence of ectopic pregnancy in UK is 11/1000 pregnancies and the mortality rate is about 10/100000. The high incidence of ectopic pregnancies can to some extent be related to the fact that the early diagnosis of pregnancy can be made with the use of β -hCG and ultrasound scans to identify the location of an early pregnancy [2].

The known etiological factors contributing to the risk of ectopic pregnancy include tub-L disease, previous ectopic pregnancy, previous tubal surgery, use of intrauterine device, subfertility [2], assisted reproductive techniques and advanced maternal age [1].

The clinical presentations of ectopic pregnancy are variable and largely determined by the location of

pregnancy. In general, ectopic pregnancies implanted close to the uterus tend to develop further and present with more severe clinical symptoms. The most common symptoms are vaginal bleeding, pelvic pain and amenorrhea [3].

Improvements in the quality of diagnostic ultrasound techniques and β -hCG test, in the recent years, have facilitated early and better diagnosis of ectopic pregnancy and the development of conservative management protocols [3]. The ectopic pregnancy can be managed using expected medical or surgical approaches, depending on the clinical presentations and patient's choice [2].

Medical treatment using methotrexate is one of the options in the treatment of stable asymptomatic women with small unruptured ectopic pregnancy and β -hCG level is less than 5000 IU/L [4]. Methotrexate is a folate antagonist which interferes with DNA synthesis and inhibits cellular proliferation in the fast growing tissues

such as trophoblasts^[3]. Methotrexate is commonly given systematically as a single dose by intramuscular injection of 50 mg. The second dose of methotrexate is required if β -hCG level did not fall by at least 15% between days 4 and 7 of treatment^[1].

Medical treatment should be tried only if the facilities are present for regular follow-up visits^[2]. Failure of medical treatment is rare and most common when the initial hCG is high (higher than 5000 IU/L)^[4].

Surgical management can be performed by laparoscopy or laparotomy. Laparoscopic approach offers significant advantages when compared to laparotomy and is the mainstay of management. Laparotomy is mainly applied to severely compromised patients or due to lack of endoscopic facilities^[3].

Therefore, the aim of current study was to evaluate tubal patency and the rates of pregnancy following medical and surgical treatments of women with ectopic pregnancies.

PATIENTS AND METHOD

Current study was an interventional controlled clinical study conducted at Bint-Alhuda Teaching Hospital during the period from February 2009 to February 2016. Informed consents were obtained from all participating women prior to the study.

During that period 300 women were diagnosed with unruptured ectopic pregnancies were enrolled in this study. The diagnosis was based on

1. Clinical history and physical examination,
2. Measurement of β -hCG level and
3. Ultrasound scans.

The exclusion criteria were:

1. Haemodynamically unstable patients with suspected ruptured ectopic pregnancy,
2. Previous history of ectopic pregnancy,
3. Patients who had completed family and not planning for further pregnancy and
4. Unable to continue with the follow-up visits.

The indications for medical therapy were:

1. No significant pain,
2. Serum β -hCG level is less than 5000 IU/L,
3. Ultrasound shows unruptured ectopic pregnancy measuring less than 4 cm and with no visible fetal heart beats,

4. No intrauterine pregnancy (heterotopic pregnancy) and
5. Methotrexate is an acceptable option (patient acceptance).

On the other hand, contraindications to medical treatment were:

1. Chronic liver, renal, or hematological disease,
2. Active infection,
3. Immunodeficiency and
4. Breast feeding.

The clinical assessment, involved detailed history and thorough clinical examination, was performed for each patient. The patients were investigated for complete blood count, random blood glucose, liver and renal function tests, β -hCG level and pelvic ultrasonography.

In the first group of patients, who selected surgical treatment, laparotomy was done with salpingectomy of the affected tube, treated as inpatients for 48 hours and then discharged.

In the second group of patients, who selected medical treatment with methotrexate, on day zero, β -hCG level was measured, pelvic U/S was performed and methotrexate injection (Methotrexate *Ebewe*® 10mg/ml solution for injection) as a single intramuscular dose (50 mg) was given. If the patient lived nearby hospital (less than 15 minutes to reach the hospital) and has support at home, she would be discharged and asked to come back after 4 days; otherwise she was treated as an inpatient.

On day four, β -hCG level was measured, pelvic U/S was performed and another dose of methotrexate injection given if the decrease in β -hCG level was less than 15% from baseline.

On day seven, β -hCG level was measured, pelvic U/S was performed to confirm the success of treatment. If any patient developed treatment failure (demonstrated by persistent symptoms, persistent high β -hCG level, ruptured ectopic by U/S or clinically unstable), the patient referred to surgery. Accordingly, 10 patients were referred and excluded from the study.

All patients who were rhesus negative, from both groups, received anti-D injection. Also patients of both groups advised to avoid pregnancy for the next three months by using ordinary contraceptive methods and were asked to return for follow-up. After three months of treatment, hysterosalpingography was done for all patients. Then they were re-examined at 6 and 12 months intervals to look for spontaneous pregnancy. Data of this study were statistically analyzed using Chi-square test.

RESULT

During the period of study, populations of 300 women were included. Out of these patients, 260 women completed the study while 40 women were excluded because they did not attend follow-up visits.

Table (1) shows demographic characteristics of participants from both groups. The proportions of both groups seemed approximately similar regarding age, parity, surgical history and history of infertility.

Table 1: Demographic characteristics of participants

No.	Parameters	Frequency (Surgical treatment)	%	Frequency (Medical treatment)	%
1.	Age (years):				
	(20 – 30)	90	34.6	69	26.5
	> 30	60	23	41	15.7
2.	Parity:				
	Primi	38	14.6	20	7.7
	Multi	112	43	90	3.4
3.	Surgical History:				
	Yes	78	30	54	20.7
	No	72	27.7	56	21.5
4.	History of infertility:				
	Yes	58	22.3	38	14.6
	No	92	35.3	72	27.7

Numbers and proportions of patients who received medical treatment (110; 42.3%) and those treated surgically (150; 57.7%) are presented in Table 1 1.

Numbers and proportions of medically-treated patients with patent contralateral tube (15; 5.8%) and those with non-patent contralateral tube (95; 36.5%) according to hysterosalpingography examination are shown in Table 4.

Table 2: Numbers and proportions of patients who were treated medically and those treated surgically

Study Groups	Frequency	%
Medical treatment	110	42.3
Surgical treatment	150	57.7
Total	260	100.0

Numbers and proportions surgically-treated patients with patent contralateral tube (120 patien; 46.2%), and those with non-patent contralateral tube (30 patients; 11.5%) are presented in Table 3.

Table 3: Numbers and proportions of surgically-treated patients according to patency or non-patency of contralateral tube

Contralateral tube		Frequency	%
Valid	Patent tube	120	46.2
	Non-Patent tube	30	11.5
	Total	150	57.7
Missing	System	110	42.3
Total		260	100.0

Table 4: Numbers and proportions of medically-treated patients according to patency or non-patency of contralateral tube

Contralateral		Frequency	Percent	Valid Percent
Valid	Patent tube	95	36.5	86.4
	Non-Patent tube	15	5.8	13.6
	Total	110	42.3	100.0
Missing	System	150	57.7	
Total		260	100.0	

The results of patency of the affected tube by ectopic pregnancy (ipsilateral tube) in the medical-treated group (78 patients with patent tube; 70.9%) while 32 patients (29.1%) were with non-patent tube are presented in Table 5.

Table 5: Results of patency of the affected tube by ectopic pregnancy (ipsilateral tube) in the medically-treated group

Ipsilateral tube	Frequency	%	Valid Percent	Cumulative Percent
Patent tube	78	70.9	70.9	70.9
Non-Patent tube	32	29.1	29.1	100.0
Total	110	100.0	100.0	

Numbers and percentages of spontaneous pregnancies after medical (90 patients; 81.81%) and after surgical (88 patients; 58.66%) treatments are presented in Table 6.

Table 6: Numbers and percentages of spontaneous pregnancies after medical and surgical treatments

Study groups (No.)	Number of spontaneous pregnancies (%)
Surgical treatment (150)	88 (58.66)
Medical treatment (110)	90 (81.1%)

DISCUSSION

Ectopic pregnancy is one of the major health problems and an important cause of morbidity and mortality in women of reproductive age [3]. Better clinical care should help prevent the avoidable mortality and also reduce physical and psychological morbidities associated with ectopic pregnancy, improve future fertility outcomes and reduce the costs associated with repeated hospital admissions [5,6].

The increasing sensitivity of our diagnostic tests for ectopic pregnancies has resulted in many cases being diagnosed earlier in their natural course and led to clinically stable patients. Those patients are usually hesitating to accept surgery with its complications and salpingectomy with its psychological burdens and the possible adverse effects of subsequent fertility potential. So, the role of medical treatment is increasing and its popularity is growing, especially at our center after the completion of this study as it had no or very limited role before that.

In this study, there was good patients' acceptance of medical treatment as 110 patients (42.3%) out of 300 patients did accept medical treatment while 150 patients (57.7%) preferred surgical treatment (Table 2).

Good compliance with follow-up has been seen for 260 patients out of 300 patients in this study, because most women took future fertility problems more seriously. Medical treatment was commonly safe with no demonstrable harms or serious side effects.

High success rate was achieved in current study using medical treatment due to good selection of patients (failure rate was low as only 10 patients needed surgery after the failure of medical treatment and they were excluded from the study).

When we compare the tubal patency of both groups (using hysterosalpingography) and compare the patency of contralateral tube (non-affected side by ectopic), we found that tubal blockage was 11.5% in the surgical treatment group (Table 3) while 5.8% in the medical treatment group (Table 4). Therefore, surgical treatment is considered more risky for adhesion formation than medical therapy. However, it was difficult for us to assess if this blockage may proceed with our treatment or not.

In the surgical group, we did salpingectomy so the affected tube was lost (i.e. 100% blockade of ipsilateral affected tube, in another word the patient lost 50% of her fertility potential. However, in the medical treatment group, 70.9% had patent ipsilateral tube (affected tube by ectopic) so its function can be preserved although could be a site of future ectopic (Table 5). Therefore, we need more accurate and sophisticated tests to prove its functional potential.

The spontaneous pregnancy rate was higher in medically-treated group (81.81%) versus (58.66%) in the surgically-treated patients (Table 6). This might be related to the patent ipsilateral tube.

Therefore, the medical treatment is safe, highly effective in the properly selected patients with better subsequent fertility and free of surgical complications with wide acceptance in our center. Hence, it should take a greater role and should be used as a first line treatment in selected patients and this is supported by special guidelines. The guidelines states that methotrexate should be used as a first line treatment if β -hCG level is less than 1500 IU/L, however, women with β -hCG levels between 1500 –5000 IU/L may be offered either surgical or methotrexate treatment [7,8].

CONCLUSIONS AND RECOMMENDATIONS

The present study demonstrated that a better fertility potential and hysterosalpingography outcomes were achieved after methotrexate treatment for ectopic tubal patency than surgical treatment.

Further studies should be performed including larger patient populations, probably multi-centre studies, and more investigation facilities like laparoscopy for assessing fertility state and tubal condition.

The Possible Role of Interleukin-17A Elevation in the Development of Chronic Fatigue Syndrome

Mohammed A. Jawad Kadhum

M.Sc. in Medical Laboratory Technology/Assist. Lecturer/AL-Nisour University College/Baghdad, Iraq

ABSTRACT

Background: Chronic fatigue syndrome (CFS) is characterized by immune dysfunctions including chronic immune activation, inflammation and alteration of cytokines profiles. Therefore, the aim of current study was to test the association between existence of chronic fatigue syndrome and serum levels of Interleukin-17A.

Method: Fifty three patients with CFS were enrolled in this study and level of Interleukin-17A (IL-17A) has been estimated in their sera. The results were compared with those for 32 Rheumatoid Arthritis (RA) patients as a disease control and 35 apparently healthy control individuals.

Results: The results showed highly significant elevation in the level of IL-17A among CFS group in comparison with RA patients and healthy controls. Evaluation of this biomarker by (ROC) application revealed that it is an important parameter in discrimination between CFS patients and healthy individuals and can be used as an indicator and diagnostic marker. Also, a concentration of 4.4 ng/ml is optimum with a sensitivity of 98.1%, a specificity of 65.7% and an accuracy of 85.23%. Therefore, IL-17A is virtuous and suitable to confirm the diagnosis of CFS in suspected cases.

Keywords: *Chronic fatigue syndrome, Interleukin-17A, Rheumatoid arthritis, biomarker,*

INTRODUCTION

Chronic Fatigue Syndrome/Myalgic Encephalomyelitis (CFS/ME) is a multifactorial disorder identified by symptom-specific criteria and characterized by severe and long-lasting weakness or fatigue, post-exertion malaise, cognitive dysfunction, non-energizing or crush sleep and other symptoms [1]. The precise etiology remains vague [2]. It was denoted that CFS/ME typically affects a variety of bod systems including the immune system [1,2]. It is well known that cytokines are important for the function, activation as well as suppression of immune cells [3]. Therefore, abnormalities in their expression may affect immune cells functions. As patients having CFS/ME commonly present with symptoms that indicate immune response abnormalities, such as flu-like symptoms, cytokines expression has been an area of interest for researchers. These cytokines maybe implicated in the pathophysiology of chronic fatigue via expansion of specific cell subsets or its maintenance following immune activation by an innocuous stimulus[4].

In addition, cytokines may serve as potential biomarkers that aid diagnosis, sub-typing, monitoring and determining the prognosis of CFS [Ref]. In rheumatoid arthritis, several biomarkers, including cytokines, have been used to create a multi-biomarker disease activity score which has been shown to significantly correlate with disease activity [4]. As CFS is a clinical diagnosis, biomarkers could be used as objective markers of disease status. Hence, there have been many studies that focus on the role cytokines may play in CFS [5].

It was proposed that T helper cells start off 'naive' T cells and can turn into Th1, Th2 or Th17 cells. A naive T cell can either become inflammatory Th17 cell or anti-inflammatory Treg cell [Ref]. Interleukin-17 (IL-17) is a cytokine produced by Th17 cells under induction of IL-23 which results in destructive tissue damage in delayed-type reactions [6] where it causes increasing chemokines production in various tissues to recruit monocytes and neutrophils to the site of inflammation, similar to Interferon gamma. In addition, IL-17 acts synergistically with tumor necrosis factor and IL-1 [7,8].

Though individual biomarkers varied, results of CFS cases collectively supported involvement of IL-23/Th17/IL-17 axis in the delineation of CFS in a sex-specific way^[9]. The aim of current study was to explore the possible association between the level of Interleukin-17A and the development of Chronic Fatigue Syndrome in patients having clinical manifestations of the syndrome.

MATERIALS AND METHOD

The study was conducted during the period between June and September/ 2016. It involved Fifty three patients having clinical manifestations of chronic fatigue syndrome (CFS) and attending Medical City Teaching Hospitals and some of private clinics. These patients were diagnosed under the supervision of consultant Rheumatologists physicians according to the criteria of the Centers for Disease Control and Prevention (CDC)/ CFS criteria. In addition, 35 apparently healthy volunteers as Healthy Controls (HC) and 32 patients having Rheumatoid Arthritis (RA) as a disease control group were recruited in the study. All study participants undergone a range of blood tests that included liver function, thyroid function, renal function and lipid profile tests. Furthermore, a questionnaire was administered for participants to collect data like participant's name, gender, medical history, clinical features, length and body weight. Chi-square test was used to test possible associations between study variables. Data were expressed as Mean \pm SE and tested for significance at P<0.05.

RESULTS

1. Demographic criteria of participants: The results of current study revealed that there was no significant difference between mean of ages of studied groups of participants (45.63 ± 2.071 , 41.03 ± 1.843 and 40.96 ± 1.875) years for HC, RA and CFS groups, respectively] (P = 0.184; Table 1). In addition, the ratios of females to males among those groups were 1.92, 2.2 and 1.28 for HC, RA and CFS groups, respectively (P = 0.911; Table 1). However, the mean age of disease onset was significantly different between CFS and RA groups of patients (35.05 ± 1.859 and 40.10 ± 0.875) years, respectively] (P <0.05; Table 1). Regarding gender of participants, results of this study revealed that most patients in the CFS and RA groups were females (64.2% and 68.8%), respectively. In addition, in terms of BMI, data from current study showed that most participants were over-weighted (26.539 ± 2.025 , 28.286 ± 5.692 and 25.957 ± 4.798) Kg/ m² for HC, RA, and CFS groups, respectively, with no significant statistical differences between them. The latter probably explains the role of obesity as a risk factor in the development of many autoimmune diseases such as RA. Moreover, current study revealed that approximately 31.25% of participants with RA have positive family history of the disease, whereas 7.55% of patients in the CFS group had positive family history of the disease (Table 1).

Table 1: Demographical criteria of studied groups

Parameters	Studied groups			Total	(P value)
	Healthy Control	RA Disease Control	CFS Patients		
Gender	No. (%)	No. (%)	No. (%)	No. (%)	Chi-Square P= 0.0911 NS (P>0.05)

Age/years (Mean \pm SE)	45.63 ± 2.071	41.03 ± 1.843	40.96 ± 1.875		ANOVA & LSD P=0.184 NS
Age of disease onset/ years (Mean \pm SE)	-	35.05 ± 1.859	40.10 ± 0.875		Chi Square P=0.001 HS
Family History No. (%)	-	10 (31.25)	4 (7.55)	11 (12.94)	
BMI (Kg/ m ²) (Mean \pm SD)	26.539 ± 2.025	28.286 ± 5.692	25.957 ± 4.798		ANOVA P=0.067 NS
Total numbers	35	32	53	120	

NS = Not significant, HS = Highly significant.

2. Disease distribution according to age groups of participants: The results of current study revealed that the age group 20-40 years included 37.1% of healthy controls, 49.1% of patient with CFS and 46.9% of patients with RA (Table 2). This indicates that approximately 50% of participants with CFS were 20 to 40 years old.

Table 2: Disease distribution according to age groups of participants

Age groups/Year		Studied groups			Pearson Chi-Square (P value)
		Healthy Control	Patients (CFS)	Patients (RA)	
20-40	No.	13	26	15	P= 0.518 (P >0.05)
	%	37.1%	49.1%	46.9%	
41-60	No.	18	21	16	
	%	51.4%	39.6%	50.0%	
> 60	No.	4	6	1	
	%	11.4%	11.3%	3.1%	
Total	No.	35	53	32	
	%	100.0%	100.0%	100.0%	

3. Levels of IL17A in the sera of the studied groups: Results of current study revealed that serum levels (Mean ± SE) of IL-17A in the sera of patients with CFS (27.0532 ± 2.08216 ng/ mL) were significantly higher (P <0.05; Table 3) than those in the sera of patients with RA (3.7486 ± 0.24578 ng/ mL) or those in the sera of healthy controls (3.9622 ± 0.28219 ng/ mL). The latter two groups of participants were not significantly different (P >0.05; Table 3).

Table 3: Levels of IL17A in the sera of studied groups

Immunoassay		N	Mean	Std. Error	P value	
					ANOVA test	LSD test
IL - 17 A ng/ ml	HC group	35	3.9622	0.28219	P=0.00 Highly sign. (P<0.01)	*P=0.00
	CFS patients	53	27.0532	2.08216		**P=0.932
	RA patients	32	3.7486	0.24578		***P=0.00
	Total	120				

* Highly significant difference between CFS patients and HC group. ** Non-significant difference between HC group and RA patients. *** Highly significant difference between CFS and RA patients.

4. Evaluation of serum IL-17A level by ROC test:

Receiver Operative Curve (ROC) test had been applied for evaluation of IL-17A as a biological marker for discrimination between normal healthy individuals and patients with CFS (Table 4 and Figure 1).

Table 4 shows that the sensitivity of this biomarker is as high as 98.1% with a specificity of 65.7% and an accuracy of 85.23%. When the optimum concentration of 4.4 ng/ml was applied, there was highly significant difference between CFS patients and healthy individuals.

Table 4: Validity of IL-17A as a biological marker for detection of CFS

Validity tests for (IL-17 A)	
Sensitivity	98.1%
Specificity	65.7%
Positive predictive value (PPV)	81.2%
Positive predictive value (NPV)	95.8%
Accuracy	85.23%
Area Under Curve (AUC)	0.972
Cut-off value	4.4
P value	0.00 HS

Figure 1: ROC showing the characteristic of area under curve for IL-17A

DISCUSSION

A study conducted by Hornig et al. [10] reported strong correlation between cytokine alterations and illness duration. These findings have critical implications for arriving at an early diagnosis of CFS/ME. Moreover, the same researcher [11] demonstrated the existence of a disturbed immune signature in CFS cases that was consistent with immune activation in the central nervous system and a shift toward an allergic or T helper type-2 pattern associated with autoimmunity. They denoted to an inverse relationship between IL-1R and IL-17 F.

On the contrary, another study [12] reported that the levels of many cytokines including IL-17A were declined in the sera of CFS in comparison with control group. This idea was also mentioned by [13,14]. These authors stressed that the results of their research did not show CFS markers. Unexplained aspect was that why cytokines' levels decreased within a duration of one year of the disease [14]. They suggested that it might be the result of exhaustion [12-14].

In view of the above observations, it could be concluded that duration of CFS illness may affect the level of cytokines. Another study [15] showed that cytokines, such as IL-1, production to be of relevance in CFS patients and its role in effective treatment of this disabling disease. The conflict in the results of cytokines' levels among different studies could be attributed to many factors such as sample size, duration of CFS, age of patients and type of cytokines that were estimated (whether proinflammatory cytokines or other types).

Hornig et al. [10] stated that there were distinct plasma immune signatures in CFS present in early course of illness. Their conclusions that classical proinflammatory cytokines were elevated during early course of illness agree, to some extent, with results of current study as related to IL-17A concentration increment. These facts explain the variation in the level of IL-17A among the current and different studies. Additionally, types of samples may result in different results such as estimation of cytokines in the CFS sera could result in variation from those quantified in the CSF [16].

Evaluation of Seminal Plasma Anti-Mullerian Hormone Levels and Their Association with Sperms' Count and Activity in Infertile Males

Thikra M. Muhammed¹, Hiba M. Saleem¹, Saleem O. Almawla²

¹AL-Maaref University College, Iraq, ²Ministry of Health, Iraq

ABSTRACT

Background: Infertility is a problem that affects approximately 10-15% of couples during their productive ages. Anti-Mullerian hormone (AMH) is produced by Sertoli cells and it regulates male sexual differentiation. Therefore, current study was conducted to evaluate seminal plasma levels of Anti-Mullerian Hormone in fertile and infertile men. **Methods:** the study was conducted in the General Teaching Hospital in Ramadi city from 1st of February 2018 to 1st of April 2018. Participants were 134 men; 70 patients (who were suffering from infertility) and 64 controls (normal healthy men). The age of participants ranged from 20 to 60 years. Conventional semen analysis was done for all cases and the AMH evaluation was done by ELISA technique. **Results:** The study showed that there were significant differences in seminal plasma Anti-Mullerian Hormone levels in fertile and non-fertile men with p-value (<0.05). The study concluded that AMH is a good biomarker for monitoring and treating male infertility and its could be an important cause of men infertility.

Keywords: Seminal plasma, AMH, Sertoli cells, normospermia, azoospermia, men infertility.

INTRODUCTION

Infertility is a problem that affects approximately 10-15% of couples during their productive ages⁽¹⁾.

Seminal fluid is a white or grey liquid (suspension) of spermatozoa in seminal plasma which is a mixture of secretions from prostate, seminal vesicles, epididymis, urethral glands, Cowper's glands and vasa deferentia^(2,3). It clots almost immediately after ejaculation forming a sticky, jelly-like liquid and liquifies again within 5-40 minutes⁽⁴⁾. The seminal fluid serves as a transport medium enabling the penetration of a spermatozoon into the ovum at fertilization. Also the seminal plasma contains several components with different origins such as Anti-Mullerian hormone (AMH). The latter provides nutritive source for spermatozoa during their journey through the female reproductive tract using fructose to produce energy (ATP) necessary for their swimming (motion). In addition, it protects them from infection and other injurious as well as toxic agents. Also, it serves as a buffer to neutralize vaginal acidic conditions. Spermatozoa constitute 2-5% of seminal fluid volume; whereas seminal plasma forms the remaining portion^(2,5,6).

Anti-Mullerian hormone (AMH), produced by Sertoli cells, is a homodimeric glycoprotein linked by disulfide bonds. It is a member of the transforming growth factor (TGF) beta superfamily with a molecular weight of 140 kDa^(7,8). In addition, its levels are down-regulated by intra-testicular testosterone and it regulates male sexual differentiation^(7,9,10).

The physiological concentration of AMH in seminal plasma is higher than in the serum. It is believed that AMH well reflects sperm production and the development of Sertoli cells^(9,11).

The present study aimed to measure the levels of AMH in seminal plasma from fertile and non-fertile men to evaluate the benefit of monitoring this hormone as a diagnostic tool for men fertility and monitoring response to treatment.

MATERIALS AND METHOD

Study Participants: The study subjects were men in their reproductive age, but suffering from infertility disorders who were attending General Teaching Hospital in Ramadi city/Al-Anbar governorate, Iraq. The study

was conducted during the period from February, 1st to April, 1st / 2018. Patients were selected randomly and their ages were 20-60 years. Controls were normal healthy subjects as well as normal semen analysis results.

Semen samples collection: Semen samples were collected from all patients by masturbation after a period of sexual abstinence for 4 to 5 days and saved in sterile containers and allowed to liquefy for at least 30 minutes at 37°C. Semen samples were centrifuged at 100 × g for 15 min and the supernatant seminal plasma was stored in polypropylene tubes at -20°C until used⁽¹⁴⁾. A routine semen analysis was then performed according to World Health Organization^(12,13). Azoospermia was tested after two semen analyses and centrifugations.

Semen analysis: Semen volume, appearance, liquefactions time, viscosity, pH were determined and duplicate assessments were performed for semen analysis⁽¹³⁾.

Microscopic examination was performed using an improved Neubauer hemocytometer and included sperms' morphology and motility, sperms count and other findings such as pus cells and red blood cells. The most appropriate liquefaction of the ejaculate was estimated and aliquots were withdrawn with a positive displacement pipette. Smears for morphology were air dried, fixed in 95% ethanol and stained with the Papanicolaou method^(12,15).

Anti-Mullerian hormone measurement: Anti-Mullerian hormone levels in seminal plasma were measured by ELISA method (DSL, Webster, TX, USA). In the assay, standards, controls, and serum samples were incubated in microtitration wells coated with anti-AMH antibody. After incubation and washing, the wells were treated with secondary anti-AMH detection antibody labeled with biotin. After a second incubation and washing step, the wells were incubated with streptavidin-horseradish peroxidase (HRP). After a third incubation and washing step, the wells were incubated with the substrate tetramethylbenzidine (TMB). An acidic stopping solution was then added and the degree of enzymatic turnover of the substrate was determined by dual wavelength absorbance measurement at 450 and 620 nm⁽¹⁴⁾.

RESULTS AND DISCUSSION

The determination of AMH levels in seminal plasma is an important tool for the accurate diagnostics and successful treatment of male fertility disorders.

Population Study: The total number of semen samples included in the study was 134 samples. Seventy samples were either azoospermic or had some abnormalities in activity while the remaining 64 samples were found to be normal in count and activity and used as controls.

Distribution of mean seminal plasma AMH levels according to age group of participants: According to semen analysis, study participants were divided into two categories (normospermic and those with abnormal sperms analysis) and according to their age, they were divided into 4 groups (Table 1). The results showed that, regardless of the age group, the mean levels of AMH in the seminal plasma of normospermic individuals were higher than those in the seminal plasma from individuals having an abnormality in sperms' count and/ or activity (Table 1). In terms of age group, individuals within the age groups 20-30 and 31-40 years were having higher mean seminal plasma levels of AMH than other age groups in both categories of individuals (Table 1). However, those from the 1st category (normospermic) had higher AMH levels than those from the 2nd category in the corresponding age groups (Table 1). These findings indicate that there is a kind of correlation between production of normal sperms and level of AMH in seminal plasma. Also, it seems that the latter decreases with advancement in age (Table 1).

Results of current study are consistent with those reported in another study⁽¹⁶⁾ that, in both genders, AMH levels decrease with age. The production of spermatozoa starts in the testes seminiferous tubules epithelium that contains Sertoli cells which produce AMH⁽¹⁷⁾. However, other studies showed a non-significant correlation between AMH production and age^(14,18).

Some physical and biochemical results: In terms of Liquefaction time, study samples were classified into 3 groups (Table 2). The results of current study showed that mean seminal plasma AMH level was higher in the 1st group (i.e. 30-45 minutes group). This indicates that the level of AMH decreases as the liquefaction time increases (Table 1).

These findings contrast those reported by⁽¹⁹⁾ who did not confirm the existence of such inverse relationship between AMH level in seminal plasma and liquefaction time of the latter. Despite that, the results reported in current study could be attributed to environmental factors.

Table 1: Mean seminal plasma AMH levels according to age groups of participants

Age Group/ Years	Total No.	AMH levels in normospermic individuals (Pmol/L) Mean \pm SD*	AMH levels in individuals with abnormal sperms analysis (Pmol/L) Mean \pm SD*	P value < 0.05
20-30	52	1.9 \pm 0.4	1.33 \pm 0.3	a
31-40	44	1.8 \pm 0.3	1.2 \pm 0.5	a
41-50	28	1.5 \pm 0.1	0.9 \pm 0.3	b
<50 Years	10	1.1 \pm 0.2	0.7 \pm 0.2	b
Total	134	64(47.8%)	70(52.2%)	
Mean \pm SD		1.575 \pm 0.3	1.03 \pm 0.2	

*: Standard Deviation.

The letters [a and b] need explanation. Also, the P values need to be mentioned: The different letters mean that there are significant differences between the averages of the totals. Similar letters mean that there is no significant difference between the averages.

Table 2: Mean seminal plasma AMH levels according to liquefaction time

Liquefaction time in minutes	No. of samples	AMH levels (Pmol/L) Mean \pm SD*	P value < 0.05
30-45 minutes	65	1.55 \pm 0.3	a
<45-65 minutes	60	1.43 \pm 0.3	b
<65 minutes	9	0.86 \pm 0.2	c
Total time in minutes	134	1.215 \pm 0.2	

*: Standard Deviation.

The letters [a and b] need explanation. Also, the P values need to be mentioned: The different letters mean that there are significant differences between the averages of the totals. Similar letters mean that there is no significant difference between the averages.

Table 3: Mean seminal plasma AMH levels according to semen analysis results

Semen analysis result	Total	AMH levels (Pmol/L) Mean \pm SD*	P value < 0.05
Azoospermia	25	0.81 \pm 0.2	a
Oligospermia	20	0.9 \pm 0.1	a
Asthenozoospermia	25	1.1 \pm 0.2	b
Normospermia	64	1.575 \pm 0.3	c
Total	134	1.215 \pm 0.2	

*: Standard Deviation.

The letters [a and b] need explanation. Also, the P values need to be mentioned: The different letters mean that there are significant differences between the averages of the totals. Similar letters mean that there is no significant difference between the averages.

Hormonal assay results: The present study showed significant differences in AMH levels in non-fertile men group (cases) as compared to healthy (normospermic) controls ($P < 0.05$; Table 3) and the mean AMH level for controls was higher than that for patients.

These findings are supported by those obtained by ⁽¹⁹⁾ who showed that mean AMH levels in normospermic men were significantly higher than those in azospermic ones. In addition, another study ⁽²⁰⁾ reported the existence of a positive correlation between AMH levels and sperm count. Moreover, ⁽¹⁸⁾ reported lower AMH levels in seminal plasma of azospermic (infertile) men as compared to normal (fertile) ones.

On the other hand, AMH may be successfully used for predictions of motile sperm recovery after semen cryopreservation ⁽¹¹⁾.

Although the relationship between AMH level in seminal plasma and spermatozoa count was concluded by ⁽¹³⁾, it had not been confirmed by ⁽²²⁾. The latter study stated that the mean AMH value was almost the same in the healthy group compared to the group with a decreased sperm count.

In present study, a significant decrease in seminal plasma AMH is associated with the absence of spermatozoa in the semen of azospermic men illuminating a handy correlation between AMH concentration and progress in spermatogenesis.

The presence of developmentally more progressive spermatogenic cells may increase AMH secretion that is related to specific stages of the seminiferous epithelium cycle ⁽²³⁾. In addition, AMH level appears to positively correlate with parameters of sperm quality such as sperm count and motility, and negatively with the percentage of damaged spermatozoa. Therefore, as a predictive value for outcomes of testicular sperm extraction, AMH had been further tested ^(18, 20, 24, 25).

Seminal AMH is also a good marker for assessments of recombinant FSH treatment in men with idiopathic infertility undergoing assisted reproduction cycles ⁽²⁶⁾. Moreover, the assay of seminal AMH may be considered as an implement for prediction of gonadotropin therapy outcome in hypogonadism, since its early increase may be a marker of good spermatogenic response ⁽⁹⁾.

CONCLUSION

Therefore, determination of AMH in seminal plasma is an important tool for accurate diagnosis, successful treatment and efficient monitoring of male fertility disorders. In addition, deficiency of AMH could be an important cause of male infertility.

ABSTRACT

The genetic analysis of PCR-RFLP technique determined the genotype of miR-499 gene, which found that the homozygote (AA) pattern was significantly higher in patients than in control group. On the other hand, the statistical analysis for the role of microRNAs genes in the hormones and physiological parameters above found that the homozygote (AA) pattern of miR-499 gene show more effects in changes of parameters (cortisol, testosterone, estradiol, insulin, glucagon, Fasting Blood Glucose (FBG), insulin resistance, insulin sensitivity, microalbuminuria, systolic and diastolic pressure).

Conclusions: polymorphisms in miR-499 mediated diabetic cardiomyopathy.

Key words: T2DM, microRNA, miR-499, Polymorphism, RFLP technique, agarose-gel electrophoresis

INTRODUCTION

The changing life style in developing countries, led to rapid changes in globalization, urbanization and industrialization which had opened new ways for successful life, but from other ways it is going together with reduced physical activity and excess of metabolic disorders [1]. One of these danger disorders is Type 2 Diabetes Mellitus (T2DM). It is characterized by insulin deficiency that resulted from dysfunction of pancreatic β -cells with decline in its mass, hyperglycemia and insulin resistance. Important causes of T2DM include interaction between environmental and genetic factors [2, 3], The accumulation of polluting organic substances and chemical agents resulting in formation of amyloid fibers in pancreatic β -cells, thus, participate in T2DM pathology [4,5,6]. About 90% of all diabetic cases resulted from complex interplay between genetic, epigenetic and environmental factors. Identification of the genetic factors has been a challenge because the major environmental factors, diet and activity level, are well known [7,8]. T2DM pathophysiological process is complex where disorganization of gene expression is predicted and this will lead to discompose of variable physiological processes in tissues which contribute to glucose homeostasis [9,12].

The aim of current study was to investigate microRNA gene polymorphism and its role in T2DM and its complications.

MATERIALS AND METHOD

Participants: The study involved 80 patients (both males and females) suffering from type 2 diabetes mellitus with a duration ranged from 1-20 years, yet without any complications. They were selected from AL-Sader Teaching Hospital, Iraq. Their controls were 40 normal healthy subjects. Informed consents were obtained from all participants prior to study.

Blood samples (5 ml) were obtained from participants by venipuncture using disposable syringes in sitting position and allowed to clot in gel-containing tubes at room temperature for 10-15 minutes. Then, blood samples were centrifuged at $2000 \times g$ for approximately 10-15 minutes then the sera were obtained and stored at -20°C until analysis (hormonal assayed).

Urine samples were collected early in the morning from patients and control groups in special container for this purpose and the test was conducted as soon as possible. The COMBINA 13 Strips kit was used to determine microalbuminuria levels in urine. It is based on the "protein error" principle of the indicator which is

caused by the presence of albumin. Sulfonephthalein has a high sensitivity for albumin^[13].

Measurement of arterial blood pressure two times, 5 minutes apart, for each patient in the sitting position by using Mercury sphygmomanometer and average blood pressure was calculated for each participant.

Determination of fasting blood glucose (FBG): The RanDox kit was used to determine serum Glucose levels. It is based on the PAP enzymatic determination of glucose^[14].

Hormonal assay: Hormones such as Cortisol, Testosterone, Estradiol, Glucagon and Insulin were assayed using the Monobind ELISA Kit, which was based on standard sandwich enzyme-linked immunosorbent assay technology.

Determination of insulin resistance and insulin sensitivity: Insulin resistance is evaluated by determination of homeostasis model assessment of insulin resistance (HOMA-IR)^[15,16] and calculated by using the following equation:

$$IR_{HOMA} = (I_0 \times G_0) / 22.5$$

Where: IR_{HOMA} is insulin resistance according to homeostasis model assessment.

I₀: Fasting insulin level.

G₀: Fasting glucose level.

The **quantitative insulin sensitivity check index (QUICKI)** is derived using the inverse of the sum of the logarithms of the fasting insulin and fasting glucose^[17]

$$1/(\log(\text{fasting insulin } \mu\text{U/mL}) + \log(\text{fasting glucose mg/dL}))$$

DNA Extraction and genotyping: Genomic DNA was extracted from white blood cells (WBCs) for both diabetes and control groups using (Geneaid) DNA extraction kit. The selected miRNA gene (miR-499 (rs3746444 G-A) F:5'-CGGCTGTTAAGACTTGCAGTG-3'; R: 5'-TCCAGTCTTCCAAGCTTCA-3' was amplified by PCR with annealing temperature 55.3 and analyzed by PCR-RFLP technique using *HindIII* enzyme^[18].

Statistical analysis: All statistical analysis was performed by using SPSS 17 version. Data were expressed as (mean±SD). Comparisons among groups were performed using *t*-test, ANOVA and Pearson correlation analyses^[19]. Statistical significance of data was tested at P ≤0.05.

RESULTS

Demographic criteria of participants: Results of current study revealed that the majority of patients with diabetic were females (67.5%), 87.5% of them were not employed and 81.25% were urban residents. There are significant association between patients and controls regarding occupation and existence of CVD, nephropathy and hypertension. However, there was no significant association between patients and controls regarding gender, residence and family history of T2DM (Table 1).

Table 1: Demographic criteria of participants

Variable	Patients No. (%)	Control No. (%)	Odds ratio	95%CI	P-value

The genotype distribution of MIR-499 gene polymorphism in patients and control: The homozygote pattern AA was more frequent in patients with T2DM (84%) than control group with odd ratio (12.2500) as shown in Table 2.

Table 2: The genotype distribution of MIR-499 gene polymorphism in patients with T2DM and their controls

AA	84	30	12.2500	6.1772-24.2931	< 0.0001	Patients	Control
AB	16	50	6.000	0.742-48.4923	0.0928	A (0.92)	A(0.55)
BB	0	20		Reference group		B (0.08)	B(0.45)

Role of MIR-499 in some hormonal and physiological parameters levels rate in type 2 diabetic patients and control subjects: Statistical analysis of data from this study revealed the presence of significant differences ($P \leq 0.05$) between patients and control groups in all parameters. According to pattern of MIR-499 genotype, the statistical analysis showed the presence of significant differences in

cortisol, testosterone, estradiol, FBG, microalbuminuria, systolic and diastolic pressure in patients with T2DM who have pattern (AA) when compared with patients who have pattern (AB). On the other hand, according to genders there were significant differences in testosterone and microalbuminuria between males and females when compared with each other.

In the control group, the statistical analysis indicated the presence of significant differences in estradiol levels in control subjects who have pattern (AA) when compared with subjects who have pattern (BB) while there were non-significant differences with subjects who have pattern (AB).

t-test at $P \leq 0.05$. * Standard Deviation.

DISCUSSION

The genetic analysis of PCR-RFLP technique was chosen in present study because it is fast and cost-effective compared with other techniques and it gives an indicator about polymorphisms of genes so that it is documented and dependent in researches. The present study is the first study in Iraq and its one of the important studies in the world that dealt with microRNA gene polymorphism and its role in T2DM and its complications.

The statistical analysis of RFLP results for miR-499 showed that the pattern AA was more frequent in diabetic patients when compared with control group (Table 2).

Several previous studies indicated that dysregulation in the expression of microRNAs such as miR-196a2 and miR-499 were associated with several pathological disease such as cerebral ischemia as well as elevated blood pressure, BMI, insulin resistance and triglycerides [20,21,22] while study of Huang et al. [23] found that expression of miR-146a with genotype G allele increased the risk of ischemic stroke and this state was associated with effects on fasting glucose and LDL levels. These findings are in agreement with those obtained from current study which showed that FBG, insulin resistance, systolic and diastolic pressure are elevated in patients who have different polymorphisms in microRNAs genes' patterns as shown in Figures 1, 2 and 3.

On the other hand, several previous studies suggested the use of microRNAs as biomarker for diseases where it has been found that miR-499 down-regulation mediated diabetic cardiomyopathy and suggested that hyperglycemia induced miR-499 down-regulation and this was dependent on oxidative stress [24-26]. Other study [27] indicated the presence of an association between miR-499 and insulin resistance by its effect on its target gene PTEN which resulted in blocking of insulin signaling pathway by dephosphorylation of PI3K. The study of Wang and colleagues [28] found that the correlation

between miR-499 and PTEN was negative and glycogen content as well as insulin sensitivity were reduced with inhibition of miR-499. This resulted in insulin resistance and progression of T2DM.

Outcome of Celiac Disease after Two Years of Gluten-Free Diet

Abbas Mohammed Hussein Al-Shebani

Department of Pediatrics, College of Medicine/AL-Qadisiyah University, Iraq

ABSTRACT

Background: Celiac Disease (CD) is one of the most common diseases of gastrointestinal tract (GIT) and presents clinically with a wide range of GIT and non-GIT manifestations. In addition, the diagnosis of CD depends on clinical features with presence of anti-CD antibodies and the presence of specific histological changes on small bowel biopsy.

Aim of study: To evaluate the role of anti-CD antibodies in follow up of patients with CD and to study the rate of relapse in CD symptoms after re-introducing gluten after 2 years of gluten-free diet.

Method: This study done in Al-diwanayah maternity and children hospital in the period from 1st of February 2014 until the 1st of July 2017 and involved sixty three patients diagnosed as having CD depending on clinical features and the presence of positive anti-CD antibodies (anti-gliadin and anti tissue glutaminase). Then all these patients were referred to GIT center for small bowel biopsy. If the classical histological findings were present in the biopsy, then the patient involved in the study. Five patients refused to do biopsy, so 58 patients were involved in this study and full instructions about the diet of the patient were discussed with their families. Also, mobile phone No. was obtained from each caregiver for follow up every three months with full history, examination and measurements of auto-antibodies. After 2 years another small bowel biopsy done for all patients included in the study.

Results: Forty nine patients (96%) have normal biopsy and 2 (3.9%) still have abnormal changes in bowel mucosa. These 2 patient were excluded from the study and the other 49 patients reintroduced gluten in their diet gradually with close observation for relapse of symptoms and for detection of any complications. After three months of gluten-containing diet, a third biopsy was done. Forty one (83%) patient had recurrence of signs and symptoms of celiac disease and have abnormal biopsy findings so they were kept on gluten-free diet for life. Eight patients (16%) did not develop any signs and symptoms and they still have normal biopsy in spite of receiving gluten-containing diet for the last three months.

Conclusion: Anti-CD antibodies have a valuable role in follow-up of patients on gluten-free diet and sixteen percent of patient may have complete cure and complete normalization of bowel mucosa even after re-introducing gluten-containing diet.

Keywords: celiac disease, gluten-free diet, ELIZA, auto-antibodies.

INTRODUCTION

Celiac disease is an immune-mediated systemic disorder elicited by gluten and related prolamines in genetically susceptible individuals and characterized by presence of a variable combination of gluten-dependent clinical manifestations, celiac disease-specific antibodies, HLA-DQ2, DQ8 haplotypes and enteropathy [1]. Celiac disease-specific antibodies comprise auto-antibodies against TG2, including endomysial antibodies (EMA)

and antibodies against deamidated forms of gliadin peptides. Celiac disease is triggered by the ingestion of wheat gluten and related prolamines from rye and barley. In most studies oats proved to be safe, however, few celiac disease patients have oats prolamine reactive mucosal T cells that can cause mucosal inflammation. Celiac disease is a common disorder (1% prevalence of biopsy-proven disease). Environmental factors might affect development of celiac disease or the timing of its presentation [1].

There are numerous studies demonstrating that children with CD have gastrointestinal (GI) symptoms such as diarrhea with failure to thrive (FTT), abdominal pain, vomiting, constipation and abdominal distension, but there is little information currently available about the prevalence of CD in children with these GI-specific symptoms. Limited data suggest that the prevalence of CD may be increased 2–10 times in children with some of these GI symptoms or occur in up to 5% of cases [2].

Celiac disease is associated with major histocompatibility complex class II genes and the alleles encoding the human leukocyte antigen molecules (HLA)-DQ2 and HLA-DQ8. Almost all patients with celiac disease carry these HLA alleles [3].

Although other environmental factors ('second hits') in addition to gluten may be involved in triggering celiac disease, the disease goes into remission when gluten is removed from diet. This suggests that gluten is a major player in the pathogenesis of the disease. Gluten-containing cereal prolamines, such as gliadin in wheat, secalin in rye and hordein in barley, have a high number of repetitive glutamine and proline-rich sequences, making them highly resistant to proteolytic degradation by human gastric, pancreatic and intestinal brush-border enzymes, even in healthy individuals [4,5].

Such proteolytic resistance results in the persistence of relatively large peptides, which are thought to activate the small bowel mucosal immune system, thereby leading to the development of celiac disease. Under normal physiological conditions intestinal epithelium is fairly impermeable to long peptides such as wheat-derived gliadin peptides. However, in untreated celiac disease, the epithelial barrier function is compromised, and gliadin peptides gain access across the epithelial layer [6].

Studies performed with small bowel biopsy organ cultures and different *in vitro* cell cultures support the idea that gluten can activate the innate immunity mechanisms. This activation is thought to be mediated by toxic gluten-derived gliadin peptides (the α -gliadin peptide 31–43), which eventually results in intestinal epithelial cell damage [1, 7]. However, a different set of gliadin peptides, the so-called immunogenic peptides, activate the adaptive immune response. First, these peptides are post-translationally modified by a ubiquitously expressed multifunctional enzyme, transglutaminase (TG) 2, which catalyzes the deamidation of distinct glutamine amino acids to glutamic acid residues [2,8]. Such deamidation greatly enhances the ability of the peptides to bind to HLA- DQ2 which thereby potentiates celiac patient

T-cell stimulation [2,9]. As a result, pro-inflammatory cytokines are secreted during small-bowel mucosal tissue remodeling and damage, which is characterized by villous atrophy, crypt hyperplasia and inflammation.

The gold standard in diagnosing celiac disease is the presence of histological changes in small bowel mucosal biopsies. In other words, villous atrophy, crypt hyperplasia and profound inflammation characterize celiac disease. However, because of the multifaceted nature of the disease, clinicians have long used various serum-based antibody tests in case finding before proceeding to diagnostic upper gastrointestinal endoscopies with multiple small bowel mucosal biopsies. Among the first serum-based antibody tests applied in celiac disease are the anti-gliadin antibody (AGA) assays.

Currently, these tests are no longer used as diagnostic aids because their sensitivities and specificities are fairly poor [10]. In addition, individuals suffering from gastrointestinal conditions other than celiac disease and healthy individuals without celiac-type genetics have been reported to have elevated AGA levels [11].

The problems with the AGA tests were overcome by the advent of the gluten-dependent IgA-class R1-type reticulon (ARA) and endomysial auto-antibody (EMA) tests [12,13]. These tests are based on indirect immunofluorescence using rodent (ARA) or primate (EMA) tissues as antigens. In most studies, their sensitivities and specificities are both reported to be above 90%, though these tissue-based autoantibody tests are often subjective and laboratory dependent. It has been suggested that symptomatic patients, both children and adults, could be diagnosed based on a positive serum EMA finding [14,15].

In 1997, Dieterich and co-workers [19] identified TG2 as the auto-antigen for celiac disease. As various TG2-based enzyme-linked immunosorbent assays (ELISA) became available, a new era in celiac disease case finding by serology began [12,16]. Thereafter, it was shown that TG2 was also the specific protein antigen in the ARA and EMA tests [17] indicating that the above-mentioned three tests in fact do measure the same auto-antibodies. Currently, TG2 ELISA tests are widely used in diagnostic workup of celiac disease [15]. However, it is important to bear in mind that the performance of the commercial ELISA TG2- antibody assays may vary depending on the quality of the TG2 antigen and thus, may yield false-positive and false-negative results [10,18,19].

Therefore, the EMA test appears to hold its place as the gold standard celiac disease-specific antibody test. The superiority of the EMA test in celiac disease diagnosis is also supported by a high concordance between EMA positivity and the presence of the celiac-type HLA-DQ2 or -DQ8 which is not always seen with TG2 ELISA seropositivity [14,20].

Furthermore, the compromised specificity of the TG2 ELISA and the high specificity and sensitivity of the EMA tests suggest that the epitope in the EMA test is somehow specific for celiac disease auto-antibodies.

In totally asymptomatic persons belonging to high-risk groups, celiac disease should always be diagnosed using duodenal biopsies. When biopsies are indicated at least 4 fragments should be obtained from the descending part of the duodenum and at least 1 from the duodenal bulb. The diagnosis is confirmed by an antibody decline and preferably a clinical response to a gluten-free diet. Gluten challenge and repetitive biopsies will only be necessary in selected cases in which diagnostic uncertainty remains. It is important that an experienced dietician with specific expertise celiac disease counseling educates the family and the child about dietary restriction. Compliance with a gluten-free diet can be difficult, especially in adolescents. It is recommended that children with celiac disease be monitored with periodic visits for assessment of symptoms, growth, physical examination, adherence to the gluten-free diet and periodic measurements of TG2 antibody levels to document reduction. It is likely that in very rare cases a milder phenotype may allow slow weaning from parenteral nutrition allowing the patient to reach young adulthood and enjoy partial oral feeding.

Aim of study: To evaluate the role of anti-CD antibodies in follow-up of patients with CD and study the rate of relapse of CD symptoms after re-introducing gluten after 2 years of gluten free diet.

PATIENTS AND METHOD

This study done in AL-Dywaniah maternity and children hospital in the period from

1st of February, 2014 until the 1st of July, 2017 and involved sixty three patients diagnose d as having CD depending on clinical features and the presence of positive anti-CD antibodies (anti-gliadin and antitissue glutaminase) the result of enzyme were as the following:

Normal range < 12 U/ml Equivocal range 12-18 U/ml Positive result> 18 U/ml

From each patient five milliliters of venous blood were drawn and sent to the lab where Enzyme-Linked Immunosorbent assay (ELIZA) were used for detection and measurement of auto-antibodies (anti- gliadin IgA, IgG and anti-tTG IgA,IgG,) (Aesku Diagnostics Microform ring 2. 55234 Wendelsheim Germany) were used in this work.

Then all these patients referred to GIT center for small bowel biopsy, if the classical histological finding were present in the biopsy, then the patient involved in this study five patients refused to do biopsy, so 58 patients were involved in this study and full instructions about the diet of the patient were discussed with their families. Also, mobile phone No. was obtained from each caregiver for follow up every three months with full history, examination and measurements of auto-antibodies.

After 3 months, 7 patients were excluded (3 lost follow up and 4 did not keep on gluten-free diet) so only 51 patient were included, anti-CD antibodies were measured every three months (after 3, 6,9 and 12 months following introduction of gluten-free diet).

RESULT

The levels of anti-CD antibodies are presented in Table 1.

Table 1: Levels of anti-CD antibodies obtained every three month following gluten-free diet

Time of enzyme assay	No. of patients with normal enzyme levels	No. of patients with abnormal enzyme levels
Before gluten-free diet	-----	-----
After 3 month	22	29
After 6 months	14	15
After 9 months	10	5
After 12 months	2	3

[It was of great importance to include enzyme levels before introduction of gluten-free diet to evaluate its effects on disease activity].

The patients continued visiting GIT clinic every three months with full history, examination and assessment of body weight and height.

After 2 years another small bowel biopsy was done for all patients included in the study and the results are presented in Table 2.

Table 2: Biopsy results after 2 years of gluten-free diet

Time of biopsy	No. of patients	Normal Biopsy No. (%)	Abnormal Biopsy No. (%)
After 2 years (2 nd biopsy)	51	49 (96)	2 (3.9)
After 3 month (3 rd biopsy)	49	8 (16.3)	41 (83.6)

The results revealed that 49 patients (96%) have normal biopsy and 2 (3.9%) still have abnormal changes in bowel mucosa. After that, two patients were excluded from the study and the other 49 patients re-introduced gluten in their diet gradually with close observation for relapse of symptoms and for detection of any complications. Three months later, another biopsy was performed for the 49 patients and the results revealed that 41 (83%) patients had recurrence of signs and symptoms of celiac disease and had abnormal biopsy findings so kept on gluten-free diet for life. In addition, 8 patients (16%) did not develop any signs and symptoms and they still have normal biopsy in spite of receiving gluten-containing diet for the last three months.

Anti-CD antibodies also done for those eight patients every three months and they still have normal enzyme levels for additional 12 months.

DISCUSSION

Regarding CD, there is concern of the possibility of contamination of oats with gluten during harvesting, milling and shipping. Nevertheless, it seems wise to add oats to the gluten-free diet only when the latter is well established so that possible adverse reactions can be readily identified. There is a consensus that all celiac disease patients should be treated with a gluten-free diet regardless of presence of symptoms. However, whereas it is relatively easy to assess the health improvement after treatment of celiac disease in patients with clinical

symptoms of the disease, it was proved difficult in persons with asymptomatic celiac disease. The nutritional risks, particularly osteopenia, are those mainly feared for subjects who have silent celiac disease and continue on a gluten-containing diet. Little is known about the health risks in untreated patients with minor enteropathy, which may be clinically silent. There are no guidelines concerning the need for a gluten-free diet in subjects with “potential” celiac disease (patients with positive celiac disease-associated serology but without enteropathy).

The Codex Alimentarius Guidelines [Ref] define gluten-free as <20 ppm, but analytical methods for gluten detection have already reached a satisfactory degree of sensitivity, yet more information is needed on the daily gluten amount that may be tolerated by celiac disease patients. The data available so far seem to suggest that the threshold should be set to <50 mg/day although individual variability makes it difficult to set a universal threshold.

New guidelines on the diagnosis and treatment of celiac disease by the North American Society for Pediatric Gastroenterology, Hepatology and Nutrition [Ref] state that tTG-IgA testing should be used for follow-up care. Interpreting this test results is straightforward in patients having CD on gluten-free diet for at least several months whom should have a negative test. The numerical value of the test is not important. Follow-up is very important because most patients with celiac disease get better symptomatically with therapy, they may not realize the need for follow-up. This view may be shared by some of their health care givers. Hence, not all patients with celiac disease get regular follow-up care. Follow-up is necessary not only to assess symptomatic recovery and to monitor complications but also to assist the patient in adhering to the diet. Follow-up care is the corner stone to dietary compliance [21].

Our study clarified that antibodies measurements in CD patients are useful in clinical practice. Serial measurements of antibodies can allow objective targeting of dietetic resources. Our study is unique in that it highlighted the benefits of measuring serial antibodies levels over several months in a routine clinical setting. These results agree with previous work by Burgin-Wolff et al. [22] who showed a clear rise in antibodies concentration following a gluten challenge in patients with controlled CD. Similarly, the finding of this study, that antibodies levels fall dramatically in the initial few

months after starting gluten-free diet, confirms and supports serial observations of previous studies [23,24].

The present study indicates how serial antibody measurements are able to provide unique information to target dietetic resources. This study has demonstrated that complications of CD are most commonly seen in those with persistently elevated antibodies [25].

Our study disagrees with study done in Department of Pediatrics, Medical University Vienna, by Edith Vécsei et al. [26] this study demonstrated the limited value of serologic testing in the follow-up of pediatric CD with respect to the mucosal status. Only the normalization of EMA indicates mucosal healing with acceptable accuracy. Human recombinant tTG-based ELISA is a sensitive, specific and reproducible test to support the diagnosis and follow-up of childhood celiac disease and can be used as an alternative to the EMA test [27].

Our study also supported by a study in France [28] showed that deamidated gliadin antibodies are strongly related with villous atrophy and must be considered valuable tools in CD follow-up and that multiplex serologic analysis for treated CD represents a promising tool for personalized patient management.

In this study the result of small bowel biopsy was abnormal at the time of diagnosis and after 2 years of gluten-free diet, 49 patients had normal mucosa and this support the diagnosis of CD. These patients given gluten-containing diet for three months and a 2nd biopsy was done, forty one patients had abnormal biopsy and kept on gluten-free diet for life and this result supported by many other result around the world [29].

Eight patients still have normal biopsy results and normal enzyme levels even after one year from taking gluten-containing diet so they may have complete cure and do not need further biopsies or enzyme assay, but this result not supported or agreed by any other study.

CONCLUSION

Celiac disease is one of the most common GIT diseases whose diagnosis depends mainly on clinical features, assessment of anti-CD antibodies and small bowel biopsy. In addition, Anti-CD antibodies have a valuable role in follow-up patients on gluten-free diet. On the other hand, 16% of patients may have complete cure and complete normalization of bowel mucosa even after re-introducing gluten-containing diet.

Immunological Assessment for Children Infected with *Human Metapneumovirus* (hMPV)

Venus H. AL-Safar¹, Mohammed A. K. Al-Saadi¹, Adnan H. Al-Jothery¹

College of Medicine, University of Babylon/Hilla, Iraq

ABSTRACT

Background: The complement system functions as an immune control system that rapidly responds to infection. It has been involved as a pathogenic effector in many diseases including contagious illnesses. This study was conducted for immunological assessment of children who have human metapneumovirus infects. **Methods:** A cross-sectional controlled study involved 80 children aged ≤ 5 years (60 patients and 20 normal healthy controls) conducted during the period from February 2017 to January 2018 in Babylon city, Iraq.

Keywords: hMPV, ELISA, immunological assessment, bronchiolitis, pneumonia, complement system.

INTRODUCTION

The complement system functions as an immune control system that rapidly responds to infection. It has been involved as a pathogenic effector in many diseases including contagious illnesses ^[1]. Activation of the complement system by particular differentiation pathways stimulates a cascade of proteases resulting in cleavage outputs that function to exclude pathogens, adjust inflammatory responses and form adaptive immune responses ^[1]. Type I and III Interferons (IFNs) are accountable for the recruitment of an antiviral event in cells promptly after infection ^[2]. However, type I IFNs are generated by abundant various cell kinds; whereas type III IFNs appear to be generally produced by plasmacytoid dendritic and epithelial cells where the epithelial cells are the major goals for action ^[3]. Due to their robust and potentially hurtful impacts, the production of these cytokines is tightly organized ^[4].

The objective of current study was to

MATERIALS AND METHOD

Participants: The study involved children aged ≤ 5 years who were suffering from lower respiratory tract infections diagnosed as bronchiolitis, according to guidelines of the American Academy of Pediatrics; AAP [Ref], and pneumonia, according to the Integrated Management of Childhood Illness; IMCI [Ref]. They were diagnosed by a paediatrician and admitted to Babylon maternity

and pediatrics teaching hospital and Al-Noor paediatrics teaching hospital in Babylon city, Iraq. The study was conducted during the period from February 2017 to January 2018. Any patient with congenital heart disease, allergic bronchitis, asthmatic bronchitis, and any child with anatomical problems were excluded from this study. On the other hand, controls (20 children) were normal healthy children who had no history of lower respiratory tract infections and who were admitted to the Al-Imam Health Center, in Babylon city, for the vaccination program. Patients were sub-divided into two groups; those who were positive for human Metapneumovirus (sero-positive; 13 patients) and those who were negative for the virus (sero-negative; 47 patients).

Ethical approval: Verbal consent was obtained from the family of each subject for participation in this study. Moreover, this study was approved by Ethical Research Committee of Faculty of Medicine, Babylon University and Babylon Health Directorate.

Immunological tests: A whole-blood sample (3 ml) was obtained from each participant (60 patients and 20 controls) by venipuncture. These samples were collected into gel tubes and left to clot. Separation of serum was performed by centrifugation at 3000 r.p.m [5] for 10 minutes, and then sera were carefully transferred to eppendorf tubes and stored at -20°C until use. Serum levels of C3, C4, IFN- α , IFN- β , IFN- γ , and IL-12 were estimated by **Enzyme Linked Immunosorbent Assay** (ELISA) according to manufacturer instructions (Elabscience-China).

Statistical analysis: Data were analysed using version 20. Categorical variables were shown as frequencies and percentages while continuous variables were presented as Mean±SD. ANOVA test was applied to compare means of three sets or more. Kruskal-Wallis test was exercised to match three independent classes when study variables do not follow normal distribution. Pearson Chi-square and Fisher's-exact tests were used to explore the association among categorical variables. A P value of ≤ 0.05 was considered significant.

RESULTS AND DISCUSSION

Estimation of C3 complement component: In current study the serum concentrations of C3 were 211.09 and 174.29 ng/ml in sero-positive and sero-negative patients, respectively, while in control group it was 142.69 ng/ml (Table 1). However, C3 concentrations were not statistically significant among the study groups ($P > 0.05$; Table 1).

Table 1: Concentrations of C3 complement component in the serum of study groups

Study marker	Study group	No.	C3 concentration (ng/ml) Mean±SD	Range	P value
C3	hMPV positive children	13	211.09 ± 103.62	37.30-303.46	0.194*
	hMPV negative children	47	174.29 ± 112.94	34.23-381.15	
	Control group	20	142.69 ± 86.12	50.76-359.61	

* = Not significant ($P > 0.05$)

It was concluded that [6] patients having chronic obstructive pulmonary disease (COPD) exhibited low activity of complement component C3 and/ or C4. On the other hand, those with pulmonary fibrosis; asthma, lung cancer and pneumonia exhibited moderate activity of complement. Nonetheless, bronchiectasis and hemoptysis had shown high efficiency of complement. Both classical and alternative routes of complement activation were reported in hemoptysis while only classical pathway of activation was indicated in bronchiactosis [Ref]. However, the results reported by [7] indicated that serum C3 was significantly higher in asthmatics when compared to controls.

Complement system has remarkable defensive functions according to data obtained from many studies[8].

Results of current study disagree with those reported in previous study [9] where serum C3 was significantly higher when compared to controls.

Estimation of C4 complement component: Current study revealed that serum concentrations of C4 were 112.14, 123.30 and 139.80 ng/ml in sero-positive, sero-negative and control children, respectively, (Table 2). In addition, there were significant differences between concentrations of C4 among study groups ($P < 0.05$; table 2).

Table 2: Concentrations of C4 complement component in the serum of study groups

Study marker	Study group	No.	C4 concentration (ng/ml) Mean ± SD	Range	P value
C4	hMPV positive children	13	112.14 ± 14.97	81.16-134.16	<0.001*
	hMPV negative children	47	123.30 ± 16.83	84.16-163.83	
	Control group	20	139.80 ± 8.09	129.33-157.66	

* P value ≤ 0.05 was significant.

A previous study involved three children with pneumonia [10] found that two of them had minimal C3 concentration while the third child had depressed levels of both C3 and C4. Moreover, another study [11] reported no differences between serum levels of IgM, C3 and C4 between two groups of patients with pneumonia and their controls ($P > 0.05$).

The complement system includes various fluid-phase and membrane-associated proteins. Under physiological states, activation of the fluid-phase synthesis of complement is ensured under strict control and complement activation exists firstly on surfaces known as "non-self" in a try to reduce harm to bystander host cells. Membrane complement composition work

to shorten complement activation on host cells or to ease uptake of antigens or microbes “tagged” with complement fractions^[12].

Estimation of IFN-α component: Results of current study showed that serum concentrations of IFN-α were

66.65 and 71.74 pg/ml in sero-positive and sero-negative patients, respectively, whereas it was 76.04 pg/ml in control children. In addition, these concentrations were not statistically different among the three study groups (P >0.05; Table 3).

Table 3: Concentrations of IFN-α component in the serum of study groups

Study marker	Study group	No.	Concentration of IFN-α (pg/ml) Mean ± SE	Range	P value
IFN-α	hMPV positive children	13	66.65 ± 5.07	41.30-88.69	0.337
	hMPV negative children	47	71.74 ± 5.16	36.52-199.13	
	Control group	20	76.04 ± 6.10	40.86-176.95	
* = No significant (P >0.05)					

The natal immune cells display weak levels of pro-inflammatory cytokines involving type I interferon (IFN), IFN-α and IFN-β as well as minimum levels of IL-12 and TNF-α. In addition, higher levels of anti-inflammatory cytokines such as IL-10 and TGF-β^[13]. On the other hand, the study by^[14] found that the levels of IFN-α remained safely low among rhinovirus patients after modulation of varied comparisons. Moreover, the study conducted by^[15] detected non-significant levels of IFN-α in severely vs. non-severely febrile children. A significant positive correlation between INF-α and viraemia was detected in severely febrile children [Ref]. Interferons alpha (IFNs-α) are pleiotropic cytokines belonging to type I IFN family, primarily qualified for their antiviral activity. These cytokines show extended lists of clinical usage in patients

with few types of cancer and viral diseases. Notably, proven autoimmune defects have been assumed to be remediated by endogenous IFN-α and are predominately observed in some IFN-cured patients. IFN-α can stimulate numerous biological effects including induction of apoptosis and suppression of cellular proliferation. In addition, these cytokines elevate the segregation and activity of host immune cells^[16].

Estimation of IFN-β component: Results of current study showed that serum concentrations of IFN-β were 195.38 and 262.03 pg/ml in sero-positive and sero-negative patients, respectively, while in control children it was 178.07 pg/ml. In addition, there were significant differences among different study groups (P <0.05; Table 4).

Table 4: Concentrations of IFN-β component in the serum of study groups

Study marker	Study group	No.	Concentration of IFN-β (pg/ml) Mean ± SE	Range	P value
IFN-β	hMPV positive children	13	195.38 ± 18.11	127.14-295.71	0.034*
	hMPV negative children	47	262.03 ± 24.25	114.28-1104.28	
	Control group	20	178.07 ± 10.86	130.0-345.71	
* P ≤0.05 was significant					

A previous study^[17] had concluded that serum levels of type I IFN-β were softly high in children whom sero-positive for human Metapneumovirus (hMPV) as compared to their healthy control children. The same study reported that serum levels of type II IFN-γ was not elevated in those patient as compared to control children. These results suggested that inflammatory response is implicated in the innate immune response to hMPV in these patients; either as a defensive mechanism or as a response to lung pathology.

Moreover, the results presented by^[18] revealed that the IFN-β pathway is stopped when there is serious excess of inflammatory cytokines, such as IL-1β, in response to LipoPolySaccharides (LPS). the authors proposed that dysregulation of IFN-β is a great determinant for preterm childbirth connected with polymicrobial infections. Furthermore, serum levels of IL-1β, the cytokine produced by TH17 cells, were safely higher in hMPV sero-positive children as compared with those having RSV infection and healthy children^[19].

Estimation of IFN- γ component: Results of current study revealed that serum concentrations of IFN- γ were 29.01 and 31.20 pg/ml in sero-positive and sero-negative patients ,respectively, while in control children it was 20.34 pg/ml. In addition, these concentrations were not statistically different among study groups ($P > 0.05$; Table 5).

Table 5: Concentrations of IFN- γ in the serum of study groups

Study marker	Study group	No.	Concentration of IFN- γ (pg/ml) Mean \pm SE	Range	P value
IFN- γ	hMPV positive children	13	29.01 \pm 13.12	13.45-39.36	0.172*
	hMPV negative children	47	31.20 \pm 14.11	14.47-42.33	
	Control group	20	20.34 \pm 9.21	9.27-48.72	

* = No significant ($P > 0.05$)

The study conducted by [20] demonstrated that children <3 years old with hMPV and RSV infections had elevated levels of rhinal airway IFN γ , CCL5 and IL-10 parallel to an elevation in Th1 (IFN γ)/Th2 (IL-4) ratios, that is predictable in antiviral responses. In contrast, early hMPV-infected children (< 32 wk gestation) did not show elevated Th1/Th2 ratio or increased nasal airway excretion of IFN γ , CCL5 and IL-10 comparative to controls.

Though the mechanism(s) by which hMPV changes IFN-mediated responses is not fully known, there is an *in vitro* evidence suggesting that hMPV modifies IFN-mediated activation of interferon-catalyzed response elements, interferon-stimulated genes and STAT 1 downstream marking [21].

The accurate cause why hMPV triggers markedly minimal IFN- γ (and IL-10, CCL5) responses than RSV is yet an area of active study, but there are many probable mechanisms of imperfect IFN-driven antiviral immune responses in hMPV infection. For instance, the structural encoding proteins of hMPV (glycoprotein G and M2) appear to play significant role in altering antiviral IFN occurring in hMPV infections [22] as shown by the control in a mutated hMPV virus not having glycoprotein G and M2 protein triggers safely great amounts of IFN and antiviral cytokines/chemokines than wild-type hMPV [23]. Moreover, hMPV also seems to overlap with the activation of the IFN signaling cascade in various points like IFNAR1 membrane expression [24]. The overall outcome of which can result in downstream repression of STAT1 and STAT2 [21,24].

CONCLUSION

The results showed that C3, IFN- α and IFN- γ

concentrations were not significantly different among study groups. However, there were considerable distinctions between concentrations of C4, IFN- β , and IL-12 among study groups ($p < 0.05$).

Ethical Clearance: this study was approved by Ethical Research Committee of Faculty of Medicine, Babylon University and Babylon Health Directorate.

Call for Papers/Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialties. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper; A general invitation is extended to authors to submit papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article an attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your affiliation (designations with college address)
- Abstract
- Keywords
- Introduction or background
- Material and Method
- Findings
- Discussion
- Conclusion
- Interest of conflict
- Source of Funding
- Ethical Clearance
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file.

All articles should be sent to: editor.ijphrd@gmail.com

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic-ISSN:** 0976-5506, Frequency: Monthly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal. The frequency is Monthly. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialties concerned with research and development for the masses. The Journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.

Indian Journal of Public Health Research & Development is a double blind peer reviewed international journal. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN) and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

The Relationship between Personality Traits and the Perceptions on Pre-Marital Sexual Relations

Affandee, S¹, Rehman, S², Ooi Boon Keat²

¹*School of Education & Social Sciences, Management & Science University, Malaysia,*

²*Senior Lecturer, School of Education & Social Sciences, Management & Science University, Malaysia*

ABSTRACT

The study was conducted to discover the relationship between personality traits of students and their perception of pre-marital sexual relations. This paper also attempted to find out the influence of internal or external factors on their perception towards the issue. Their personal background such as relationship status was taken into account. A questionnaire was administered to 100 male students and 100 female students in a private university. The results revealed that there are differences among those who accepts and rejects the act based on their relationship statuses. People who are married have different say on the matter as opposed to those who are not married yet. However, there were no significant relation between personality traits and their perception on pre-marital sex. Based on the results collected, we were able to conclude that no matter which personality the person may have, the majority of pupils are against the idea of pre-marital sexual relations. No effect on opinion based on gender can be seen as well. Though, a look at the data on internal and external factors, another conclusion can be made. Religion is the main factor that influences the students' perceptions on pre-marital sexual relations. It being a main theme in Malaysia, strong implications are present for certain issues that have a connection with religion. Despite the person's relationship status, personality or gender, the social standard and expectations are what control their perception on the matter of pre-marital sexual relations.

Keywords -Personality Traits, Perceptions, Pre-marital Sexual Relations.

INTRODUCTION

The relationship between personality structure and sexual functions, as well as expression of sexuality in the period of adolescence has not been studied very often.¹ Eysenck (1976)² initiated the pursuit for exploring the relationship between traits that describe human personality and sexual expression. He used his Eysenck Personality Questionnaire (EPQ) to examine Extraversion, Neuroticism and Psychoticism in relevance to the traits table that describes the personalities to find out patterns of sexual activity. Based on his personality theory, Eysenck (1976)² postulated those with Extraversion or extraverts, because of their high sensation seeking needs, would be more inclined to engage in a wider range of sexual behaviour and be more active in this area than introverts. With regard to the Neuroticism (N), Eysenck (1976)² predicted that high N scorers would be more likely to be anxious and find certain aspects of sex to be disgusting. On the Psychoticism (P) dimension

Eysenck (1976)² predicted high P scorers would be more interested in impersonal sex or aggressive sex and be more inclined to participate in socially disapproved acts. In addition to predicting different patterns of sexual behaviour based on personality, Eysenck (1976)² also noted that differences in sexual arousal patterns would also occur.

The simplified objectives of this research are as follows:

To identify perception on pre-marital sexual relations among different personality types of the students.

To identify the personality type that highly rejects pre-marital sexual relations and the personality that approves of the act.

To look for other internal or external factors (individual, partners, religion, morality, society, family, friends, social media, etc.) that may shape the mindset

of acceptance or rejection towards pre-marital sexual relations.

To identify if there is a difference in opinion on pre-marital sexual relations based on different genders.

To get the opinion (very good, good, normal, bad, very bad) of the people on the current condition of pre-marital sexual relations in society.

RELATED LITERATURE

The review of related literature regarding Perception, Personality & Values, Gender Differences and Pre-Marital Sex has been able to provide relevance and work as supporting materials for this synthesis.

Anna C. Bocar (2013)⁷ stated that conservatism is signified by the act of adhering to and tending to preserve the accepted societal order, specifically on sex issues. The result of the study shows that 60% of male respondents were slightly conservative and only three percent were liberal. On the other hand, majority of the female respondents were conservative, with 52% and none of them achieved the result of liberalism towards pre-marital sex. The source of which most information was obtained about sex shows that the male respondents mostly obtain their information from mass media, whether it is from television, internet, or social networks; which is 56.67% of them. None of the male respondents obtained information about sex from books, magazine or parents. Meanwhile, most of the female respondents, at 36.67%, mainly obtained information about sex from sex education at school or from teachers, and 33% from mass media. Based on these findings, it shows that the majority of female respondents have a higher value towards chastity before marriage compared to their male counterpart.

In a study conducted by SalamehP., JomaaL., IssaC., FarhatG., ZeghondiN., &GergesN. (2012)⁸, they assessed the sexual attitudes and behaviours of university students, while identifying the possible relationships with their attitudes towards risky behaviours such as smoking cigarette, water pipe smoking, and alcohol consumption. This study also takes into consideration the respondents' gender, age group, socioeconomic status, risk involvement excitement, and motives and apprehension. Among 3384 participants, 20% were current cigarette smokers, while 23% were current waterpipe smokers and 33.5% declared consuming alcohol. Higher rates

were found for smoking and alcohol consumption in private versus public universities ($p < 0.001$). Participants also reported a very low consumption of fruits and vegetables. Moreover, 31% of boys and 8.6% of girls declared having regular sexual activity; among them, 41% of boys and 26% of girls declared using a condom regularly. Substantial proportions of university students in Lebanon adopt risky behaviours for health, particularly in private universities. (SalamehP. et al., 2012) It is clear that this study has managed to find the relationships between sexual attitudes and behaviours with demographic factors and risky attitudes and behaviours. Therefore, this may indicate the presence of a relationship between perceptions towards sexual relations, particularly pre-marital, and personality traits according to the Big Five.

According to Eze I. (2014)¹³ human sexual behaviour is strongly determined by cultural and social influences. The study was on the adolescents' attitude towards pre-marital sex in Awka North and South Local Government Areas of Anambra State. The general purpose of the study was to identify some of the attitudes of adolescents towards pre-marital sex and the major factors responsible for them. From this research it was found that, adolescents have various permissive attitudes towards pre-marital sex; majority of both gender permit the act with 20 out of 21 permissive attitudes present for males and 19 out of 21 for females. Many factors influence the adolescents' attitudes towards the act; both genders identified 10 of the listed 10 factors influencing their attitudes towards pre-marital sex. Due to these findings, it is clear that there are various factors that affect one's attitude towards pre-marital sex.

LIMITATION

This research was conducted in a concentrated geographical and background setting among respondents belonging to Management & Science University in Shah Alam. It is important to take note that Malaysia has many different areas and regimes that may contribute to the result of this kind of research. Considering that this was done in an urban area, its representation on rural area or youth as a whole can be contentious. However, the limitations of this research do not necessarily make the results insignificant but relatively call the prospect for further research and studies.

RESULTS

After data analysis, it was found out that the students' perception as a whole were affected mostly by external factors. The relationship between their perception and personality were also uncovered. The outcome presented in this study demonstrates the impending measure for a more advanced, in-depth research development and new findings.

Table 1: The perception on pre-marital sexual relations according to relationship status

Relationship Status	ACCEPT			REJECT	
	f	x ²	p	x ²	p
Married	7	130.60	0.02	83.77	0.96
Single	134				
In a relationship	57				
Undecided	7				

Note. $p < 0.05$

Table 1 shows the correlation between the relationship status of the students and their perception. Results of the chi-square test (Pearson chi-square) for the research sample shows that there is significant difference in the perception of accepting according to relationship status comparing to those who are rejecting which appear to have no significant difference. The ratio for those who accept is significantly different among relationship statuses but the ratio for those who rejects it is smaller.

Table 2: The Perception on pre-marital sexual relations based on Personality Traits

	ACCEPT		REJECT	
	M	SD	M	SD
Openness	27.55	8.33	34.85	8.97
Conscientiousness	30.43	6.35	35.71	5.31
Extraversion	22.50	10.61	41.50	3.54
Agreeableness	26.04	6.34	35.67	6.92
Neuroticism	24.14	9.60	38.14	10.29
Others	26.60	9.60	36.33	5.59

Note. $p < 0.05$

Table 2 shows the perception on pre-marital sexual relations based on different personality traits. From the total of 200 respondents, it is seen that the highest acceptance on pre-marital sexual relations come from those who has Conscientiousness as it has the highest mean. While the highest mean for those who rejected the subject comes from Extraversion. The standard deviation for those who accept the issue appear to be the highest at 10.61 for Extraversion, while rejection the highest falls on Neuroticism with 10.29. Those who are extraverted, has the smallest standard deviation while they also have the highest mean on rejection, meaning that those who rejected pre-marital sex are distributed and resulted closely to each other.

However, from the result, we can see that for each of the personality, the mean for rejection is always higher than the acceptance, proving that most of the students are against the issue of pre-marital sexual relations.

Table 3: The relationship of Personality Traits and the Perception on Pre-Marital Sexual Relations

	ACCEPT		REJECT	
	r	p	r	p
Openness	-0.02	0.82	-0.04	0.55
Conscientiousness	0.03	0.73	-0.02	0.80
Extraversion	0.01	0.93	0.01	0.90
Agreeableness	-0.09	0.23	0.00	1.00
Neuroticism	0.05	0.48	-0.02	0.80
Personality Traits	0.01	0.23	0.01	0.49

Note. $p < 0.05$

Table 3 shows the relationship of each personality traits with the perception of pre-marital sexual relations according to Spearman Rho's correlation. It can be observed that there is no significant relationship between each of the personality traits with their perception of pre-marital sex. Due to that, the regression came out insignificant as one change on the variable (personality traits) does not produce change towards another (perception). In this case, the difference of personality does not indicate or affect their perception on pre-marital sexual relations.

Table 4 Factors that affect perception towards Pre-Marital Sexual Relations

	f	%	Cum.%
Individual	35	17.5	17.5
Partners	18	9.0	26.5
Religion	66	33.0	59.5
Morality	6	3.0	62.5
Society	23	11.5	74.0
Family	6	3.0	77.0
Friends	12	6.0	83.0
Social Media	34	17.0	100.0

Table 4 shows other factors that may affect students’ perception on pre-marital sexual relations. 66 out of 200 respondents stated that their perception on pre-marital sex is the result of their religion, where it encompasses 33.0% of the data. Both family and morality had the smallest value of three percent each (frequency of six) in terms of shaping the students’ perception on the issue. As such, we can conclude that the students’ perception on the issue is highly influenced by their religion which deems the act as immoral.

Table 5: Gender differences on perception towards Pre-Marital Sexual Relations

	FEMALE		MALE		t	p
	M	SD	M	SD		
Perception					0.16	0.87
Acceptance	26.68	8.13	27.37	7.77	-0.61	0.54
Rejection	34.46	8.15	36.36	8.12	-1.57	0.12

Note. $p < 0.05$

Table 5 shows the perception of the male and female students. Both male and female has the n of 100 for each group. The rejection for both gender obtained a higher inference score than those accepting. We could see that the mean for rejection for both genders are higher at 34.46 and 36.36 as compared to their acceptance mean which are 26.68 and 27.37 for female and male respectively. Male students obtaining a slightly higher mean score on both acceptance and rejection.

The table noted that $p < 0.05$ where it is the cut-off for significance and thus, as both p values for acceptance and rejection are much higher, it can be denoted that the results were not statistically significant. The perception towards pre-marital sex between the genders held no substantial difference; being a female or a male had no bearing on the decision to either accept or reject pre-marital sex, it is a non-factor.

Table 6: The opinion on the current situation of Pre-Marital Sexual Relations by the students of Management & Science University

Opinion	f	%	Cum.%	M	SD
Very Good	2	1.0	1.0	3.83	0.87
Good	5	2.5	3.5		
Normal	69	34.5	38		
Bad	74	37	75		
Very Bad	50	25	100		

Table 6 shows that the students' opinion on the current situation of pre-marital sexual relations and it seems that it is Bad to the majority of the students with 37 percentage. The others that come close are those with the opinion of that it is Normal with 34.5% and Very Bad at 25%. Very Good and Good opinions are in the minority with one percent and 2.5% respectively. Hence, we can conclude that most of the students perceive the act of pre-marital sex as a norm in today's society as well as something to be frowned upon.

CONCLUSION

The perception of pre-marital sexual relation can't be easily determined by the "type" of person one is. Not even their personality or their gender. Belonging to the same cultural context and environment, people are expected to have the same views and morality especially regarding social issues. From this research, we can see that the most intriguing factor that affects opinion of youngsters in Malaysia is religion. Understandably the concept of religion is very strong in Malaysia; ever since the beginning, the nature and culture of this land is based entirely on religion. As such, the deeply engraved social structure may contribute to the development of attitude, behaviour and personality. Be it Islam, Buddhism or Christianity, all religion frown upon sexual intercourse before marriage. This feature is so strong that it diminishes the effects of the rest of the circumstances including friends, the influence of media and technology, personality, gender and even family.

Visual Impairment: A Comparison of Global and Indian Perspective

Soumya Thankam Varghese¹, Maya Rathnasabapathy²

¹Research Scholar; ²Assistant Professor (Senior), School of Social Sciences and languages, Vellore Institute of Technology – Chennai

ABSTRACT

This paper is a comparative review on the global and Indian perspective on blindness. The estimates, initiatives and better plans are described in detail. As India is trying her best to help with own people to achieve the global status of equality as in all realms of life this attempt is really significant. Thoughts about how much we have undergone and how much left to reach are key points to address in each phase of all kinds of developmental initiatives. The paper has been divided into two parts to come up with clear thoughts for further actions.

Keywords: *Visual impairment, Global perspective, Indian perspective*

BACKGROUND

Eyes are the most sensitive organ for all living beings. Absence of eyes is in a way absence of colors too. Taking care of our eyes is of course quite important to us for this single reason alone. Seeing and helping others to see, both initiatives are needed to be addressed seriously in the present situation. The reasons are many though we could categorize it as national and international. The imbalances in the distribution of visual impairment throughout the world are totally disappointing as the least developed regions carry the largest share¹. The same reflects when it comes to the age group also. Largely spread over among the group of 50 years of age and older. Gender wise estimates telling that females are more prone to get low vision problems compared to males. Social and medical explanations were there to support on gender wise in equal distribution of visual impairment. There are 1.4 blind children below the age of 15 years pointing towards the seriousness of childhood blindness across the world. The magnitude is little when compared to older adults make us as worried as children are the future of every nation. Initiatives of the WHO were quite instrumental in recognizing uncorrected refractive errors as a major cause for blindness globally.

The initiative “VISION 2020” – The Right to Sight is clearly focused to wipe out the preventable or avoidable cases of blindness completely from the globe.

Visual impairment: A Global Perspective:

The global perspective of visual impairment shifted its focus from infectious causes of blindness to the chronic causes. The World Health Organization’s global review on visual impairment estimation for the year 2002 was that 161 million people with visual impairment and 37 million with blindness against the background of 1973 report of World Health Organization was 15 million people worldwide². These numbers are associated with the VISION 2020 global initiative. The Right to Sight is a joint plan of WHO and the International Agency for the Prevention of Blindness, which targeted to work for the elimination of the avoidable blindness by 2020³. The majority of cases are reported due to refractive error followed by cataract. The definitions of visual impairment in the International Statistical Classification of Diseases (ICD) are the actual base for the categorization on degrees of blindness. ICD consider low vision (visual impairment less severe than blindness) as best-corrected visual acuity less than 6/18 to 3/60 and best corrected best-corrected visual acuity less than 3/60 or central visual field no greater than 10 degrees in the better eye. Single issue with the nature of definition is that exclude uncorrected refractive error as a cause leads towards an underestimation of the actual number of cases

Correspondence:

of visual impairment. The leading causes of blindness are still reported as cataract, trachoma and glaucoma from 1990's. Most of the cases of visual impairment due to cataract are either preventable or treatable as global scenario depicts.

After the surgical interventions started for cataract there were tremendous progress in the in the therapeutic interventions for eye diseases. Unfortunately even after the interventions remains the leading cause of blindness and visual impairment in all regions of the world excluding the most developed countries. The past estimates about visual impairment worldwide (2002) revealed the median ratio as 3.7 for 37 million blind and 124 low vision affected people. Apart from the cataract surgery the activities undertaken for vitamin A campaign were also quite significant globally. Vision- 2020 worldwide targets 32 million cataract surgeries annually by the year 2020³.

The discovery of role of Vitamin A has helped people a lot to reduce the childhood morbidity and mortality. World Health Organization has announced that age related cataract has become the single most important cause of blindness in developing world. The age group 5-11 years constitutes a good amount of low or no visual impairment cases all over due to various reasons as reported by many authors. Most of the infectious and nutritional diseases too came under control like Onchocerciasis⁴. Same time non cataract age related vascular and degenerative conditions have progressively become more crucial for the development of blindness.

Visual Impairment: An Indian Perspective

Though the efforts for prevention of blindness are happening globally the number of people with blindness is still increasing in the South Eastern Asian region. The number doubled from 7 million to 15 million in this region. As there is increase in the total population as well as aging population these numbers may again gross before the first quarter of the next century. Apart from cataract the other cause glaucoma has also got public health significance in the Indian context. The reasons may start from priority allocation to poor financial strategies⁵. Vision – 2020, the global initiative launched on February 18, 1999 by the world health organization and the international agency for prevention of blindness is targeted to work towards the elimination of avoidable blindness by the year 2020 by all possible means⁶. The

global collaborative approach where governmental and non-governmental organizations valuable outputs work hands on with each other seemingly more productive. The strategic schemes of Vision 2020 are giving great priority for eye care policies and preventive measures. Recent reports from WHO and other nongovernmental organizations revealed that 80% of all visual impairment and blindness can be avoided or cured. We can make the impossible possible with helping each other. WHO, the United Nations specialized agency for health, has been created the Prevention of Blindness (PBL) programmes in 1978 and developed many prevention strategies to fight major causes of avoidable blindness and visual disability⁶. They have been helping India in all various measures like planning, establishment, monitoring and evaluation kind of work through NPCB. Apart from this they are offering training fellowships and conducting many policy awareness workshops too. After 1991 World Bank has raised their contributions on health sector for the development of India. It is of course a great help for us to reduce the level of mortality, morbidity, and disability. The three main focuses of these approaches were:

1. To reduce the burden of significant diseases.
2. To strengthen the performance of state health systems.
3. To strengthen essential functions such as food and drug administration capacities.

UNICEF has worked for the alleviation of nutrition related blindness through both the central and state government by Vitamin A supplementation and interventions programmes.

For a majority of people the eye care services are not at all affordable since they belong to the low income category. Many NGO's are working on remote areas of India and helping to spread more awareness among people. Governments should come up with policies which encourage people to go for frequent eye check up and proper treatment if required. For example plans for spreading awareness about the importance of a healthy diet as well as vitamin A deficiency as a major cause of blindness. Eye donation programmes are also having huge impact on people though it is really difficult job. The eyes should remove within 4-5 hours after death. Here addressing the emotional problems of the families of donor itself a great deal. Psychological measures and

assistance to the family members also needed to be taken care of.

Department for International Development(DID) also prioritized their work for strengthening the capacity of organizations to develop and implement more policies and promotions for education, health care and improvement of livelihoods. NGO's like sightsavers are also working their maximum to reach the aim through sponsor eye camps and subsidy arrangements for hospitals.

CONCLUSION

The government should come up with innovative programme which aim on prevention, cure and awareness of low vision and blindness. The private sector can align with government to create more facilities for eye care and prevention of eye diseases. If so, the problems with availability and accessibility of treatment options could be solved in a better way. Donating eyes also have a great impact on the treatment part. 90 percent of the eye transplant surgeries are positive and also they help the researchers to contribute more into the preventive measures. Unfortunately the majority of cases are happen(ed)ing in less advantaged countries is itself calls for the necessary strategies to prevent, screen and treat the various causes. Together we could work towards the Vision 2020 through the implementation of activities

to strengthen the work we are carrying on for the elimination of avoidable blindness.

Cohesiveness Factors of Employee Group SKK Migas Pekanbaru Riau Indonesia (Case Study)

Didik Widianoro¹, Nur Fitriyana²,

¹Faculty of Psychology, Islamic University of Riau, ²Islamic Study Program of Psychology, Muhammadiyah University of Riau

ABSTRACT

This study aims to find out and describe the formation of cohesiveness of employee groups in SKK Migas Pekanbaru in general. The type of research used is pure descriptive research with data sources derived from primary data through interviews. The scope of the discussion in this study is based on four factors of group cohesiveness by Forsyth namely Social Strength, Unity in Groups, Attractiveness and Collaboration in Groups. The purpose of this study was to determine the process of group cohesiveness formation for employees. From the results of the study it is known that the factor of group cohesiveness formation through mutual recognition between employees, the intensity of cooperation and work communication.

Keywords--- *Group Cohesiveness, Knowing Between Employees, Cooperation Intensity, Working Communication.*

INTRODUCTION

The development of this globalization era has made special attention in improving human resources for each service provider/company. In creating a conducive environment in human resources, many strategies should be implemented to support the success of the company.

The success of the company can not be separated from the important role of the quality of human resources owned. One of the success factors of achievement is how far the group's performance is effective in a company. This paradigm arises when individual achievement is no longer the main foundation in the success of each achievement. Togetherness and cooperation creates a sense of unity called group cohesiveness. Cohesiveness is a process that is grouped together by group members to remain united in working towards the common goal. ²

SKK Migas is tasked with carrying out the management of upstream oil and gas business activities under a Cooperation Contract. The establishment of this institution is intended so that the extraction of state-owned natural oil and gas resources can provide maximum benefits and revenues for the country for the greatest prosperity of the people. The HR development

process is an important learning medium for companies to maximize the potential of their employees in working groups and individuals. For this reason, research is conducted to see the picture of cohesiveness formation in groups, so that the results of the research can make new recommendations in the development of potential employees.

METHOD

The method in this study uses qualitative research, because researchers are interested in exploring and understanding the group cohesiveness formation factors mentioned earlier. This method also gives meaning and research results obtained will be larger, more flexible, and flexible.

In this study the subject to be used by researchers is a group of employees taken randomly. The research subjects consisted of 10 employees of SKK Migas Pekanbaru. Data collection in this study will use in-depth focused interviews and FGD (focus group discussions). This interview is an important source in research using case studies. In-depth interviews focused on open questions, but researchers used a set of pre-prepared questions. The topic of the question has been directed

at several things that might lead researchers to answer the research questions. In this situation, these questions must be designed so that the subject can provide original comments. Proper excavation must still be done to get other facts that may not have been revealed in the subject's spontaneous answer. FGD (focus group discussion) becomes a comparison source of the main data obtained from in-depth interviews. FGD data is data for clarifying data in this research case study.

Data analysis in qualitative research is an effort made in organizing data, sorting data into units that can be processed, finding and determining data patterns, and finding out what is important and what is learned from the data in order to determine what should be told to public audience. Data analysis is the process of dividing, separating or describing research material into pieces, parts, elements or units. After the data is broken down, the researcher sorts and filters the data to get the type, sequence class, pattern or overall picture.¹⁶

RESULTS AND DISCUSSION

From the results of data collection through interviews of 10 research subjects taken into 3 employees, it was found that group cohesiveness formation occurred because of the social relationships that existed between employees, both from superiors to subordinates as well as fellow colleagues.

“I felt the bond in the group happened after I got to know and help each other in terms of work and personal matters at my workplace” (WIS217 December 2017)

Social strength is one of the main factors in the formation of work group cohesiveness. This makes the basis of each working group to have a sense of unity in supporting the common goals in work.⁷

“Because I have often been together, so I have to develop chemistry with each other, so I have been comfortable working with my colleagues in the office” (WIS117 December 2017)

Attachment in work is created because of the attractiveness between employees. Attractiveness arises because another greeting is interconnected and dependent. So in the work climate, cohesiveness aspects in the working group are formed automatically.²

In collecting data through FGD (Focus Group Discussion) which is a process of gathering information

about certain very specific things. Based on the results of the discussions that have been conducted by researchers there are several important notes. The important record is related to communication that is still not open between one employee and another employee. As an example of communication that has not been open to several employees, there are still employees who keep their own information related to work that is an important matter and also a matter of personal conflicts with colleagues. Many employees do not want to share their problems with colleagues or superiors on the grounds that they do not want to burden others. Some employees convey good communication to make a good working relationship in supporting tasks and work in the workplace. In the theory of cooperation, success in a work group or company is influenced by mutual communication and mutual cooperation.¹⁵

In addition, from the results of the discussion, some employees were less brave in issuing opinions about work. So that in communicating there is often a lack of conveyed information that is important to follow-up. From this it often occurs in the group work team and that of fellow colleagues in the company. In terms of employee perceptions of superiors, data was obtained that the attitudes of the participants to superiors were quite varied, some participants said that their superiors were very disciplined, even if they were going to pray, they had to ask permission first. This also puts pressure on them because they have to be ready. Employees convey in increasing unity in groups with no employees who are limited in expressing their opinions. This makes the unity in the work group created properly because all are open to each other in expressing opinions or information about tasks and jobs.

CONCLUSIONS

The results of the research on cohesiveness formation of the SKK Migas Pekanbaru employee group showed that group cohesiveness was formed from various processes. The first factor in the formation of cohesiveness is knowing each other among employees so that the formation of social forces. Furthermore, in terms of intensity of mutual cooperation in completing tasks and work, this creates attraction between employees. The last factor is communication between employees. Mutual information with each other fosters unity in groups and the formation of cooperation in working groups.

Based on the results of various research findings, the researchers put forward several suggestions:

For further research can be done by other researchers using other objects such as government, educational institutions. In addition, group cohesiveness can be investigated using other types of research and methods.

For SKK Migas Pekanbaru, from the results of this case study research can be used as a reference in developing human resources related to cohesiveness issues.

Dimensions of Preference Towards Organic Products: An Empirical Study on Consumer's Perspective

Solomon Christopher D¹, C.B. Senthilkumar²

¹Research Scholar (CM16D001), ²HOD Supervisor, Dr. M.G.R. Educational And Research Institute University, Declared as deemed to be university u/s. 3 of the UGC Act, 1958, Maduravoyal, Chennai

ABSTRACT

This marketing research was conducted to explore the dominant dimensions of consumer preference towards organic products in Chennai city of Tamil Nadu. The researcher has adopted survey method to gather the responses from the organic consumers through structured questionnaire. The empirical evidences proves that, Eco-Friendly, Price, Health, Environmental Conservation, Adequate Availability of Products, Safety, Chemical Free, Consumer Attitude and Environmental Non-Degradation are the dominant dimensions of consumer preference towards organic products consumption and they are highly correlated to each other.

Keywords: Organic Products, Preference, Safety, Eco-Friendly and Agriculture

INTRODUCTION

In recent years, Consumers have become more conscious of the nutrition, health, environment and quality of the food they consume^{1, 2}, and healthiness is important criterion³. The growth has prompted the many organic researchers^{4, 5} and marketing explore the development and growth of the organic product industry^{6, 7}. Over the past few decades, the organic food industry in India has been experiencing an annual growth between 20-22 % across the globe^{8, 9}, and Indian export and import has expanded largely¹⁰. India produced around 1.35 million (2015-16) of certified organic products which includes all varieties of food products^{11, 12}, and organic food export realization was around 298 million USD^{13, 14}. The organic products are offering more eco-friendly environment, helps in the maintenance of consumer health^{15, 16}, more use of products which has long lifecycle and also promoting the agriculture economy in the¹⁷.

REVIEW OF LITERATURE

Gaetano Chinnici & et.al (2002)¹⁸ have carried an empirical research to understand the Consumer's Behaviour towards Organic products for that he adopted survey method to indicate that sex, age class, family size, educational qualification, occupational status have significant influence and concluded that healthy, nutritious, tasty and eco-friendly products are the major

aspects.

Sushil Kumar and Jabir Ali (2011)¹⁹ The researcher have made an attempt to examine factors affection Consumer's awareness on Organic food. The socio-economic profiles, monthly income and location have significant association with consumer awareness.

Efthimia Tsakiridou and et.al (2008)²⁰ have carried an exploratory study to explore the consumer attitude and behaviour towards organic products of Greek consumers which results in health concern, environmental concern and animal welfare consumption are major drivers.

Brijesh Sivathanu (2009)²⁴ explored the factors affecting the consumer preference to the organic food by identifying the influence of healthy, safety, environment friendly, nutrition value, reasonable price, trust in product certification and availability of the product. The result indicates that availability of the product, price, safety, certification, eco-friendliness and nutrition value are the significant inducers of consumer preference to the organic food purchase in the order of influence.

Rambalak Yadav and Gvind Swaroop Pathak (2016)²¹ The researcher examined the applicability of theory of planned behaviour and its applicability in organic food choice behaviour and the results indications that subjective norm and behavioural control have

significant influence on the intention to purchase organic food among youngsters in India.

RESEARCH GAP

Based on the literature of review, the former authors focused only the reasons on which factors consumers purchase the organic products. This study focused on the consumer preference and perception of demand for the organic products.

OBJECTIVES OF THE STUDY

The main objective of the research is to study socio-economic profiles, dimensions of perception and relationship among factors of perception towards organic products.

SCOPE OF THE STUDY

This present study focused on the number of consumer perception towards organic products consumption in Chennai City by giving importance to health, eco-friendly concern, normative concern and safety preference towards organic products purchase intention.

RESEARCH METHODOLOGY

The present study is descriptive in nature and has adopted survey, telephone interview, and observation method for its findings. This study is based mainly on the primary data collected from 100 consumers interested in purchasing organic products. The questionnaire was well- designed and well-structured.

RESULTS AND DISCUSSION

Table 1: The Demographic Profile of the Consumers

Demographic Profile (N = 100)	Percent
Age (D1)	
15 to 25 Years	74
26 to 35 Years	16
36 to 45 Years	7
Above 45 Years	3
Gender (D2)	
Female	61
Male	39

Educational Qualification (D3)	
School Level	2
Graduate	17
Post – Graduate	67
Professional and Others	14
Occupation (D4)	
Self Employed	8
Govt. Employee	10
House Wife	5
Private Employee	77
Family Monthly Income Level (D5)	
Below Rs. 20,000	62
Rs.20,001 – Rs.40,000	24
Rs.40,001 – Rs.60,000	10
Above Rs.60,001	4
Area of the Living (D6)	
Urban	83
Semi – Urban	17
Nature of Family (D7)	
Nuclear Family	76
Joint Family	24
Marital Status (D8)	
Married	19
Un Married	81

The above table inferred the majority of the 25 years below age group respondents prefer organic products and consequently other age group respondent. 60% of female respondents and male respondents are 39%. Majority are post graduates. 77% of the occupation is private employments and 10% are PSU employment respondents. 62% of respondents whose income <Rs.20,000/- per month prefers organic products more. 83% of respondents are residing at urban area prefers organic products than semi-urban area. 76% of nuclear family respondents prefer organic products than joint family and 81% of unmarried respondents are consumes organic products more than married group.

KMO and Bartlett's Test Kaiser-Meyer-Olkin Measure of Sampling Adequacy Value = 0.662 (Bartlett's Test of Sphericity Approx. Chi-Square 675.075; df = 253; Sig.0.000)				Total Variance Explained Rotation Sums of Squared Loadings 71.089% of nine dominant groups		
Reliability Statistics Cronbach's Alpha Value = 0.660 of the 23 items						

The Factor analysis has been applied to 23 consumer organic product preference variables to understand the dominant latent dimensions in them.

The above table, that 2 items exhibit the total variance is 71.089% by nine factors are extracted with Eigen values of more than one, which is statistically significant to go ahead for the meaningful data reduction process. KMO and Bartlett's Test Kaiser-Meyer-Olkin Measure of Sampling Adequacy Value = 0.662 (Bartlett's

Test of Sphericity Approx. Chi-Square 675.075; df = 253; Sig.0.000) indicates sample size adequate for the meaningful factor reduction process. A variable with communality lower than 0.4 should be omitted as it has insufficient explanation²³ suggests that variables candidates are those factors with factor loading or communality lower than 0.4 respectively, and with cross loading of values exceeding 0.4 on more than one factor . Therefore, item purchase of organic food for family has

been eliminated (0.36) due to low value of communality of less than 0.4. After the deletion of the item, all the items of the current study are acceptable communality values, ranging from 0.490 to 0.812. (49 percent to 81 percent), which is statistically significant and it has been proceed for data reduction process.

Factor – 1: The most dominant factor 1 consists of five items representing health aspects to the consumers. The items are “Organic products have more nutritional value, chemical free, fresher, healthier than industrialized and conventional grown products”. It has been labeled as “**Health Consciousness**” with the explained variance of 11.255%.

Factor – 2: The second dominant factor consists of three items and the items are “Consumer purchase organic food products because of its quality, protect the environment and is good for health”. It has been labeled as “**Eco-Friendly**” and 9.733% of variance explained.

Factor – 3: The third dominant factor consists of three items of consumer organic product preference and items are “I would rather buy organic food products even though it is expensive, quality and safety are more important than price”. It explained variance is 9.292% and it has been labeled as “**Price**”.

Factor – 4: The fourth dominant factor consists of two items which related to the organic product preference and the items are “Consumer practice and prefer environment conservation task, recycled organic products”. It has been labeled as “**Environmental Conservation**” and it explained variance is 7.38%.

Factor – 5: The fifth dominant factor consists of two items among the consumers organic product preference and the items are “Consumers feel organic products is available more in online and in stores”. It has been labeled as “**Availability of Organic Products**” and it explained variance is 7.28%.

Factor – 6: The sixth dominant factor consists of three items which relates to consumers organic product consumption safety preference and the items are “Consumers would buy products with logo, dispose my

garbage in different containers environmental concern and consumer is beauty / health conscious”. It has been labeled as “**Safety**” and it explained variance is 7.011%.

Factor – 7: The seventh dominant factor consists of four items inferred the organic products are chemical free compares to the other industrial conventional products are “Organic food product consumption will help to protect the environment, readily available, no side effects and for the goodness of environment they prefer organic products”. It has been labeled as “**Chemical Free**” and it explained variance is 6.731%.

Factor – 8: The eighth dominant factor consists of two items are “The current development path is destroying the environment (development destruction) - industrialized conventional agriculture” and “Unless we do something, environmental damage will be irreversible (environmental damage)”. It has been labeled as “**Consumer Attitude**” and it explained variance is 6.401%.

Factor – 9: The last dominant factor consist of only one item which relate to environmental sustainability for organic product prefer consumers and the item is “Consumers dispose of my garbage in different containers environmental concern”. It has been labeled as “**Environmental Non-Degradation**” and it explained variance is 5.994%.

Thus, nine independent factors have been extracted out of 23 consumer organic products.

Correlation between Dimensions of Consumers Organic Product Preference and Attitude

To examined the significant relationship between dimensions of organic product preference and attitude such as Eco-Friendly, Price, Health, Environmental Conservation, Adequate Availability of Products, Safety, Chemical Free, Consumer Attitude and Environmental Non-Degradation, Bi-variate Correlation was applied to find out significant relationship the inter dimension.

Table 3: Correlation

Dimensions of Organic Product Preference	Mean (SD)	1	2	3	4	5	6	7	8	9
Health Consciousness	15.39 (2.944)	1								
Eco-Friendly	11.93 (2.396)	.323** (.001)	1							
Price	10.46 (2.480)	.305** (.002)	.419** (.000)	1						
Environmental Conservation	7.12 (1.552)	.133 (.186)	.203* (.043)	.138 (.172)	1					
Availability of Products	6.45 (1.956)	.162 (.107)	.078 (.441)	.188 (.061)	.049 (.631)	1				
Safety	9.98 (2.256)	.187 (.063)	.063 (.532)	.372** (.000)	.338** (.001)	.304** (.002)	1			
Chemical Free	11.45 (1.940)	.370** (.000)	.430** (.000)	.328** (.001)	.280** (.005)	-.041 (.688)	.194 (.054)	1		
Consumer Attitude	7.63 (1.509)	.160 (.111)	.306** (.002)	.289** (.004)	.136 (.179)	.170 (.091)	.099 (.329)	.330** (.001)	1	
Environmental Non-Degradation	3.48 (1.068)	.145 (.149)	.128 (.205)	.221* (.027)	.385** (.000)	.016 (.871)	.180 (.073)	.124 (.220)	.030 (.768)	1

** . Correlation is significant at the 0.01 level (2-tailed).

* . Correlation is significant at the 0.05 level (2-tailed).

The correlation coefficient between consumer's organic product preference dimensions such as Health Consciousness and Eco-Friendly is 32.3%, Health Consciousness and Price indicates 30.5%, Health Consciousness and Chemical Free is 37%, Eco-Friendly and Price indicates 41.9%, Environmental Conservation and Chemical Free indicates 43.0%, Environmental Conservation and Consumer Attitude is 30.6%, Price and Safety indicates 37.2%, Price and Chemical Free 32.8%, Price and Consumer Attitude indicates 28.9%, Environmental Conservation and Safety indicates 33.8%, Environmental Conservation and Chemical Free indicates 28.0%, Environmental Conservation and Environmental Non-Degradation is 38.5%, Availability of Products and Safety indicates 30.4%, Chemical Free and Consumer Attitude indicates 33.0% are positive relationship at 1% level of significance. The correlation coefficient between Eco-Friendly and Environmental Conservation is 20.3% and Price and Environmental

Non-Degradation is 22.1% are positive relationship is significant at 5% level. . Hence the above table reveals there is a relationship between dimensions of consumer's organic product preference and their attitude. Furthermore, the price concern, health concern, environmental and eco-friendly concern are imperative relationship between each other for consumer's organic products prefers ²².

SUGGESTIONS AND IMPLICATIONS

The awareness about organic through awareness campaigns by Government, Implementation of Government Organic shops and Consumers initiative to buy organic products directly from farmers to avoid price hike, New Entrepreneurs can invest in organic to earn profit because of increase in health consciousness present days.

CONCLUSION

This marketing research was conducted to explore the dimensions of organic products preference among the consumers and the result indicates that Eco-Friendly, Price, Health, Environmental Conservation, Adequate Availability of Products, Safety, Chemical Free, Consumer Attitude and Environmental Non-Degradation are the dominant dimensions of consumer preference towards organic products consumption. This study reveals that the preference on organic products is less among people but the youngsters prefer organic products more as they take care health, beauty etc. but, ultimately, the consumers should take initiative to contribute the growth of the organic agriculture development in the country.

Activity based Learning for Slow Learners in Colleges through Mollycoddle Method

Suresh Rasappan¹ and John Sunil Manohar²

¹Department of Mathematics, Veltech University, 400 feet outer Ring Road, Avadi, Chennai, Tamilnadu, India,

²Vethathiri Maharishi School, Tiruttani, Tamilnadu, India

ABSTRACT

Teaching and Training the slow learners are the biggest challenge that the Institutions are facing nowadays, since in a classroom all category of students like toppers, averages and slow learners will be seated together it's a tough task for the faculty to show focus on the slow learners in specific. Most of the schools nowadays categorize the classrooms based on the students' performance and skills set, which cannot be done in colleges as the environment of the colleges mustn't allow the students above 17+ to think that they are being discriminated because of their performance and knowledge, adding to this reason even many Institutions cannot afford more manpower in coaching the slow learners in separate. This manuscript talks about a methodology to train the slow learners of colleges to show some extent of progress without splitting them or either categorizing them.

Keywords: *Slow Learners, Knowledge, Skills, Mollycoddle.*

Abbreviations: Activity Based Learning (ABL).

INTRODUCTION

Both physical body and mental ability of a person has got limitations, for e.g if 100 people are participating in an endless marathon competition, some may walk up to 50 miles and quit, some might walk up to 100 miles and few may walk even up to 1000 miles or more, the point is, at some point of miles everyone even those who are unyielding will also quit, since the physical body has got limitations. So in the same way the capability of learning differs from person to person, some can understand the concept very quickly, some might understand in the second attempt of learning¹, but for few it requires a lot of practice whom at Institutions are called as slow learners. Many factors were studied by many subject experts on what made the students as slow learners², here in this manuscript we are not going to address about the issue of why being a slow learner?

Therein we discuss about the remedial measures and methodologies for college faculties to handle the slow learners for emulation in their learning skills³⁻⁵. If we ask a group of same subject teachers to teach a same topic to a same class, everyone will be unique and different, in the same manner the learning of the students will also differ from student to student, since manuscript focuses mainly about college students a little knowledge is required about the differences from a school student to college student.

Differences between a College Student and a School Student

Several factors are there to differentiate between a college student and a school student, since it is not our main focus lets us discuss some of the prime factors, apart from the general difference like age and growth there are some factors which play a major role.

S No	School Student	College Student
1	School is place where the students will be taught a lot about discipline, obedience, manners, respect and many more	Whereas in Colleges the lectures never take serious steps in teaching the said qualities, only the expectation will remain from the students to exhibit it.
2	At schools the job of a teacher is hectic as much, since they have to ensure to students understanding a lot and mostly in cases the teachers have to do spoon feeding.	In Colleges, the Lectures will prefer mostly on given a lecture on a topic, rather than the teaching, to which the students have to take effort for better understanding.
3	The activities of students are limited	The activities of students are liberal.
4	The atmosphere in the school doesn't allow the students to perform or either act outside of the campus	In case of college the students are considered for enough exemptions and flexibilities by the faculties.

The writing can be extended further about the differences, as we get enough for our understanding we conclude about the differences and move on to our prime topic. Since our topic covers about the slow learners of colleges, we are bounded to know about the slow learners which should cover about their capability⁶⁻⁹, strength, barriers and some common factors.

About Slow Learners in Colleges

Several parameters are there for a student being a slow learner in a college; let's discuss some of the common factors.

Students those who joins a chosen college because of their parents compulsion and selects a course or branch of study, will never pay 100 %focuses towards the subjects and 90% of chances are there for them to become as a slow learner.

At schools when students really don't understand a teacher teaching, the students will never feel shy or sullen in asking the teacher to repeat or explain again, whereas in colleges the sullenness of the students will stay on higher grounds, since the age factor plays a role, that's too if the Institutions is co-education both the men and women students will never prefer asking doubts about the topic that wasn't clearly understood, which could also be one of the reason for the students to be a slow learner.

When a practical concept is explained through a lecture, the toppers and even the average students can have good understanding as they may have the capability of converting the audio mode into a visual mode,

which the slow learners might find difficult, hence the possibilities are there for the slow learners to perform in debacle.

Many students believe that college life is a place of dreams in such a case most of the students will be in day dream for many hours during the class hours which will make to let pass the focus towards lecture and chances for them to become a slow learners.

Another common factor is the basic instinct of the students, which compiles the family background, living atmosphere, and capability of understanding, behavioral conditions and many more.

Activity Based Learning (ABL)

The ultimate goal of the College Institutions is to make the students learn, the objective of teaching is being provided from the faculties end whereas the learning has to be acquired by the students, thou the students play a vital role in learning it is job of the faculties to insist and make the learning effective and coherent. There are various methodologies are being observed and applied by many experts in the history of teaching, out of the many some were found to be more successful and still prevail, among all the methodologies Activity based learning holds high frequency note because of its cultivating quality over the students^{10,11}. The activity based learning can be split into various kinds which totally depend upon the mood and mindset of the teacher, since the in ABL the teacher must act as a facilitator who is in-charge to run the show. Here in this article we have discussed one specific kind of methodology from ABL which focuses

on the development of slow learners in colleges.

Mollycoddle Methodology

Mollycoddle methodology is been constituted specifically for the slow learners who won't give much attention to the teaching. This mollycoddle method will do wonders in the classroom more than the traditional black board learning and lecture method, since it covers all the said above within one roof. This method is being applied and tested by many subject experts and proven to be more effective. The objectives of the mollycoddle methodology follow below.

The teacher must give a lecture on a topic by using any teaching aid which should not long for more than 30 minutes, the usage of teaching aid will ensure the attention of the students in the beginning and the teacher must ensure that the attention stays till the completion of the lecture. Preparation will alone help the teachers to have the students' attention till the end.

The 30 minutes of lecture must be precisely manipulated by covering the aspects of pedagogy, interesting facts, historical facts, current affairs, discoveries and inventions related only to the topic.

Once the lecture is completed the teacher must split the students into team covers maximum of 6 in a team with an inclusion of at least 3 toppers and 3 slow learners in the same team.

All teams must be given at least 10 minutes of time for discussion on the topic in which the lecture was given, whereas the teacher must ensure that all the slow learners contribute something in the discussion.

After the completion of discussion the slow learners must be separated from the toppers and need to split them again into teams.

And now the slow learners alone will have a discussion on the same topic, by now the discussion from the slow learners would quite enhanced than the previous one, as they would have heard and understood from the discussion of toppers, since now it's their own jungle and the possibilities are there for the slow learners to prevail and present some ideas fearlessly.

After the completion of discussion the slow learners must be asked to frame the questionnaires at least two from each, the topic has to be kept in mind and the

teacher has to initiate the questionnaire by framing a sample question, which will give an idea to the students on framing questionnaires on the topic.

After the completion of questionnaire session the teacher has to initiate for quick recapitulation and revision in which the teacher can ensure about the students understanding.

The mollycoddle method covers all the four process of lecture, discussion, framing questionnaires and recapitulation.

The best pro of this method is it allows the slow learners to involve themselves activity with any stress or constrain, since it gives them a wide opening when are together with the toppers and allows them to apply when they enter their domain.

CONCLUSION

Mollycoddle method is almost like method of feeding food to the children; since the toddlers won't be having enough understanding to feed themselves, the mollycoddle method is like a robotic device which ensures that the students are being fed.

Stability Analysis of a Prey-Predator System involving Holling's Response Using Back-Stepping Regimentation

Suresh Rasappan¹, Vijaya Lakshmi Gandhavadi Mohan Rao¹, Pugalarasu Rajan²

¹Department of Mathematics, Veltech University, 400 Feet Outer Ring Road, Avadi, Chennai, Tamilnadu, India,

²Department of IT, Ibri College of Technology, Sultanate of Oman, Ibri

ABSTRACT

In this paper, a mathematical model with back-stepping controller is proposed and analyzed to study the prey-predator interaction in which the prey population is infected. Investigation is made of the dynamical complexities of a prey-predator model with susceptible and infected (SI) prey including the non-selective prey harvesting with back-stepping controller. In this work, it has been assumed that in the interaction of susceptible and infected prey populations, predator predate on infected prey only. By constructing a suitable Lyapunov function, global asymptotic stability is established. Comparative analysis has been presented between the system without control and the system with control. Numerical examples are furnished and diagrams are presented which support our results.

Keywords: Prey-predator system, SI model, Lyapunov function, Back-stepping Control, Stability.

INTRODUCTION

The study of ecology and epidemiological models has been gaining popularity day-by-day. Epidemiological models have received much attention of the scientists. For the analysis of the spread and control of infectious disease, a mathematical model has become an appropriate tool. The infectious disease transmission models come under the broad classification of classical susceptible, infectious, and recovery (SIR) model.

A species does not have independent existence in the world. A susceptible species, while coming into contact with an infectious one turns into infectious. Several biological studies focus attention on the dynamical behaviours of epidemiological models wherein the effect of interacting species with infected one is considered.

This paper falls under the purview of Eco-epidemiology involving prey harvesting. Kar et. al,¹ have considered two fish species competing with each other for the use of a common resource and pointed out then both of them may be subjected to continuous harvesting. There is a predator (for example a *whale*) feeding on both of them. It is assumed that the predator population is not harvested (for example *whale harvesting has been prohibited*). Thus the interaction

between the harvesting agency and the predator is through the third party, namely, the prey. Since we are not making a case study in respect of a specific prey-predator community, we have opted for the investigation of logistic growth function for the prey species (that is, the population density of prey is resource limited) and for simplicity, the feeding rate of the predator species is assumed to increase linearly with prey density.

The stability analysis of prey-predator with control phenomena is a challenging problem in many ecological systems for which there are quite a few references. Al-Ruziaza², Amit Bhaya³, Frederic Gronard⁴, Vijaya Lakshmi⁵ and Awad El-Gohary⁶ have dealt with the nonlinear feedback control, positive control, controlling chaos and adaptive control on prey-predator system. Krishnapada Das et.al.⁷ and Prasenjit Das et.al.⁸ have studied the prey predator system with disease in the predator population and examined the chaos in this system.

The dynamics of stage structure prey-predator model with parasitic infectious disease has been discussed in Raid Kamel Naji et. al.⁹ and Pal et. al.¹⁰ wherein they analysed the eco-epidemiological model with a prey refuge. The aspects of persistence and stability of a two prey and one predator system have been studied by Kar

et. al.¹¹. Several authors have taken up a study on the prey-predator system with diseased prey¹²⁻¹⁷. Various types of harvesting such as the one with susceptible and infected prey, known as combined harvesting, optimal harvesting etc.. on prey-predator system have been formulated by many authors¹⁸⁻²².

Kar and Pahar et. al.²³ have studied the dynamical behaviour and the harvesting problems of a prey-predator fishery with a protective patch for the prey species. Shib sankar et. al.²⁴ have gone into the optimal joint harvest of prawns and poultry in a bio-economic system. Purohit et. al.²⁵ have dealt with the combined bio-economic harvesting of two competing fish species, each of which obeying the Gompertz⁷ law of growth.

The ecosystem perturbed by independent white noise and other related models have been investigated by Mukherjee²⁶ and Srinivasan et. al.²⁷.

Based on the above literature, we have investigated the epidemiological model, namely susceptible-infected prey (SI) and predator model, to find out how the process of predation influences the epidemics. In the present paper, we consider the case of the predator eating the infected prey only because the infected individuals are less active and are more easily caught. For instance,²⁸Peterson and Page have found that the wolf attacks on moose are more often successful if the moose is heavily infected by “*Echinococcus granulosus*”. We have taken up the problem of harvesting two competing species in the presence of a predator species which feeds on only infected species. That is, a combined harvesting effort is devoted to the exploitation of two prey species while the predator species is not harvested.

Most often, harvesting policy is one of the major problems in ecology, eco-epidemiology, economics, etc. The harvest of population species is mostly practiced in agriculture, fishery, forestry and population management. To control the oscillations arising in eco-epidemiological systems, the role of harvesting in an eco-epidemiological system wherein the susceptible prey and infected prey are subjected to combined harvesting is studied. Harvesting harms some of the species living on the other species. As a consequence, the predator species becomes extinct with an indiscrete increase in the harvesting of prey species. Therefore, to maintain the ecological balance, introducing controllers in the system is a challenging problem. Most of the mathematical

models deal with the harvesting of three species, first two species, third species etc. There has been no work so far in the introduction of back-stepping control in the study of harvesting model of two competing species in the presence of a predator, the third species (predator) being not harvested.

In this paper, we present a new approach by going in to the stability of SI prey-predator model by using back-stepping nonlinear control. This paper is organized as follows: In section 2 we introduce the model with assumptions. In section 3 we have presented the plots for the system without control. In section 4 we have furnished the problem statement for the system with back-stepping control. In section 5 we introduce the back-stepping nonlinear controls and derive the global stability conditions by constructing suitable Lyapunov function. In section 6 we have presented the numerical simulations for the system with back-stepping control which supports our result. Findings on the comparative analysis in the variations of the disease transmission rate and harvesting rate are presented. The last section 7 is devoted to the concluding remarks.

2. The Mathematical Model of the System

In this section, we study the dynamics of the continuous time three species prey-predator populations with combined harvesting in which we will use the mathematical tools and biological assumptions for modelling prey-predator system which consists of two preys and one predator.

2.1 The Basic Model and Modified Model with Assumptions

In this section, we consider the three species prey-predator system which consists of two preys, namely susceptible prey, infected prey (SI) and one predator. Here we assume that the predator predate on only infected prey with Michaelis-Menten-Holling type II functional response. Such system can be obtained from the following set of non-linear differential equations:

$$\begin{aligned} \dot{X}_1 &= rX_1 \left(1 - \frac{X_1}{K} \right) - PX_1X_2 \\ \dot{X}_2 &= PX_1X_2 - f(X_2, X_3)X_3 \\ \dot{X}_3 &= ef(X_2, X_3)X_3 \end{aligned} \quad (1)$$

$X_3(t)$:the number of the predator population at time t,

r : the growth rate of susceptible prey population,

K : the environmental carrying capacity,

P : the rate of transmission from susceptible to infected prey population,

e : the coefficient of conversion of prey into predator is e , where $0 < e < 1$.

Now to formulate the modified mathematical model of a prey-predator system with disease in prey population involving combined harvesting in prey species, we make the following assumptions:

1. In the absence of infection and predation the susceptible prey population grows logistically with intrinsic growth rate ($r > 0$), carrying capacity ($K > 0$) and then we have

$$\frac{dX_1}{dt} = rX_1 \left(1 - \frac{X_1}{K} \right) \tag{2}$$

2. In the presence of infection, the prey population is divided into two groups namely susceptible prey denoted by $X_1(t)$ and infected prey denoted by $X_2(t)$ at all time t , the total population is

$$N(t) = X_1(t) + X_2(t).$$

3. The disease is spread among the prey population only and the disease is not genetically inherited. The infected prey populations do not recover or become immune. We assume that the disease transmission follows the simple law of mass action $PX_1(t)X_2(t)$ with P as the transmission rate.
4. The susceptible prey $X_1(t)$ and infected prey $X_2(t)$ is removed by combined harvesting rate Eq_1 and Eq_2 where $q_1 (> 0)$, $q_2 (> 0)$ and $E (> 0)$ (non- selective harvesting).
5. We assume that the predator population consumes only on infected prey with Michaelis Menten-Holling functional response:

$$f(X_2, X_3) = \frac{\gamma X_2}{X_3 + \gamma\beta X_2}, \quad (\gamma, \beta > 0) \tag{3}$$

that is, the Michaelis-Menten-Holling type is a functional response for infected prey and it is a numerical response for predator. In this γ is the total attack rate for predator or predation coefficient and β is the handling time of predator to prey.

Therefore the modified of the model (1) becomes:

$$\begin{aligned}
\dot{X}_1 &= rX_1 \left(1 - \frac{X_1}{K} \right) - PX_1X_2 - Eq_1X_1 \\
\dot{X}_2 &= PX_1X_2 - \frac{\gamma X_2X_3}{X_3 + \gamma\beta X_2} - Eq_2X_2 \\
\dot{X}_3 &= \frac{e\gamma X_2X_3}{X_3 + \gamma\beta X_2} - dX_3
\end{aligned} \tag{4}$$

with initial data $X_1(0) \geq 0$, $X_2(0) \geq 0$, $X_3(0) \geq 0$ and the coefficients r , K , P , γ , β , e , d , E , q_1 and q_2 in model (4) are all positive constants. In the above model, q_1 and q_2 be the catchability coefficients of the susceptible and infected prey, respectively and E be the combined external effort devoted to non-selective harvesting of both the susceptible and infected preys by the external harvester (not by predator). Thus Eq_1X_1 and Eq_2X_2 represent the catch of the susceptible and infected prey species. Also q_1 , the catchability coefficient of the susceptible prey may be less than q_2 the catchability coefficient of the infected prey because the infected prey is less active than their healthy counterpart. Therefore, for the same effort E , the number of infected prey caught per unit time may be much higher than that of non-infected prey.

2.2. Non-dimensional model

In the above model, we have specified 10 parameters which make the analysis difficult. Now to reduce the number of the system parameters we will transform the system (4) to the non-dimensional form by using the following transformation of the variables:

$$x_1 = \frac{X_1}{K}, \quad x_2 = \frac{X_2}{K}, \quad x_3 = \frac{X_3}{\gamma\beta K}, \quad t = r\tau \tag{5}$$

The modified Michaelis-Menten-Holling prey-predator with vulnerable infected prey dynamics that is, using the transformation (5) the system (4) takes the non-dimensional form:

$$\begin{aligned}
\dot{x}_1 &= x_1(1 - x_1) - kx_1x_2 - \alpha_1x_1 \\
\dot{x}_2 &= kx_1x_2 - b \frac{x_2x_3}{x_3 + x_2} - \alpha_2x_2 \\
\dot{x}_3 &= c \frac{x_2x_3}{x_3 + x_2} - ax_3
\end{aligned} \tag{6}$$

where the relations between the non-dimensional and dimensional parameters given by:

$$k = \frac{PK}{r}, \quad b = \frac{\gamma}{r}, \quad c = \frac{e}{r\beta}, \quad a = \frac{d}{r}, \quad \alpha_1 = \frac{Eq_1}{r}, \quad \alpha_2 = \frac{Eq_2}{r} \tag{7}$$

The system (6) is more simplicity than (4) for the mathematical study, since the number of system parameters has been reduced from 10 to 6.

Now we will analyze the system (6) with the following initial conditions:

$$x_1(0) > 0, x_2(0) > 0, x_3(0) > 0 \tag{8}$$

The conditions (8) represent the conditions of positivity or biologically feasibility of the densities of susceptible prey, infected prey and predator populations respectively.

3. Numerical Simulation for the system without control

In this section, we have presented the diagrams for the prey-predator system (6) without control with prey harvesting by keeping the parameters fixed and varying transmission rate and harvesting rate.

Figure 1 (a): The variation of population against time with $k = 2.5$; $\alpha_1 = 0.0002$; $\alpha_2 = 0.0002$ of the system (6).

Figure 1 (b): Phase-space trajectories with $k = 2.5$; $\alpha_1 = 0.0002$; $\alpha_2 = 0.0002$ of the system (6).

Figure 2 (a): The variation of population against time with $k = 2.5$; $\alpha_1 = 0.1$; $\alpha_2 = 0.1$ of the system (6).

Figure 2 (b): Phase-space trajectories with $k = 2.5$; $\alpha_1 = 0.1$; $\alpha_2 = 0.1$ of the system (6).

Figure 3 (a): The variation of population against time with $k = 1.5$; $\alpha_1 = 0.2$; $\alpha_2 = 0.2$ of the system (6) approaches the equilibrium point.

Figure 3 (b): Phase-space trajectories with $k = 1.5$; $\alpha_1 = 0.2$; $\alpha_2 = 0.2$ of the system (6).

$$\dot{V}_3 = -\alpha_1 x_1^2 - \alpha_2 w_2^2 - a w_3^2 \tag{49}$$

which is a negative definite function.

Thus by Lyapunov stability theory (Hahn, 1967)²⁹ the dynamics of the prey-predator system (6) is globally asymptotically stable by using back-stepping controllers.

6. Numerical Simulation for the system (23) with back-stepping control

In this section we present some results of numerical simulations and discuss their implications to explore the possibility of the variations and the effect of the back-stepping controllers. From the below figures, we keep the parameters $a = 0.2$; $b = 0.9$; $c = 0.5$ fixed with the initial densities $x_1 = 0.9$; $x_2 = 0.8$; $x_3 = 0.7$ and varying the disease transmission rate and harvesting rate parameters.

Figure 4(a)

Figure 4 (a): The variation of population against time with the parameters

1. $4 < k < 3.5$; $0.0001 < \alpha_1 < 0.3$, $0.0001 < \alpha_2 < 0.3$ and approaches the stability of the system (23).

Figure 4 (a) shows the population densities approaches the point (0,0,0) for the controlled system (23) which proves our theorem when the disease transmission rate and the harvesting rates, and figure 4 (b) shows the corresponding phase portrait. That is, for the back-stepping controllers as long as this feedback stabilizes, the states in the system (23) converges to zero as .

At last, we conclude that the three species prey-predator model, that is, two preys and one predator model, including prey harvesting with back-stepping controllers approaches the stability quickly when compared to the system without control.

CONCLUSION

In this paper, a mathematical model consisting of susceptible, infected (SI) prey and the predator interactions involving Michaleis – Menten – Holling functional response has been studied analytically as well as numerically. We show that the three species prey-predator populations is globally asymptotically

stable using back-stepping control inputs, that is, the system (23) is examined via the techniques of global asymptotic stability analysis by constructing Lyapunov function. Also comparative analysis has been given for the disease rate and harvesting rate. That is, if the disease transmission rate is decreased from to , then the density of infected prey and predator population also decreased and the susceptible prey increased which is observed in figure 3 (a). Also when we increase the harvesting rate, the infected prey density will decrease which is shown in figure 2 (a), this shows that the harvesting controls the disease in the prey species. Numerical simulations were done to observe the effect of the control on the three species and diagrams were presented which are support our results.

Academic Performance, Social Adjustment and Emotional Intelligence of Students Involved in Social Networking Sites

Nimisha Beri

Associate Professor, School of Education, Lovely Professional University, Phagwara

ABSTRACT

Social networking sites have greatly influenced the life of students their academic as well as their social and personal life. These networking sites have good as well as adverse impact on the lives of students. It is a good platform for building social relationships. It is used as a communication media to share pictures, videos and personal experiences etc. Over- usage of social networking sites makes the adolescents more aggressive. Adolescents are getting affected in their mental and knowledge concentration. It affects the individual's social as well as emotional intelligences and therefore their way of behaving. This study was conducted to explore the relationship of student involvement in social networking sites to their academic performance, social adjustment and emotional intelligence among undergraduate students from both professional and non-professional courses. The findings of the study revealed that there exists a positive relationship between level of involvement in social networking sites and Academic performance, Social adjustment and Emotional intelligence.

Keywords: *Student Involvement, Social Networking Sites, Academic Performance, Social adjustment, Emotional Intelligence*

INTRODUCTION

Social network sites viz. Facebook, Twitter, Instagram, WhatsApp, LinkedIn etc. are the prevalent tools of teenage communication. Social Networking Sites are available on gadgets with active internet connection as independent applications. Although the Facebook is a growing social networking sites having 500 plus millions of members registered over it. From Schneider (2010) view's, approximately 85% of undergraduate students have Facebook account¹. Whereas, Len hart and Madden (2007), pointed out that if we are talking about year 2005, only 8% adult internet users had used online profiles but in 2007 year the strength has been increased quadrupled to 35%. It means that the social sites have greater influences on the adolescent's life style. As per Pew Research Centre report (2015), 92% of adolescents of 12–17 age group are going online daily. Teenagers and young adults have exceeded all the age group in terms of internet usage. 71% youth are involved in more than one social networking sites and these social networks plays a significant role in the life of these teens². A report submitted by Common sense Media revealed that about 45% youths are using social networking sites in

their daily routines. Moreover, the report of daily social media indicates that traditional media usage is still more than social media³.

According to CMS (Common Sense Media) report, 68 percentage users have used Facebook profile out of which 75 percentage teenagers still have their profile on social networking sites. Another common and popular SNS is Facebook, with an estimated 1.44 billion members across the globe (as per 31st March, 2015), and 125 Million Indian users while the third most used web site in India, in every week there is addition of millions of the new users. Thus, there is no doubt on the increasing membership of Indian youth in these websites, thereby bringing our attention to the potential possible benefits and drawbacks of these sites.

According to ASSOCHAM survey, about 73% of children of 8 to 13 years are making use of social networking sites like Facebook. Shockingly 75 of the parents of these children are aware of this fact. The survey was conducted in tier-I and tier-II cities such as Ahmadabad, Delhi-NCR, Bangalore, Mumbai, Kolkata, Chennai, Lucknow, Dehradun and Pune. The survey also states, "Nearly 25 percent of 13-year-olds, 22% percent

of 11-year-olds and 15 percent of 10-year-old are on Facebook, while 5-10 percent of 8 and 9-year-olds are also active on the site.”

Valkenberg, et.al (2006) investigated 881 adolescents (10-19-year olds) and found that the social self-esteem and well-being of adolescents is being affected by the frequency with which teenagers use these sites⁴. Tian (2011) reveals that the uses of social networks determine the students’ influence to social learning whereas academic learning may be achieved through a gradual process⁵.

Ahmed (2011) found that male students are more involved in the use of these sites than female students. Further the study explored that there was a time spent on SNS usage have a significant effect on academic performance of the students.⁶

Wilson (2009) found that the results of university students are adversely pretentious by Facebook practice⁷. Khan (2009) explored that student involved in use of Facebook performed poorly in exams. Students also feel that excess use of internet may cause some socialization problems⁸. Helou and Rahim (2014) found that usage of social networking sites positively impacts the academic performance of university students in Malaysia^{9, 10}.

PERSONOLOGICAL VARIABLE

Per sonological variable is defined as any measure of individual characteristics. In this study following two variables has been taken up for study:

Social Adjustment

Social adjustment means those types of relationships which involve the accommodation of the individual to circumstances in his environment for the satisfaction of his needs and motives. Social adjustment is very important for success in life. It is an adjustment which is responsible for the organization of behavior to life situations at home, at school and at work.

Emotional intelligence

Emotional intelligence is defined as a bunch of interconnected skill regarding the tendency of people to perceive exactly, assess and articulate emotions; the tendency to access and exhibit feelings when they ease thought; the capability to know emotion and emotional information and the capability to control emotions to

encourage emotional and scholarly growth.

Significance of the study

This study aims to explain the impact of the social networking sites on the students’ academic achievement, social adjustment and emotional intelligence. The need of this study emerges from the fact that science and technology has revolutionized our all walks of life on the one hand it raised man from his confined limits/power but on the other hand it takes all the sources of mental peace from him. The practice of social networking sites has a prodigious bearing on overall development of the personality. It affects the individuals social as well as emotional intelligences and therefore their way of behaving.

OBJECTIVES OF STUDY

To explore the relationship among the student involvement in social networking sites, their academic performance, emotional intelligence and social Intelligence.

To find the difference in Academic performance, social adjustment and Emotional intelligence of the students at different levels of involvement in social networking sites.

Method and Procedure

In the present research the researcher followed Descriptive Survey method. Purposive sampling technique has been used to collect the data from the undergraduate students. Investigator had taken the sample of 480 male and female undergraduate students. The sample has drawn from the Government universities/ colleges and private universities/colleges from four districts of Punjab i.e. Jalandhar, Kapurthala, Ludhiana and Amritsar Districts. The sample is designed to include 50 percent males and 50 percent female undergraduate respondents.

Tools for data collection

The following tools are required and used in study:

A self-constructed questionnaire on student’s involvement in Social Networking Sites: For this questionnaire was prepared in which there 10 items which are related to involvement in social networking sites and 30 items are related to Attitude toward social networking sites.

Emotional Intelligence Scale by Dr.S.K.Mangal and Mrs. Shubra Mangal (2004) : This tool has four dimensions namely: “Intra-personal Awareness, Inter-personal Awareness, Intra-personal Management and Inter-personal Management”.

Bell’s Adjustment Inventory (B A I) by Dr.R.K.Ojha, (2006) : This inventory includes four parts: Home, Health, social and Emotional.

RESULTS AND DISCUSSIONS

Table No. 1 Correlation between overall involvement in social networking sites (SNS) and Academic performance (AP)

Variables	Number	Mean score	Coefficient of correlation	Interpretation
SNS Score	480	98.09	0.09	Low Correlation
AP score		72.37		

The table no. 1 depicts that the co-efficient of correlation between Level of involvement in social networking sites and Academic performance is positive but negligible. It is concluded that level of involvement in social networking sites have no effect on Academic performance of students.

Table No. 2 Correlation between overall involvement in social networking sites and social adjustment

Variables	Number	Mean score	Coefficient of Correlation	Interpretation
SNS Score	480	98.09	0.43	Positive Correlation
Social adjustment		2.34		

The table no.2 depicts that the co-efficient of correlation between Level of involvement in social networking sites and Social Adjustment is positive. It is concluded that there exists a positive relationship between level of involvement in SNS and Social adjustment.

Table No. 3 Correlation between overall involvement in social networking sites and emotional intelligence

Variables	Number	Mean Score	Coefficient of Correlation	Interpretation
SNS Score	480	98.09	0.29	Positive Correlation
Emotional intelligence		63.33		

The table no. 3 depicts that the co-efficient of correlation between Level of involvement in social networking sites and Emotional intelligence is positive. It is concluded that there exists a positive relationship between level of involvement and Emotional intelligence.

Table no. 4 Results of ANOVA on difference between different levels involvement in social networking sites and academic performance.

Source of Variation	Df	SS	MS	F- Value	Significance
Among means	2	694.502	347.251	6.27	Significant at 0.01 level
Within means	477	26401.498	55.349		
Total	479				

It is evident from table no. 4 that the calculated F-ratio of academic performance is 6.27 that is significant at 0.01 level. Therefore, it can be interpreted that there exists a significant difference between the levels of SNS and academic performance. Therefore the hypothesis which reads that there is no significant difference among levels of involvement and academic performance is rejected. However, a significant F-ratio does not tell us which of the group means differ significantly; it merely tells us that at least one mean is relatively different from some other. Consequently, there arises a need for further testing to determine which of differences between means is significant. In order to find out where these differences exist, t-test as a post hoc comparison has been used in which all possible comparisons have been considered. The results of post hoc have been shown in table no. 4.1

Table 4.1 Comparisons Between three Pairs of Groups on levels of involvement

S. No	Group	N	Mean	SD	df	t-vale	significance
1	Medium & Low 110	250	71.40	7.35	358	1.19	NS
		72.44	7.84				
2	High & Medium 250	120	74.32	7.22	368	3.65	Significant at 0.01 level
		71.40	7.35				
3	High & Low 110	120	74.32	7.22	228	1.88	NS
		72.44	7.84				

Table no. 4.1 reveals that the calculated t-value of two groups i.e. first pair on level of involvement is 1.9 which is not significant at both the levels. This indicates that the two groups do not differ significantly with each other on level of involvement.

It can also be inferred from the table no. 4.1 that the calculated t- ratio of high and medium is 3.65 which is significant at both the levels. Therefore, it can be interpreted that there exists a significant difference between the high and medium level of SNS in academic performance. In third group, the t-ratio is 1.88 which is less than the table value at both the levels. Therefore, it can be interpreted that the two groups do not differ significantly in their academic performance.

Table no. 5 Results of ANOVA on difference between different levels involvement in social networking sites and social adjustment.

Source of Variation	df	SS	MS	F- Value	Significance
Among means	2	54.826	27.413	9.032	Significant at 0.01 level
Within means	477	1447.749	3.035		
Total	479				

It is evident from table no.5 that the calculated F-ratio of social adjustment is 9.032 that is significant at 0.05 and 0.01 level. Therefore it can be interpreted that there exists a significant difference between levels of SNS and social adjustment. Therefore the hypothesis which reads that there is no significant difference among levels of involvement and social adjustment is rejected.

Table No. 6: Results of ANOVA on difference between different levels involvement in social networking sites and Emotional Intelligence.

Source of Variation	df	SS	MS	F- Value	Significance
Among means	2	3450.11	1725.05		Significant at 0.01 level
Within means	477	42302.88	88.68	19.45	
Total	479				

It is evident from table no.6 that the calculated F-ratio of social adjustment is 19.45 that is significant at 0.05 and 0.01 level. Therefore it can be interpreted that there exists a significant difference between levels of SNS and emotional intelligence.

Therefore the hypothesis which reads that there is no significant difference among levels of involvement and emotional intelligence is rejected.

In order to find out where these differences exist, t-test as a post hoc comparison has been used in which all possible comparisons have been considered. The results of post hoc have been shown in table no. 6.1

Table 6.1 Comparisons Between three Pairs of Groups on levels of involvement in Emotional intelligence

S. No	Group	N	Mean	SD	Df	t-vale	Significance
1	Medium & Low	250	62.89	9.80	358	2.95	Significant at 0.01 level
		110	59.82	8.92			
2	High & Medium	120	67.46	8.90	368	3.90	Significant at 0.01 level
		250	62.89	9.80			
3	High & Low	120	67.46	8.90	228	6.52	Significant at 0.01 level
		110	59.82	8.92			

Table no. 6.1 reveals that the calculated t-value of medium and low involvement group i.e. first pair on level of involvement is 2.95 which is significant at 0.01 level. This indicates that the two groups differ significantly with each other on level of involvement.

It can also be inferred from the table no. 6.1 that the calculated t- ratio of high and medium is 3.90 which is significant at 0.01 level. Therefore it can be interpreted that there exists a significant difference between the high and medium level of SNS in emotional intelligence.

In third group, the t-ratio is 6.52 which is higher than the table value at 0.01 level. Therefore, it can be interpreted that the two groups differ significantly in

their social adjustment.

CONCLUSION

The findings of the present study revealed that there exists a positive relationship between involvement in social networking sites and Academic performance, social adjustment and emotional intelligence. Further the three groups (students with low, medium and high level of involvement of in social networking sites) differ significantly in their academic achievement, social adjustment and emotional intelligence. Govt. should restrict websites which blow violence and parents should not allow their children to use social networks, so as to make their future secure.

Effect of Affective, Normative and Continuance Commitment on Organizational Effectiveness

Archana Shrivastava

Professor, Balaji Institute of Modern Management, Pune, India

ABSTRACT

The aim of the present exploratory and empirical research paper was to analyze the role of organizational employee commitment in promoting organizational effectiveness. In this research paper the approach taken is the well-established Meyer and Allen's Three-Component Employee Commitment Model approach¹. The effect of the three components of commitment namely- Affective, Normative and Continuance Commitment is studied on Organizational effectiveness. Literature on the topic offers enough evidence supporting the benefits that organizations have of maintaining a strongly committed workforce. The study was conducted on the employees of the telecommunication sector using a sample size of 266 employees. Primary data for the study was collected through questionnaires, using structured questions to elicit information on the predictor variables of Affective, Normative and Continuance Commitment and response variable of Organizational effectiveness. The three different conceptual components of commitment have different antecedents and different implications for work related behavior^{2,3}. The predictive model arrived at in this research explains that an increase in any of the three commitments will lead to increase in organizational effectiveness. The final predictive model explained 54.5% of the variability of the response variable of Organizational effectiveness.

Keywords: *Affective commitment, Normative component, Continuance commitment, Organizational effectiveness, TCM Employee Commitment (TCM) Survey*

INTRODUCTION

The business environment today is witnessing VUCA (Volatility, Uncertainty, Complexity, Ambiguity) like never before. Organizations are increasingly depending on their human resources to help them tide over the challenges created by the business ecosystem. In such a scenario committed employees can be a valuable assets for organizations to achieve their goals. Committed employees stay with the organizations during difficult times and propel the organization forward during conducive times. As such organizations should consciously try to build commitment amongst their employees to improve the organizational outcomes. Organizational commitment is a complex construct. An employee can be committed for divergent reasons. It is important for organizations to understand what constitutes organizational commitment and how it can be inculcated. Organizational effectiveness can be explained as how effective an organizations is in achieving its goals. According to Richard et al. (2009) organizational effectiveness is explained by internal performance

outcomes resulting because of efficient operations and other broad measures encompassing not only financial performance but value created for the wide array of stakeholders like shareholders, employees, customers, suppliers etc. Committed employees are required by organizations to create and maintain competitive edge and achieve superior organization effectiveness.

LITERATURE REVIEW

A committed employee is one who stays with an organization, contributes to work regularly, puts in a full day and more, safeguards corporate assets and identifies with the organizational goals⁹. Ongori (2007) explained employee commitment as an affective response to the whole organization and the degree of attachment or loyalty employees feel towards the organization.

Mowday, Steers, and Porter (1979) gave behavioral and attitudinal definitions of commitment. Behavioral commitment, also referred to as attributional commitment in the literature, involves "behaviors that exceed formal and/or normative expectations". Salancik (1977)

proposed that behaviors that are explicit, irrevocable, volitional, and public bind individuals to the behaviors, thus causing greater commitment. In this approach, employees are deemed as becoming committed to a particular course of action, rather than to a particular entity; commitment is developed retrospectively⁹.

Many researchers have defined commitment on the basis of Affective commitment, also referred to as psychological or attitudinal commitment in the literature. Porter et al. (1974) opined that affective commitment can be characterized by three aspects: (1) identification with and acceptance of the organization's goals and values, (2) an inclination to focus effort on helping the organization achieve its goals, and (3) a desire to preserve organizational membership. It "represents a state in which an individual identifies with a particular organization and its goals and wishes to maintain membership in order to facilitate these goals". Normative commitment as suggested by Wiener (1982)¹ results from pressures exerted either prior to, or after entering into an organization. Continuance commitment is referred to as calculative and exchange-based commitment in the literature. This type of commitment is a function of the rewards and costs associated with organizational membership. According to Meyer and Allen (1997)⁹, employees preserve relationship with the organization because of an emotional attachment which is represented by affective commitment. Sometimes employee feel an obligation to continue their relationship with the organization which is termed as Normative commitment. Further, Meyer and Allen (1997), contended, employees who possess continuance commitment retain membership because they need to do so⁹. Morrow (1993) also came up with a model of work commitment that included affective organizational commitment, continuance organizational commitment, career commitment, job involvement, and work ethic endorsement.

In this research paper the approach taken is what is proposed in the well-established Three-Component Model proposed by Meyer and Allen²⁻⁵. For the purpose of this study commitment is viewed as a force that binds an employee to their organization. This binding force with the organization includes an affective attachment with the organization, a felt obligation towards the organization, and an awareness of the costs associated with discontinuing involvement with the organization.

In their pure forms, these psychological outlooks are referred to as affective commitment (AC), normative commitment (NC), and continuance commitment (CC), respectively.

In the literature, the goal model explains organizational effectiveness in terms of the extent to which an organization accomplishes its intentions. The legitimacy model views organizational effectiveness in terms of a background assessment "of component preferences for performance and natural limitations on performance from an external environmental perspective". The constituency model believes organizational effectiveness "as a set of several statements, each reflecting the evaluative criteria applied by the various constituencies" involved with the organization being assessed with a stress on means criteria. The systems resource model defines organizational effectiveness "in terms of its (the organization's) bargaining position, as reflected in the ability of the organization, in either absolute or relative terms, to utilize its environment in getting hold of scarce and valued resources" and how they make use of these resources. Organizational effectiveness is the extent to which an organization, by the use of certain resources, fulfils its objectives without depleting its resources and without incapacitating its means, placing undue strain on its members and/or society.

In general, the organizational commitment is considered as a useful measure of organizational effectiveness. Employee commitment has been widely investigated to predict employee retention. The review of literature revealed that employee commitment towards the organization was a persuasive predictor for organizational outcomes such as absenteeism, job performance and organizational citizenship behavior. According to Morrow, organizational commitment is a multidimensional construct that has the potential to predict the organizational outcomes such as performance, turnover, absenteeism, tenure and organizational goals. Meyer and Allen (1991) used affective, continuance and normative commitment to capture the multidimensional nature of organizational commitment^{6, 7, and 8}. Meyer and Allen (1997) opined that the affective commitment was important as the employees with strong affective commitment would be motivated for exhibiting higher levels of performance and make more meaningful contributions as compared to the employees who expressed continuance or normative commitment⁹. In a study of 238 nurses, Cohen (1993) investigated

the relationship between affective, continuance and normative commitment. Findings revealed that the affective commitment is highly correlated with all the other types of commitment. In other words, employees remain with the organization because they want to exhibit higher levels of commitment to their work, job, and career.

There is enough evidence supporting the benefits that organizations have of having a strongly committed workforce. Meta-analytic reviews of this research reveal that employees who are committed to an organization are less likely to leave⁴ and less likely to exhibit absenteeism at work¹⁰, perform job roles efficiently^{29,30}, and exhibit organizational citizenship behavior³⁰. Employee Commitments to other work-relevant vertices, such as occupations¹¹, supervisors³¹, work teams²⁷, and customers²⁸, have also been related to retention and other performance dimensions important to employers. It has been reported in literature that some forms of commitment are more advantageous than others. Commitments reflecting an affective attachment and involvement with the organization have been shown to have greater benefit for that organization than those grounded in concerns over social or economic costs.

II. Research Objective

The objective of the research is to propose a multivariate regression model where the three components of organizational commitment namely Affective Commitment, Normative Commitment and Continuance Commitment act as predictors of Organizational Effectiveness.

III. Research Methodology

Primary data was collected through questionnaire using Simple random Sampling. A sample size of 266 respondents belonging to the Telecom sector was considered for analysis. Affective, Normative and Continuance Commitment were the predictor variables and Organizational Effectiveness was the outcome variable. The Sample size was 266 with 153 respondents being male and 113 being female. 75 respondents were in the age group of 20 -30 years, while 97, 69, 25 were in the age groups of 30-40 years, 40-50 years and 50-60 years respectively. 93 employees surveyed, had worked with the current organization for at least 2 years, 72 for 2-4 years, 48 for 4-6 years, 29 for 6-8 years and 24 for more than 8 years.

Research Instruments Used

The TCM Employee Commitment (TCM) Survey

TCM survey was used to collect data on employee commitment. TCM is based on the Three-Component Model (TCM) of commitment^{8, 9}. TCM Employee Commitment Survey measures three forms of employee commitment towards an organization: desire-based (affective commitment), obligation-based (normative commitment) and cost-based (continuance commitment). The survey includes three well-validated scales, the Affective Commitment Scale (ACS), the Normative Commitment Scale (NCS) and the Continuance Commitment Scale (CCS). Each is scored separately and can be used to identify the “commitment profile” of employees within an organization. TCM survey comprises statements pertaining to employees’ perception of their affiliation with the organization and their reasons for staying with the organization. The scale is seven point Likert scale wherein the respondent indicates the strength of their agreement by selecting a number from 1 (strongly disagree) to 7 (strongly agree). Allen and Meyer (1993) reported a high reliability score in almost all the items in the instrument. To elicit careful deliberation rather than choosing alternatives mindlessly many of the statements in the scales were reverse keyed⁴.

Organizational Effectiveness Scale (O.E.S)

It is accepted that business performance is a multi-dimensional and highly complex phenomenon^{25, 26}. While a number of studies have measured organizational performance as uni- or bi-dimensional, it was resolved to gauge organizational effectiveness on dimensions which included customer, competitor and employee perspectives. Consequently, after a range of studies a measure of organizational effectiveness was adopted which fulfilled these criteria. The Organizational Effectiveness Scale (O.E.S.) developed by Srivastava and Banerjia was used to assess organizational effectiveness. O.E.S consists of 56 items which are rated on a five point scale ranging from 1 (completely disagree) to 5 (completely agree).

The 56 items measure the eight dimensions of Organizational Effectiveness which are as following:

- Effective organizational system
- organizational climate

Congenial Organizational efficiency

Job satisfaction and commitment

Dynamism and adaptability

To ascertain the extent of consistency of the resources on the Organizational Effectiveness Scale, split half reliability index by odd even method on a sample of 300 employees, and retest reliability index on a sample of 100 employees, with a gap of 15 days, were worked out for the scale as a whole. The following Table records the obtained reliability indices:

Interpersonal harmony

Efficient leadership

High morale

Sub Scales of O. E. S.	Split half reliability index (N=300)	Retest Reliability Index (N=100)
1. Efficient organizational system	.857	.914
2. Congenial organizational climate	.882	.899
3. Organizational efficiency	.895	.952
4. Dynamism and adaptability	.850	.923
5. Interpersonal harmony	.863	.943
6. Efficient leadership	.816	.907
7. High morale	.916	.947
8. Job satisfaction and commitment	.876	.954
9. Whole Scale	.843	.935

All coefficients values are significant at 0.01 level

IV. Data Analysis and Interpretation

The concurrent validity of the O.E.S. was tested by administering it alongside the measure of organizational effectiveness developed by C. N. Daftuar(1984) on a sample of 102 employees. The coefficient of correlation between the scores on two was found to be .697 which indicates the high validity of the present measures of organizational effectiveness.

The data was analyzed using SPSS 16. In order to determine the overall fit (variance explained) of the model and the relative contribution of each of the predictors i.e. Affective Commitment, Normative Commitment and Continuance Commitment to the total variance explained multiple regression was applied. The dependent variable was Organizational Effectiveness. Descriptive statistics of the variables are as shown in Table1.

Table 1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Affective Commitment	266	14	54	36.26	9.419
Normative Commitment	266	16	54	34.09	10.091
Continuance Commitment	266	14	55	32.37	9.956
Organizational Effectiveness	266	101	264	176.35	48.260
Valid N (listwise)	266				

In order to ensure unbiased results the data was checked for meeting the assumptions required for applying multiple regression. The following Section explains the test and results obtained in checking for the assumptions before applying multiple regression. The data was tested for normality and Kurtosis and Skewness were found to lie between +1 and -1.

The dependent variable of Organizational Effectiveness was measured on a continuous scale. The independent variables namely Affective Commitment, Normative Commitment & Continuance Commitment

were all measured on continuous scale. In order to check independence of observations Durbin-Watson statistic was used. The statistic returned a value of 1.722 signifying there is no autocorrelation in the data. There needs to be a linear relationship between (a) the dependent variable and each of the independent variables, and (b) the dependent variable and the independent variables collectively. Scatter plots for Regression standardized Residual and Regression Standardized predicted value for the response variable of Organizational Effectiveness are reproduces in Fig 1.

Fig 1: Scatterplot of Standardized Predicted Value and Standardized Residual

From the Loess curve, it appears that the relationship of standardized predicted to residuals is roughly linear around zero. We can conclude that the relationship between the response variable and predictors is linear since the residuals seem to be randomly scattered around zero.

Another assumption of multiple regression is that the variance of the residuals is homogeneous across levels

of the predicted values, also known as homoscedasticity. The data needs to show homoscedasticity, which is where the variances along the line of best fit remain similar as you move along the line. If the model is well-fitted, there should be no pattern to the residuals plotted against the fitted values. The scatter plot (Fig 2) between regression standardized Predicted value and Regression standardized Residual shows a random distribution showing homoscedasticity.

Fig 2: Scatterplot of Standardized Predicted Value and Standardized Residual to check homoscedasticity

The data must not show multicollinearity, which occurs when two or more independent variables are highly correlated with each other. This leads to problems with understanding which independent variable contributes to the variance explained in the dependent variable, as well as technical issues in calculating a multiple regression model. Collinearity statistics are reproduced in the Table 5. The variance inflation factor (VIF) which is (1/tolerance) was found to be 4.405 for Affective Commitment, 9.402 for Normative commitment and 6.914 for Continuance Commitment. Values of VIF less

than 10 are acceptable and hence it is concluded the independent variables do not exhibit multicollinearity. The residuals (errors) should be approximately normally distributed. : Standardized variables (either the predicted values or the residuals) have a mean of zero and standard deviation of one. If residuals are normally distributed, then 95% of them should fall between -2 and 2. Standardized variables (either the predicted values or the residuals) have a mean of zero and standard deviation of one. In this case Standard Predicted value Is between -1.897 and 1.984 standard residual is between -1.824 and 1.978 (Mean=0 and Std Deviation =1)(Table 2)

Table 2: Residuals Statistics^a					
	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	108.76	247.05	176.35	35.639	266
Residual	-98.978	107.284	.000	32.542	266
Std. Predicted Value	-1.897	1.984	.000	1.000	266
Std. Residual	-1.824	1.978	.000	1.000	266

a. Dependent Variable: Organizational Effectiveness

The PP plots were also plotted to check for normality of residuals as reproduced below in fig 3..

Normal P-P Plot of Regression Standardized Residual

Fig 3: PP Plot of Regression Standardized Residual

The Model Fit

The model Summary (Table 3) gives the multiple correlation coefficient, R which can be considered to be one measure of the quality of the prediction of the dependent variable of Organizational effectiveness. A value of 0.738, indicates a good level of prediction. The coefficient of determination) “R Square” is the

proportion of variance in the dependent variable that can be explained by the independent variables (technically, it is the proportion of variation accounted for by the regression model above and beyond the mean model). This value is .545 signifying that our independent variables explain 54.5% of the variability of our dependent variable, Organizational effectiveness.

Table 3: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.738 ^a	.545	.540	32.727	1.722

a. Predictors: (Constant), Continuance Commitment, Affective Commitment, Normative Commitment

b. Dependent Variable: Organizational Effectiveness

Statistical significance

The F-ratio in the ANOVA table (Table 4) tests whether the overall regression model is a good fit for the data. The table shows that the independent variables statistically significantly predict the dependent variable, $F(3,262) = 104.746, p < .05$ (i.e.the regression model is a good fit of the data).

Estimated model coefficients

The general form of the equation to predict Organizational Effectiveness from Affective Commitment, Normative Commitment & Continuance Commitment is (Table 5):

$$\text{predicted Organizational Effectiveness} = 51.945 + (0.512x \text{ Affective Commitment}) + (1.455 x \text{ Normative Commitment}) + (1.738 x \text{ Continuance Commitment})$$

Table 5: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	51.945	8.001		6.493	.000		
	Affective Commitment	.512	.448	.100	1.142	.254	.227	4.405
	Normative Commitment	1.455	.611	.304	2.382	.018	.106	9.402
	Continuance Commitment	1.738	.531	.358	3.272	.001	.145	6.914

a. Dependent Variable: Organizational Effectiveness

Unstandardized coefficients indicate how much the dependent variable varies with an independent variable when all other independent variables are held constant. Considering the effect of Affective component we can say for a unit increase in Affective commitment there will be an estimated expected increase of .512 units in Organization Effective. Like wise a unit increase in Normative Commitment and Continuance Commitment will result in an estimated expected increase of 1.455 units and 1.738 units in Organizational Effectiveness respectively.

RESULT

A multiple regression was run to predict Organizational Effectiveness from Affective component, Normative Component and Continuance Commitment. These variables statistically significantly predicted Organizational Effectiveness, $F(3, 262) = 104.746$, $p < .05$, $R^2 = .545$. All four variables added statistically significantly to the prediction, $p < .05$.

DISCUSSION

In 2002 a meta analysis of empirical studies from Meyer, Stanley, Hercovitch and Topolnytsky showed that the Affective, Normative and Continuance components of Commitment are distinguishable from each other. The three different conceptual components of commitment have different antecedents and different implications for work related behavior^{2,3}. The predictive model arrived at in this research also explains an increase in any of the three commitments will lead to increase in organizational effectiveness. The adjusted R Square vales are quite close to R square vales (Adjusted $R^2 = .540$, $R^2 = .545$). Affective commitment can be inculcated when employees identify with the vision of the organization. Affective component depends

largely on the quality of experiences the employees have over time. Organizations must foster a culture where the employees develop a feeling of ownership resulting in improved organizational effectiveness. The literature describes employees with strong normative commitment as generally behaving in ways supportive of the organization. Normative commitment, however, is based on feelings of obligation, and thus organizations must create opportunities of growth and development for the employees to boost the normative component. The flip side is that employees with strong normative commitment may also resent the organization if they feel a sense of obligation⁹. According to the model Continuance commitment also has the potential to impact organizational effectiveness significantly. However employees with high continuance commitment may remain with the organizations because they feel they have no choice but to do so. Such employees need to be engaged and nudged to improve their skill set to positively impact organizational outcomes.

Limitations

This study has some limitations as the sample size was 266 respondents hence the findings cannot be generalized. The sector chosen for study was the telecom sector and as such the conclusions arrived at may not be applicable to all types of organization. The study is a cross sectional study and does not afford a trend analysis. Employee commitment may have many foci like leaders, work, team etc. In this paper we consider the employee commitment towards the organizations,

The Trauma of Partition in Nayantara Sahgal's Storm in Chandigarh

S Prabhakaran¹, R Lakshmi²

¹Research Scholar, ²Research Guide, Vel Tech Rngarajan & Dr. Sagunthala
R&D Institute of Science and Technology, Avadi, Chennai

ABSTRACT

This paper deals with the trauma of partition of Punjab and Haryana encountered after two decades of India - Pakistan partition. Storm in Chandigarh primarily explores the clash of ideas between the power hungry politician and the national conscious politician and the calibre of new leaders and Gandhian type politician. The novel has theme of the bifurcation of Punjab into Punjab and Haryana on linguistic and religious ground as the repercussion of bifurcation of India and Pakistan. Sahgal explores political conflicts over power supply and distribution of water and difference of opinion between two Chief Ministers,

Keywords: Power hungry politician, national conscious politician and bifurcation.

INTRODUCTION

The present paper deals with the socio political issues encountered after independent India represented in Nayantara Sahgal's novel, This Time of Morning. On the one hand, the study explores the conflict of ideas between power hungry and crafty politicians and ideal and national conscious politicians. It explicates disillusionment about the functioning of democratic institutions, the calibre of the new leaders. The erosion of moral values in politics found their articulation in her fiction. On the other hand, the novel reveals the perception of marriage of both traditional woman and new woman. In a nutshell, it deals with the theme of the conflict between idealism and materialism in post independent India's political world and tradition and modernism in the lives of man woman relationship in the society¹

Nayantar Sahgal is an Indian writer in English. Her novels deal with India's elite responding to the crises imperilled by political dynamic. She was one of the first woman Indian writer in English to receive wide recognition. She is the second of three daughters of Jawaharlal Nehru's Sister, Vijalakshmi Pandit. Since she spent her childhood in Anand Bhavan in Allhabad politics is in her ever drop of her blood. Primarily political trauma is reflected in Sahgal's novels. Nayantara Sahgal's political ideologies have been taken up in a

systematic and exhaustive manner. The basic obsession of the novelist with the policy –making aspect of society and the method of the distribution of power makes her chronicle the political dynamics in the country during the last century. She explores the political perplexity and predicament of the masses and she digs up the letters of faith in Gandhism, the latest aspires to revitalize and reinvigorate faith. She discovers both an idiom of comment on and a description of political conduct.

In Storm in Chandigarh, Chandigarh is typical and symbolic of its constructive approach to the problem of violence during the partition. Chandigarh is the city which was paralysed and helpless victim of the two bifurcations that took place within a period of two decades. At the same time Chandigarh is the virtual, painful remember of a nation that can never be a whole, and the prevailing situation of political turmoil upon which the violent scene is enacted repeatedly. Chandigarh is a place which connects two borders and two reminiscences come together: it is the place that holds cultural memory of the national breach exists on the one hand; it is land of modernity par brilliance on the other. Two cultures or constructed ethnicities (Hindu/ Sikh) interested upon one another in the land of 'Green Revolution.' Chandigarh stands in very significant idol. It symbolizes a dream of progress and perfection. But the forthcoming storm signifying an erosion of those dreams proves that any attempt at imposing of order and balance

from outside is an illusion. The Chandigarh architecture becomes similar with Indian democracy for Dubey; “That was architecture transplanted not conceived here and he wounded how successful democracy was superimposed on illiterate masses exploding millions of them” (SC212)².

The novel presents a clear picture of the clash between Gayan Singh, the Chief Minister of Punjab and Harpal Singh, the Chief Minister of Haryana. Chandigarh is the joint capital of the Hindi speaking Haryana and the Punjabi speaking Punjab, is scene of action. Vihal Dubey is an intelligent administrative officer who has been assigned the task of bringing out concord between the two warring section and rehabilitate harmony and peace among the people of Chandigarh. The clash between Gayan Singh and Harpal Singh is fight of principles and ideologies. It is a clash between the cult of violence and the ideal of non-violence. Sahgal shows the evil of hypocrisy, sham and self-importance existing at the human level.

Nationalism is a dogma or political philosophy that involves a strong identification of group of individuals in a nation. The experience and exposure which an individual has with the society in which he is born or group in which he lives, experiences either of contented state or discontented state because he is a member of the group. Conventions, customs, cultures and doctrines regarding the group become part of individual’s mental process, and therefore of his experience through the progress and development of education in the larger sense. These acquaintances become codified into system with the group as the central object. The usual feelings and intuition become one with them, lightly or deeply and these experiences are profound and baffled or merely frivolous and moving. Under proper conditions, this system so well ordered may show itself in behaviour as a distressed and distressing concern with the life and honour of the group. When this distress is more or less chronic, it becomes the sentiment of nationalism.

The other day, Indian novelist in English have emerged and grown conscious of the problems, emanating out of the working of political democracy in developing countries like India. They have tried to give a representational and realistic portrayal of the conflicts and clashes among the new unseasoned and new breed of politicians who exercised power and use their political influence perfidiously of their own private

vested interest. Their Novels depict the continuing corruption, double-dealing, swindling, inefficiency, poverty and collective misery of the public under the popular government. Political contention and contest and issues over ten decades are reflected various ways, both direct and indirect literature. The bifurcation of India has been one of the most dreadful and traumatic experiences of recent history. In the history of India, the bifurcation does not only mean the partition or separation of a vast subcontinent but also termination and devastation, catastrophe and contretemps for millions of people, the result of which has not died out yet as recommended by recent events. The political partition of India disturbed and disheartened the Indian psyche, mind and soul and also it’s social fabric. It brought to sudden end a long communally shared history. It engendered one of the great human convulsions of history³.

Sahgal’s novels depict the dilemma and turmoil and situation of Indian polity and proffer solution to political conflicts, individual confrontation and social wickedness. Her objective is to tackle the problems of politics, power, culture and history honestly. A scholarly pleasure with a profoundly reflective commonsense idea through which the reader hears the echoes of Sahgal’s ideology of nationalism fictionalized as empirical reality⁴.

The theme of Storm in Chandigarh is partition of Punjab into Punjabi speaking Punjab and Hindi Speaking Haryana on linguistic and religious ground as the consequence of the bifurcation of India and Pakistan. ‘Violence’ and ‘Power’ are themes of the novel, but it is not only political, referring to the forced linguistic partition of Punjab, but a multifarious one. It is an inconspicuous and more subtle form of ‘Violence’: “The infliction of one person’s will on another”(Asnani P125) or “emotional violence that a husband can cause to his wife, or vice versa” (Rao P 42). Sahgal not only portrayed man’s hunger to gain control over other’s mind but has also dissected deeper layer of human behaviour, accentuating the fearsome jungle of man-woman relationships.

“In Europe, eating and drinking together. Wine is part of culture. It is big performance all by itself. Here it’s a performance, a measure of one’s westernization...” (SC 75) contemplates Mera, one of the characters in Storm in Chandigarh – a series of thought that had been worked well in one of Nayantara Sahgal’s Sunday newspaper

articles. In fact, the entire novel is as of current interest as today's newspaper discussing in minute association of the partition of Punjab.

Storm in Chandigarh, one of the perfect and best political novels, deals with the bifurcation of East Punjab of linguistic lines just when the state had recuperated from the trauma of India-Pakistan partition. Faisal Fatehali Deviji, in "Hindu/Muslim/Indian," altercation that India is constructed and structured quite fervently upon lack and upon the violent demarcation of the others, such that nationalist accounts become significant only in the light of partition tale. The theoretical perception makes pleasant sense when understanding meaning in the numerous narratives of the trauma of the India-Pakistan split that took place due to the politico-geographic line mapped out by the British. Besides, over the last five decades, this partition has been iterated in folk memory, movie, literature and mythology. Storm in Chandigarh deals with the issue of political turmoil, violence and tension originating from its being: Chandigarh, the common capital of the both states – Hindi speaking Haryana and Punjabi speaking Punjab. Chandigarh, being a quite new city, has nothing to exhibit of its traditions. A new type of society has originated and emerged in this town, and people who have come to live in it have brought their ideas, creeds and traditions with them. This has improved the culture of the town; this has also engendered a sort of confusion or cultural storm. For example, Indian people have involved themselves to do the high-handed role English language. It is the consequence of the British rule and is one of the most modern features of Indian society. But it is not completely deteriorated their love for native language. It is this love that brought transformation of the earlier Punjab into Punjabi –Hindi speaking states were also the result of tradition thinking of the people. And it was conventional attitude of the Indian leadership that delayed the constitution of the new state. One of the most traditional characteristics of the Indian society is that people can still be perturbed and provoked to fight contentiously one another religion and language.

The opening sentence of Nayantara Sahgal's novel Storm in Chandigar set in the tone to zeitgeist discourse. Violence pervades the nation as well as the family in the course of narrative. The novel depicts the story of a wife who struggle to maintain her distinctiveness and individuality admits domestic violence and an administrator who struggle to maintain harmony and

peace amidst civic violence in the city of Chandigarh.

The novel opens with dismal and ominous words of proclamation of the Home Minister the Government of India to Visal Dubey, an intelligent I.C.S. officer: "violence lies close to the surface of Punjab." The Punjab has been partitioned into Punjab and Haryana and the two states are now interknitted in a fight over many issues because they accord and share many resources. The Home Minister considers the violence may be imputed to the long continuous and unbroken tradition of land ownership the pride of possession, the fact that the area was under the British Raj for less than a century and agriculture did not undergo revolution or transformation. All adding to an environment where in "the strong right arm is apt to flourish" (SC 5-6)

Dubey reflects on the predominance and of violence and hostility in the country: outbreaks of brutal, deliberated and preconceived violence had become a feature of the cities. There had become an earmark of the cities. There were too many in the tumult and turmoil that had nothing to lose by violence, to many others who sat idle and uninterested, their spirit sucked dry, watching it mount and ebb like some rough tidal wave, waiting for it to engulf them. Patiently waiting as the waited for the seasonal rains, for the harvest, for the birth of unwanted children for death. violence had become common and expected.

The Home Minister says that situation and condition in Punjab and Haryana poses an issue of violence of attitude, which may and often does lead to aggressive civic violence, an attitude that "brooks no compromise and rejects all but one solution." However, the Home Minister still deems that "The restraining voice has great value at a time like this," the approach making so much disparity. Answering Dubey's query, the Home Minister says that Dubey has been selected to be sent to Chandigarh because of his intellectual power of persuasion so that he may empower the Government to take one step ahead, hold on and wait. The Home Minister feels that Dubey has the capacity to counsel patience. The Minister ensures Dubey they will be in touch. He is dumfounded to perceive that Dubey can leave the next day. Dubey explicates that his wife died six years ago and that he has no children

The topography of India, once a homogeneous and well-balanced piece of territory to administer was now confusion of separate, sensitive separate identities,

electrified and aroused after independence. Psychology seems to play as significant a part in understanding as did history, economics and geography. Much more than realities and figures were needed in coping with political malevolence and rivalries that had now ceased even to make bargains. As long as an agreement could be made, work could go on. When the power and capacity wore out, only a collision was possible. In the new states, Punjab and Haryana carry off of water and electric power persisted, strengthened by the presence of both new states Government in a common capital, Chandigarh, which each demanded exclusively as its own. And now Gayan Singh, Chief Minister of Punjab, blackmailed and threatened to demonstrate the power and strength of his demands by instigating a crippling strike that would incorporate both states. Dubey had felt awkward that it was too late to consider persuasion. The man now meditating pensively in terms of a conclusion has committed too much of his reputation to it. In these years there had been no tug of war over power, no conflicts on political issues between state Governments even though there had been disagreement and dispute. No one had the inclination or the organization to risk an open threat.

Dubey analyses the information relating to the two states Punjab and Haryana: power systems, production industry work force, common irrigation and their exports. The power system is under jurisdiction of central government, but Gayan Singh, the Chief Minister of Punjab, now demands central of it for his state. Since he is a Left Wing leader, it is an apt setting for a showdown. Dubey is acquainted that as liaison officer between the two states and centre he will not be a popular and will not gain the credence of neither perhaps. Dubey had not question the Home Minister why the centre had admitted the Punjab to be redivided twenty years after the bifurcation of 1947, creating a new mass, because “it was the kind of question civil servant did not ask politicians”(SC13-14)

Nikil and Gauri Ray, mill owning family of Delhi, symbolizes the world of gracious and privileged living, which is no longer safe in India. Dubey started coming to Nikil Ray's home during befuddled and bewildered remorseful years following his wife's death because “there was no sign of strain in it”(SC16). Nikil contemplates that Gayan Singh is an egotistic and whimsical. Dubey tells that there is principle of it in all politicians. Nikil expounds that tribulation has been coming for years, with the labour constitution making a

monster out of labour, the congress party disintegrating people like Gyan Singh, his Haryana opposite Harpal Singh confronting each other. Dubey says that the issue between the two is a conflict of personalities, to which politics has deteriorated, with no issues left, only difference of opinion. Nikil thinks that as long as the transport keeps moving the people will not disquiet.

Harpal Singh, Chief Minister of Haryana, never desired it to exist. The formation of the new states constituted a criminal devastation of his vision. The Punjab has been his accomplishment. He had worked hard for its reconstruction, put heart into the expatriates who has resided there after the bifurcation and welcomed those who had straggled back once the annihilations were over. He really loved the Punjab. He criticised the partition disposition that had led to the bloodshed and massacre of the Punjab apparently in the interest of Punjabi language. Harpal Singh deplores that there is no big dream and vision any more.

When Dubey visits Harpal in his office, the Chief Minister says him that the issue is one of keeping the peace and placid in the face of Gayan Singh's strike threat. He desiderates Dubey to indite an appeal to all industrial establishments to keep their machinery working. He tells that Haryana Government destines to keep its concern going. He is spirited to hold the usual cattle market at Rohtak on schedule since it is likely to be occasion for a celebration once the entire problem is over. Preparing to leave for a Government machine tool factory at Pinjore. Harpal is stalled because his car does not start. Grumbling about the dearth of spares parts because of a go slow strike, Harpal is aboard into Dubey's car and invites him to the function at Pinjore because the industry is doing well in exports and it will be bad thing if the workers put down their tools. Harpal tells that Dubey will have to tell him If Gayan Singh 's approach and attitude will change.

The political conclave which carved and set out the new state of Haryana was fateful and destructive for Gayan Singh. He approached the centre to altercate of a state where the Punjabi language would have superiority and pride of place. He became the focus of editorials and news reports. He was represented as the common man who emanated from the ranks to the peak of power and yet reminded representative of the common people. After that he started to project himself as a simple and honest-to-goodness man whose only purpose was “to

call his soil his own in the language of his fore fathers” (SC142) and to dwell on his poor, rural decent and street childhood. Even the revered and admired Home Minister’s objections were countermand. Harpal Singh’s altercation against partition was ignored. Gyan Singh stuck to the language and won. He also suggested at a reserve card... the religion card.

With Gayan Singh and Punjab becoming more audacious and growing strong-willed day by day, Harpal has no ardour for the position of the Chief Minister of Haryana. When Vishal Dubey meets in his headquarters, Harpal Singh tells that he is going to quit his position. Vishal Dubey’s dissensions deprecate him. A group of university students persuade him that he is needed and has a job to do.

The schemed and calculated strike is to start in four days. For some unusual reason, perhaps as an admonishing, the State Electricity Board goes on a day strike, advocated and supported by government employee. However, Chandigarh’s electricity and light supply, unlike those of smaller neighbouring towns and cities, remain normal because the officer of the Electric Board patrolled and protected the lines for breakdowns. The Haryana cabinet meets for one whole morning and finds no concrete solution or at least a temporary suggestion.

After the conclave, in the Chief Minister head Quarters, Vishal Dubey counsels Harpal of confronts of strike, keep the works going by appealing to his stanch and faithful workers and bureaucrats and support and make a stand. Harpal Sinng is bothered and distressed about planning, strategy and tactics and afraid of failing in such a situation. Vishal Dubey suggests that the risk should be taken because a single man cannot be suffered and tolerated to run down the machinery of two states. Harpal Singh tells that prevailing belief is in support of Gayan. Dubey tells that Harpal Sing can win public belief and public opinion over to his side if he make a stand. Harpal Singh contemplates for sometimes, determine to make a stand. Harpal cogitates for some time, determines to make a stand, and requests to workout strategy.

Going to his office, Vishal Dubey works out the tactics, making a grand design of game plan on a notepad, covering all important points and contriving for all contingencies. He telephoned to the Home Minister in Delhi, who admonishes that a decision should be

made and offers to come over personally. Perturbed by the prospect of having to defend and safeguard in such a tense situation. Vishal Dubey advocates him against a visit at this moment. The Home Minister accedes his advice.⁵

Vishal Dubey’s contact at the Bahakra power plant is anxious because the protesters blocked all the road junctions so that only four hundred bureaucrats and charge-men could be put inside the plant. He announced that there are more than two thousand protesters and that the police dare not audacity the protesters because they feel that there not enough of them to contend. He dreads that the men inside may lose their spirit. Vishal Dubey discerns that it is the speaker who is afraid. So, he is says that to approach that another deputation of police will arrive in the afternoon. He instructs that meanwhile, no one is giving up anything. The approach is frightened the protesters may turn to violent, bloodthirsty and destructive. But Vishal Dubey promises him that loyal workers will not have to hold out for more than fifty eight hours. The approach is relieved to hear this. In the evening light is on agenda. Harpal Singh comes to Vishal’s office looking young and almost gay. He tells he has no thought of retirement now. He is going home and counsels Vishal to do like.

As Vishal is to leave to his office, a news flash announces the death of the Home Minister and the last rites the next morning and Vishal muses. It would mark the end of an era known as Gandhian. Crowd sweeps into the roads of Chandigarh that evening. Harpal’s car is seized in the crowd at the secretariat. A few hundred hands thrash and beat against his car. The tyres of the car are punctured. Cow dung is thrown on the car. A shot breaks the windshield of the car. A second shot thwack on his shoulder and he slumps in his seat. When he recovers consciousness in the hospital, he knows that Gayan Singh has called of the strike as a taken of respect for the death of a patriot.

CONCLUSION

Thus Nayantara Sahgal pictures the issues of nationalism, heroes in its own way. Sahgal portrays the violence in the contemporary Punjab-Haryana which mirrors the trauma of the India-Pakistan partition. Vishal Dubey reflects the actions of and principles of Gandhiji and Nehruji. Sahgal clearly shows in matching the occurrences and utterances of everyday political reality

and its consequences with larger concerns of the nation in a deliberate and reflective manner.

Soft Computing based Cluster Head Selection for Secured Energy Aware Routing in Flying Ad Hoc Networks (FANET)

Esraa Saleh Alomari

Wasit university, computer science department, Iraq

ABSTRACT

Flying Adhoc Networks (FANET) refers to the Unmanned Air Vehicle (UAV) that is used for defense applications so that the multiple flying objects or military air vehicles can communicate with each other. Network Communications generally encounter assorted assaults from different sources and channels which creates huge vulnerabilities and susceptibilities in the overall environment. By this integration of assaults, the overall communication gets under halt and the cumulative trust factor is affected. In this paper, the different perspectives of wireless communication on flying objects are underlined with the different types of energy based attacks. FANET is a type of ad hoc network in which the temporary communication channel is created on demand so that the communication and transmission of signals can be done for specific applications with the higher degree of accuracy and performance. In this manuscript, the implementation of Simulated Fermentation Optimization (SFO) is implemented so that the higher degree of performance and optimization can be done.

Keywords: FANET, Flying Adhoc Network, Wireless Network, Simulated Fermentation Optimization (SFO)

INTRODUCTION

Wireless communication involves the transmission and sharing of information in multiple nodes without using the electrical conductor. The wireless communication depends on the radio technology and related assorted aspects for effective and secured data transmission. There are assorted perspectives of wireless

communication including wireless sensor networks, mobile ad hoc networks, wi-max and many others. Now days, the inclusion of flying objects are prominent in military applications so that the flying aircrafts can communicate with each other during war time or other similar instances. The wireless communication when takes place in the flying objects or flying aircrafts are commonly known as Flying Adhoc Network (FANET)^{1,2}.

Figure 1.1. Depiction of MANET, VANET and FANET

Figure 1.2. Flying Ad-hoc Networks (FANET)

Energy and Power in Wireless Sensor Networks

The energy and power in the wireless nodes are very limited which makes the network scientists aware with the development of new protocols so that the high performance algorithm for energy optimization can be devised. There are number of algorithms and approaches for energy optimization and harvesting in wireless sensor networks which are having key focus on the cluster head formation so that the minimum energy loss can be implemented in overall network scenario.

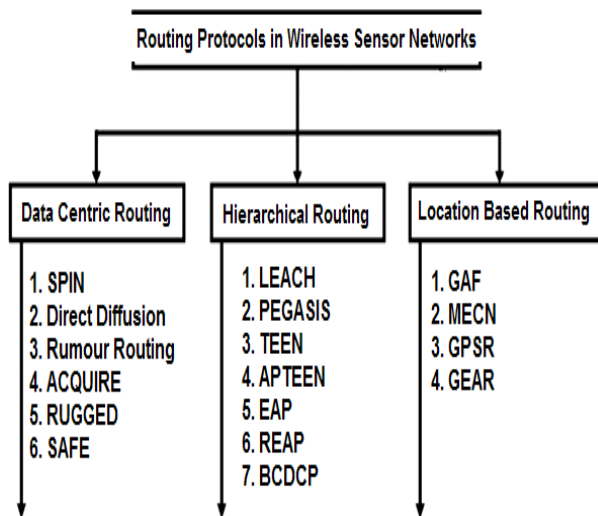

Figure 1.3. Taxonomy of Routing Protocols in Wireless Networks

Following are the excerpts from the key routing protocols in wireless sensor networks. Low-energy adaptive clustering hierarchy or LEACH is one of the prominent protocols for energy optimization in the wireless sensor networks. LEACH encapsulates the properties including threshold value, TDMA based communication, cluster based aggregation, direct communication by the cluster head to the node or sink.

Figure 1.4. Low-energy adaptive clustering hierarchy (LEACH) Protocol

SPIN - Sensor Protocols for Information via Negotiation (SPIN) is a Data-Centric routing approach that is based on the negotiation family with the elimination of redundant data. This family avoids the limitations of Implosion, Overlap and Resource Blindness as key obstacles in the traditional flooding.

Direct Diffusion - The implementation of data aggregation is done at each node. The advertising of data is done after confirmation from base station (BS).

Rumour Routing - The routing of queries is done to the events with the acknowledgement from the event to which the query is transmitted.

ACQUIRE - ActiveQuery forwarding InsensoRnEtworks or ACQUIRE follows the approach of active query routing that is transmitted to the network to fetch the solution. The query is transmitted to each node and multiple hops to resolve the query.

RUGGED - It is RoUting on finGerprint Gradient in sEnsor networks. It is gradient based routing that relies on the utilization of fingerprint associated with the event for logging and tracking.

PEGASIS - It refers to Power Efficient Gathering in Sensor Information System with the key focus on energy efficient approach in the wireless environment. The approach grants the local communication and coordination in the nodes so that minimum bandwidth and energy can be consumed.

TEEN - Threshold sensitive energy efficient protocol or TEEN focuses on the grouping of sensor nodes so that the cluster formation can be done with the generation of cluster head to lead the cluster communication. APTEEN is the escalated or improved version of TEEN that refers to Adaptive Threshold sensitive energy efficient protocol.

EAP - Energy Aware Routing Protocol (EAP) is another class of hierarchical protocols in wireless sensor networks for the lifetime improvement and optimization of the energy in wireless environment. EAP presume that the locations are not known to the sensors and these sensors communicate using different paradigms of information including Global Positioning System (GPS), Positional Algorithm and Antenna^{3,4}.

REVIEW OF LITERATURE

A number of researchers and practitioners have worked on the analysis of similar domain with the suggestive remarks but there is huge scope for the improvement in cases where the deep evaluation of the tools, technologies and paradigms are required to be done. Enormous multi-sources based manuscripts, research papers and articles are analyzed from the time span up to year 2017 so that the latest trends in wireless communication can be evaluated. Enormous multi-sources based manuscripts, research papers and articles are analyzed from the time span up to year 2017 so that the latest trends in energy optimization and lifetime of flying adhocnetworks can be evaluated.

Bekmezci et al. (2013)⁵ worked on the assorted aspects of energy and security in Unmanned Air Vehicles (UAV) commonly referred to as Flying Objects communicating in the wireless environment. The work presents the key differences in FANET, MANET, VANET and related technologies of wireless communication with the advantages of using FANET.

Sahingoz et al. (2014)⁶ underlines the network models and paradigms of flying ad-hoc networks with the challenges and key concepts. The identifies the architectures and security models associated to enable the integrity aware FANET.

Singh K et al. (2015)⁷ presents the experimental evaluation of flying ad-hoc networks on different protocols including AODV, DSDV, OLSR with the effectual comparative analysis. The work presents the use of FANET for military applications and performance aware environment in minimum delay.

Temel S et al. (2013)⁸ depicts the promising technologies of High Altitude Platforms (HAP) with the integration of Flying Adhoc Networks (FANET) for different domains including military as well as civilians. The work projects the unique and effective protocol

titled Location Oriented Directional MAC (LODMAC) based on MAC for the network discovery and effectual data transmission.

Rosati S et al. (2016)⁹ evaluates the dynamic routing in the unmanned air vehicles or flying adhoc networks with the experimental evaluation and results on small flying robots for testing. The work presents the comparison of two routing approaches in ad hoc networks including OLSR and Predictive OLSR (P-OLSR). The approach of P-OLSR is developed for FANET and tested as the effectual algorithm.

Koucheryavy A et al. (2015)¹⁰ presents the research challenges and assorted aspects of public flying ad hoc networks in multiple applications. The work evaluates the assorted aspects of Public Flying Ubiquitous Sensor Networks (FUSN-P) with the presentation of a network model and the effectual solution for different application in military.

Research Objectives and Methodology

The multilayered approach for energy harvesting and energy optimization shall be done in the proposed approach at the multiple layers of sea with the deployment of FANET. The work includes the research goals including subterranean evaluation of energy and optimization approaches in Flying Ad-hoc Network (FANET). The work presents the pragmatic Exploration of the Energy Harvesting and Associated Packets Loss in the Flying Ad-hoc Network (FANET). The work proposes and devises an effectual and novel algorithm for energy optimization in Flying Ad-hoc Network (FANET) using Simulated Fermentation Optimization (SFO). The implementation of proposed approach using open source research based simulation tool is done with the evaluation of the Projected Proposed Results with the Traditional Approach. The work includes sensors deployed to form the dynamic clusteredhead and reconfiguration of the network. The fuzzy formula based dynamic selection of the cluster head shall be implemented with the shuffling of cluster heads. The proposed work is providing the feature and dynamic nature to the cluster head. The work is fault and failure tolerant due to shuffling of the cluster head.

In this novel and effectual research work, we hereby present and depict the Soft Computing Approach titled "Simulated Fermentation Optimization (SFO)". This approach can be used for optimization of Engineering as

well as Social Problems.

Figure 1.3. Simulated Fermentation Optimization (SFO)

In Figure 1.3, the proposed Nature Inspired Algorithm (SFO) is depicted. The components and process of classical fermentation is related to the proposed approach. Using SFO, we can fetch the integrity and performance based results. The wireless nodes with degree of energy and lifetime shall be given occasion to be cluster head so that overall performance and lifetime of the clustered environment can be escalated.

There are many procedures to select the cluster head based on the criteria including fermentation quantity and timelines, Battery power, Communication range, Position of the node, Total number of nodes in range and Mobility of the node

Projected Results and Outcome

Figure 1.4. Implementation of Clustering in Wireless Environment

Figure 1.4 depicts the implementation scenario of clustering in the flying adhoc networks in the aerial region. The different points in plot presents the flying

objects or aircrafts in communication with each other to share and signals and the data transmission.

Figure 1.5. Communication in Wireless Flying Objects

Figure 1.5 presents the communication scenario between the flying aircrafts and communication with the base station and controller along with the inter-aircraft transmission of signals.

Figure 1.6. Comparison of Efficiency in Existing and Proposed Approach

From the results, it is evident that the projected approach of SFO is presenting the superior results in terms of efficiency or performance as compared to the traditional approach of energy optimization in FANET. The implementation is done in the performance aware simulation tool to have the overall outcome. By this, it is palpable that the soft computing approaches are quite effectual and integrity aware for multiple scenarios and applications.

CONCLUSION

Soft computing approaches are widely used for the optimization of engineering problems including wireless energy optimization, security, malware detection, log file analysis, image processing, video forensic and many others. In this research work, the proposal of a new approach Simulated Fermentation Optimization (SFO) is presented with the pragmatic evaluation on performance and found the approach better to improve the lifetime and energy optimization in the flying ad hoc networks.

Survey on Faculty Members Attitude on Selection Criteria for Digital Archives at Raman Research Institute, Bengaluru

E Nanda Kumari ¹, E S Kavitha²

¹ Ph. D Research Scholar, Department of Library and Information Science, Periyar University, Salem and Sr. Library cum Information Asst. Gr. I, JNCASR, Bengaluru, ²Assistant Professor, Department of Library and Information Science, Periyar University, Salem

ABSTRACT

A repository is which stores one or more collection of digital information objects with the intention of providing long-term access to the information known as digital archives. This study is attempted on the selection criteria for the digital archives at RRI Library. To know the level of awareness on various copyright or legal issues associated with the digital collection and to get opinion from various categories of respondents about criteria guide on selection of materials for digitization. The present study analysis is to know various problems while using digital archives and ways to Publicize to use the IR/ digital archives and discuss about the special skills required for library staff to implement various methods to access the digital collection and precautionary measures relating to issues on digitizing the documents in the digital archives

Keywords: Digital Archives, IR, RRI

INTRODUCTION

A digital archive is a repository that stores one or more collection of digital information objects with the intention of providing long-term access to the information. Digital archives can be a sophisticated, multi-tiered storage system or simply from a local drive on someone's home computer. 'Long-term' refers to a period of time which is long enough to be concerned about the impact of changing technologies, including support for new media and data formats, and with a changing user community, on the information being held in a repository. This period extends into the indefinite future. Digital technology is constantly shifting, and the challenges of preserving materials in digital formats require constant innovation. This means that the curation of archives 'born-digitally' is heavily reliant on research, development and problem-solving. Ensuring long-term access to digital information is a complex challenge that includes issues such as: storage media instability and deterioration technology obsolescence and incompatibility (at the level of: hardware, system software, application software, data and file formats, storage media readers and drivers) lack of metadata which results in the failure to locate information, the inability to render and read the information, or the

inability to attribute meaning or value to the information due to the lack of contextual information lack of clearly assigned responsibilities and resources for long-term preservation

Advantages of digital archiving

Archives of artifacts is helpful for historical reasons. Physical artifacts may get worn out in few years.

Searching of the contents in digital versions can be made powerful and this can help literally to all stakeholders.

Visibility of such archives is achieved which helps users to understand the importance of archives.

Better access to information and Data retention and backup

Less space requirements for physical document storage

Cost savings due to reduced overheads for storage, searching and handling of paper documents

Raman Research Library

The present library has been developed around

the library started by Prof. C. V. Raman. After the institute's activities enlarged from 1972 onwards, library's collection developed in the new areas of research activities. Its collection is strong in the areas of astronomy and astrophysics, theoretical physics, optics and liquid crystals. Apart from these subjects there are books on Computer Science, Electronics, scientific biographies, general science, nature and fine arts. It has also a collection of non-book materials like scientific slides, CD-ROMs, DVDs and audio and video tapes. The library participates in inter library networking activities and has a good rapport with the libraries in the city as well as outside. It is used by not only by the scientists of this institute but also by others belonging to Indian Institute of Science, Indian Institute of Astrophysics, Jawaharlal Nehru Centre for Advanced Scientific Research, National Aerospace Laboratories, National Centre for Biological Sciences, TIFR Centre for Applicable Mathematics and others. The library has full text access to several online journals. The Digital repository is built to showcase all the research publications of Prof. C.V. Raman. It includes research publications of the faculty and students of RRI in addition to the historical/ archival records such as Annual Reports, Newspaper clippings, Photographs and multimedia objects. A collage of profiles and publications of RRI members (whose imprints) have been culled and collated for posterity.

REVIEW OF LITERATURE

Kim, Julia Y (2018) conducted the study about the archives and library communities had benefited from major innovations in emulation and software preservation¹. Presently the digital archives were accessible to all users and supported all major operating and desktop systems, and much of the work in determining platform requirements can be made almost invisible to end-users. The study investigating solutions for emulation, but also legal issues, metadata, and other impediments to the preservation of software necessary for rendering digital files. **Ravenwood, Clare (2015)** examined the social context of selection in institutions, in which the responsibilities of stakeholders and relationships between them can affect the material chosen for preservation by practitioners². A range of stakeholders is identified and addressed the relationships between practitioners, information technology staff, and sources of material are found to be crucial. The influence of senior managers is important in providing a

mandate and encouraging shared working and networks of expertise. **Chen, Tin-Kai (2014)** aimed to digitize video collections hosted by the Museum of Shadow Play of the Kaohsiung City Cultural Affairs Bureau in Taiwan³. The study cooperated with the museum and digitizes films kept there, whilst also constructing a Web 2.0 interactive online platform to promote the culture of shadow puppet theatre. The study designed and validated three prototypes of social interfaces representing the cultural context by taking advantage of interactive technology. **Muir, Adrienne (2014)** discussed that there are various possible approaches to dealing with the issues, including extending legal deposit law, amending copyright and related law, development and use of preservation clauses in licenses or collective licensing and the provision of preservation rights metadata⁴. There is a need for clarification of the legal situation and a raising of awareness. Roles and responsibilities in digital preservation and the impact of new trends in electronic publishing also need to be investigated.

Calanag, Maria Luisa (2001) stated about the Selection and metadata issues which surround the preservation of digital information are discussed, in particular, the assignment of "collection levels" to Web materials to ensure preservation. PMES have been identified as informed by the OAIS as Reference Model⁵. They expressed preservation decision and responsibility for the resource at the time of selection. **Bähr, Thomas (2011)** described the necessary knowing about how identified, ranging from digital curation skills needed to evaluate digital data carriers to specialist digital preservation knowledge of file formats needed to describe information with the goal of sustaining accessibility over long-term⁶. It shows how central tasks of digital preservation like process description and preservation planning require expert knowledge of traditional librarian and information technology skills as well as new knowledge which is described as digital preservation skills. **Maxwell, Alexander (2010)** discussed the mission and implementation of digital libraries from an historian's perspective⁷. This paper summarizes the abstract qualities that historians look for in their sources, and then compares various digital archives both qualitatively and quantitatively, highlighting design features that enhance or detract from the ease of use. It gives library scientists candid opinions from an intensive end user of digital information, contains several practical suggestions,

and explains the reasoning behind those suggestions. **Hodge, Gail (2004)** discussed about OAIS Reference Model which provided the framework for discussing the key areas that impact on digital preservation, the creation of the electronic information, the acquisition of and policies surrounding the archiving of resources, preservation formats, preservation planning. They are encouraged to monitor developments and projects in the field, to raise awareness of the need for preservation within their institutions, to consider preservation and long-term access issues when negotiating licenses for electronic resources⁸.

OBJECTIVES

To study the awareness levels on various copyright or legal issues associated with the digital collection

To get opinion from the respondents about criteria guide on selection of materials for digitization

To analyse various problems while using digital archives and ways to Publicize the use of IR/ digital archives

To discuss about the special skills required for library staff to implement and manage the digital collection and precautionary measures to be taken to digitize the documents.

METHODOLOGY

The researcher used a design of empirical survey using questionnaire method. This study involves both primary, secondary data and wide interaction with a sample group. Simple random sampling method is adopted to collect data from the faculty members of RRI.

Analysis

Table no: 1: Distribution of the respondents by gender

Sl. No	Gender	No of respondents	Percentage
1	Male	91	75.8
2	Female	29	24.2
	Total	120	100

The table no 1 shows the distribution of the respondents by their gender. It is noticed from the table that 76% of the respondents were male and 24% of the respondents were female.

Table No: 2: Distribution of the respondents by age

Sl. No	Age	No of respondents	Percentage
1	Below 35	29	24.2
2	36 – 40	67	55.8
3	41 – 45	10	8.3
4	46 – 50	7	5.8
5	Above 51	7	5.8
	Total	120	100

The table no 2 shows the distribution of the respondents by age. It is clear from the table that 56% of the respondents belong to the age group of 36-40. Around 24% of the respondents were below 35 aged and 8% of the respondents belong to the age group of 41-45 age. 6% of the respondents were aged 46-50 and another 6% of the respondents were aged above 51.

Table No: 3: Frequency level of accessing the digital archives

Sl. No	Frequency level	No of respondents	Percentage
1	Daily	66	55
2	Twice a Week	23	19.2
3	Occasionally	31	25.8
	Total	120	100

The table no 3 shows the frequency level of accessing the various digital archives materials is clear that 55% of the respondents were accessing the digital archives daily and 26% of the respondents were accessing the digital archives occasionally. 19% of the respondents were accessing the digital archives twice a week.

Table No 4: Awareness on copyright or legal issues associated with your digital collection which would result in restrictions on its use

Sl. No	Type		Highly Aware	Aware	Moderately Aware	Somewhat Aware	Never	Total	Mean	Std. Div	Rank
1	Publishers Policy	N	42	14	8	7	49	120	3.06	1.798	9
		%	35	11.7	6.7	5.8	40.8	100			
2	Sherpa Romeo	N	42	13	23	26	16	120	2.68	1.473	7
		%	35	10.8	19.2	21.7	13.3	100			
3	Creative Common Licensing	N	34	21	16	22	27	120	2.89	1.549	8
		%	28.3	17.5	13.3	18.3	22.5	100			
4	Fair Dealing / Fair use Rights	N	34	7	15	7	57	120	3.38	1.74	10
		%	28.3	5.8	12.5	5.8	47.5	100			
5	Site Licensing	N	49	7	31	15	18	120	2.55	1.494	6
		%	40.8	5.8	25.8	12.5	15	100			
6	Indian Copyrights Act	N	32	37	30	8	13	120	2.44	1.256	3
		%	26.7	30.8	25	6.7	10.8	100			
7	International Copyrights	N	50	37	8	15	10	120	2.15	1.313	1
		%	41.7	30.8	6.7	12.5	8.3	100			
8	Confidentiality	N	27	41	27	13	12	120	2.52	1.237	5
		%	22.5	34.2	22.5	10.8	10	100			
9	Multiple Format	N	45	29	10	18	18	120	2.46	1.489	4
		%	37.5	24.2	8.3	15	15	100			
10	Inter Library Loan	N	44	25	36	8	7	120	2.24	1.188	2
		%	36.7	20.8	30	6.7	5.8	100			

The table no 4 shows the respondents’ opinion about Awareness on copyright or legal issues associated with digital collection which would result in restrictions on its use. It is noticed that 47% of the respondents were aware about the publishers policy related copyrights. Around 46% of the respondents were aware about Sherpa Romeo type of copy rights and another 46% of the respondents were aware about the Creative Common Licensing. 34% of the respondents were aware about Fair Dealing /Fair use Rights and 46% of the respondents were aware about Site Licensing. It is noticed that 57% of the respondents were aware about the Indian Copyrights Act, Confidentiality based rights and 73% of the respondents were aware about the International

Copyrights. It is noticed that 62% of the respondents were aware about multiple format of rights and 58% of the respondents were aware about the inter library loan rights.

Among the various factors of the awareness on copyright or legal issues associated with the digital archives, high level on awareness is noticed on International Copyrights, Inter Library Loan Indian Copyrights Act and Multiple Format. Moderate level of awareness was found in Confidentiality, Site Licensing and Sherpa Romeo. Low level of awareness noticed on Creative Common Licensing, Publishers Policy and fair Dealing /fair use Rights

Table No 5: Criteria guide selection of materials for digitization

Sl. No	Criteria		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total	Mean	Std. Div	Rank
1	Preservation	N	27	32	36	11	14	120	2.61	1.259	10
		%	22.5	26.7	30	9.2	11.7	100

		%	49.2	9.2	13.3	15.8	12.5	100			
12	Added Value	N	38	21	15	23	23	120	2.77	1.538	12
		%	31.7	17.5	12.5	19.2	19.2	100			
13	Ease of accessibility	N	27	20	28	38	7	120	2.82	1.263	13
		%	22.5	16.7	23.3	31.7	5.8	100			
14	Legal issues	N	64	15	14	14	13	120	2.14	1.455	4
		%	53.3	12.5	11.7	11.7	10.8	100			

The table no 5 shows the respondents' opinion about various criteria guide selection of materials for digitization in the digital archives. It is clear that 50% of the respondents were considering for type of preservation and digitization of digital archives. 64% of the respondents thought about enhanced access for digital archives. 68% of the respondents considered for archival values. 43% of the respondents were thinking

of academic importance before digitization of the documents and 40% of the respondents have agreed to save the space. It is noticed that 83% of the respondents have thought of organizational commitment factor for digitization of materials and 76% of the respondents have agreed for criteria of quality of information to meet the user need. It is clear that 52% of the respondents have thought about selection of materials based on subject

relevance and 57% of the respondents about the cost effectiveness. It is noticed that 72% of the respondents have discussed about authenticity of information for digital archives and 58% of the respondents have agreed for distributed access of digital archives. . It is clear that 49% of the respondents have agreed to the point of added values of the digital collection and 65% of the respondents agreed about the ease of accessibility to be considered for digitization.

Among the various criteria guide for selection of materials for digitizing the digital archives, high level of acceptance was found as criteria for Organizational Commitment, Quantity to meet user need, Authenticity of information, Legal issues and Enhanced Access. Moderate level of acceptance was found on distributed access, archival value, subject relevance, cost effectiveness and preservation. Low level of acceptance noticed on saving the space, added Value, ease of accessibility and academic Importance.

Table No 6: Major Problems while using digital archives

Sl. No	Problems		Always	Often	Sometimes	Rarely	Never	Total	Mean	Std. Div	Rank
1	Inadequate Funding	N	25	22	37	23	13	120	2.81	1.272	11
		%	20.8	18.3	30.8	19.2	10.8	100

		%	29.2	20	28.3	15.8	6.7	100			
7	Support from Administration	N	37	33	26	16	8	120	2.38	1.237	1
		%	30.8	27.5	21.7	13.3	6.7	100			
8	Rapid Growth	N	18	35	41	17	9	120	2.7	1.12	8
		%	15	29.2	34.2	14.2	7.5	100			
9	Sustainability	N	18	57	21	16	8	120	2.49	1.108	3
		%	15	47.5	17.5	13.3	6.7	100			
10	Management of resources	N	14	26	47	25	8	120	2.89	1.075	12
		%	11.7	21.7	39.2	20.8	6.7	100			
11	Partnership / Collaboration	N	24	38	34	16	8	120	2.55	1.151	5
		%	20	31.7	28.3	13.3	6.7	100			
12	Lack of Flexibility	N	25	45	29	14	7	120	2.44	1.121	2
		%	20.8	37.5	24.2	11.7	5.8	100			
13	Lack of Expertise	N	18	29	45	21	7	120	2.75	1.094	9
		%	15	24.2	37.5	17.5	5.8	100			

The table no 6 shows the respondents' opinion about major problems faced by them while accessing and developing the digital archives. It is noticed that 39% of the respondents mentioned about inadequate funding, 44% of the respondents stated about the lack of human resources, 35% of the respondents said about the lack of IT support and 57% of the respondents faced the lack of sufficient space for data storage for developing the digital archives. It is clear that 44% of the respondents were worried about copyright issues and 58% of the respondents were faced the lack of expertise and experience in accessing the digital archives. It is clear that 44% of the respondents faced the lack of support from the administration, 63% of the respondents faced the rapid growth of literature and another 63% of the respondents were worried about the sustainability problems. for developing the digital archives. It is noticed that 34% of the respondents thought about the

management of resources in the digital archives and 52% of the respondents considered about the partnership and collaboration areas of digital archives. Around 58% of the respondents faced the lack of flexibility in maintaining the digital archives and 40% of the respondents were worried about lack of expertise in developing and accessing the digital archives.

Among the various problems faced by the respondents while accessing and developing the digital archives, majority of the respondents faced lack of support from Administration, lack of Flexibility, Sustainability, Expertise and experience ranked fourth, Moderate respondents were lack of Partnership / Collaboration, data storage, lack of Human resource support and rapid Growth on literature. Least preference of barrier to be mentioned by the respondents like lack of Expertise, Copyright issues, inadequate funding, Management of resources and IT support.

Table No 7: Ways to Publicize to use the IR/ digital archives

Sl. No	Factors		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total	Mean	Std. Div	Rank
1	User orientation	N	26	24	42	17	11	120	2.69	1.222	3
		%	21.7	20	35	14.2	9.2	100			
2	Intimation through email	N	27	24	41	24	4	120	2.62	1.139	2
		%	22.5	20	34.2	20	3.3	100			
3	Notice board	N	29	22	33	23	13	120	2.74	1.312	4
		%	24.2	18.3	27.5	19.2	10.8	100			
4	Pamphlets	N	25	22	29	27	17	120	2.91	1.347	5
		%	20.8	18.3	24.2	22.5	14.2	100			
5	Seminar	N	32	40	20	16	12	120	2.47	1.289	1
		%	26.7	33.3	16.7	13.3	10	100			

The table no 7 shows the respondents opinion about ways to publicize the use of digital archives. It is noticed that 42% of the respondents agreed about user orientation to help to publicize the effective use of digital archives. Around 43% of the respondents agreed about intimation through emails which promote the effective use of digital

archives and another 43% of the respondents agreed about display on notice boards will promote the digital archives. 39% of the respondents agreed about using the pamphlets to promote the digital archives and 60% of the respondents agreed about promoting the digital archives by conducting seminars.

Among the various ways to publicize the use of digital archives, majority of respondents suggested to publicize the digital archives through Seminars, intimation through email and through user orientation. Some of the respondents suggested to promote through notice board and pamphlets to publicize the digital archives.

Table No 8: Opinion about special skills required for library staff possess in the field of digital preservation

Sl. No	Factors		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total	Mean	Std. Div	Rank
1	Technical skills	N	33	23	29	20	15	120	2.68	1.367	4
		%	27.5	19.2	24.2	16.7	12.5	100			
2	Assistance in digitization	N	31	22	36	22	9	120	2.63	1.256	3
		%	25.8	18.3	30	18.3	7.5	100			
3	Copyright advice	N	32	30	31	18	9	120	2.52	1.243	1
		%	26.7	25	25.8	15	7.5	100			
4	Ensuring material availability for long term	N	16	32	43	19	10	120	2.79	1.122	5
		%	13.3	26.7	35.8	15.8	8.3	100			
5	Allowing other institutions to view the material	N	16	51	26	18	9	120	2.61	1.125	2
		%	13.3	42.5	21.7	15	7.5	100			

The table no 8 shows the respondents’ opinion about special skills required for library staff to possess in the field of digital preservation. It is noticed that 47% of the respondents agreed that the library staff must have adequate technical skill to manage the digital archives. Around 44% of the respondents agreed about the library staff need for assistance in digitization. 52% of the respondents agreed about the library staff to know about the copyright advices. 40% of the respondents accepted to ensure the material availability for long term through

the library staff. 56% of the respondents agreed about allowing other institutions to view the material.

Among the various special skills required for library staff to possess in the field of digital preservation, more number of respondents agreed for required skills on Copyright advice, allowing other institutions to view the material and assistance towards digitization. Some of the respondents had mentioned about the technical skills and ensuring material availability for long term.

Table No 9: Opinion about the precautionary measures relating to while digitizing the documents in the digital archives

Sl. No	Factors		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total	Mean	Std. Div	Rank
1	Future changes in hardware technology	N	13	24	47	27	9	120	2.96	10.8	5
		%	10.8	20	39.2	22.5	7.5	100			

Cont... Table No 9: Opinion about the precautionary measures relating to while digitizing the documents in the digital archives

2	Future changes in software technology	N	20	36	37	18	9	120	2.67	1.147	3
		%	16.7	30	30.8	15	7.5	100			
3	Security issues	N	24	48	33	10	5	120	2.37	1.028	1
		%	20	40	27.5	8.3	4.2	100			
4	Copyright issues	N	14	31	50	20	5	120	2.76	1.004	4
		%	11.7	25.8	41.7	16.7	4.2	100			
5	Copying and updating incase of obsolescence of storage device	N	18	22	65	10	5	120	2.68	0.97	2
		%	15	18.3	54.2	8.3	4.2	100			

The table no 9 shows the respondents' opinion about the precautionary measures relating to digitizing the documents in the digital archives. It is noticed from the table that 31% of the respondents agreed to adopt the future changes in hardware technology while digitizing the documents in the digital archives. Around 46.7% of the respondents agreed about adopting the future changes in software technology while digitizing the documents in the digital archives. 60% of the respondents agreed about security issues related to digital archives. 38% of the respondents agreed about maintaining the copyright issues related to digital archives and 33% of the respondents agreed upon copying and updating incase of obsolescence of storage device for digital archives.

Among the precautionary measures relating to digitizing the documents in the digital archives, more number of respondents showed concern about the Security issues, future changes in software technology, copying and updating incase of obsolescence of storage device. Moderate levels of concern were identified on copyright issues and future changes in hardware technology.

FINDINGS AND DISCUSSIONS

It is noticed that high level on awareness noticed on International Copyrights, Inter Library Loan Indian Copyrights Act and multiple Format of copy right/Legal issues associated with the digital Archives.

There is need to give more awareness on Creative Common Licensing, Publishers Policy and fair Dealing /fair use Rights related to digital archival policies

Majority of the respondents agreed to follow Organizational Commitment, Quantity to meet user need, Authenticity of information, Legal issues and Enhanced Access as criteria for digitization of materials in the archives.

It is identified that majority of the respondents faced the lack of support from Administration, lack of Flexibility, Sustainability, Expertise and experience. Moderate respondents faced lack of Partnership / Collaboration, data storage, lack of Human resource support and rapid Growth on literature while accessing and developing the digital archives.

The study indicated that more number of respondents suggested to publicize the digital archives through Seminars, intimation through email and through user orientation. Some of the respondents suggested to promote through notice board and pamphlets to publicize the digital archives.

It is suggested that more number of respondents agreed to the requirement of staff skills on Copyright advice, allowing other institutions to view the material and assistance towards digitization.

It is clear that more number of respondents have shown concern about the Security issues, future changes in software technology, copying and updating incase of obsolescence of storage device.

CONCLUSION

A successful digital archives could be brought together by all the efforts taken by the library professionals. Confidently, digital archives would develop over time

and pull the library services into digital information service and the optimistic concentration taken for the efforts to reach this goal. The study attempted to draw the attention of the users towards digital archives on their copyright awareness and their own criteria for the digital collection. The digital archives policies and the strategy is simple, and to know about the digital collection which could identify possible partners and projects. Digital archives identified the importance of the users and associated with understanding of the specific user needs.

The Synergistic Antibacterial Effects of *Cinnamomum Verum* and *Cymbopogon Citrates* on Urinary Tract Infections Causing Pathogens *Escherichia Coli* and *Pseudomonas Aeruginosa*

Fiona Lawing¹, Noor Faradilla Abdullah¹, Che Wan Imanina Che Wan Takwa¹

¹Faculty of Health Sciences, aSIA Metropolitan University, Selangor, Malaysia.

ABSTRACT

Escherichia coli (*E.coli*) and *Pseudomonas aeruginosa* (*P. aeruginosa*) have been one of the few main pathogens that lead to urinary tract infection. The study was conducted because there have been an increase in antibiotic resistance pattern in the world. Ethanol and aqueous extract of medicinal plant, cinnamon, *Cinnamomum verum* and lemongrass, *Cymbopogon citrates* were prepared to test its synergistic antibacterial effect against *Escherichia coli* and *Pseudomonas aeruginosa*, using the disk diffusion method. The test was then preceded with the Minimum Inhibitory Concentration (MIC) using the 96 well microtitre plate. The Minimum Bacterial Concentration (MBC) were then attained after the the MIC result were observed. The MIC of *E.coli* was at 6.25 µg/mL for the synergy ethanolic extract between *Cinnamomum verum* and *Cymbopogon citratus*. The aqueous extract did not visualize any growth inhibition on the bacteria *E.coli*. Both ethanolic and aqueous extract also had no inhibitory effect on the *P. aeruginosa*. The synergistic extract of *Cinnamomum verum* and *Cymbopogon citratus* was effective against *E. coli*. Therefore, it was concluded that the effect of the extract was effective on *E. coli* and it was almost as effective as the antibiotics that were usually prescribed for the treatment of urinary tract infections.

Keywords: Synergy, *Cinnamomum verum*, *Cymbopogon citratus*, *Escherichia coli*, *Pseudomonas aeruginosa*.

INTRODUCTION

Urinary tract infection (UTI) is a common bacterial infection that can occur in both males and females of any age group, though it affects females more than the males. This is due to the anatomical structure of the female urinary tract. Previous studies have reported that the total of 50-60% of woman will experience urinary tract infection in the lifetime ¹. UTI also shows high prevalence in pregnant woman as it the second common complications after anemia ². In the world, the total number of 150 million cases has been reported per year ³. In urinary tract infections, antibiotics are used as the primary measure to treat the infection.

Although antibiotic treatment has been widely used for the treatment of urinary tract infection, this has also contributed to the rise of antibiotic resistance in the population. From 2000 to 2010, the antimicrobial resistance of urinary tract pathogen, *Escherichia coli*

towards the antibiotic ciprofloxacin and trimethoprim and sulfamethoxazole have increased rapidly ⁴. As for the antibiotic resistance case of the pathogen *Pseudomonas aeruginosa*, more than 6,000 (13%) of the 51,000 health care-associated infections occur in the United States annually ⁵. Since the increase of antibiotic resistance have rise all over the world, this have made plant and other natural resources to be the best option for treatment of urinary tract infection. Plus, it is also known to the researchers and also the public that the use of plant will have minimal side effects and it is easier to obtain, thus minimizing the risk of antibiotic resistance pattern in the population.

Cinnamon is one of the most well known common spices that can be found all over the world. It has also been used both as cooking material and medicine over thousands of years. Cinnamon comes from the family of *Lauracea*. The cinnamon is derived from the inner bark of trees from the genus *Cinnamomum* ⁶.

The species that is used in this study is *Cinnamomum verum* (*C. verum*). Cinnamon possesses a characteristic odour and a pungent taste. The taste and scent of the cinnamon is caused by cinnamaldehyde, which ages in the presence of oxygen and it is also believed to be the compound that carry the antibacterial effect of the plant⁷. Cinnamon also contains other compounds such as cinnamic acid, hydroxyl cinnamaldehyde, cinnamyl alcohol, coumarin, cinnamyl acetate, borneol and more. Various studies have reported several antibacterial activity of the cinnamon. The extract of the *C. verum* were also tested to have effect against dental caries causing bacteria, *Gingivalis*. This is believed to be due to the presence of cinnamaldehyde in the cinnamon bark⁸. There was also a study that was conducted to view the antibacterial activity of *Cinnamomum verum* and *Eclipta alba* (*L*) *Hassk*. The test extract were tested against the bacteria of *E. coli* and *P. aeruginosa*. The experiment have concluded that *Cinnamomum verum* possessed more antibacterial activity compared to *Eclipta alba* (*L*) *Hassk*. Compared to commercially used antibiotics, the *C. verum* also had more effect towards the inhibition of the growth of the bacteria⁹. There had also been a few synergistic study that was done using the said plant. One of the researches was on the effect of combination of the cinnamon bark extract and honey. The study was known as “Antibacterial Activity of Ethanolic Extract of Cinnamon Bark, Honey, and Their Combination Effects against Acne-Causing Bacteria”. The two plant extract inhibited the growth of *P. acnes* and *S. epidermidis*¹⁰.

The other plant that was used in this synergistic antibacterial study was lemongrass. The plant is scientifically known as *Cymbopogon citratus* (*C. citratus*). It is known as lemongrass due to the typical lemon-like odour of the essential oil present in the shoot. When squeezed, the leaves usually produce yellow or amber colored, aromatic, essential oil. Its aqueous extract is commonly used as an aromatic drink while the whole plant is well incorporated into traditional food for its lemon flavour¹¹. The plant also used widely in Ayurvedic medicine. One of the recent studies have stated that the ethanolic extracts of the leaves of lemongrass showed potential antibacterial property against *Staphylococcus aureus*. It is believed that this is resulted due to the presence of flavonoids and tannins that is present in the extract¹². Another research on in vitro study of antibacterial activity of *Cymbopogon citratus* have shown that the extracts inhibited the growth of

the bacterial strains that were tested. Alcohol and water extracts of *C. citratus* was investigated for anti bacterial properties and phytochemical constituents. The extract was screened against four gram-negative of bacteria *Escherichia coli*, *Klebsiellapneumoniae*, *Pseudomonas aeruginosa*, *Proteus vulgaris* and two gram positive bacteria *Bacillus subtilis* and *Staphylococcus aureus* at four different concentrations of 1:1, 1:5, 1:10 and 1:20 using disc diffusion method. The presence of alkaloid and phenols were inferred as being responsible for the antibacterial properties of the extracts¹³. A research made on the year of 2018 entitled “In vitro antibacterial activity of lemongrass (*Cymbopogon citratus*) leaves extract by agar well method” demonstrated that the extract have its antimicrobial activity against various bacteria such *Escherichia coli*, *Pseudomonas aeruginosa*. The result demonstrated that the lemongrass leaves extract have a great antimicrobial activity against the antibiotic resistant microorganisms¹⁴. Nyamathet. al also conducted another study on the antifungal activity of the lemongrass. The result that was recorded had shown that the extract was effective against *Aspergillusniger*. Its high citral content, flavanoids and tannins may be the some of the few factors on why it has a great antimicrobial ability. Due to the great results that were obtained from the previous study and researches, it was expected that this study would follow lead and produce such result too. Therefore, the main aim of this study was to investigate the synergistic antibacterial effect of cinnamon, *Cinnamomumverum* and lemongrass, *Cymbopogon citrates* against *Escherichia coli* and *Pseudomonas aeruginosa*, using the disk diffusion method. It is anticipated that data gathered from this study will open new approaches for the development of pharmacological bio-products from local resources that can be used to treat infectious diseases.

MATERIALS AND METHOD

2.1 PLANT MATERIALS

The cinnamon bark and lemongrass were purchased at the local market in Cheras. The cinnamon and lemongrass species were send to Universiti Putra Malaysia (UPM) and was botanically identified for the confirmation of its species.

2.1.1 Plant Extraction

The plants were cut into small pieces and then were soaked briefly with distilled water before blotting the

excess water with tissue paper. The plants were then placed in a clean steel tray and were set in the hot air oven at 40°C. The plants were left to dry in the oven until a constant reading of the weight of the plant were achieved. Once the constant reading of the plant materials were achieved, the plants were deemed to be dry enough. In order to obtain the powdered form of the plant material, the plants had to be finely grinded using a dry blender. Then, about 200g of fine powder of both plants were weighed and were soaked in 600ml of 95% of ethanol and water. The plant materials were soaked for 3 days. After 3 days of soaking, the filtrates were filtered using Whatman filter paper. The aqueous extract were placed in the hot air oven at 40°C while the ethanolic extracts were be concentrated using the rotary evaporator also at 40°C¹⁵. From this process, the ethanolic and aqueous extracts were obtained, and the extracts were chilled in the refrigerator until used at 4°C.

2.2 BACTERIAL STRAINS

Bacterial strains of *E. coli* (ATCC 11775) and *P. aeruginosa* (ATCC 27853) were used in this study. The two bacterial strains were obtained from the Asia Metropolitan University Research Laboratory.

2.2.1 INOCULUM PREPARATION

The pure culture was cultured on sterile nutrient agar and was incubated for 24 hours at 37° C. The cultures were then being stored at 4° C to maintain its growth. The inoculums were prepared by growing the sub culturing the bacteria that had been made in Mueller Hinton broth at the temperature of 37° C, overnight¹⁶.

2.3 ANTIBIOTIC SUSCEPTIBILITY TEST

The antibiotic susceptibility test was performed using the disk diffusion method. It is also more commonly known as Kirby Baur test. First, the bacteria inoculum was prepared. It was prepared by inoculating a single colony of the bacteria *E. coli* and *P. aeruginosa* into the Mueller Hinton broth. The inoculums were then incubated at 37°C overnight in the incubator.

The next day, suspension of the bacteria would be swabbed all over the surface of the Mueller Hinton agar plate. Then, the paper disk which contained single concentration of each antimicrobial agent will be set on the surface of the agar that has been inoculated with the bacteria. Next, blank disc that had been soaked in the

extract of the *C. verum* and *C. citratus* were also placed on the agar for testing. Three different concentration of tested plant extract were prepared, which started off from 20 mg/mL, 50 mg/mL and 100 mg/mL. For *E. coli*, the positive control that was used for the experiment was ciprofloxacin. As for *P. aeruginosa*, the positive control was gentamicin. The negative control used for both organism was distilled water for aqueous extract, 10% DMSO for ethanolic extract. The extract of the cinnamon and lemongrass antibacterial effect would be compared with the commonly used antibiotic¹⁷. Then, the agar plate was leaved to be incubated overnight at 37°C and measurement of inhibition zone was taken the following day.

RESULTS AND DISCUSSIONS

The emergence of antibiotic resistance has been alarming in the past few years. Due to the increasing cases of the antibiotic resistance among the world's population, various experiments and researches have been done to counter this problem by using plant and fruit resources which are deemed to be safer with fewer side effects. Furthermore, plant and fruit are easier to obtain and they are easily available. It is also believed that these products will have lesser side effect compared to antibiotics. The World Health Organization (WHO) had also released a statement that stated there around 21,000 plant species all over the world that can be used as medicinal plants with a high potential¹⁸.

In the study that was conducted, two different plants which have their own medicinal property were used. The first plant that had been used was the cinnamon bark, which is known scientifically as *cinnamomumverum*. During ancient period, the cinnamon was used often due to its antibacterial nature. The plant bacteriostatic and bactericidal effects on food spoiling, human and plant pathogenic bacteria were widely observed using cinnamon products, extracts, oil and oleoresins¹⁹. The second plant that was used in this study is the lemongrass, which is also scientifically known as *cymbopogoncitratus*. As for the extraction, 2 different type of solvent has been prepared which were ethanol and aqueous solution. The synergistic study was made by combining the two plant extract based on 1:1 ratio.

The pathogens that were used in this study were *E. coli* (ATCC 11775) and *Pseudomonas aeruginosa* (ATCC 27853). Using the two plant extract that had

been made, 3 different concentration of the plant were prepared, starting from the concentration of 20 mg/mL, 50mg/mL and lastly 100mg/mL.

At the concentration of 20mg/mL, the synergy ethanolic concentration have shown the zone of inhibition of 11 mm on the bacteria *E.coli*. The single ethanolic plant extract cinnamon showed the inhibition of bacteria growth at 16 mm on *E. coli*, while the single ethanolic extract of lemongrass show the zone of inhibition of 33 mm on *E.coli*. Compared to the other concentration, the zone of inhibition of lemongrass ethanolic extract was the highest at 20mg/mL. The extracts did not show any inhibitory activity on *Pseudomonas aeruginosa*. The aqueous extracts did not show any inhibitory activity too.

Figure 1 Comparison between the zone of inhibition (in mm) produced by the extracts at the concentration of 20 mg/mL on *E.coli* and *P. aeruginosa*.

For the concentration of 50 mg/mL, the the synergy ethnolic concentration have shown the zone of inhibition of 31 mm on the bacteria *E. coli*. The single ethanolic plant extract cinnamon showed the inhibition of bacteria growth at 14 mm on *E. coli*, while the single ethanolic extract of lemongrass show the zone of inhibition of 17 mm on *E. coli*. Again, no inhibitory activity on *Pseudomonas aeruginosa* can be seen, along with no inhibitory activity for the aqueous extract towards both bacteria were seen.

Figure 2 Comparison between the zone of inhibition (in mm) produced by the extracts at the concentration of 50 mg/mL on *E.coli* and *P. aeruginosa*.

The final concentration was 100 mg/ml. The the synergy ethanolic concentration have shown the zone of

inhibition of 33 mm on the bacteria *E. coli*. The zone of inhibition for the synergistic ethanolic extract was at the highest at this concentration. The single ethanolic plant extract cinnamon showed the inhibition of bacteria growth at 27 mm on *E. coli*, while the single ethanolic extract of lemongrass show the zone of inhibition of 24 mm on *E. coli*. From this, what can be concluded that the synergistic extract showed the highest efficacy at the concentration of 100 mg/mL. The one way ANOVA test that were carried out also have shown the significance of the result. By using the SPSS, the value of P had been expressed to be less than 0.05 Even though the extracts produced significant result for *E. coli*, it did not show any inhibitory activity on *Pseudomonas aeruginosa*. The inhibitory activity by the aqueous extract on both of the tested bacteria was not present too.

Figure 3 Comparison between the zone of inhibition (in mm) produced by the extracts at the concentration of 100 mg/mL on *E.coli* and *P. aeruginosa*.

Since the presence of antibacterial activity is detected from the antibiotic susceptibility test, the experiment was preceded for the determination of Minimum Inhibitory Concentrations (MIC). The method that was used for the minimum inhibitory concentration determination was the broth microdilution method. It was done on the 96 well microtitreplate. As for the result of the minimum inhibitory concentration (MIC), the extracts that were tested against *Pseudomonas aeruginosa* were all negative. The negative result was observed by the cloudiness or the formation of palette which indicated the growth of bacteria at the bottom of the well. As for the positive or no growth of bacteria, it was indicated by no clumping or formation of palette at the bottom of the well. The result that were obtain showed the following. The MIC of *E.coli* was at 6.25 µg/mL for the synergy ethanolic extract between *cinnamomumverum* and *cymbopogoncitratus*. The same MIC result of 6.25 µg/mL was also recorded for the *cinnamomumverum* ethanolic extract for *E.coli*. As for the *cymbopogoncitratus* ethanolic extract, the MIC were

recorded to be 12.5 µg/mL. The aqueous did not show any inhibitory activity on both organisms.

Table 4: The Minimum Inhibitory Concentration of *C. verum* + *C. citratus* ethanol extract (100 mg/mL) against *E. coli* and *P. aeruginosa*. Growth is indicated with (+) and no growth of bacteria is indicated with (-).

Bacteria	<i>C. verum</i> + <i>C. citratus</i> ethanol extract (µg/mL)									
	50	25	12.5	6.25	3.12	1.56	0.78	0.39	0.19	0.095
<i>E. coli</i>	-	-	-	-	+	+	+	+	+	+
<i>P. aeruginosa</i>	+	+	+	+	+	+	+	+	+	+

The minimum bactericidal concentration was the last test that was run after the MIC. It is referred to as the lowest concentration of the antimicrobial agent that is needed in order to produce a sterile culture. The result of the minimum bactericidal concentration that have been obtain from the MIC show that a few colony of bacteria can still be visualized after it is being subcultured on the Mueller Hinton agar.

Even though the study that was conducted using the *C.verum* ethanolic extract did not show any inhibitory activity towards *Pseudomonas aeruginosa*, another study that was conducted by in 2012 stated otherwise. The study concluded that ethanol extract of cinnamon were found sensitive to *Pseudomonas aeruginosa*, and *E. coli*. Another study that was conducted by Unachukwu et al. also showed that the ethanolic lemongrass extract have its effect on *P. aeruginosa*²⁰.

There was also a study back in 2017 that revealed that the aqueous extracts of *C.verum*, alongside other plant extract which were *Terminalia bellirica*, *Ammomum subulatum* and *Glycyrrhiza glabra* were ineffective against all the test organisms of the study, in which one of it was *E. coli*. The concentration of the extract was prepared was 50 µL. On the other hand, the researcher also prepared the same concentration of ethanol extract of cinnamon for the study and the outcome of it was the extract of the cinnamon proved to have inhibitory activity at 27 mm²¹.

The inability of the both of the ethanolic and aqueous extract to inhibit the growth of the *P. aeruginosa* may be due to a few factors. First is it may be due to the nature of the bacteria itself. *P. aeruginosa* is strictly aerobic but it can also be a facultative anaerobe at times. The suitable temperature of growth for *P. aeruginosa* can also be a

factor that lead to the inability of the extract to inhibit its growth which range from 4°C to 43°C²².

As stated by Ochei et al. in the book of Medical Laboratory Science, Theory and Practice year 2000, there are a few factors that can affect this antimicrobial susceptibility test. The first is the depth of the medium²². The depth of the media that is being used may affect the result as it can interact and disturb the concentration gradient of the diffusing antibacterial or antimicrobial agent. Thicker agar medium will give out smaller zone of inhibition while thinner agar medium will produce a larger zone. In order to standardize, it is advisable to pour 25 ml of medium in agar plate which will produce an agar with the depth of 4mm. Next factor that can interfere with the test is the atmosphere of the incubator. The incubation is recommended to be carried out in incubator with ambient air. If the incubation is carried out, for an example in a carbon dioxide incubator, it may result in decrease pH of the agar, thus affecting the action of some drugs.

CONCLUSION

The synergistic ethanolic extract of *Cinnamomum verum* and *Cymbopogon citratus* was effective against one of the bacteria which were *E. coli*. The result that were obtained had also shown that effect of the extracts were almost as effective as the antibiotics that were usually prescribed for the treatment of urinary tract infections. To ensure the safety of the extract, the extract can also be tested against the normal flora of the urinary tract. Toxicity test of the extract can also be done. The extract can also be tested on extended spectrum beta lactamase (ESBL) bacteria, in order to know more about its effect on Gram negative bacteria.

Readiness in Implementing a National-wide K-12 Curriculum: A Case Study in Cotabato City School's Division

NhelbourneK. Mohammad ¹ Yanping Li²

¹ Ph.D. Program, ² Assistant Professor, School of Education, Shaanxi Normal University, China

ABSTRACT

The K-12 Education program is the basic and essential program of the Philippine government, it is a new curriculum comparing to the K-10 program to be harmonizing with international trend in the 21st century. This enactment of the reform thrusts Basic Education Sector Reform Agenda. It is a process or policy reform that sought to systematically enhance a critical regulatory, structure, institutional, financial, physical, and cultural and information conditions influencing of primary education provision link and delivery on the ground. This study is descriptive, investigating the possible impact of the DepEd program implementation on teachers' and pupils' behaviors. The aim of the study focused on the aspects of readiness program of elementary schools in Cotabato City Division in implementing the K-12 Curriculum; it was concerned instructional materials, classroom management, assessment of learning, techniques, human resource, and school facilities. The study used a self-made questionnaire in collecting the data.

Keywords: *k to 12 program, readiness, basic education, educational implementation, contemporary education, curriculum development*

INTRODUCTION

Before the arrival of Magellan, the education system in the Philippines was informal, unstructured and devoid of methods more vocational, pieces of training and fewer academics by their parents and in the house of tribal tutors, and experienced several process and development from pre-Spanish until the present. The tribal tutors took place by the Spanish missionaries; hence, education was for elite and became religious-oriented by the Spanish settlement¹. Access to education by the Filipino was later liberalizing through the enactment of the Educational Decree series 1863 which offered for the establishment of the at least one primary school. The primary school in every town for boys and girls under the management of the district government. Primary school was free, and teaching of Spanish was a prerequisite, and definitely, the school was under controlled by the Spanish and American¹.

The Philippine education had closed about three centuries and reopened during Aguinaldo's Republic on 29th August 1898, namely the Burgos Institute, Military Academic and the University of the Philippines under Act No. 74 series 1901 on public school system of the Philippines commission². Later, the American

sent 600 teachers to teach English as a medium of instruction and established a high school, unique educational institution, such as the college of arts and Trades, college of agricultural, Institute of Commerce and the marine institute were established in 1902 by the Philippine Commission on Higher Education. In 1908, on Act No. 1870, the Philippine Legislature approved the establishment of the University of the Philippines. In 1945, the Japanese Educational Policies established under Military Order no. 42 series 1945².

K – 12 Education System in the Philippines

The K – 12 Program is a public education curriculum that currently most familiar for the people. The so-called K – 12 Curriculum is a flagship program of the Department of Education (DepEd) that aims to improve the standard quality of primary education in the Philippines and offer more opportunities for graduating students or for graduates to be employed merely. Everyone knows that implementing of the K – 12 education system is the key to developing to our country because we are left behind concerning the curriculum adjustments. The K – 12 Basic Education Curriculum is a new curriculum development of the Department of Education program which converted from 10-Year Basic

Education Curriculum (BEC) to 12-Year Education Cycle. A logical reason for the implementation of this program is the Philippines the only country in Southeast Asia is still using ten years education system and among three remains countries in the world⁷.

The former President Aquino – III was instituting of the K – 12 Program last October 05, 2010, this is one of the political agendas that he wants to expand the basic education curriculum to a globally competitive from 10 years into 12 years education cycle⁸. On May 13, 2013, Aquino signed into law on the implementation of the K – 12 Basic Education Program under the Republic Act No. 10533 series 2012. This law was enacted and promulgated that aims to enhance and upgradethe old curriculum. K – 12 Curriculum was fully implemented in 2012 nationwide regulated and managed by the Department of Education. DepEd seeks to design a primary education agency that capable of obtaining all the objectives and the Millennium Development Goals of the country in the future and Aquino 10 points agenda of primary education in 2016. This curriculum development is expected to introduce critical changes necessary to yonder accelerate, broaden, and deepen and to furnish the effort of the Department of Education in enhancing or improving the quality education system in the country⁹.

Importance of Education in the Society

Education is an essential aspect of the country that plays vital roles in the modern world. Every human being needs the school to be able to survive. Nowadays, people realize how important education is for future generations. At the same time, the government all over the world is spending money on a good education system, and students are actively encouraged to win a scholarship and pursue their studies¹⁴. To have a better life, people need high-level training for their future growth, while the parent's responsibility to send their kids to the school that hopes they succeed from poverty. Everyone knows that people who have a degree holder as well as who have completed their master and postgraduate degrees are very likely to get professional work in the future. Therefore, today the education carries greater importance than ever in our nation¹⁵.

Typically, the people who live in rural areas have a different understanding towards education, they understand education is just to learn how to read and write but in fact education is also it offers them the opportunity

to have a good life, communicate better, develop new technologies and support the economy but they do not know. Thus, education must be genuinely directed to produce quality human being who can compete and have noble character and good morals¹⁶.The critical value of education is an investment in human resources which in itself will provide monetary and non-monetary benefits. That is why the educational investment needed for the people of the Philippines is actually must first lead to primary education and not a highly sophisticated culture. Guided by what was proclaimed by UNESCO, the process of learning in basic training must at least fight on the four pillars, namely 1) learning to know; 2) learning to do; 3) learning to be, and 4) learning to live¹⁶.

According to Plato, a model designed is to produce proficient adults to meet the needs of the nation. The teacher educators could work to provide people who are both self-actualized and functional to the state¹⁷. Too many controversies and praises that hassle this new policy on education, nevertheless, the schools in the country should buckle up to cope with the request as they have already contended globally even the law was a passage. To meet the global demands of the schools, have to face the defiance of the implementation of the K to 12 Education Program by the Philippine government. Also, Plato believes that we should educate our children according to their capabilitiesand needs because they should not have the same educations as Plato's plan produced for the specialized training of guardians, workers, soldiers, and artisans¹⁸.

METHOD

The researcher presents the research design, locale of the study, respondents of the survey, sampling techniques, research instrument, data gathering procedures, and statistical analysis.

The study focused on assessing the three years of implementation of the K – 12 Program in Cotabato City School's Division. Specifically, the study seeks to find the answer to the following research problem. The questions of the study were as follows:

What is the level of readiness of the elementary school in Cotabato City Division in implementing K-12 curriculum concerning instructional materials?

What is the level of readiness of the elementary school in Cotabato City Division in implementing K-12 curriculum concerning classroom management?

What is the level of readiness of the elementary school in Cotabato City Division in implementing K-12 curriculum concerning the assessment of learning?

What is the level of readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning the teaching strategies?

What is the level of readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning the human resources? and

What is the level of readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning the physical and facilities resources?

Research Design

This study is descriptive, investigating the possible impact of DepEd program implementation on teachers' pupils' behavior/attitudes. Also, this study focused on the aspects of program readiness of the elementary school in Cotabato City Division in implementing K-12 curriculum concerning instructional materials, classroom management, assessment of learning and teaching strategies. It also described the level of readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning human resources, financial resources, and physical resources.

Respondents of the Study

The respondents included in this study are teachers of the different elementary school in Cotabato City Division.

Sampling Techniques

Stratified sampling techniques using proportion allocation used in determining the sample included in this study. The Cotabato City Division composed of four districts the district will serve as strata, and from there a sample elementary school will be chosen.

Research Instrument

The researcher here is the main instrument of this research (Lincoln & Guba, 1985; Miles & Huberman, 1992). The researcher as an instrument in this study does not mean eliminating the essence of human of the researcher himself, but the spiritual capacity in

observing, questioning, tracking and abstracting is a valuable tool. Therefore, the position of the researcher being an instrument is the ability of the researcher himself.

A gathering the data needed in this study is a self-made questionnaire. The research instrument is composed of two parts. Part I are a statement that briefly described the readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning instructional materials, classroom management, assessment of learning and teaching strategies. Part II described the level of readiness of the secondary school in Cotabato City Division in implementing K-12 curriculum concerning human resources, financial resources, and physical resources. The self-made instrument subjected to validity and reliability. For the validity of the tool this will be submitted to the screening committee for content validity and to determine the security of the instrument, this will be done using the test and re-test methods.

Data Gathering Procedures

Data in this study collected in the following stages. The first stage of the data collection will be the preparation of the all the needed instrument, includes the revision of the self-made instrument base on the recommendation of the screening committee. After revising the tool, a pre-conversation with the division superintendent, district supervisor and principal of the targeted included school will be adhering to explain to them the nature and concept of the study. After pre-conversation, a letter of approval will seek to the division superintendent through the recommendation of the respective school principal. As soon the approved message from the division superintendent will be received the self-made instrument distributed to the teacher's respondents and the pupils. The second stage of the data collection will be the conduct of the ocular visits to the school and personal interview with respondents to validate the information given to the self-made instrument. The third stage will be the encoding of the data in excel software to facilitate secure data analysis using SPSS statistical software.

RESULT

The researcher came to the necessary field of the study to collect the data, and how this data has been analyzed, interpreted and presented in the easiest possible way.

Instructional Materials

The level of readiness of the elementary school in Cotabato City Division in implementing K-12 Curriculum concerning Instructional Materials.

The respondents rated ready the level of readiness of the elementary school in Cotabato City Division in Implementing K-12 curriculum regarding the instructional materials with the grand mean of 2.51. The researcher validated this information through personal interviewed with the respondents. The respondents explained that the Department of Education prepared and distributed instructional materials to all elementary school in Cotabato City division to prepared teachers in the implementation of the K-12 curriculum.

Further, the respondents show some of the instructional materials provided by the DepEd in preparation for the implementation of the K-12 curriculum like teachers guide manual, textbook, and handbook for the pupils. Specifically, the respondents rated elementary school in Cotabato City Division ready like general reference (2.56.). The researcher observed that there was plenty copy of general reference available in the classroom and in the library for the teachers and pupils to use in case their assignment given by the teachers. However, textbooks rated less ready, and handouts also assessed less inclined. The teacher’s respondents explained that books and gifts were not enough to cater to the needs of the pupils. The textbooks ratios for ten pupils is only one textbook, means that in everyone textbooks it will cater to ten pupils.

Moreover, modules and teachers guide was rated ready with an average means of 2.56 and 2.68 respectively implied that the elementary school in Cotabato City division has enough modules and teachers guide to make teaching and learning process more productive. Likewise, the workbook rated as very much ready with an average means of 3.52. As showed by the respondents during the ocular visits of the researcher to the teacher’s classroom there were significant numbers of workbook displayed in the bookshelves of the school. There were visual aids also rated as ready with an average 2.54. However, audio-visual aids evaluated less prepared with an average mean of 1.76.

Table 1. Instructional Materials (n=75)

Instructional Materials	Mean	Description
General reference	2.56	Ready
Text Books	2.21	Less Ready
Handout	2.23	Less Ready
Modules	2.56	Ready
Teachers guide	2.68	Ready
Workbook	3.52	Very Much Ready
Visual Aids	2.54	Ready
Audio-Visual Aids	1.76	Less ready
GRAND MEAN	2.51	Ready

Range of Means

- 1.74 Least Ready
- 1.75 - 2.49 Less Ready
- 2.50 - 3.24 Ready
- 4.00 Very Much Ready

Classroom Management

The level of readiness of the elementary school in Cotabato City Division in implementing K-12 Curriculum concerning Classroom Management.

The respondents rated their readiness in implementing the K-12 curriculum regarding the classroom management such as the use of every corner of the room to goodness rated as ready with an average mean of 2.45. The accessibility of the instructional materials to the pupils (2.53), regular arrangement of the desk height of the blackboard, charts, and visual aids on the walls (3.31), structuring of the classroom to stimulate the pupil’s curiosity and interest in what they are about to learn (2.42). The arrangement of the rooms that look bright and Airy with children moving freely in performing their Classroom activities (3.11). The provision of pupil’s health and comfort in the classroom (3.11), the provision pupils health and prosperity in the

school (3.42). Structuring of the rooms to provide pupils Sense of nationalism (2.89), the structure of the classroom to develop Pupils love for beauty and orderliness (3.52), use of colorful, attractive printing words for the pupils (3.24), and the changing of pinboard according to the units taught (3.11).

Table 2. Classroom Management (n=75)

Classroom Management	Mean	Description
The use of every corner of the room to goodness	2.45	Ready
The accessibility of the instructional materials to the pupils	2.53	Ready
The regular arrangement of the desk height of the Blackboard, charts, and visual aids on the walls	3.31	Very Much Ready
The structuring of the classroom to stimulate the pupil's curiosity and interest in what they are about to learn	3.42	Very Much Ready
The arrangement of the rooms that look bright and Airy with children moving freely in performing their Classroom activities	3.11	Ready
The provision pupil's health and comfort in the classroom	3.42	Very Much Ready
The structure of the rooms to provide pupils Sense of nationalism	2.89	Ready
The structuring of the school to develop Pupils love for beauty and orderliness	3.52	Very Much Ready
The use of colorful, attractive printing words for the pupils	3.24	Ready
The changing of pinboard according to the units taught	3.11	Ready
GRAND MEAN	3.10	Ready

Range of Means

- 1.0 – 1.74 Least Ready
- 1.75 – 2.49 Less Ready
- 2.50 – 3.24 Ready
- 3.29 – 4.00 Very Much Ready

Assessment of Learning

The level of readiness of the elementary school in Cotabato City Division in implementing K-12 Curriculum concerning Assessment of Learning. The respondents rated the level readiness such as, classroom evaluation instrument 3.52; grade level evaluation instrument 3.11; subject level evaluation instrument 2.35; program evaluation instrument 2.31; and school evaluation instrument 2.31.

Table 3. Assessment of Learning (n=75)

Assessment of Learning	Mean	Description
Classroom evaluation instrument	3.52	Very Much Ready
Grade level evaluation instrument	3.11	Ready
The Subject level evaluation instrument	3.43	Very Much Ready
Program evaluation instrument	2.35	Ready
School evaluation instrument	2.31	Ready
GRAND MEAN	2.94	Ready

Range of Means

- 1.0 – 1.74 Least Ready
- 1.75 – 2.49 Less Ready
- 2.50 – 3.24 Ready
- 3.29 – 4.00 Very Much Ready

Teaching Strategies

Level of Readiness of the Secondary School in Cotabato City Division in Implementing K-12 Curriculum regarding the teaching strategies.

Table 4. Teaching Strategies (n=75)

Teaching Strategies	Mean	Description
Reporting	3.19	Ready
Modular	3.13	Ready
Lecture type	3.40	Very Much Ready
Discovery approach	3.17	Ready
Group Reporting	3.19	Ready
GRAND MEAN	3.21	Ready

Range of Means

- 1.74 Least Ready
- 1.75 – 2.49 Less Ready
- 2.50 – 3.24 Ready
- 4.00 Very Much Ready

The respondents rated their readiness in implementing the K-12 curriculum regarding the teaching techniques average mean of 3.21, reporting or presentation by the pupils mostly active (3.19), modules and syllabus from the teachers were made accurate and standard (3.13), very strategic style of teaching by doing more on activities in an outside and inside the classroom. The teachers were always doing their best motivation stimulating and make the pupils enthusiastic in the class (3.40). The School’s Division often visited the schools to discover a new and development on teaching approach by the teachers (3.17), and the pupils very interested by doing any activities by doing with the other pupils, such as group reporting (3.19). The elementary schools, as well as the secondary schools in Cotabato City, were conducive for learning with atmosphere environment and good communities.

Human Resources

Level of readiness of the Secondary School in Cotabato City Division in implementing K-12 Curriculum

Table 5. Human Resources (n=75)

Human Resources	Mean	Description
Supervisor	3.26	Very Much Ready
Principal	3.30	Very Much Ready
Department Chairman	3.25	Very Much Ready
Librarian	3.20	Ready
Laboratory Custodian	2.45	Less Ready
Guidance Counselor	3.20	Very Much Ready
Registrar	3.05	Ready
Teachers	3.20	Ready
Security Guard	3.27	Very Much Ready
10. Janitor	3.10	Ready
GRAND MEAN	3.12	Ready

Range of Means

- 1.0 – 1.74 Least Ready
- 1.75 – 2.49 Less Ready
- 3.24 Ready
- 3.29 – 4.00 Very Much Ready

The respondents rated their readiness in implementing the K-12 curriculum regarding the human resources in an average mean of 3.12, there many teachers who are qualified and undergone their master’s degree to prepared as a position of the supervisor (3.26) and the school principals (3.30) and even as a department chairman as well (3.25). The Philippines produced graduates every year, therefore, hiring for a qualified person for the position of a librarian is very friendly (3.20). For now, not all elementary schools and secondary schools have a laboratory custodian (2.45), but they have complete guidance counselors (3.20) and

even registrar (3.05). As mentioned above there are many qualified novice teachers in the city, but the hiring of novice teachers is minimal and very competitive. The division office open for new teachers' application as long as there is a slot from the national government or the Department of Education, therefore teachers here is good enough for all schools in the city (3.20). Not compulsory for security guard have a license (3.27) and janitor (3.10) like teachers one the qualifications should pass the national examination held by the Philippine Regulation Commission (PRC) so-called Licensure Examination for Teacher (LET).

Physical and Facility Resources

Level of Readiness of the Secondary School in Cotabato City Division in implementing K-12 Curriculum

Table 6. Physical and Facility Resources (n=75)

Physical/Facilities Resources	Mean	Description
Classroom building	2.65	Ready
Faculty room	3.02	Ready
Principal's office	3.26	Very Much Ready
School Library	3.11	Ready
Science Laboratory	2.60	Less Ready
Computer Laboratory	2.45	Less Ready
Comfort room	3.00	Ready
Sport complex	1.80	Less Ready
Audio-Visual Room	3.28	Very Much ready
Grand Mean	2.80	Ready

Range of Means

- 1.0 – 1.74 Least Ready
- 1.75 – 2.49 Less Ready
- 2.50 – 3.24 Ready
- 3.29 – 4.00 Very Much Ready

The respondents rated their readiness in implementing the K-12 curriculum regarding the Physical and Facility Resources with an average mean of 2.80. The classroom building such as the use of every room of the school building is goodenough (2.65), the

faculty room as well (302) especially the office of the head (3.26). Each school has a library (311) although the science laboratory some of the schools are still in the process their buildings (2.60) and computer laboratory (2.45), while the restroom (3.00) are almost complete in every school. The school has not yet fully prepared the sports complex (1.80), but every school has sports playground as their alternative sports complex and sometimes they used the sports complex of the Cotabato City State Polytechnic College (CCSPC) for the city meets and since this college is own by the government. Hence, every citizen has the right to use the government facilities.

Accordingly, the Department of Education has no enough budget for adding two years in secondary level because of the Philippine government failure to solve the old K – 10-year Basic Education Curriculum (BEC) and even the 547 public universities and college all over the country (Calderon & Ph, 2014). See table 7 below:

Table 7. Level of Ratio According to the World Bank Database Online

Level	Ratio

Cuba Elementary School	1:9
Sweden Elementary School	1:9
China Primary School	1:27

CONCLUSION

In this study, we examined the level of readiness in implementing the K – 12 Education Program particularly in Cotabato City, Southern Philippines. The K – 12 Curriculum is a concurrent education program in the Philippines to improve a global standard education system in the country. In Asia, developing countries,

like Singapore, Hongkong, Korea, and Malaysia today is educational systems is one of the primary reasons for their progress. Hence, the Philippine government should make them a tool guides in implementing education curriculum.

Comparative Study in EHR between Iraq and Developed Countries

Ali Fahem Neamah¹, Asmala Ahmad²

¹Mohd. Khanapi Abd Ghani, ²Biomedical Computing and Engineering Technologies (BIOCORE), Faculty of Information and Communications Technology, University Technical Malaysia, Melaka, Malaysia

ABSTRACT

Electronic health records (EHRs) have led to a major transformation in the health care sector. EHRs have progressed the person of supply within the varied health care groups. While recognizing the modifications in health care zone, this research studied the implementation and additionally using EHRs in four advanced countries, the United States (USA), United Kingdom (UK) and Australia and one growing Iraq. By way of comparison amongst these international locations still as lessons for growing international locations have been known.

Keywords- HER, E-health, NCVHS, NHS, Npfit, ICT, NSFS

INTRODUCTION

Records unit of measurement unbroken to behave type of indicates that of communication, offer of reference or perhaps for the intention of untrustworthiness. This takes place altogether sectors of life. In care, information are used for same features. Previously, there wasn't abounding would love for definition of health data aside from as notes on history, illnesses, lawsuits and hypersensitive reactions that to deal with any health hassle¹. However, because of the rising role of individuals assortment and assembling facts referring to their health, and moreover the emergence of recent technology similar to the internet, altogether totally distinctive definitions are advanced, despite the fact that, the core which suggests stays equal.

EHR TECHNOLOGY

EHRs are managed via health information systems that present the technological technique normally this can be often used internal with-it health report management structures. The adoption and implementation of generation within the type of health facts systems is inspired through method of the performance and effectiveness at some stage in that health information are controlled thru this method². The maximum large role of document management in the course of a very care cluster beside a health facility is to facilitate assortment,

storage, retrieval and use of the health information. Health information embody of data and information at the care cluster of employees and sufferers³. Health statistics are without a doubt sensitive and therefore the protection of the health report management appliance is one in every of the crucial problems through health report managers and directors⁴.

EHRs include demographics of recent and past patients. The virtual data inner this tool moreover includes the approaches in which sufferers need to undergo or have already suffered throughout the techniques of treatment or treatment. The EHR jointly consists of electronic discharge outline (EDS) this is used for the motive of shifting patient medical information between the primary care medical health practitioner and hospitalist⁵. The extremely good of the EDS content cloth is taken into thought to be absolutely immoderate visible that it is short.

THE IMPLEMENTATION OF EHRs IN THE USA

The us care comfort is that the most dearly-gained health machine at durations the global; but, relative to all absolutely different global locations, it continuously underachieves in most elements of overall performance. Maximum evolved worldwide locations have national medical insurance programmes operated through victimization the government and supported via preferred

taxes. Maximum citizens in such worldwide places are lined through shows that of coverage hence are entitled to urge care offerings. The USA is in difference to absolutely one-of-a-kind worldwide locations due to the real truth now not all individuals are coated via medical insurance. The following provides an excessive level read of the United States care system, comprehensive of the shape, improvement, EHR implementation and form of the problems facing its development¹⁰.

a. The Healthcare System in the US

Much like all thoroughly completely unique countries, there unit every private and public insurers at durations America aid machine, but, not like completely exceptional countries, the united states resource facilities unit loosely owned and operated with the aid of implies that of the private sector. The general public health tool covers the aged and occasional-profits households while all absolutely exclusive folks especially line of coverage through organization- backed private insurance¹¹.

The health care application covers bad families and moreover the disabled. States unit responsible to cover low-earnings pregnant girls, kids, the elderly and additionally the disabled. Similarly, states also can increase their coverage. People over age sixty five unit included thru the health care programme.

Youngsters whose families do not appear to be eligible for the health care programme but who cannot word the money for to induce personal coverage unit served at a decrease place the country children's health insurance programme¹².

b. Implementing EHRs

The implementation of EHR in north nation is additionally categorized thru awing durations. The duration before 2004 represents the first length of implementation, marked by using pattern very low degree of presidency pursuit to assist EHR diffusion. In 2004, president bush required a "well-known EHR adoption" most of the following 10 years, making the number one wave of pursuit and swollen popularity of the capability benefits that EHR has in enhancing care exceptional. A look at aimed to assess the EHR adoption some of the USA. Before and as soon as 2004 (2001-2004 and 2001-2007 correspondingly) determined that the physicians' disposition to undertake EHR of their exercise has swollen at some stage in the second one

period. In addition, it anticipated that with the aid of technique of 2014 (47.Three %) of physicians could have applied the EHR¹⁰.

c. US's EHRModel

The development of EHR model a few of the USA. Is evolving on the national degree. A number of the implementation of EHR among the USA, technical elements are given essential priority with the aid of indicates that of the IOM and therefore the country wide committee on necessary and health facts (NCVHS). Two center components a few of the duties have been identified with the aid of shows that of the IOM and NCVHS preliminary, constructing an infrastructure for health knowledge, and second, fixing region data ability and examine for the protection of patient statistics. As a consequence on carry domestic the 1st baron beaver brook the electricity and statistics assessment, a recommendation for the adoption of center standardized EHR terminologies has been given with the aid of victimization the IOM and NCVHS. The modern stage, architects of EHR country wide model development the various USA. Are specializing in statistics capacity and assessment for the protection of clinical data, developing a complete "pull" structural fashion. This indicates centralized and community data can introduce semantically comparable statistics¹³.

d. EHRs in Hospitals

In recent times, the huge selection of aid corporations the USA of EHR grows but however the share of aid firm's victimizationEHR is low. It became expected that during 2008 handiest one.5% of hospitals in the USA. Have a complete EHR (i.e., administered in all medical departments), and similarly, 7.6% have a number one tool (i.e., administered in at the tiniest amount one clinical department). Further, only revolutionary organization terrorist organization of hospitals inside the United States have administered cope for remedy. However, as have a study carried out in 2010 that aimed to appear at EHR adoption in USA. Hospitals in 2008 and 2009 observed that the percentage of hospitals enforcing a whole EHR almost doubled, from 1.5% in 2008 to 2.7% in 2009. At the identical time, they have got a look at indicated a delicate increase within the form of hospitals that followed a primary EHR, from 7.6% in 2008 to 9.2% in 2009. In total, 11.9% folk's hospitals had each a simple or complete EHR tool in 2009. It became

prepare stated that huge hospitals, those placed in cities, and coaching hospitals had been in addition ability to possess EHR systems. Respondents from hospitals which have no longer implemented EHR noted capital desires and moreover the immoderate prices of keeping such systems as a consequences of the maximum barriers to their adoption. However, hospitals administered EHR systems had been much less capability to counsel those boundaries¹⁴. But, charges of EHR develop continuously.

THE IMPLEMENTATION OF EHRS IN UK

The country wide health carrier (NHS) end up based in the main inside the united kingdom in 1948. It's most of the foremost complete and green health services inside the globe. The NHS is loose (other than prices for dental and optical offerings and a few prescriptions) to any or all residents and long-term residents, currently larger than sixty million human beings. This system includes a significantly strong focus on the gatekeeper role of beloved physicians¹⁶.

a. The Healthcare System in UK

The health device is prepared a few of the next approaches. The primary a part of the benefit vicinity unit the physician's international agency all through this example place unit GPs. This set of physicians is on occasion the primary trouble of come across with patients. They need to skip through their palms earlier than they gather secondary care services. Most GPs vicinity unit reimbursed squarely by using way of darling care trusts through a gathering of systems: remuneration, capitation, and charge-for-service. Instead, private vendors of large person services lay down their very own charge-to-carrier price lists. The second detail of the machine is goals. Those had been set down through suggests that of British government for associate in nursing enlargement of variables that replicate the standard of care added¹⁷. Most of these goals region unit scrutinized with the assistance of the restrictive our bodies. The 1/3 element of the ease is carrier frameworks (NSFS). British department of health frequently guarantees that it develops a set of NSFS projected at improving positive quarters of care, for example, most cancers, genetic ailment and coronary health. This lays down the national values and categorizes leader interventions for specific offerings. The remaining element of the gadget is also a terrific and very last consequences framework. That is devoted hobby the worth of care bestowed through

the general practitioners. As soon as practitioners supply great services to their consumers, they may be basically furnished factors or bonuses¹⁸.

b. Implementing EHRs

The implementation of EHR is one in every of the country wide tending reform desires at durations the United Kingdom. The EHR programme was initiated by methodology of the ministry of health in land with the goal of up interest. The planned imaginative and prescient for Npfit is to possess mate less principal digital affected individual statistics through 2010, and to connect 30,000 GPs, three hundred hospitals and utterly completely exceptional concerned organizations in tending. In 2007, a survey report confirmed that eightieth of this organize location unit finished¹⁹.

c. UKEHR Model

The EHR style in UK primarily based altogether at the separation of EHR systems into native EHR device (utilized by one useful resource placing) and shared structures. In England, the EHR systems turn out to be mounted at a pair of tiers: an outline care report present everywhere in England; and a de-tailed care file present at intervals a regionally well-known useful resource community which may also together embody perfect and secondary care givers at intervals a particular community that has London. Get right of access to every EHRs may also even be managed with the help of strict security and confidentiality roles. The scar ambitions to aid a twist of fate and emergency care, even as decry goals to offer exclusive health data for every day continual scientific practices¹⁹.

d. EHRs in Hospitals

The adoption of EHR in UK hospitals is uncommon, no matter the actual reality that there isn't always forever spare information relating to this material. No matter the almost customary use of EHR amongst GPs many of the United Kingdom, exploitation the type of machine in UK hospitals has been a concern for future efforts. In 2004, it come to be visualized that seven.7% of superb Britain hospitals have fully digital medical outcomes, while pleasant 2.6% of hospitals use a virtual prescribing system. In distinction to the case in cell care, hospitals leaders have commonly concept-about such generation as an in addition cost with very little benefits²⁰.

Npfit ensures sort of benefits for every affected character and a focus organization, as soon as the assignment is finished. In 2002, national audit price tutored that “NHS spends £3.6 billion in clinical negligence claims a year.” inside the identical document, it grow to be predicted that “1,000 deaths yearly unit of size as a effects of scientific errors - maximum extensively with the assistance of clinicians no longer having the proper affected person expertise on the purpose of care”. The identical file stated that seventy five of these deaths May area unit hold on via way of the Usage of diploma EHR tool. But, there unit of dimension form of difficulties addressing every attention companies and sufferers that want to be resolved, because the manner to be illustrated most of the subsequent sections²¹.

THE IMPLEMENTATION OF EHRS IN AUSTRALIA

The branch of health and acquiring older in Australia identifies national health regulations, whilst kingdom and territory governments give economic facilitate for health offerings. The complete expenditure on health payments for about 98 consistent with cent of Australian’s gross domestic products furnished through victimization government and consequently the personal space.

a. The Healthcare System in Australia

Much like altogether completely one-of-a-kind international places, the health offerings in Australia unit of measurement prepared via every the private and non-private residence. Publicly, attention offerings unit of measurement delivered by means of methodology of a comprehensive programme, Medicare, introduced in 1984. Medicare affords free or low-rate get admission to for entitled Australian residents to scientific, optometric and public hospice care, at consistent time on boot they have got the choice of personal medical health insurance. Individuals create a contribution in investment the very last public interest tool via ‘a taxation levy’ primarily based totally on their earnings. The governments in Australia unit of measurement chargeable for investment the very last public health facility contrivance. Patients admitted to public hospitals as public sufferers unit of dimension prohibited through scientific medical doctors and experts pick by methodology of the hospitals. Those offerings unit of size freed from charges²².

b. Implementing EHRs

There was extensive improvement at periods the implementation of the national EHR in Australia. The paintings in the direction of this implementation have become initiated once the House of Representatives ‘health on-line’ document. In 1999, the national EHR taskforce turned into established as a commission of the nationwide health records management consultative committee. The taskforce established ‘a health data network for Australia’, at periods that an advice for a rustic wide approach to the adoption of EHR have become included. In 2001, the ‘health join’ programme became introduced, this is that the center nationwide EHR initiative planned in Australia. The health connect programme is probably an internet-based community that interests to aid the collection, storage and percentage of outline patient records²³.

c. Australian’s HER Model

The health be part of version aimed in the direction of extracting a précis record from locally amassed affected character facts that then were collective to make a centralized health join document that have become shared among collaborating and certified organizations.

d. EHRs in Hospitals

Using EHR among Australian hospitals is uncommon, notwithstanding the actual reality that there is not enough data for the duration of this regard. Several researchers mentioned that quite huge amount of hospitals in Australia have digital administration device likewise as digital insurance for the laboratory consequences. In addition, evaluation show that affected person clinical summaries have been dispatched electronically from hospitals to GPs²⁴.

THE IMPLEMENTATION OF EHRS IN IRAQ

The Iraqi authorities has given healthcare offerings a priority. The past few decades have witnessed an extremely good development in health and clinical offerings however after war and the destruction of the united states of America, the health area fell critically and reached its lowest stages, there at the moment are severe attempts to develop the health region in Iraq no matter the many obstacles and demanding situations surrounding the development of the health sector.

a. The Healthcare System in Iraq

Iraq’s healthcare gadget is classified as primary by means of the arena health corporation, which shows it is primarily based upon practical, scientifically sound and socially appropriate techniques and technology made universally handy to individuals and households inside the community through their complete participation in the spirit of self-reliance and self-willpower.

The Iraqi healthcare machine is in tremendous need of rebuilding since the invasion of 2003 and fall of the saddam regime. Numbers from the numerous surveys reflect this: in keeping with mics, the multiple indicator cluster surveys administered with the aid of UNICEF and the Iraqi authorities, the quantity of immunized kids dropped from 60.7% in 2000 to 38.5% in 2006. It bounced back to 46.5% in 2011, however this range is still extensively decrease than pre-invasion rates. Consistent with the sector health enterprise, in 2011 Iraq’s physician to patient ratio was 7.Eight to 10,000. This price turned into exponentially lower than surrounding international locations—Syria, Lebanon, Jordan and Palestine²⁵.

b. The adoption of E-Health in Iraq

Health improvement has become a pre-considered necessary as regards to the Iraqi sustainable improvement and a crucial element of the procedure of reconstruction. This take a look at decline inside the healthcare of the populace alongside the values of health services within the last decades this explains the troubles now faces the country in improving health and rebuilding it has the health offerings as well as, it determines priorities for improvement and investment over the subsequent few years. The Iraq populace has extra than bending inside the today’s 25 years. It reached to 27.1 million and it is growing about 3% each 12 months. The health regarding the populace became constantly growing between the 12 months’ 1960 & 1990. At some stage in this time, infant mortality fell (from 117 to be forty deaths for every one thousand births) similarly to child mortality dropped by 70 percentage (from 171 to be 50 deaths for each one thousand births).

EHR IMPLEMENTATIONCOMPARISON

This study investigated the state of EHR implementation in four developed countries, the US, UK, Australia, and one developing country, Iraq. Both similarities and remarkable differences were found

among the four developed countries in implementing EHRs.Although, the adoption and use of a national EHR system are in the early stages in these four countries, the UK, Australia were far ahead of the US in implementing EHRs in the primary care settings. While only 26% of ambulatory care physicians in the US use a comprehensive EHR, almost all GPs in the UK, Australia use a highly computerized health record system. The following Table 2 illustrates different levels of EHR adoption among GPs in these four developed countries.

Table 1: different levels of EHR adoption among GPS across the US, UK, Australia

Countries	EHR functions (0-14) in practices		
	Low (0-3)	Middle (4-8)	High (9-14)
US	51%	23%	26%
UK	0	11%	89%
Australia	3%	6%	91%

The table illustrates that the large percentage of GPs a number of the use. Use companion EHR device categorized as low, while however 4 wheel drive of GPs in Australia use this kind of low overall performance machine. In evaluation Australia comes as a number one (91%), and, with solely possibilities however Australia, the United Kingdom comes as 2nd. America lagged far wherein among the rear of these global locations in enforcing a high normal performance EHR system in which simplest twenty sixth of GPs the Usage of such machine. It’s far noteworthy that these chances don’t replicate the perfect utilization of those fourteen medical features, while they represents the extremely good of the EHR systems applied among GPs in those countries¹⁸.

The deviation in EHR adoption amongst GPs a few of the 3 advanced countries is additionally attributed to distinctive reasons. For example, excessive costs of EHR use among GPs in UK seem as an outcomes of a complicated set of things which includes associate prolonged records of mechanization, partially supported by using shows that of free or low price hardware and code. Furthermore, one in every of the climate that contribute to the present excessive fee of adoption is that the NHS 2003 settlement with GPs, that allocated tidy economic incentives for conducting quality standards²⁶.

LESSONS FOR DEVELOPING COUNTRIES, IRAQ

International places the world over have meted out the EHR however with varied rate of successes. This take a look at shows that evolved countries which incorporates the United Kingdom, Australia have recorded outstanding fulfillment in implementation of EHRs, in comparison to growing countries. This state of affairs has been attributed to over quite a number of factors furthermore as notably further assets assigned to EHR systems in evolved international locations and so the technique utilized in implementation. Due to the real fact that powerful implementation of EHR is crucial in making sure that the objectives of EHRs, similarly to the ones of the care change, area unit completed, developing countries got to observe the advanced practices from the advanced nations.

Advanced worldwide places have devoted to dynamic the art work strategies to be in bike with the EHR structures; they have got insisted that all applicable stakeholders and, notably physicians, use the computers; they have got covered the physicians the least bit ranges of implementation; they've got designed EHR device in the sort of approach that everybody, alongside conventional guys, is aware of but the gizmo works; that they have got without end added further functionality to the gizmo wherein they study crucial. Inadequate cognizance on those factors (of course amongst absolutely completely one-of-a-kind factors) by way of growing nations is what has hampered effective implementation of EHRs. The advanced international places have attained their gift call of care bailiwick with the assistance of focusing in massive 0.5 on these components, further to totally different elements that location unit instrumental in EHR implementation ²⁷.

CONCLUSIONS

The resource zone the world over has witnessed excellent transformation and improvement in the direction of advanced shipping of fine carrier. Ample these upgrades is also attributed to the speedy advancement some of the expertise era, that has visible the seams of virtual EHRs in document management, record retaining and analysis of diseases.

Four nations were studied in this analysis regarding EHR implementation and operation. 3 of them are immoderate-profits superior nations, the United

States, kingdom and Australia, whereas one can be a growing international locations. Iraq. Via sample developing an evaluation at some point of the ones 3 evolved international locations, EHR's use, advantages, demanding situations, and accomplishment elements are recognized. In addition, the evaluation illustrated lessons that growing worldwide places like Iraq have to detain thoughts whereas adoption EHRs.

Scientometric Study on Diabetic Retinopathy Research during the Year 2017

Hemala K¹, Kavitha E.S²

¹Research Scholar, ²Assistant Professor, Department of Library and Information Science,
Periyar University, Salem -11

ABSTRACT

The present study attempted to analyze the growth in diabetic retinopathy (DR) research in 2011 through Scientometric study. For the purpose data retrieved from ISI Web of Science database using the search team of “Diabetic Retinopathy”. Data was analyzed with the help of bibexcel, Pajek and VOSviewer. The article found that during 2011 more number of articles published in English and contributed from USA. Investigative Ophthalmology & Visual Science published more articles on diabetic retinopathy. The degree of collaboration shows that more number of multiple authors contributed in DR. The results of the study show promising output of scientific publications in diabetic retinopathy and comparatively high-quality of scientific productions in this field.

Keywords: *Scientometric, Diabetic Retinopathy, WOS, Bibexcel, VOSviewer.*

INTRODUCTION

Scientometrics defined as “the quantitative study of the disciplines of science based on published literature and communication. This could include identifying emerging areas of scientific research, examining the development of research over time, or geographic and organizational distributions of research” Tague-Sutcliffe (1992) defines Scientometrics as “the study of the quantitative aspects of science as a discipline or economic activity. It is part of the sociology of science and has application to science policy-making. It involves quantitative studies of scientific activities, including, among others, publication, and so overlaps bibliometrics to some extent”.

Van Raan (1997) supposed that scientometric research is devoted to quantitative studies of science and technology. It aims at the advancement of knowledge and the development of science and technology; it is also in relation to social and political questions.

He divides the core interests of scientometric research to four interrelated areas:

Development of methods and techniques for the design, construction, and application of quantitative indicators in important aspects of science and technology.

Development of information systems in science and technology.

Study of the interaction between science and technology.

Study of cognitive and socio-organizational structures of scientific fields and developmental processes in relation to social factors.

Diabetic Retinopathy:

An estimated 18 million American children and adults have diabetes. Within 10 years of diagnosis, 75 percent will have some degree of diabetic retinopathy. Diabetic retinopathy is caused by high blood sugar, which damages tiny blood vessels of the retina. In response, the body grows fragile new blood vessels (neovascularization) within the retina. A person with diabetic retinopathy might notice symptoms only after damage is done. A doctor is usually able to detect retinal changes much sooner and can help prevent vision loss. Therefore, regular dilated eye exams are extremely important.

Review of Literature

Ali, Hydar (2018) revealed that relative growth rate of article contributions of biodiversity literature

has shown a decreasing trend, whereas the doubling time for publications has shown increasing trend during the period from 1989 to 2016.. Most of articles were contributed by multi authored papers and lesser number of articles contributed by single authors. The Chinese Academy of Sciences occupies the first rank among the top institutions contributing Biodiversity literature¹.

GonzaÁlez-Alcaide, Gregorio (2018) examined patterns of research on Chagas cardiomyopathy. The study found 1932 documents on Chagas cardiomyopathy in the MEDLINE database. More publications were found as journal articles and reviews and clinical trials. Brazil and the USA dominated the research. Although clinical research dominated overall, the USA, Mexico and several countries in Europe produced a considerable body of basic research on animal models².

Sweileh, Waleed M (2018) focused on the psychiatric component of diabetes mellitus needs to be strengthened and encouraged. At the practical level, screening for depression/suicide among patients attending primary healthcare clinics is needed to optimize health and quality of life of diabetic patients. The data retrieved from SciVerse Scopus for retrieve relevant literature up to 2016³.

Abrishami, Zahra (2017) analyzed the research output in the field of diabetes complication in Iran in details and identify research gap in this field. However, results show lack of studies with high level of evidence including cohorts and systematic reviews in Iran. Although the trend of publications is growing but considering the importance of this issue, it is not enough and more funds should be allocated in this field⁴.

3Gao Y, et al. (2017) used the WOS and retrieved the publications on DM and T cells from 1997 to 2016 using bibliometric methodology. The study indicated that highest contribution came from the United States having 61.44% of the citations and the highest H-index. China had the 5th place for total publications; the quantity of publications on DM and T cells grew rapidly around year 2000, but has relatively decreased recently⁵.

Hemala K (2017) aims that the publication of the papers in Diabetic Retinopathy. The five years data were collected the Diabetic Retinopathy Disease to find out the area of research authors. The information used for this research year wise distribution of publication, Authors productivity, Source of Journal List, country wise distribution, Exponential growth Rate, Arithmetic

Mean. The Degree of collaboration is 4.73⁶.

Caglar C, (2016) investigated diabetic retinopathy (DR) literature using ISI WOS database and to analyze the correlation results between socio-economic development data and number of DR publications. The study found that more DR studies have been published in developed countries, DR and other complications of diabetes have gradually increased in developing countries over recent decades⁷.

Mansour, A M (2015) discussed about the citation patterns in ophthalmic journals and contrast them with major medical and surgical journals from 1997 to 2009. The study found that JIF rose steadily around 10% annually in ophthalmic journals, and likewise for major medical and surgical journals. JIF of subspecialty journal Retina rose from 0.740 in 2000 to 3.088 in 2007⁸.

K. K. Mueen Ahmed (2014) analyzed the 1293 Indian publications in cataract research during 2002-2011 using Scopus Citation Database. Indian publications increased from 87 papers in 2002 to 195 papers in 2011, having growth rate of 10.03%. The study was registering an average citation impact per paper of 3.26 and international collaborative share of 21.58% during 2002-2011⁹.

Liu, Lei (2011) analyzed the progress in diabetic retinopathy (DR) researches between 2000 and 2010 through bibliometric study. DR researches changed as a linear upward trend, the main researches focused on ophthalmology, endocrine and metabolic diseases. There has achieved a significant increase in the number of ISI publications and collaborations in DR literatures from 2000 to 2010¹⁰.

OBJECTIVES OF THE STUDY

- The study the authorship pattern of Diabetic Retinopathy research and to find the degree of collaboration.
- To find the language, document type and keyword wise distribution of articles in Retinopathy research,
- To find out the source wise and country wise distribution of articles in diabetic retinopathy research.

METHODOLOGY

For this study, data were retrieved from Web of Science (WoS) using the search term of “diabetic

Retinopathy” of papers on the period of 2017. Totally 2016 records were downloaded and analyzed by using Bibexcel. The collected data have been analyzed with the Bibexcel, VOSviewer and presented in the form of tables and pictures.

Data Analyzing and Interpretation

Table No 1 : Language wise distribution of articles

S.No.	Language	Records	Perce-ntage
1	English	1976	98.01
2	German	20	0.99
3	Russian	7	0.35
4	Spanish	3	0.15
5	Portuguese	2	0.1
6	Italian	2	0.1
7	French	2	0.1
8	Czech	1	0.05
9	Hungarian	1	0.05
10	Japanese	1	0.05
11	Korean	1	0.05
	Total	2016	100

The table no 1 shows the language wise distribution of the articles published in the area of diabetic retinopathy. It is known that majorities (98%) of the articles were published in English. One percent of the article published in the German. In Russian language, seven articles were published and three articles were published in Spanish.

Table No: 2 : Document type of the articles

S.No.	Document type	Records	Perce-ntage
1	Article	1448	71.82
2	Meeting Abstract	257	12.75
3	Review	195	9.67
4	Letter	46	2.28
5	Editorial Material	43	2.13
6	Article; Proceedings Paper	11	0.55

Cont... Table No: 2 : Document type of the articles

7	Correction	9	0.45
8	Article; Book Chapter	3	0.15
9	Review; Book Chapter	3	0.15
10	News Item	1	0.05
	Total	2016	100

The table no 2 shows the document wise publications available in the area of diabetic retinopathy in 2017. It is noticed that majorities (72%) of the publications were related to articles. Around 13% of the documents were meeting abstracts and 10% of the documents were reviews. 2% of the letters and editorial materials were published. 10 numbers of records found to be as articles as proceedings papers and lesser number of records found under the heading of corrections, book chapters articles & Reviews and news item.

Table No 3: Keyword wise distribution

S.No.	Keyword	Records	Perce-ntage
1	Diabetic-Retinopathy	418	4.92
2	Retinopathy	192	2.26
3	Endothelial Growth-Factor	190	2.24
4	Prevalence	187	2.2
5	Mellitus	156	1.84
6	Disease	138	1.63
7	Macular Degeneration	134	1.58
8	Risk-Factors	132	1.55
9	Complications	130	1.53
10	Macular Edema	126	1.48
11	Expression	119	1.4
12	Optical Coherence Tomography	116	1.37
13	Oxidative Stress	107	1.26
14	Population	83	0.98
15	Progression	77	0.91

Cont... Table No 3: Keyword wise distribution

16	Proliferative Diabetic-Retinopathy	75	0.88
17	Eye	68	0.8
18	Association	67	0.79
19	Ranibizumab	66	0.78
20	Angiogenesis	64	0.75

The table no 3 shows the distribution of the articles by the keywords. For understanding purpose, the top 20

keywords were listed for analysis. 418 numbers (5%) of articles were published with keyword of diabetic retinopathy. Around 2 % of the articles were published on retinopathy, endothelial growth factor and prevalence keywords. One percent of the articles were published with the keyword of Mellitus, Disease, Macular Degeneration, Risk-Factors, Complications, Macular Edema, Expression, Optical Coherence Tomography and Oxidative Stress. Lesser than one percent of the articles were published with the keywords of Population,, Progression, Proliferative Diabetic-Retinopathy, Eye, Association, Ranibizumab and Angiogenesis

Figure No 1: Keyword distribution of articles

Table no 4 : Authorship Pattern

S.No.	Authors	No.of publications	Percen-tage
1	Single author	78	3.87
2	Two authors	174	8.63
3	Three authors	220	10.91
4	Four authors	272	13.49
5	Five authors	261	12.95
6	Six authors	256	12.7
7	Seven authors	199	9.87
8	Eight authors	171	8.48
9	Nine authors	111	5.51
10	Ten authors	95	4.71
11	Above Ten authors	179	8.88
	Total	2016	100

The table no 4 shows the authorship pattern of the articles published in the area of diabetic retinopathy. It is noticed from the table that 13.49% of the articles were published by four authors. Around 12.95% of the articles were published by five authors and 12.7% of the articles published by six authors. 9.87% of the articles had seven

authorship patterns. 8.88% of the articles were published by more than ten authors. 8.63% of the articles were published by two authors. 8.48% of the articles were published by eight authors. It is highlighted that only 3.87% of the articles were published by single author.

Table No: 5 ; Degree of Collaboration

S.No.	Authorship pattern	Publications	Percen-tage	Degree of Collaboration
1	Single author	78	3.87	
2	Multiple Authors	1938	96.13	0.96
	Total	2016	100	

Degree of collaboration is an examination of the prominent area of inquiry in the study indicating the trend in patterns of single and joint authorship in the publication. It is found that the degree of collaboration

diabetic retinopathy was 0.96. As the degree of collaboration exceeds 0.5, it indicates a high degree of collaborative research in diabetic retinopathy which is already evident from Table number 5.

Table No: 6: Source wise Distribution of Publications

S.No.	Types of Source	Records	Percen-tage
1	Investigative Ophthalmology & Visual Science	228	11.65
2	Retina-The Journal Of Retinal And Vitreous Diseases	54	2.76
3	Plos One	50	2.55
4	Scientific Reports	42	2.15
5	European Journal Of Ophthalmology	38	1.94
6	Acta Ophthalmologica	34	1.74
7	Graefes Archive For Clinical And Experimental Ophthalmology	33	1.69
8	International Journal Of Ophthalmology	33	1.69
9	Jama Ophthalmology	29	1.48
10	Ophthalmology	29	1.48

The table no 6 shows the top 10 source wise distribution of the publications in the area of diabetic retinopathy. It is noticed that 228 (11.65%) records were found in Investigative Ophthalmology & Visual Science. 54 (2.76%) records found in Retina-The Journal Of

Retinal And Vitreous Diseases, 50 (2.55%) of the articles published in PLOS One. 42 (2.15%) numbers of the articles found in Scientific Reports. 38 (1.94%) numbers of the records found in European Journal Of Ophthalmology

Table No: 7: Country wise distribution top 10 countries

S.No.	Country	Records	Percentage
1	USA	562	21.55
2	Peoples R China	363	13.92
3	UK	171	6.56
4	India	149	5.71
5	Japan	144	5.52
6	Italy	105	4.02
7	Germany	88	3.37
8	Australia	84	3.22
9	South Korea	77	2.95
10	Singapore	67	2.57

The table no 7 shows the top ten countries wise distribution of the articles in the area of diabetic retinopathy in the year 2017. It is noticed that 562 (21.55%) of the articles were published from USA. 13.92% (363 no) of the articles were published from Republic China. 171 numbers (6.56%) of the articles were published from UK. 6% of the articles were contributed from India and Japan. It is followed by Italy, Germany, Australia, South Korea and Singapore.

Figure No: 2: Mapping of Country Collaboration

The above VOSviewer picture shows the mapping between co-authorship with country wise contribution. Out of 93 countries, 49 records meet the conditions of

maximum number of authors per documents 5. All the 49 records were taken for mapping. Yellow color score shows the high density contribution countries in the area of diabetic retinopathy.

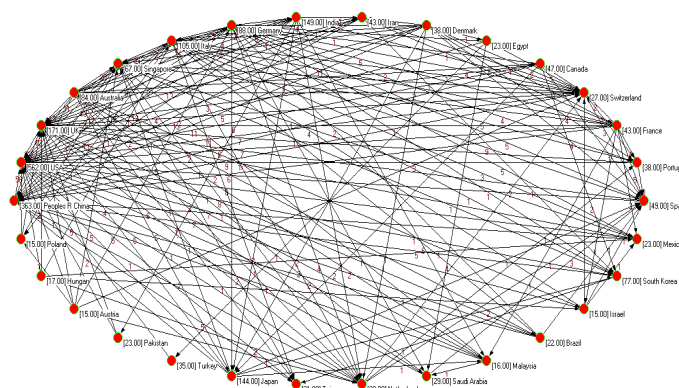

Figure No: 3: Country Collaboration

The figure no 3 shows the Pajek output of country wise collaboration of the diabetic retinopathy in the year 2017. From the picture it is understand about more collaboration found among top 10 countries such as USA, Peoples R China, UK, India, Japan, Italy, Germany, Australia, South Korea and Singapore

Figure No:4: Mapping of Co-authorship with authors

The above VOSviewer picture shows the mapping between co-authorship with authors. Out of 8179 authors, 228 records meet the conditions of maximum number of authors per documents 25 and minimum authors as 5. Among this top most 100 records taken for the mapping. Red color score about maximum of 5 and Blue color score about minimum of 1 and shows the relationship.

Figure No: 5 Mapping of Co-authorship with authors

The above VOSviewer picture shows the mapping between citation with the organization of the authors. Out of 2418 citation records, 203 organization records meets the conditions of maximum number of authors per documents 25 and minimum authors as 5. Among this top most 170 records taken for the mapping. The highly contributed citation with the organizations highlighted in the bright colors.

FINDINGS

- It is understood that 98% of the articles were published in English. One percent of the article published in the German. In Russian language,
- The study indicated that 72% of the publications were related to articles and it was followed by .meeting abstracts and reviews.
- It is understand that 5% of articles were published with keyword of diabetic retinopathy and 2 % of the articles were published on retinopathy, endothelial growth factor and prevalence keywords.
- It is noticed that 13.49% of the articles were published by four authors and 12.95% of the articles were published by five authors It is highlighted that only 3.87% of the articles were published by single author.
- It is found that the degree of collaboration diabetic retinopathy was 0.96 which having high degree of collaborative research in diabetic retinopathy
- Most of the DR article were published from Investigative Ophthalmology & Visual Science and followed by Retina-The Journal Of Retinal And Vitreous Diseases and PLOS One.
- It is understand from the study that 21.55% of the articles were published from USA, 13.92% of the articles were published from Republic China.
- Using the VOSviewer, mapping between co-authorship with country wise contribution found. Out of 93 countries, 49 records meet the conditions of maximum number of authors per documents 5.
- Pajek output shows about more collaboration found among top 10 countries such as USA, Peoples R China, UK, India, Japan, Italy, Germany, Australia, South Korea and Singapore
- The mapping between co-authorship with authors indicated about the out of 8179 authors, 228 co-authorship data were taken. Red color score about

maximum of 5 and Blue color score about minimum of 1 and analyzed the relationship.

- Mapping between citation with the organization of the authors through the data of 2418 citation records and 203 organization. Among this top most 170 records taken for the mapping. The highly contributed citation with the organizations highlighted in the bright colors.

CONCLUSION

The results of the present scientometric analysis showed promising output of scientific publications in diabetic retinopathy and comparatively high-quality of scientific productions in this field. In this paper, we have presented VOSviewer, a freely available computer program for constructing and viewing bibliometric maps. VOSviewer pays special attention to the graphical representation of bibliometric maps. This study provided practical information to researchers who look for studies with potentially highly citations, and also would be helpful for researchers to conduct better researches that eventually could lead to more publications in this field.

Aggressive Packet Combining with Consideration of the Physical Signal and Different Error Control Scheme

Achyuth Sarkar¹, Swarnendu K Chakraborty², C.T. Bhunia³

¹Assistant Professor, Department of CSE, NIT, Arunachal Pradesh

ABSTRACT

Aggressive Packet Combining (APC) is one of the most convenient and efficient tool for receiving the corrected version of the transmitted packet. In APC three copies of each packet is transmitted from source to the destination and receiver performs majority logic on the received erroneous copies to extract the correct version. However one of the major drawback of this scheme lies in the fact that it fails to correct the error when erroneous bits are present in two or more transmitted copies or at the same bit location. To overcome these limitations of conventional APC we proposed a new modified version of APC by considering the physical signal through which the transmitted copy can be more efficiently and coherently received by the receiver. Study and analysis made in this paper clearly reveals that the proposed scheme is indeed superior to that of conventional APC

Keywords: *Aggressive Packet Combining, Correction capability, Third bits left/right shift, circular Left shift, MSB, LSB, Physical level, error control.*

INTRODUCTION

To transmit data reliably from a source to a destination is indeed a research challenge for the scientists and researchers for many years. For this purpose Backward Error Correction (BEC) and Forward Error Correction (FEC) are the two methods that are extensively used in this regard. BEC has found its application in wired transmission and FEC in wireless transmission^{1,2}. BEC technique is found to be cost effective and due to this many researchers are trying to implement BEC for wireless transmission of data. In the traditional error correction technique, an erroneous packet is dropped. But the erroneous packet may have both correct and erroneous information. Chakraborty³ proposed Packet Combining scheme, a simple technique to explore the information present in erroneous packet. In PC scheme bit errors are located by XORing two erroneous copies of the packet. Leung⁴ proposed APC. APC is a low latency error correction scheme, so it is important for wireless data network. APC is well established and well studied elsewhere performance, so it is important for wireless data network⁵⁻⁸. In APC transmitter transmits

three copies of the packet through the same transmission link. The receiver applies bit wise majority logic to recover a correct copy of the packet. It is well studied that APC offers better performance. But APC suffers from many drawbacks. The major limitation of APC is its inability to correct the errors when errors are present at same bit location of two or more copies. Receiver applies bit wise majority logic to recover a correct copy of the packet. It is well studied that APC offers better performance, so it is important for wireless data network. APC is well established and studied elsewhere. In APC transmitter transmits three copies of the packet. The receiver applies bit wise majority logic to recover a correct copy of the packet. It is well studied that APC offers better performance. But APC suffers from many flaws. The major limitation of APC is its inability to correct the errors when errors are present at same bit location of two or more copies⁹⁻¹¹.

The Review of Aggressive Packet Combining (APC) Scheme

Aggressive Packet Combining (APC) is a modified form of Packet Combining scheme. Here three copies of a packet are sent via same transmission link to the receiver. At the receiver side all the three copies are

received erroneously .The Receiver then applies majority logic bit by bit the received three erroneous copies.

For Example:

Original Packet: 11000001

First Copy: 10000001

Second Copy: 01000001

Third Copy: 11010001

The Majority Logic: 11000001 which is the original packet.

In case where the generated copy after applying majority logic is not correct, the receiver searches for the least reliable bits and after selection of the least reliable bits the receiver applies brute force correction to that bits followed by error detection. In case of failure, it is request retransmission request to the transmitter in which the sender sends three copies for transmission.

The Proposed Scheme of Modified APC

Protocol I

Suppose original packet: “11101000 ”.As per proposed new protocol 1st and 3rd copy will be send as it is sender as receiver but second copy will be send as “00010111” also we are assuming that error places will be (-) error from MSB in 1st and 2nd copy and positive error at 3rd place from MSB in 3rd copy in the environment of non-repeated error syndrome.

First copy 11001000

Second Copy 11101000

Third Copy 11101000

11101000

2nd copy 10111011
 3rd copy 10100011
 10100011

Fig 1. Physical level signal of Protocol I

Applying majority logic: 11101000 original copy of the packet that we have sent at sender side.

On the other hand 1st copy 10101011 and 2nd copy 01010111 and 3rd copy 10101011 here 1st and 3rd copy as it is transmitted and 2copy 1bit left shift: So it is the part of sender copy

1st copy 10101011

2nd copy 01011011

3rd Copy 10101011

10101011

Study and Analysis of Modified Aggressive Packet Combining with Consideration of the Physical Signal 3

The receiving side receive easily able to collect the sender copy :

The Receiving side will be

1st copy 10101011

2nd copy 10101011

3rd copy 10101011

10101011

On the other hand with error

1st copy 10100011

2nd copy 01110111

3rd copy 10100011

10100011

Receiver of this receive the sender information

1st copy 10100011

Protocol II

Another example we like to describe in the environment of repeated error syndrome, suppose original data stream is 11011100.

First copy: 11101000

Second Copy 00010111

Third Copy 11101000

Sender side 11101000 bit

Receiver side receive the information:-

The Receiving side will be

1st copy 11101000

2nd copy 00010111

3rd copy 11101000

11101000

Fig 2. Physical level signal of Protocol II

Protocol 1:

In this protocol, the 1st, 2nd and the 3rd copy is transmitted as it is. In this transmission, assuming the error places are (-) error in 3rd bit and (+) ve error in 5th bit from MSB in the environment of repeated error syndrome

Suppose original data stream is 10101011

Different physical level representation are:

1st, 2nd and 3rd copy:

At the receiver side:-

1 0 1 0 00 1 1

1 0 1 0 0 0 1 1

1 0100011

1 0 1 0 0 0 1 1 Unable to generate the correct packet.

Physical level representation at the receiver.

Protocol 2:

In this protocol while transmitting the first copy, the last four bytes are reversed. In the second copy, the whole bytes are reversed and the 3rd copy is transmitted as it is. In the transmission assuming that the error places will be (-) ve error at 3rd place from MSB in the first and second copy and (+) ve at 3rd place from MSB in the third copy.

Suppose original data stream: 10101011

Different Physical level representation are:

Representation of first copy.

Representation of second copy

Representation of third copy.

At the receiver side:

1 0 0 0 1 0 1 1

1 0 1 0 1 0 1 1

1 0 1 0 1 0 1 1

1 0 1 0 1 0 1 1 which is the correct packet

Representation of first received packet

Representation of second and third received packet.

Protocol 3:

In this protocol , during the transmission of the first copy the last four bytes are reversed. In the second copy left bit circular shift is applied and the third copy is received as it is. The different physical level representations are-

Physical Representation of first copy:

Physical level representation of second copy

Physical level representation of third copy

Suppose transmitted bit stream 10101011. Assuming error positions as (+)ve from 4th bit of MSB in the first and second copy and (-) ve from 4th bit of MSB in the third copy in the environment of non repeated error syndrome.

Error positions of first and second copy

Error positions of third copy.

At the receiver side:

1 0 1 1 1 0 1 1

1 0 1 0 1 0 1 1

1 0 1 0 1 0 1 1

1 0 1 0 1 0 1 1 which is the correct packet

First received packet

Second and third received packet.

CONCLUSION

As per the suggested protocols the correction capability and reliability of APC is improved by a considerable extent. Through these protocols the corrected copies of the packets can be recovered at the receiver with ease. Therefore the proposed scheme can be considered fruitful and beneficial in data transmission over wireless networks.

A Study on Engineering Properties of Black Cotton Soil Mixed with Ground Granulated Blast Furnace Slag and Embedded with Polypropylene Fibres

HeeraLal M¹, Venkatesh N² and Praveen G V³

Associate Professor¹, Research Scholar², Professor³, Department of Civil Engineering, National Institute of Technology, S R Engineering College, Warangal

ABSTRACT:

Black cotton soils which are well known for their expansive nature are a worldwide problem posing many challenges to civil engineers, construction firms and owners. Stabilization of black cotton soils with different additive materials has likewise achieved great progress and on account of fast industrialization all through the world; the generation of enormous amount of waste materials creates ecological issue as well as disposal problems. Numerous methods have been developed by many researchers to enhance the mechanical properties of soil by incorporating an extensive variety of stabilizing materials. An attempt has been made in this paper to utilize Ground granulated blast furnace slag (GGBS), an industrial by product and polypropylene fibres as stabilizing materials. The impact of GGBS and polypropylene fibers on certain properties of soil, for example, Atterberg limits, compaction characteristics (MDD, OMC), Unconfined compressive strength (UCS) and Free swell had been examined. All the tests were performed on the samples by utilizing GGBS and 12mm polypropylene fibers. A series of UCS and Free swell tests were carried out on black cotton soil by varying percentage of GGBS (0%, 10%, 20%, 30%, 40% 50%, 60%) and polypropylene fibers of length 12 mm and proportions (0%, 0.25% 0.50%, 0.75%, 1.00%) by weight of dry soil with optimum percentage of slag). Results of various tests demonstrated the inclusion of GGBS and polypropylene fibers in soil with appropriate proportion improved strength and swelling behavior of soils.

Key words: Black cotton soil; GGBS; Polypropylene fibre; unconfined compressive strength; free swell index

INTRODUCTION

Black cotton soils cause serious harm to property on account of their expansive nature. They are highly fertile for agricultural purposes but pose severe problems to the pavements, embankments and light to medium loaded residential buildings resting on them due to cyclic volumetric changes caused by moisture fluctuation. This volume change behaviour is the reason for cracking to the overlying structures. The reason for this behaviour is due to presence of clay mineral such as montmorillonite that has an expanding lattice structure. During monsoon's, this montmorillonite mineral has the behaviour of absorbing water, swelling and becoming soft due to which the water bearing ability of the soil is reduced. In summer seasons, on account of evaporation of water, the soil shrinks and becomes harder. This type of alternate swelling and shrinkage behaviour of

black cotton soil resulting in severe losses to buildings, pavements and embankments.

Thus black cotton soils are to be stabilized in order to resolve its insufficiencies in engineering properties to use especially as a pavement material. Different stabilizers like lime, fly ash, blast furnace slag are available. Lime and cement are the most widely used stabilizers for improving the strength of the black cotton soils^{1,2}. On account of cement and lime being expensive these days resulting in increment of the total project cost. Thus research has mainly focused on lessening the expenditure of the binders. One more issue which the world is confronting these days is the disposal of industrial wastes like Fly ash, Ground granulated blast furnace slag (GGBS). Use of these byproducts as additives for black cotton soils not only reduces the project cost but also helps in reducing landfill problems³.

Addition of fibers to the soil-binder mix leads to the improvement of tensile and flexural strength of the soil.⁴ observed the effect of polypropylene fibers on cemented and uncemented clayey soils and found that fiber inclusions leads to the increment in the shear strength and reduction in post peak strength.⁵ studied the effect of fibers on fly ash embedded clayey soil and observed a drastic improvement in unconfined compressive strength and soaked CBR.⁶ performed durability tests on expansive soil with and without lime kiln dust and quarry fines and concluded that addition of lime kiln dust is more durable when compared to quarry fines addition to expansive soil.

From the above literature, it is observed that less research has been done on the effect of fiber on the binder embedded black cotton soil. In the present study, effect of polypropylene fibers on the unconfined compressive strength of GGBS embedded black cotton soil has been studied. Compaction characteristics and swelling behaviour of GGBS-fiber reinforced soil are compared

with virgin black cotton soil.

MATERIALS AND METHOD

Black Cotton Soil: Local Black Cotton soil was collected, air dried and stored in containers. Below natural ground level at a depth of 1m, soil was collected by open excavation and sieved through 4.75mm sieve for performing various tests and the index properties of BC soil are listed in Table 1

Ground Granulated Blast Furnace Slag (GGBS): GGBS which is popularly known as steel slag was collected from nearby steel manufacturing unit which contains nearly 33% calcium oxide which can be observed from Table 2.

Polypropylene Fibers: In recent years the uses of fibers in various fields have gained much importance. The research on fiber-reinforced soils demonstrated that this material might be a practical and cost efficient. Polypropylene fibres of aspect ratio 300 are used and the properties of the fibres are presented in table 3.

Specific gravity test was carried out by Pycnometer as per for BC soil⁷. Grain size analysis tests are conducted according to respectively which consists of 40% silt and 27% clay. This method is followed for size of particles more than 75micron only⁸. Hydrometer analysis was carried out for size of particles less than 75micron. Atterberg limits, liquid limit as per and plastic limit were performed on various soil-GGBS mixes and the optimum content was determined⁹. Standard proctor compaction tests were conducted as per on the soil-GGBS mixtures where increment in OMC and decrement in MDD is observed with increase in GGBS content¹⁰. Unconfined compressive strength tests were performed on different fibre embedded GGBS soil mix according¹¹. The Free Swell Index of the soil was carried in accordance with the for the various soil-GGBS mixes.¹²

RESULTS AND DISCUSSIONS

Atterberg's limits

The test results from fig. 1 shows that LL and PI decreased whereas PL increased for BC Soil mixed with GGBS. This is because of the diffused double layer thickness reduction and flocculation of clay particles. Addition of GGBS to BC soil significantly reduced the plasticity index of black cotton soil. This implies there is a significant reduction in swell potential by addition of GGBS to BC Soil. From the fig, we can observe that the liquid limit and plastic limit shows similar results for 40%, 50% and 60% soil-GGBS mixes thereby indicating 40% GGBS content as optimum value.

Fig 1: variations of liquid limit, plastic limit and plasticity index with addition of GGBS

Standard proctor test

The standard proctor tests were conducted by mixing different percentages of GGBS from 10% to 50% to the Black cotton soil. After selecting suitable proportion of GGBS as 40%, polypropylene fibres were mixed from 0.25% to 1% in increments of 0.25% and standard proctor tests were conducted on these mixes.

Figure 2: showing changes in OMC and MDD with addition of GGBS to BC soil.

From figure 2, it is observed that there is an increase in the OMC and decrease in MDD when GGBS is added to BC Soil. The decrease of the MDD by adding GGBS to BC Soil is mainly due to its lower specific gravity and the immediate formation of cementation products. The pozzolanic reaction between BC soil and GGBS is responsible for increase in OMC. As GGBS content increases, the water sensitivity of GGBS stabilized clay

decreases i.e., causing only a minor change in dry density with large increase in water content. The dry density increased with GGBS increment upto 40% whereas for 50% GGBS addition, the dry density decreases indicating 40% GGBS content as optimum value. From figure 3, it can be seen that the MDD value decreases with increase in fibre content whereas maintaining nearby constant OMC of 16%.

Figure: 3 Showing changes in OMC and MDD of BC soil treated with 40% GGBS with varying percentages of Polypropylene fibres

Unconfined compressive strength

The unconfined compressive strength tests were conducted on the optimum mixes which are selected from standard proctor’s compaction test. The stress-strain behaviour of different composites with 28 curing period is shown in figure 4. Up to 40% GGBS, there is a drastic increment in unconfined compressive strength and there after reduction in UCS strength is observed. The

reason for this behaviour is due to the fact that complete consumption of Ca(OH)_2 by the natural pozzolonic material in the soil happening at 40% GGBS. It can be observed that the maximum UCS is coinciding with the GGBS fixation point obtained from the Atterbergs limits. For more than 40% increment in GGBS content results in non-occurrence of pozzolonic reaction and the added GGBS particle remain as unbounded particles thereby resulting in the reduction of overall strength.

Figure 4: Stress-Strain behaviour of BC soil treated with GGBS for a curing period of 28 days

In the presence of fibers, even when the soil deforms in compression, the normal strains in certain other directions may be a tensile extension. The deformation is resisted by fibers in the direction of the tensile strains through fiber–soil frictional interactions, and the high tensile strength of the fiber itself. The overall failure surface is larger and non-planar, owing to the

presence of fibers, and the failure load and energy are increased. Thus, from the figure 5, it is observed that the peak strength increases for fibre mixed soil-GGBS samples when compared to soil-GGBS mixes. The UCS value increases till 0.75% fibre inclusions whereas on 1% addition of fibres UCS value decreased thereby indicating 0.75% fibres as optimum content.

Figure 5: Stress-Strain behaviour of BC soil treated with 40% GGBS with varying percentages of Polypropylene fibres for a curing period of 28 days

Free swell

Figure 6: Swell% of BC soil treated with varying percentages of GGBS

From fig. 6, it is observed that when free swell tests were performed on BC soil with different GGBS mixes and it was observed that the swell percent reduced from 24% to 5% for 1000 mins with increase in GGBS from 0% to 40% and for 50% GGBS mix the swell percent was observed to be nearly same as 40% GGBS mix which can be observed from fig6.

In the expansive soil swell percentage is reduced due to exchange of sodium ions in expansive soils with

calcium ions presented in the in GGBS there by leading to the formation of calcium aluminates and calcium silicates which reacts with water and hydration takes place due to pozzolonic reaction The paste which is formed will form a stable cementitious bonded-structure on treatment with slag. On the other hand, as expansive soil is sensitive to the moisture and swelling occurs whereas for treated soils GGBS helps in the prevention of moisture to expel out of soil particles.

Figure 7: Swell percentage of BC soil treated with 40% GGBS with varying percentages of polypropylene fibres

Free Swell percent tests were performed on BC soil + 40% GGBS content which is considered as optimum percentage and the glass fibres were added in increments of 0.25% till 1%. From fig. 7 it is observed that the swell percent at 40% GGBS was observed to be 5% which was further decreased to 2% with increase in glass fibres from 0.25% to 0.75% where similar results were observed for soil-GGBS mix with 1% glass fibre inclusion. The reason behind this is that as the soil swells, the stretching of the fiber occurs and throughout the length of the fiber tension will be induced which helps in reduction of further swelling. The more the fibers connection with the soil particles, the better effects on swelling reduction.

CONCLUSIONS

The following conclusions can be drawn from the experimental results:

The LL, PI decreased and PL increased with increase in GGBS content on account of the reduction in the thickness of the diffuse double layer and flocculation of clay particles. On further increment in GGBS content from 40% LL, PL and PI values are nearly constant. Thus, 40% GGBS is taken as optimum content.

Addition of GGBS to the BC soil results in increment of maximum dry density and decrement in optimum moisture content because of the reduction in clay content and increment in frictional resistance.

The increment in Unconfined Compressive strength is observed on addition of GGBS up to 40% for 28 days curing period whereas decrement in strength is observed on further addition of GGBS. The UCS value of soil-GGBS- mix is observed to be higher when compared to soil-GGBS mix on account of the higher tensile strength of fibre itself.

Free swell percent is reduced considerably with increment in GGBS content because of the stable cementitious bonded-structure formed through the slag treated soil

Discuss the Notion of ‘Sustainability’ and its Application to Archaeological Heritage Management

Zhu Yonghan

*Institute of Archaeology, University College London, WC1E 6BT,
London, Great Britain*

ABSTRACT

‘Sustainability’ is a kind of policy concept which emphasizes a system of harmonious development. This dynamic system is composed of economic growth, well-protected environment and stable society, it devotes to a well-being achievement from generation to generation of human society. This study discusses the application of “sustainability” to archaeological site management, several possible methods, such as educational interpretation, a participatory planning process and the ecotourism, are analyzed. Although some of applications are inevitably faced with problems because the site management is a complicate process, the notion of ‘sustainability’ helps to promote and develop a long-term plan that is beneficial to both local society and archaeological site.

Keywords: *Sustainability, Archaeological Management, Long-Term Development, Well Protection*

INTRODUCTION

As a kind of policy concept, ‘sustainability’ was promoted in the Brundtland Report of 1987, the document discussed the tension between human desire and limited resources¹. Currently, with the increasingly social and environmental problems worldwide, ‘sustainability’ is becoming a significant term because it is believed to help solve these difficulties. Sheehan (2009)² claimed that ‘sustainability’ is usually concerned with social, economic and environmental system. Thus, this term might be able to apply to many fields, such as archaeological site management. In fact, before considering the application of ‘sustainability’, it is wise to rethink the notion of this term. This probably helps lead the work more effectively. The purpose of this study is to discuss the concept of ‘sustainability’ and critically analyze some possible applications to archaeological site management. The discussion of this study will help to promote the related research in sustainable development of archaeological site.

The study achieved objective by being divided into three main parts. Firstly, there is a discussion about the concept of ‘sustainability’. In part two, three possible applications are critically analyzed by discussing their benefits and potential limitations. The last part of this study concludes discussions above and argue that in

general while some applications may be faced with potential problems, the notion of ‘sustainability’ which strongly links to sustainable development, is of great importance to archaeological site management.

Notion of ‘sustainability’

The concept of ‘sustainability’ is not a static one, according to Kuhlam and Farrington(2010)¹, it has changed over a long historical period. Thus, it is necessary to briefly introduce the evolution of this term. The notion of ‘sustainability’ was originally created in forestry to warn woodcutters against harvesting more than new growth³. Obviously, this concept began to discuss a relation between human and nature at that time. Indeed, there usually is an opposite relation between human and nature, because the development of human society inevitably causes consumption of natural resources. Currently, the consumption experiences increasing trend and further generates many problems on environment, such as global warming, water pollution and desertification. With the development of human society and the consumption of nature, how to deal with this opposite relation possibly will become a permanent topic between human and nature.

Over a long period, 'sustainability' also has been regarded as a natural topic of research by economists. For example, a theory about looming mass starvation was published by Thomas Malthus in 1798. Another example is that Harold Hotelling formulated a theory about the optimal rate of exploitation of non-renewable resources in 1936¹.

According to Kuhlman and Farrington(2010), the report of the club of Rome forecast that many important resources would be exhausted within one or two generations, this point of view captured the attention of global public policy¹. In 1987, the World Commission published another famous report which is named Brundtland Report. This report includes a famous definition of 'sustainable development' which still has significant impact on current society. As it defines, "sustainable development is a development that meets the needs of the present without compromising the ability of future generation to meet their own needs"⁴. The reason why this definition has lasting influence is that it not only emphasizes the tension between natural resources and present generation, but also considers the need of future generation. According to this definition, the term which is called 'sustainability' should be considered as a dynamic concept.

In fact, except this famous report, there were countless definitions of 'sustainability' in history. For example, Sheehan(2009)² asserted that 'sustainability' means people need to find a way to lead wealthy, healthy and stable lives without damaging present environment and welfare of future generation. In addition, 'sustainability' might also represents a new course which can help to improve the quality of lives from generation to generation though economic and eco-friendly development⁵. Kuhlman and Farrington(2010) believed that sustainable development is a undertaking to achieve high quality of lives though economic development, social development and environmental protection¹. Clearly, all of these definitions almost involve three elements: economy, environment and society. In fact, even two decades ago, Elkington(1994) pointed out the Triple Bottom Line concept which emphasized that 'sustainability' is mainly concerned with those three elements⁶.

According to Elkington(1994), this concept is a reliable way to operationalize corporate social responsibility. The triple Bottom Line can be divided into

economic bottom line, environmental bottom line and social bottom line. As the term described, 'sustainability' means people need to keep a balance between these three lines. More specifically, the development of profit should care for the environment and human society. This essay will respectively discuss these three elements and summarize a personal view of 'sustainability'⁶.

One of important purposes of 'sustainability' is to maintain economic development⁶. Thus, analyzing the objective of economic development might help to understand the notion of 'sustainability'. Currently, economy is often regarded as equation of money¹. Indeed, as a part of economy, money possibly is a symbol of economy in some areas. However, it is hard to agree that money can represent everything about economy because economy also includes other factors, such as products. Thus, it is also difficult to claim that the purpose of economic development is only to make more profits or improve income. Generally, there is a link between economy and quality of live. With the rapid growth of economy, the fact is that the quality of live has become higher than ever before. Moreover, people tend to feel more satisfied because a high quality of live may help them meet their needs more easily. Thereby, the development of economy plays an indirect but important role in helping people meet their desires. This probably can be considered as the main purpose of economic development.

According to the triple bottom line, environment is another crucial element in notion of 'sustainability'. Sheehan(2009) thought that environment is composed of diverse resources. Hence, resources can be regarded as a symbol of environment². In fact, the growth of economy usually relies on consumption of resources and some of resources are nonrenewable. Therefore, protecting environment is important for humans to achieve a kind of development that can be beneficial to both present generation and future generation. Furthermore, one of most significant processes of conservation is to define what kind of resources should be regarded as environment. Because this can help people identify the targets which they need preserve. Indeed, when people consider environment, it is common that they tend to associate this word with nature because they can easily feel consumption of natural resources. For instance, development of human society usually consumes those fundamental natural resources, such as water, wood and minerals. However, environment not only includes

natural resources. As Kuhlman and Farrington(2010) asserted, environment also involves cultural resources, all the paintings, theories, folklore and other man-made resources should be considered as a part of environment. Therefore, environmental conservation means both natural resources and cultural resources are well-protected¹.

In addition, 'sustainability' is also concerned with social element⁶. The purpose of sustainable development is to meet the needs of present generation and future generation, Kuhlman and Farrington(2010) believed that a stable social structure is helpful to achieve this object. Indeed, it is often easier for people to organize their work effectively in a stable society¹. Thus, a well-organized human society is a cornerstone of economic growth and environmental preservation. In general, social structure is a system of social elements, these elements contain population, institution, social groups, and other important factors. A stable social structure means all of these elements should be managed both reasonably and efficiently⁷. Therefore, a rational management of social structure is important to achieve sustainable development.

After a long discussion above, some main characteristics of 'sustainability' probably can be found out to help make a personal definition. According to the Triple Bottom Line concept, 'sustainability' mainly consists of economic, environmental and social elements⁶. Moreover, because the main purpose of 'sustainability' is to help both present generation and future generation achieve well-being, this term should be seen as a dynamic concept. In conclusion, 'sustainability' is a dynamic system which aims to helping people meet their needs from generation to generation. The whole of system achieves its objective by maintaining economic growth, well-protected environment and stable society from generation to generation. According to this personal understanding, in the next part, this essay will critically analyze some possible applications of 'sustainability' to archaeological site management.

Possible applications of 'sustainability' to archaeological site management

Archaeological site management, as a complicate progress, contains many specific contents. This essay only chooses three possible applications of 'sustainability' to this field and critically discuss

them. Firstly, the conception of 'sustainability' can be applied to interpretation of site management. Nigro and Taha(2006) suggested that the sustainable role of interpretation within site management area can be approached from a preservation perspective⁸. More specifically, interpretation is believed to achieve this sustainable role through two processes. In the first process, interpretation is used to help the public understand the values and uses of archaeological site, this process is related with education⁸. For instance, some education programs probably help the explanation to both visitors and residents. Furthermore, Heritage sites inevitably face different problems. Hence, Nigro and Taha(2006) claimed that the second process is to interpret these issues and explain how to deal with them. This might help the public raise the awareness of their behaviors because they can know how to cooperate with managing plan. After these two interpretative processes, Nigro and Taha(2006) believed that some of visitors and residents will change their attitudes as well as behaviors. In fact, these changes play a sustainable role in protecting heritage site because economy, environment and local society all benefit from these changes. For instance, interpreting the values and uses of heritage site may enhance awareness of the public and create a sense of ownership⁸. As a result, the public tend to reduce some activities that have negative impact on the environment of heritage site, such as looting, rubbish dumping and damage⁸. Sometimes, visitors even donate money after they know the value of heritage site and these donation may make an economic contribution. Moreover, a detailed explanation of issues and plans helps the public understand how to cooperate with managing strategies. One example is that the public tend to comply with managing arrangement and social orders. This plays a positive role in maintain a stable local society. Obviously, the most important role of interpretation is to provide a protective motivation for people. When the public improve their motivations of conservation, their behaviors will be beneficial for economy, environment and society. This helps to achieve a sustainable and long-term conservation.

In addition, there is a valuable view which need be considered. Because archaeological site management is a long process, interpretation should maintain the sustainable role as much as possible in the long process. Thus, explanation not only communicate present situation of heritage site, but also introduces a possible

future⁸. This may help the public understand the whole managing strategy more comprehensively and know how to cooperate with this strategy over a long period of time.

Meanwhile, the notion of 'sustainability' also can be applied to the planning process of site management. Nigro and Taha(2006) pointed out that a participatory planning process partly reflects this concept because this kind of planning process contributes to maintaining a stable local society⁸. Generally, participatory planning process is used to create an effective communication between site managers and stakeholders⁸. Through the communication, stakeholders can directly join in the planning process of heritage management. In the planning process, stakeholders have chances to share their opinions as suggestions. It is clear that their sense of ownership can be increased in this way. As a result, more adaptive decisions are made and stakeholders usually tend to support these decisions, because these plans include some of their suggestions and needs. Finally, it is helpful to maintain a stable society because most of people are willing to comply with managing strategies. Therefore, the sustainable role of a participatory planning process is to help keep local society stable.

Because 'sustainability' means a the social order should be maintained steady from generation to generation. Thereby, before making every important decision, stakeholders should be invited to join in a participatory planning process. This can help managing plan continuously be supported by stakeholders. Moreover, Nigro and Taha(2006) also thought that site managers need to invite stakeholders as many as possible because it is helpful to achieve a more extensive communication⁸. Then after extensive debate, a more reasonable decision might be made. Indeed, a more reasonable plan means it is supported by more people, the social order can benefit from this kind of wide support. However, one problem is that more stakeholders may easily cause a difficult negotiation because the managing plan should meet more needs. Sometimes, it is hard to achieve a compromise due to many different standpoints. Personally, before inviting stakeholders, a significant task is to find out those key stakeholders who have strong relation to the managing strategy. Their suggestions should be firstly considered because they are concerned about the managing plan more than other stakeholders. In general, a managing plan involves four groups of key stakeholders: local

communities, site managers, operators and visitors. These four groups of people are directly affected in different ways by managing policy⁹. Therefore, the opinions of these four groups are more considerable. In fact, it is difficult to make a decision that can satisfy every stakeholder, what site managers can do is to meet the needs as many as possible through a participatory planning process. Hence, when many stakeholders are involved in a managing planning process, it is wise to firstly consider the interests of key stakeholders.

Currently, with the rapid growth of tourism industry, ecotourism is believed to help achieve a sustainable development of archaeological site. According to Keitumetse(2009), ecotourism is a kind of responsible trip to natural areas that improves the well-being of local society without environment damage¹⁰. Clearly, this definition conforms with the notion of 'sustainability'. From a sustainable perspective, Wood(2002) claimed that ecotourism has four important roles¹¹. The first role is that ecotourism emphasizes responsible business which works cooperatively with local government and residents in order to improve local economy. As a kind of tourism, ecotourism emphasizes the economic value of archaeological site and one of most significant roles of ecotourism is to develop economy. For instance, area protected tourism in Canada made nearly 370 billion dollars in 1996⁹. Moreover, tourism is the second largest source of foreign currency in Egypt, because this industry makes countless profits, Egyptian authorities highly value tourism industry¹². In fact, ecotourism aims to improving local economy, government and residents usually prefer to support a managing strategy that can improve local economy. Therefore, site managers should consider the tourism as a part of managing strategy. The second sustainable role of ecotourism is to help residents and local authorities raise the awareness of heritage conservation¹¹. Generally, travelers are the main financial source in tourism industry, and they often prefer to visit a well-protected heritage site rather than a damaging one. Thereby, local government and residents tend to value the site and protect it. This is beneficial for both heritage site and local environment. If the heritage site can constantly attract visitors, it will be protected by local communities from generation to generation. Wood(2002) also pointed out that ecotourism directly provides an economic support for archaeological site conservation. With the development of tourism, more revenues can be offered to site management and environmental preservation¹¹.

For example, it is common that entrance fees account for a large proportion of protective expenditure in developed countries. In 1994, this proportion is over 40%⁹. According to Wood(2002), the last sustainable role of ecotourism is to minimize the negative influence on natural and cultural environment¹¹. As a complicate industry, tourism inevitably leads to some problems and these issues may threaten heritage sites as well as natural environment. For instance, site managers and local communities usually blame an excessive number of visitors for damaging environment. Indeed, although visitors make economic contribution, they also impose pressures on heritage site and nature. However, in contrast to conventional tourism, ecotourism not only emphasizes the economic benefits, but also concentrates on environmental preservation. Developing ecotourism means site managers and local authorities should make reliable plans to minimize visitor impacts¹¹. For example, site managers need to design a reasonable tour route that avoids some sensitive areas, and local government also can provide a certain level of environmental education for visitors⁹. Therefore, ecotourism can reduce the negative impact on environment and promote sustainable development of heritage site.

In fact, one of most important problems might be that some local authorities refuse to develop the ecotourism. Compared with traditional tourism, ecotourism needs more investment because it requires a great deal of information to make a sustainable plan. For instance, before making a strategy of sustainable tourism in Sahara, much information was collected by researchers, such as population, trade, geographic features and climate¹². Thus, some governments tend to develop a tourism that only concentrates on making profits because it is unnecessary to invest much money in environmental conservation. However, the fact is that this kind of unsustainable development only makes a short-term benefits. With the environmental deterioration, visitors gradually lose interests in the archaeological site. Thereby, a long-term consideration is of significance. Personally, it is wise to develop an ecotourism due to these sustainable roles.

CONCLUSION

‘Sustainability’ is a kind of policy concept which emphasizes a system of harmonious development. This dynamic system is composed of economic growth, well-protected environment and stable society. In this system,

these three elements work cooperatively to help people achieve well-being from generation to generation. Furthermore, as a policy conception, the notion of ‘sustainability’ can be applied to archaeological site management. In fact, several possible applications were discussed above, such as educational interpretation, a participatory planning process and the ecotourism. Although some of applications are inevitably faced with problems because the site management is a complicate process, the notion of ‘sustainability’ helps make a long-term plan that is beneficial to both local society and archaeological site. For instance, with sustainable development, the economic level of local society is improved and heritage site can be protected well by local communities. Therefore, the concept of ‘sustainability’ is worthy to be considered when site managers make a plan.

Customer Shift from E-Banking to M-Banking in State Bank of India: A Study to Identify Influencing Factors Causing the Change in Behaviour

Deepa Damodaran, N Sambandam

¹Assistant Professor, ²Pro Vice Chancellor, VIT Business School, VIT University, Chennai Campus, India

ABSTRACT

The basic purpose behind writing this paper is to identify those variables that causes shift of customers from e-banking to m-banking of State Bank of India. A quantitative approach was used. The study was conducted on 450 people customers, out of which 384 respondents were finally shortlisted. Simple random sampling method was used to select them. It was identified that perceived benefits of using the banking services over mobile phones, influence of peer groups, service provider facilitating conditions and technology are the major influencing factors. It was suggested that banking institution must extend their services offering through the m-banking and more and more customers must be encouraged and convinced to use m-banking services. Emphasis must be laid on ease of use of technology in the hands of customers. Employees must be trained enough to promote m-banking services not only in-house (within the branch), but also by becoming brand ambassadors in promoting m-banking services at other places as well. Bank must make use of different medium of communication to connect with customers to increase level of awareness and to build positive perception of customers towards m-banking services.

Keywords: *Technology Acceptance Model, M-Banking, Services, State Bank of India.*

INTRODUCTION

Technology advancement over past few years had a tremendous effect on Indian banking industry leading different players to introduce its offerings over mobile for its customers, timely, safely and reliably. Banking system have a history of over 200 year's serving the customers through their branch-based systems. However, developments in technology and growth in e-commerce revolutionized the nature of banking activities towards its customers.

Stiff competition within the BFI sector has forced the players to develop strategies to overcome competition level and to survive within this environment^{[1][18][11]}. Need is to develop, adopt innovative technologies and to transform their business operations to web-based by adding element of mobility. Mobile based banking activities ushered a new era within banking sector across the globe^{[19][32][29]}, leaving with the banks as their only survival strategy^{[1][18][11]}.

Despite of the fact that m-banking extends numerous advantages to users, the adoption process is not exciting^{[27][19][28]}. The success is decided how user uses m-banking services in daily activities^{[20][17]}. Lot of studies were conducted to explore various factors that effects consumers' to accept m-banking^{[3][1][9][7][10][12][11][16][15]}. However, findings remained fragmented. No relation identified between different factors that effect IN adoption m-banking services offered by banks^{[21][10][28]}.

Mobile banking is a result of wireless communication interface that add value for customers with respect to banking transactions. Providing banking services over smart phones is a miraculous development in present scenario. Use of smart phones to perform banking operations is in infancy stage, even then momentous development is observed which promises remarkable outcomes in future^[43].

The amazing development of technology and its expansion into monetary and banking markets across the world has considerably changed current banking

methods while providing facilities in customers' affairs. With the increasing growth of electronic commerce transactions across the world and today's commerce need for bank participation in financial resources transfers, electronic banking has become an inseparable part of electronic commerce and plays a fundamental role in its implementation. It is worth noting that electronic commerce is not realized without electronic banking. With the development of internet and its accessibility to all people, the method of service providing has extensively changed in banks and these developments have laid the grounds for the emergence of phenomena such as mobile banking, internet banking and virtual banking^[40].

Currently, banks have provided online banking services for their customers via the internet in most developed countries and customers can easily perform most of their bank affairs by getting connected to banks home pages using their unique account passwords without their presence in banks. These factors have created a platform for facilitating commercial transactions resulting in competition growth among financial banks and non-bank institutes. Therefore, Electronic banking is defined as providing certain facilities for the customers who can access banking services without the need for their physical presence in bank using secure interfaces^[39].

E-banking is a mix of all those e-channels that customers use to access their bank accounts to make money transfer or to pay their bills^[44]. Mobile-based banking is considered as one of the latest achievements of technology in banking industry, which serves numerous advantages for banks and their customers. Thus, bank managers' interest in identifying which factors and elements may lead to the use of services such as mobile-based banking by customers is obviously justified. In addition, finding influential factors in accepting and using such services will provide more appropriate planning in the enhancement of the number of mobile-based banking services users and faster utilization of this modern phenomenon both for banks and users of this high-tech service.

Based on the experiences of the developed countries and the growth of electronic banking services could help predict the evolving and increasing process of needs in banking services in India to some extent. Referring to the current traditional methods in national banks and the insufficiency of these methods in providing new banking

services, it is highly crucial to establish the required infrastructures in banks, which is fortunately highlighted by the related authorities. In addition, certain expansive activities have been completed in the banking system to present electronic banking and other modern banking services^{[41][42]}.

LITERATURE REVIEW

M-banking

In present scenario, almost all of the banks are now busy in providing their product mix and services mix electronically that reduces the use of traditional practices followed from decades. Customers' likelihood towards smart phones also provided a new channel of marketing in the hand of banking industry. More and more banking activities are now technology driven creating a need to identify and understand competition within the industry. Technological developments have given a new dimension to concepts of services marketing^[6].

Using the term '*electronic banking*' means making the information related to services and product offerings available to users via electronic or wireless channels^[22]. It is necessary to quote at this point that though the technology based applications that expedite the users to perform banking services are available, but the fact is that the USE (usage rate) within India and across the globe is too low. Even the financial institutions of developed nation's offered mobile based banking services to their users, very recently. Hence, m-banking services is still in infancy stage^{[23][14]}.

Technology based m-banking blessed customers and banks with number of advantages. Banks are able to reduce down the cost and time of serving their users; whereas, provided convenience of place and time to conduct transactions resulting in quality service delivery^{[11][17][29][18][33]}. However, these benefits will get applause if m-banking are adopted by every single user using banking services^{[12][3][17][21][20][28]}.

M-banking Scenario in India

Recent telecommunication developments is considered as genesis of m-banking and given a channel in hands of shoppers to transact^[4]. M-Banking may also be considered to be as m-commerce where users carry bank with them and enjoy all the services over it phone with the help of mobile applications, economically. This

also helps in increasing customer's satisfaction and thus leading to loyalty^[11].

Indian users does not believe in taking risks especially when it is related to monetary aspects, therefore banks need to ensure security of customer's money. Quick technological developments have re-drafted all the processes of providing services, which finally become the backbone of economic growth. Banking sector also admires the effect of technology advancement over its functioning and customer's-centric activities that can be easily amended because of information technology. Technological developments not only assisted banks in extending their offerings to customers such as ATM, Internet Banking, and M-Banking etc., but drawn their attention towards customization also. Replacement of plastic money over conventional note is the result of such technological advancement^[34].

Growth of Indian Economy in recent years is the result of liberalization in 1991 that also leads to transform banking sector in a great way^[8]. The government has taken corrective measures resulting the growth in monetary sector. Indian banking discovered vital reforms in recent times with a focus around profit, minimum investment and maximizing the value and satisfaction of the client. In spite of all these happenings, one area of concern is left behind i.e. long waiting queues within banks. Therefore, mobile banking could be the answer to this issue^{[25][26]} as customers can perform different banking activities without actually moving to the banks, physically^[13].

There exists a direct relationship between the use of new technology and bank's performance. Therefore, it is said that technology plays an important role in elevating quality of banking services, however, Indians believe to have face to face contact with the personnel's of service provider which is not available in technology based services^[5]. Therefore it is required to identify those factors that effects customers' to adopt technology based services i.e. m-banking in India and how customers react to it after adopting the same^{[24][31]}.

India enjoys second largest mobile user base of the world which accounts to be 10% of total global users. Approximately, 983.21 MM customers' are mobile users, out of which 57.69% represents urban area and remaining 42.31% represents rural areas of India.

In India, ICICI bank and Union bank must be praised for introducing the concept of m-banking^[2]. Presently, banks are targeting to the segment of users who might not have access to computer but have a mobile phone. Introduction of idea 'Digital India' developed the prospects for m-banking growth in India. Security, privacy, quick changing technology and lack of information are creating problems in the way of m-banking revolution in India^[30].

Statement of Problem

Although Mobile banking service has been recognized as a newly established system within the country, it may encounter an important problem in the process of development which is due to the non-acceptance of its practical usage by the users. Thus, it is essential to follows certain research in order to identify the influential factors involved. This problem is likely to play a considerable impact on the level of application and expansion of mobile banking, since we are facing an updated technology which is not widely welcomed by numerous public customers. Despite its remarkable advantages and banks' substantial investment, mobile banking has not received satisfactory acceptance and recognition by public users yet. Hence, it is crucially important to determine the key factors involved in accepting and using this new developed technology^[35].

Recently, all organizations are seeking to attract more customers and increase their satisfaction. It is of particular importance in case of banks, which are in frequent contact with customers. On the other hand, competition between banks and interest free loan institutions and other forms of absorbing financial resources are growing rapidly. Nevertheless, creating competitiveness for banks survival is very essential. Modern bank services which are closely integrated with information and telecommunication technology serve as highly important factors in developing competitiveness for banks, inducing customers' attraction and increasing their satisfaction^[36].

Significance of the Study

Today's, banking industry is changing as fast as possible. Technology will lead in breaking legal, geographical, and industrial obstacles and in developing new service-mix for the bank's customers. It is more than 2 centuries during which banks served their customers via network of branches. However, the way the services

mix are offered to customers changed greatly as a result of the advancement in Information Technology.

It is worth noting that mobile banking technology has expanded in recent years as a method to maintain customers' faithfulness and increasing market share. Thus, the present study seeks to examine different

influential factors changing change in behaviour from online based banking to mobile based banking, and play an effective role in increasing customers' use of mobile banking.

Research Hypotheses

Table 1 indicates the various research hypotheses

Hypotheses	
H ₁	Relationship between perceived advantage of using m-banking and customers' attitude is significant.
H ₂	Relationship between complexity of using m-banking and customers' attitude is significant.
H ₃	Relationship between compatibility of using m-banking and customers' attitude is significant.
H ₄	Relationship between peer group and subjective norms is significant.
H ₅	Relationship between superior group and subjective norms is significant.
H ₆	Relationship between self-efficacy and perceived behavioural control is significant.
H ₇	Relationship between source facilitator conditions and perceived behavioural control is significant.
H ₈	Relationship between technology facilitator conditions and perceived behavioural conditions is significant.
H ₉	Relationship between bank customers' attitude and behavioural tendency toward using mobile banking is significant.
H ₁₀	Relationship between bank customers' subjective norms and behavioural tendency toward using mobile banking is significant.
H ₁₁	Relationship between perceived behavioural control and behavioural tendency toward using mobile banking is significant.
H ₁₂	Relationship between behavioural tendency toward using mobile banking and customers' actual behaviour from online banking to mobile banking is significant.

Table 1 Research Hypotheses

METHODOLOGY USED

A quantitative approach was used. The study was conducted on 450 people customers, out of which 384 respondents were finally shortlisted with use of simple random sampling method. The questionnaires consist of close-ended questions in order to have proper considerate, precise and authentic information about the research problem. The Planned Behaviour Theory Questionnaire including 39 questions, along with a sociological questionnaire including age, sex, studies, monthly income were applied for data collection. In order to insure the reliability of the questionnaire, Cronbach's α coefficient techniques was used. Table-2 indicates the reliability of the variables included in the questionnaire.

Variable	α
Variable-1: Perceived Advantage	0.81
Variable-2: Complexity	0.93
Variable-3: Compatibility	0.75
Variable-4: Peer Groups	0.82
Variable-5: Superior Groups	0.78
Variable-6: Self-Efficacy	0.72
Variable-7: Source Facilitator Conditions	0.71
Variable-8: Technology Facilitator Conditions	0.76
Variable-9: Attitude	0.88

Data Collection

In order to collect data on literature and theoretical issues of this research, the author used library method such as books, and articles, dissertations, websites etc., were applied while questionnaire distribution, field-

survey study and holding analytical meetings managers and employees were used in order to collect data on research hypothesis.

Hypothesis Testing

Data were analysed as shown in Table 3.

Hypothesis	Standardized Coefficient	t-Value	P-Value	Result
H ₁	0.53	9.66	< 0.01	+
H ₂	0.37	- 6.55	< 0.01	+
H ₃	0.15	2.89	< 0.01	+
H ₄	0.45	8.12	< 0.01	+
H ₅	0.38	7.10	< 0.01	+
H ₆	0.08	1.89	< 0.01	-
H ₇	0.42	7.67	< 0.01	+
H ₈	0.40	7.66	< 0.01	+
H ₉	0.61	10.97	< 0.01	+
H ₁₀	0.43	8.22	< 0.01	+
H ₁₁	0.33	6.42	< 0.01	+
H ₁₂	0.68	12.35	< 0.01	+

Table-3: Research Hypothesis Testing

Sources: Primary Data Analysis

RESULTS AND DISCUSSION

Descriptive results for main research variables

The mean values indicate that with regard to average value (number 3), the mean value of all variables except “complexity” is higher than the mean level. The highest mean value belongs to variable 1 (M = 4.3), variable 9 (M = 3.9) and variable 11 (M = 3.8). The lowest mean belongs to variable 2 (M = 2.4).

Correlation of Variables

The results of Pearson’s correlation test indicated that a positive correlation was observed between variables 1, variable 3 and variable 9 ($p < 0.01$) while it was negatively correlated with variable 2. Further, a positive and meaningful correlation was observed between variable 10 and variable 4 ($r = 0.6$), and variable 5 ($r = 0.5$). In addition, there is positive and meaningful correlation between variable 11 and variable 6 ($r = 0.6$), with variable 7 ($r = 0.6$) and variable 8 ($r = 0.7$).

The results of the study showed that the intensity of correlation between variable 9 and variable 12, between variable 10 and variable 12, and between variable 11 and variable 12 is equal to 0.59, 0.5 and 0.52, respectively. The results also indicated that a meaningful correlation was reported between variable 12 and variable 13 ($r = 0.7$).

Correlation Analysis of the Research Components

Amongst the different influencing variables of attitude, the highest level goes to variable 1 ($r = 0.5$). Regarding subjective norms, variable 4 had the highest correlation ($r = 0.4$). Amongst the different variables on behavioural control, variable 7 and variable 8 had the highest correlation ($r = 0.4$). Finally, regarding behavioural tendency, the highest correlation was observed between variable 9 and variable 12 ($r = 0.6$).

Recommendations for Research Hypotheses

Regarding the results of research hypotheses, the following recommendations are made.

It is suggested that the banks must expand their service offerings via m-banking and must encourage customers to use it.

m-banking software must be simple to handle and easy to understand for customers.

Because of the increasingly rapid changes of environment, every six months or every year, a field study should be performed for the customers in order to achieve an accurate understanding of the customers’ basic needs and substantial beliefs.

Employees must be trained enough to promote m-banking services not only in-house (within the branch), but also by becoming brand ambassadors in promoting m-banking services at other places as well.

It is also recommended to hold regular meetings with managers of different organizations explaining the advantages of using mobile banking services, they are more encouraged and motivated toward using mobile banking services and are requested to introduce these special advantages to their employees.

Banks should enhance the individuals’ self-efficacy in using computers and internet banking systems by holding workshops and training courses.

It is suggested that bank authorities should provide available and ready-made references such as skilled individuals or groups with strong communicative capabilities and appropriate teaching skills via online or telephone for guiding and helping customers in facing problems during internet banking operations in order to improve source facilitator conditions.

Bank authorities are advised to establish internet banking systems in brochures, home pages, websites, mass media, etc., in order to take effective steps in attracting customers' confidence and motivating them to use mobile banking services.

Banking systems authorities should influence families perceptions and attitudes in creating more tendency to use internet banking services by proper advertisements via mass media and correct marketing.

It is suggested that bank managers should provide customers' satisfaction and comfort of mobile banking by having full knowledge of internal and external factors.

Bank managers must use combination of different medium of communication mix (both electronic media and print media) to increase awareness level and must take necessary measures to create positive attitude on use ability of mobile banking amongst general public.

CONCLUSIONS

The basic purpose behind writing this paper is to identify those variables that causes shift of customers from e-banking to m-banking of State Bank of India. It was identified that perceived benefits of using the banking services over mobile phones, influence of peer groups, service provider facilitating conditions and technology are the major influencing factors. It was suggested that banking institution must extend their services offering through the m-banking and more and more customers must be encouraged and convinced to use m-banking services.

An Intelligent Universal Remote Control for Home Appliances

K Girija Rani¹, S Rama Kishore², Basava Dhanne³

¹M.tech Student, ²Associate Professor, ³Assistant Professor, Dept of ECE,
CMR Engineering College, Hyderabad, Telangana

ABSTRACT

In this Paper Wi-Fi module is introduced to make easy usage of home appliances with mobile application called as IoT-device-control. It is implemented using Arduino software to control home appliances. Through Wi-Fi, control the switching access of multiple appliances in the house from one place. It can be also useful to physically handicapped people to operate home appliances without facing any difficulties. What's more, traditional strategies for correspondence between remote controllers and associated are IoT applications. In earlier days Point-n-Press tends to the directionality include, which empowers simple and instinctive control by indicating the objective gadget to show the objective's control interface on the screen of the remote controller. To address these issues, a wise general remote control system for home appliances is proposed. That application can be used to control all the home appliances operating from anywhere trough internet. By this reduce the space for remote controllers for each and every device. It creates new IP address every time which can protective from hacking.

Keywords: *Arduino controller, Wi-Fi module, LCD module, mobile application, IP address, IoT,*

INTRODUCTION

Internet of Things (IoT)^[1] is a technology that connects all things and the Internet in smart spaces. By implementations of intelligence with sensing devices, IoT has been widely applied to different fields, such as smart homes^{[2], [3]}. The application fields in smart homes^[4] incorporate smartness into home areas for comfort, safety, security, healthcare, and energy conservation^{[5], [6]}. The need for comfort and a convenient life are especially important in smart homes. Thus, home automation is one of the most essential and critical components for the IoT-based smart home technology.

Home automation systems are used to control home devices or appliances in smart homes and provide automatic remote control inside or outside homes^[7]. Nevertheless, although remote control provides convenience and ease of use, some major problems require consideration and improvement, such as how to provide an intuitive and user-friendly remote control scheme in IoT-based smart homes^[8]. The goal of this paper is to develop an intelligent universal remote control system for home appliances. Two real prototypes are implemented in smart homes to demonstrate the feasibility of the proposed scheme. In this control

prototype is implemented in a mobile phone; a fan can be directly controlled by mobile application. Note that two state dependencies are included in the control process of the fan. First, the fan can only be started by pressing the "Power" button when it is powered off, whereas pressing other buttons is useless. Second, the "wind speed" button has no effect on the fan when the fan is in sleep or natural mode, because the wind speed is automatically adjusted. Thus, by considering the state dependencies, only functional buttons that are relevant to the current context are displayed on the screen of the controller.

Related work

The home computerization controls the home gear. "Spare ELECTRICITY" is the primary motivation behind home robotization. The adequate utilization of power is essential in day by day routine life. The home hardware or office gear naturally controlled by everybody. Different kinds of advancements are studied in this paper. Presentation of a few remote correspondences, for example, GSM, ZIGBEE, WIFI and Bluetooth are talking about here. Home computerization framework (HAS) spares time, cash even power, man workforce. The detail of home computerization framework is

Reliable, Secured, adaptable, easy to understand and moderate. The remote innovation is more celebrated in mechanization process. Any sort of home machines can be controlled and observed through the home robotization by means of web. In some task Bluetooth and GSM innovation is utilized. GSM innovation home machine is controlled by message administrations and in Bluetooth innovation home apparatus is controlled utilizing android applications application. The data of the home mechanization segments, for example, sensors, techniques, remote innovation.

Bluetooth based Home Automation framework utilizing mobile phone.

In this paper creator planned Bluetooth based robotization. An independent Arduino BT board and the apparatuses of home are associated with the information and yield ports of this board by means of transfers.

The Arduino BT board can be modified remotely finished the association of Bluetooth utilizing the microcontroller’s abnormal state intelligent C dialect. The approved clients are just permitted to getting to the home machine so assurance is finished by giving a secret key. The remote correspondence is built up between the mobile phone and the Arduino BT board. Python content is utilized where it is versatile and can keep running on any of the Symbian Operating System stage. To demonstrate the status of the gadget in the wake of accepting a charge from mobile phone the criticism circuit is outlined and actualized. The calculation which collaborate with the cell phone Bluetooth stack and show the rundown of known gadgets. Figure 1 has shown the block diagram of proposed system. In block diagram use the wi-fi module is connected to the arduino controller and the loads can be connected as output side. And the loads can be controlled by using mobile application.

Figure 1: Block Diagram of home automation

Hardware Description

Arduino Controller

The Arduino UNO is a broadly utilized open-source microcontroller board in view of the Microchip ATmega328P microcontroller and created by Arduino. cc. The board is furnished with sets of computerized and simple information/yield (I/O) sticks that might be interfaced to different extension sheets (shields) and other circuits. The board highlights 14 Digital pins and 6 Analog pins. It is programmable with the Arduino IDE

(Integrated Development Environment) through a sort B USB cable.

It can be fuelled by a USB link or by an outside 9 volt battery; however it acknowledges voltages somewhere in the range of 7 and 20 volts. In Figure 2 as shown the flowchart of this project. In this flow chart explain how control the loads in home by using the arduino controller.

Liquid-Crystal Display

LCD is a flat panel display, electronic visual display

that uses the light modulation properties of liquid crystals. Liquid crystals do not emit light directly. LCDs are available to display arbitrary images or fixed images which can be displayed or hidden, such as preset words, digits, and 7-segment displays as in a digital clock. They use the same basic technology except that arbitrary images are made up of a large number of small pixels, while other displays have larger elements.

Board hardware resources features Wi-Fi Module

ESP8266 is a 3V Wi-Fi module extremely mainstream for its Internet of Things applications. The ESP8266's greatest voltage is 3.6V, so the thing has a locally available 3.3V controller to convey a sheltered, steady voltage to the IC. That implies the ESP8266's I/O sticks additionally keep running at 3.3V, you'll have to Logic Level Controller any 5V signals running into the IC.

Opto Coupler

Transformers separate the essential info voltage from the optional yield voltage utilizing electromagnetic coupling and this is accomplished utilizing the attractive transition circling inside their covered iron core. But we can likewise give electrical disconnection between an information source and a yield stack utilizing simply light by utilizing an exceptionally normal and significant electronic segment called an Opto coupler. The fundamental plan of an opto coupler, otherwise called an Opto-isolator, comprises of a LED that produces infra-red light and a semiconductor photograph touchy gadget that is utilized to recognize the discharged infra-red bar. Both the LED and photograph touchy gadget are encased in a light-tight body or bundle with metal legs for the electrical associations.

Arduino Software

Arduino is a model stage (open-source) in light of a simple to-utilize equipment and programming. It comprises of a circuit board, which can be programmed (alluded to as a microcontroller) and an instant programming called Arduino IDE (Integrated Development Environment), which is utilized to compose and transfer the PC code to the physical board. Arduino gives a standard shape factor that breaks the elements of the miniaturized scale controller into a more available bundle.

Flow Chart

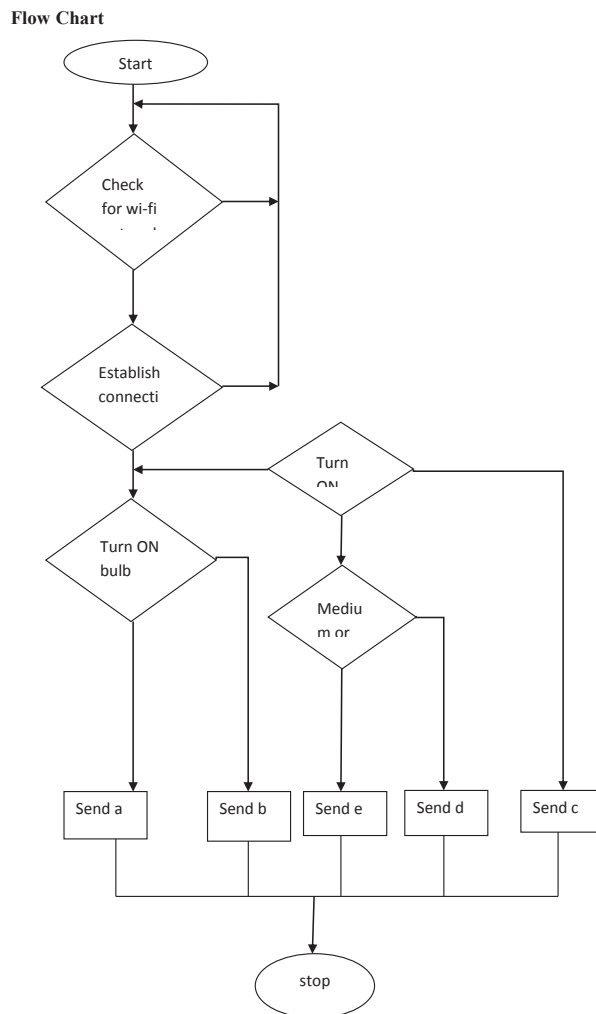

Figure 2: flow char of home automation

RESULTS AND DISCUSSION

An intelligent universal remote control for home appliances circuit connected with respected to block diagram is shown in the Figure 3. At first open the mobile app and set the IP address. IP address is from the Wi-Fi module which unique after that by using app the home appliances can control. If Press the fan ON button in mobile app then FAN will be ON as shown in Figure 4 & this also can be shown in LCD module. If press the fan OFF button then FAN is OFF. If press the load1 ON button in mobile app then the first bulb1 will be ON as shown in Figure 5 & this can be shown in LCD module. If press the load1 OFF button then bulb1 is OFF. If press the load2 ON button in mobile app then the first bulb2 will be ON as shown in Figure 6 & this can be shown in LCD module. If press the load2 OFF button then bulb2 is OFF. Likewise all the loads can be controlled.

Figure 3: Complete module with input devices

Figure 4: Output When Fan is ON

Figure 5: Output when load1 is ON

Figure 6: Output when load2 is ON

Mobile app:

By using this mobile application to control all the home appliances from one place. In this application first access the IP address then the loads will control.

CONCLUSION

At last presumed that our strategy works adequately on smart home appliances by utilizing android

application controlled through Wi-Fi module. With the demonstration of genuine model controlling appliances in homes. The feasibility of an intelligent universal remote control system for home appliances with intuitive and user-friendly features is verified. In future work will extend the controller as raspberry pi 3, by using this the cost of the design will reduced because of raspberry pi 3 is have on board Wi-Fi module. The range can also increased by using advanced wireless technologies.

TMD Material A Revolution for Next Generation Transistors

N Soujanya¹, T Satyanarayana², T Madhavi³

¹Asst Prof, ²Assoc Prof, ³Assoc. Professor, CMR Engineering College

ABSTRACT

Today's world is technologically emerging world. In which everything is technology oriented. In this changing environment every well equipped system need to be very efficient. In this new era of electronics industry there is need of devices which are having high speeds, enough band gap, high On/Off ratio and also high efficiency in-turn having less leakage current and occupancy. Up to some extent this can be achieved by using a new generation 2-D materials. In this paper we present an extensive study on TMD material Molybdenum Disulphide (MoS₂) which is a combination of Transition metal and di-Chalcogenide atoms (TMD). These are rigorously researched now a day due to their excellent semi conductor properties and also excellent temperature sensitivity. Not only in the area of semiconductor devices, these TMD's are also applicable in many areas like Optoelectronic devices, Gas sensing devices (GSD), Energy storage devices (ESD) etc.

Key Terms: TMD, MoS₂, GSD, ESD, Leakage current, On/Off ratio, Ballistic conduction, Band gap etc.

INTRODUCTION

The days when devices made of vacuum tubes sat murmuring in whole devoted rooms and could do around 360 duplications of 10 digit numbers in a second. In spite of the fact that they were proclaimed as the quickest figuring devices of that time, they definitely don't stand a shot when contrasted with the cutting edge devices. Current semiconductor devices are getting littler, quicker, and less expensive and more power proficient each advancing second. Be that as it may, what drove this change? The entire space of figuring introduced another day break of electronic scaling down with the appearance of semiconductor transistor by Bardeen (1947-48) and afterward the Bipolar Transistor by Shockley (1949) in the Bell Laboratory. Since the development of the primary IC (Integrated Circuit) as a Flip Flop by Jack Kilby in 1958, our capacity to pack an ever increasing number of transistors onto a solitary chip has multiplied generally at regular intervals, as per the Moore's Law. Such exponential advancement had never been found in some other field despite everything it keeps on being a noteworthy territory of research work^[1].

The advancement of microelectronics traverses a period, which is considerably lesser than the normal future of a human, but then it has seen upwards of four ages. Mid 60s saw the low-thickness creation forms

arranged under Small Scale Integration (SSI), in which transistors were restricted to around 10. This quickly offered approach to medium-scale integration in the late 60's when around 100 transistors could be put on a solitary chip.

It was the time when the expense of research started to decay and private firms began entering the opposition rather than the prior years, where the principle load was borne by the military. Transistor-transistor logic (TTL) offering higher coordination densities that outlived other IC families like ECL turned into the premise of the primary incorporated circuit insurgency. It was the creation of this family that offered force to semiconductor goliaths like Texas Instruments, Fairchild, and National Semiconductors. Mid seventies denoted the development of transistor check to around 1000 for every chip, called the expansive scale reconciliation ^[2].

By mid-eighties, the transistor depend on a solitary chip had just surpassed 1000, and consequently came the period of Very Large Scale Integration or VLSI. In spite of the fact that numerous enhancements have been made the most of and the transistor is as yet rising, additionally names of ages like ULSI are for the most part maintained a strategic distance from. It was amid this time TTL lost the fight to MOS family inferable from similar issues that had pushed vacuum tubes into carelessness.

VLSI is ruled by the CMOS innovation and much like other rationale families ^[3], this too has its confinements which have been combat and enhanced since years. Taking the case of a processor, the procedure innovation has quickly contracted from 180 nm in 1999 to 60nm out of 2008 and now it remains at 45nm and endeavors being made to decrease it further (32nm) while the surface area which had contracted at first presently is expanding attributable to the additional advantages of more prominent pressing thickness and a bigger element measure which would mean more number of transistors on a chip. ^[4]

As the quantity of transistors increment, the power dispersal is expanding. In the event that warmth created per unit region is to be viewed as, the chips have just neared that of the spout of a stream motor. In the meantime, the Voltage scaling of edge voltages past a specific point presents genuine impediments in furnishing low unique power scattering with expanded many-sided quality. The quantity of metal layers and the interconnects be it worldwide and nearby likewise have a tendency to get chaotic at such nano levels.

Indeed, even on the creation front, we are before long drawing nearer towards the optical furthest reaches of photolithographic forms past which the element measure can't be lessened because of diminished exactness. This opened up Extreme Ultraviolet Lithography strategies. Fast tickers utilized presently make it difficult to diminish clock skew and thus putting timing requirements. This has opened up another outskirts on parallel preparing. Or more all, we appear to be quick moving toward the Atom-Thin Gate Oxide layer thickness where there may be just a solitary layer of atoms filling in as the oxide layer in the CMOS transistors. New options like TMD innovation are turning into a functioning territory of research inferable from this ^[5]. Numerous businesses are calling for gadgets that can work dependably in an unforgiving domain, including extraordinary temperatures over 200° Celsius. Precedents of the high temperature applications incorporate turbine motor control in aviation and gadgets or sensors utilized for boring activity in oil and gas industry. Albeit conventional cooling frameworks can

enable gadgets to work at high temperatures, in a few applications, cooling may not be conceivable or it might be additionally engaging for the hardware to work hot to enhance framework unwavering quality or decrease cost. Be that as it may, the accessibility of transistors and circuits for high temperature task is extremely constrained. This issue is also answered to some extent by TMD's.

II EVOLUTION OF TMD's

Silicon is quickly achieving its cutoff points yet client interest for control is continually expanding. Soon another material needs to venture in and give the truly necessary handling power ^[6]. Molybdenum disulphide gadgets indicate much guarantee in the field of nanometer scale gadgets however whether they turn into the semiconductor without bounds stays misty.

A group of analysts from Stanford have made transistors from molybdenum disulphide utilizing standard modern compose generation systems. Will silicon at long last be supplanted once transistors can't be made any littler utilizing silicon? Transition metal dichalcogenides (TMD) mono layers are atomically thin semiconductors of the type MX_2 , with M a transition metal atom (Mo, W, etc.) and X a Chalcogenide atom (S, Se, or Te) as shown in the periodical table of Figure 1. The structure of a monolayer TMD is shown in the Figure 2. One layer of M atoms is sandwiched between two layers of X atoms ^[7]. They are part of the large and new family of the so-called 2D materials, name used to emphasize their extraordinary thinness. For example a MoS_2 monolayer is only 6.5 Å thick. The key feature of these materials is the interaction of large atoms in the 2D structure as compared with first-row transition metal dichalcogenides, e.g., WTe_2 exhibits nearly a great amount of magneto resistance and superconductivity properties which make these materials interesting to study ^[8]. Having a direct band gap these TMD's have become promising materials in optoelectronics ^[9]. They also have many applications in various areas like digital switches ^[10], analog amplifiers etc.

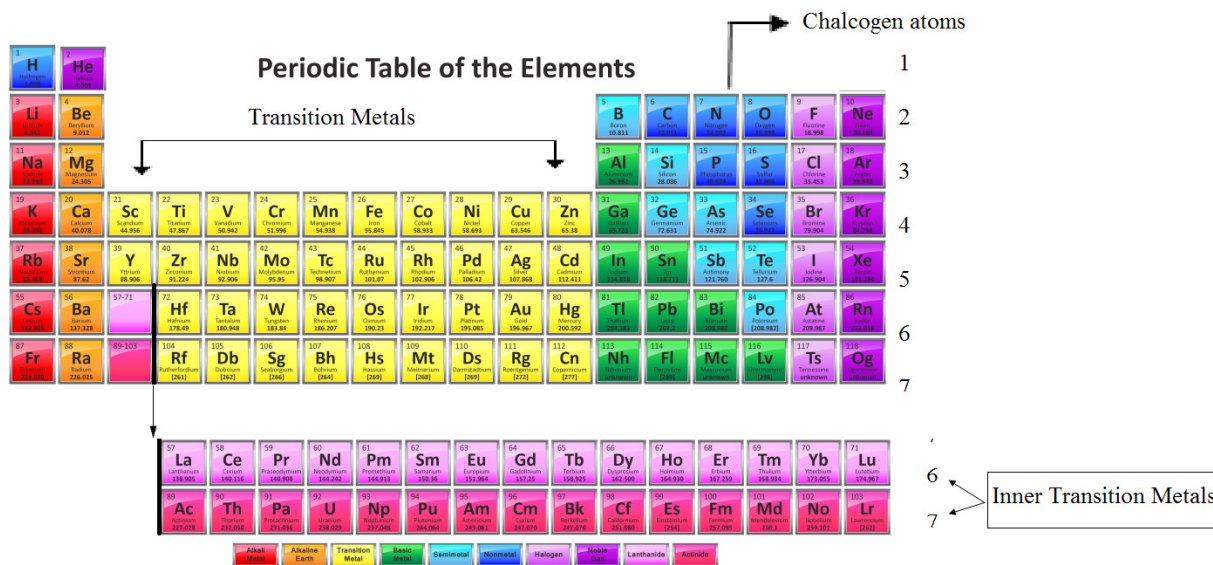

Figure: 1 Periodic table showing transition metals and Chalcogenide atoms

Figure: 2 (a) Structure of a hexagonal TMD monolayer. M atoms are in black and X atoms are in yellow. (b) A hexagonal TMD monolayer seen from above.

The discovery of graphene^[11] shows how new bodily properties emerge while a bulk crystal of macroscopic dimensions is thinned all the way down to one atomic layer. Like graphite, TMD bulk crystals are fashioned of mono layers bound to each different by Van-der-Waals appeal^[12]. TMD mono layers have properties which are tremendously one-of-a-kind from those of the semimetal graphene.

- TMD mono layers MoS₂, WS₂, MoSe₂, WSe₂, and MoTe₂ have a direct band hole, and can be utilized in electronics as transistors and in optics as emitters and detectors^[13].
- The TMD monolayer crystal shape has no inversion center, which permits to access a new diploma of freedom of price vendors, particularly the okay-valley

index, and to open up a brand new area of physics: valleytronics

- The strong spin-orbit coupling in TMD mono layers results in a spin-orbit splitting of masses in the valence band and some within the conduction band, which allows management of the electron spin through the excitation laser photon strength and handedness.

The paintings on TMD mono layers is an emerging studies and development area for the reason that discovery of the direct band gap and the capability programs in electronics and valley physics. TMDs are often blended with different 2d materials like graphene and hexagonal boron nitride to make Vander Waals hetero structures.

PROPERTIES OF MoS2

Thermally steady and highly versatile at high temperatures: Utilizing standard lithography systems in a spotless room condition, Balandin’s group at Stanford University fabricated molybdenum disulfide transistors on silicon substrates for high-temperature tests. Some had only a couple of layer and others had increasingly, numerous layers . The generally thick layers were all the more thermally steady and exhibited a higher versatility at hoisted temperatures, as per Balandin.

Ballistic conduction: As per the Stanford specialists, when molybdenum disulfide transistors are on the size of 10nm, electrons diffuse by employing ballistic conduction, which is when electrons quit dispersing as they travel through the material. This diffusing is the thing that causes resistivity in materials—without it, a material basically has almost 0 resistances [14].

Higher-speed: Eric Pop trusts that, if the nature of the semiconductor material is enhanced and the transistor decreased in estimate, this ballistic conduction number will increment. This would result in higher-speed gadgets which can direct more present without warming up as much as a silicon gadget.

Larger Band Gap: A solitary layer molybdenum disulfide demonstrates a band gap of 1.9 eV, which is bigger than that of silicon and gallium arsenide. This is valuable for the high temperature applications. The nearness of a bigger band gap implies that a gadget can be effortlessly turned on and off, a significant property for transistor’s activity.[15]

High switching speed: Not at all like graphene, molybdenum disulfide has a vitality band gap, which means its conductivity can be turned on and off. Such a characteristic is basic for semiconductor gadgets utilized in processing.

Optical Ability: Another distinction is that molybdenum disulphide transmits light, which means it could be utilized in applications like LEDs, self-detailing sensors and optoelectronics.

High On/Off ratio: If a transistor is manufactured using MoS2it can have a very high on/off ratio. We need 1’s and 0’s to do computation; graphene can only give us 1’s and .5’s and MoS2 gives the required one’s due to its high band gap [16].

Less Energy Consumption: The researchers also report that transistors made from molybdenite will use 100,000 times less energy in a standby state than traditional silicon transistors.

Low contact resistance of 0.21micro ohm

Less power dissipation: Being just a single layer thick, they speak to a definitive point of confinement of scaling in the vertical course and could offer decreased power dissipation due to littler short channel impacts [17].

Easy to Fabricate [10]: The fabrication and also synthesis of MoS2 is simpler and also similar to that of Silicon [18].

Formation of high K dielectric on the surface: Upgraded oxygen plasma treatment of MoS2 surface can fundamentally enhance the development conduct of ALD high-k dielectrics on MoS2, giving an imperative ramifications to coordination in FET applications [19]

The Table 1 below summarizes the properties of MoS₂.

SNo	Property	Range
	Thermal stability	High
	Ballistic conduction	High
	Time Delay	Less
	Band Gap	1.9eV
	switching speed	high
	On/Off ratio	high
	Energy Consumption	Less
	contact resistance	0.21micro ohm
	Power Dissipation	Less
	Fabrication Process	Easy

Table: 1 Table showing the properties of MoS₂

MoS₂ TRANSISTOR DESIGN

Professors from Stanford University have designed the transistors using MoS₂ [20]They have rigorously worked on it and they have brought down the wafer size of 31 layers of MoS₂ to 10nm. Also these transistors were found to have good properties for the next generation electronics. The devices so found were able to work with high stability even at high temperatures of above 200 degree Celsius. Hence forth the requirement of coolers can be reduced to some extent. These devices

can have applications in harsh environments like sensors used for drilling in Oil & Gas Industry, Turbine Engine control in aero space Industry etc. Where these are high temperature required applications MoS₂ transistors can withstand such high temperatures. The below Figure 3 shows the construction of a FET using TMD.

Figure 3: MoS₂ Transistor Structure

The device in the Figure 3 comprises of two field-effect transistors in series and characterized by three gold leads that fill in as source and drain terminals for the two transistors. Monolayer MoS₂ is secured by 30 nm of ALD-with HfO₂ deposited on it which acts as both gate dielectric and a mobility enhancer.

Single layers of MoS₂ have an extensive characteristic band gap of 1.8 eV already revealed mobilities in the range of $0.5 \times 10^{-3} \text{ cm}^2$ which were found to be very low. Hence Hafnium oxide was used as a gate dielectric to get the expected characteristics. At room temperature the FET was able to exhibit the mobility of $200 \text{ cm}^2 \text{ V}^{-1} \text{ S}^{-1}$ and also an ON/OFF ratio of 1×10^8 . They also exhibited very less power dissipation and due to their direct band gap they are able to provide less power consumption. It has also provided a less leakage of $2 \text{ pA } \mu\text{m}^{-2}$. Below Table 2 exhibits some of the properties of MoS₂ FET's.^[21]

Table 2: Properties of MoS₂

ON/OFF ratio	mobility	Gate dielectric	Leakage current
1×10^8	$200 \text{ cm}^2 \text{ V}^{-1} \text{ S}^{-1}$	HfO ₂	$2 \text{ pA } \mu\text{m}^{-2}$.

CONCLUSION

Observing all the above properties it can be assumed that the 2-D material MoS₂ can be a promising material for the next generation transistor fabrication. It has all the properties which a semiconductor should possess to operate as perfect device with a better control. Properties

of monolayer MoS₂ like high thermal stability, chemical inertness, transparency, flexibility, and relative inexpensiveness give MoS₂ transistors a unique advantage for several low cost electronic applications.

A Thorough Investigation on Designs of Digital Hearing Aid

T Madhavi¹, N.soujanya², A Chaitanya Krishna³

¹Assoc Prof, ²Asst Prof, ³Asst.Professor, CMR Engineering College

ABSTRACT

Hearing loss which looks a very common health issue but affects nearly 10% of the world population as indicated by many international studies. Hearing disorders effectively frail sensitivity to the sounds ordinarily heard. Deafness and speech perception are two different categories of hearing losses. Any Hearing Impaired (HI) person is an applicant of wearing a hearing aid. This paper describes various design techniques and speech enhancement algorithms of Digital Hearing Aids (DHA).

Keywords: DHA, HI, DSP's, Filter bank speech enhancement, Noise Reduction

INTRODUCTION

HI typically experience more frustration, anxiety, irritability, depression, and disorientation than those with normal hearing levels. People who are suffering from deafness are not able to understand discourse even in the presence of amplification.^[1] Another aspect is speech perception, which involves the speech clarity rather than amplitude. Hearing disorders may occur due to birth defects or it may occur due to accident. The two main categories of hearing losses are conductive and sensor neural. Hearing loss can also be attributed to a combination of both types, a mixed hearing loss ^[2].

The audible frequency range for human ears is 20 Hz to 20 kHz and human hearing is most sensitive in the range of 1 kHz to 4 kHz ^[3]. Hearing is measured in decibels. In all frequencies 0 to 20 db is the normal hearing range. To identify the hearing loss pattern, technical researches have been conducted and conclude some plots, like spectrograms and other is audiogram. With the help of Audiogram, hearing can be plot on graph or in other words audiogram may define as, a graph that shows the audible threshold for standardized frequencies as measured by an audiometer^[4].The horizontal axis of audiogram represent frequency in Hz, vertical axis indicates the amplitude in db as shown in Figure 1.

Figure1: Frequency versus Amplitude of Hearing Level

At the end of a hearing test, hearing levels decide the degree of hearing loss. Hearing loss is measured in decibels hearing level (dB). If person can hear sounds across a range of frequencies at -10dB-20dB it will be considered as having normal hearing. Now days digital hearing aid are preferred over analog hearing aid, as these are programmable. Digital hearing aids have greater precision in adjusting electro acoustic parameters with self monitoring capabilities, have also feature of acoustic feedback. Noise in hearing aids can be reduced by advanced signal-processing techniques it also helps in automatic control of signal level.

DESIGNS

In 1980's the development of fast DSP chip technology in a small size has brought a number of notable efforts in the design of wearable DSP hearing

aids [5]. As the technology developed there are so many advancement and changes taking place in designing process of digital hearing aids using DSP's. The following Figure 2 shows the basic block diagram of DHA using DSP [6].

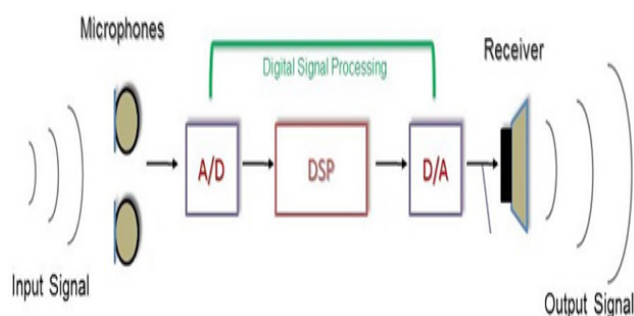

Figure2: Basic DHA using DSP

The introduction of DSP in hearing aid designed by using DSP's noise reduction, compressions, directionality of the signals can be achieved rigorously as compared to analog processors.

Hardware Designs

The variations in the hardware designs are mainly the changes in filter banks of DSP. Some of them are discussed below.

The design of digital hearing aid with digital IIR filter was discussed in paper [7]. The structure of filter had a combination in parallel form of IIR (Infinite Impulse Response) a low-pass, a band-pass and a high-pass filter. The filter coefficients of IIR filter were obtained from the optimization procedure by Genetic Algorithm (GA). The error between desired magnitude response and actual magnitude response was minimized by GA.

Uniform filter bank design for digital hearing aid application has meet the following requirements such as strong alias suppression, with low delay and sufficient frequency resolution^[8] which simplifies sub sampling of the bands and thus helps saving power.

In the application report [9], was describe the development of a low power binaural wearable digital hearing aid platform based on the TMS320C5000E fixed point digital signal processor (DSP). It provided for frequency shaping using multichannel FIR filters, noise suppression, multiband amplitude compression, and frequency dependent intraoral time delay algorithms.

The focus of this [10] paper was on the algorithms used to build digital compression systems. Of the various

approaches that could be used to design a digital hearing aid, this paper considers broadband compression, multi-channel filter banks, a frequency-domain compressor using the FFT, the side-branch design that separates the filtering operation from the frequency analysis, and the frequency-warped version of the side-branch approach that modifies the analysis frequency spacing to more closely match auditory perception.

In [11], a 3-channel VFB approach has been proposed for digital hearing aid applications. As compared with traditional filter-banks with fixed bandwidths, the proposed 3-channel VFB was constructed by parallelizing variable low pass, band pass and high pass digital filters whose both magnitudes (gains) and bandwidths could be independently tuned for matching various hearing loss patterns.

Software Designs

Software design variations are of algorithms developed for further improvements in noise reductions and enhancement of speech quality. Algorithms are designed to support the minicomputers of digital hearing aids to know how to sort and categorize different noises and environments. Some of them are described below.

In this algorithm [12](2017), the gains are calculated in the time domain, which avoids the process of the inverse Fourier transform and leads to a decrease in computational complexity. Compared with the traditional spectral subtraction and basic Wiener filtering method, the delay in this algorithm is reduced by 40.4 and 60.6%, respectively. It is also compared with the modulation depth integrated into hearing aids under an experimental simulation and a real scenario. The results indicate that the output SNR is improved by 1 dB under the software simulation and 3.1 dB in the real scenario when the input SNR is set as 10 dB. Compared with the simulation environment, the proposed algorithm only fell by 1.5% in the real scenario.

Santosh et al (2013) [13] proposed a spectral subtraction technique is in modern hearing aids utilized for real-time speech enhancement in the aids used by hearing impaired listeners. For reducing computational complexity and memory requirement, he used a cascaded-median based estimation of the noise spectrum without voice activity detection. The technique is implemented and tested for satisfactory real-time operation, with sampling frequency of 12 kHz, processing using

window length of 30 ms with 50% overlap, and noise estimation by 3-frame 4-stage cascaded-median, on a 16-bit fixed-point DSP processor with on-chip FFT hardware. Enhancement of speech with different types of additive stationary and non-stationary noise resulted in SNR advantage of 4 – 13 dB.

Heinrich and Peter Vary (2012) in ^[14] proposed A beamformer for binaural speech enhancement systems for digital hearing aids. Its single modules for the estimation of the time-difference-of-arrival (TDOA) and time-alignment operate in the frequency-domain and have a low computational complexity. The TDOA estimation is performed efficiently by a generalized cross-correlation with phase transform weighting. The estimation accuracy for filter-banks with a limited number of subbands, which are needed for hearing aids to meet tight delay constraints, is improved by a histogram-based TDOA estimation. The subsequent time-alignment is accomplished by a simple multiplication with spectral phase factors.

Ulrik Kjems et al (2012) ^[15] has proposed Multi-microphone speech enhancement systems can often be decomposed into a concatenation of a beam former, which provides spatial filtering of the noisy signal, and a single channel (SC) noise reduction filter, which reduces the noise remaining in the beam former output. Here they proposed a maximum likelihood based method for estimating the inter microphone covariance matrix of the noise impinging on the microphone array. This method allows prediction of this co-variance matrix for non-stationary noise sources even in signal regions where the target speech signal is present. they used it in for estimating the power spectral density (psd) of the noise entering the SC filter.

John Woodruff et al (2011) ^[16] proposed methods for using the directionality of sound energy as a criterion to estimate single- and multichannel linear filters for suppression of diffuse noise and reverberation in a hearing aid application. They compare conservative strategies where direction of arrival is unknown and more aggressive strategies where their proposed methods can be used to derive a fast acting post-filter for the output of a beam former. They showed that in situations where a target of interest is near to the listener while interfering sources are more distant, simple features that capture the directionality of sound energy can be used to attenuate significant undesired signal energy and can be more

effective .

JEON Yu-yong, LEE Sang-min 2011,^[17] proposed a algorithm, to enhance the speech quality that is degraded by environmental noise, reinforce the speech. The minima controlled recursive averaging (MCRA) algorithm was used to estimate the noise spectrum and the partial masking effect which is one of the psychoacoustic properties was introduced to reinforce speech. The performance evaluation was performed by comparing the PESQ (perceptual evaluation of speech quality) and segSNR (segmental signal to noise ratio) by the proposed algorithm with the conventional algorithm. As a result, average PESQ by the proposed algorithm was higher than the average PESQ by the conventional noise reduction algorithm and SNR was higher as much as 3.2 dB in average than that of the noise reduction algorithm.

Junfeng Li, Shuichi Sakamoto, Satoshi Hongo, Masato Akagi and Yoiti Suzuki 2009,^{“ [18]} presented a equalization-cancellation (EC) model which has been extensively studied for expressing binaural masking level difference (BMLD) in psychoacoustics. In this paper, they proposed a two-stage binaural speech enhancement with Wiener filter (TS-BASE/WF) based on the EC model. In this TS-BASE/WF, interfering signals are first estimated by equalizing and cancelling the target signal based on the EC model, and a time-variant Wiener filter is then applied to enhance the target signal given noisy mixture signals. The main advantages of this TS-BASE/WF are: (1) effectiveness in dealing with non-stationary multiple-source interfering signals; (2) success in localizing the target sound source after processing.

HeinrichW. Löllmann and Peter Vary 2009 ^[19] presented a new system for single-channel speech enhancement , which achieves a joint suppression of late reverberant speech and background noise with a low signal delay and low computational complexity. It is based on a generalized spectral subtraction rule which depends on the variances of the late reverberant speech and background noise. The calculation of the spectral variances of the late reverberant speech requires an estimate of the reverberation time (RT) which is accomplished by a maximum likelihood (ML) approach. The enhancement with this blind RT estimation achieves almost the same speech quality as by using the actual RT.

Tim Van et al (2007) [20] described the binaural cue preservation of a noise reduction algorithm for bilateral hearing aids. The researcher utilized multi channel Wiener filter along with interaural transfer function extension (MWF- ITF).

Young et al (2007) [21] proposed a modified spectral subtraction and companding for increasing the speech quality in digital hearing aids. Here the noise level is completely reduced through the adjustment of the biases of the evaluated noise spectrum that depends on the subtraction factor. The channel format is improved

by means of speech indicator via implementing the companding. In this method the weak speech components are extracted during that extraction the noise level is diminished. The algorithm is experimented based on a variety of objective and subjective evaluation. The performance metrics utilized in this paper for evaluating the algorithm is SNR and log likelihood ratio. The Likelihood Ratio (LLR) has a less correlation and SNR has the more correlation with subjective appraises.

The below Table 1 shows various algorithms described till now.

Table 1: Various Algorithms

Author Name	Proposed Algorithm
Jiang, Tao & Liang, Ruiyu	Speech Noise Reduction Algorithm (2017).
David	Based on supervised machine learning and time frequency masking 2013
Santosh	Spectral subtraction technique for real time speech enhancement 2013
Heinrich and Peter vary	Beam former method using Time-Difference-of-Arrival(TODA).2012
Ulrik Kjems	Noise matrix calculation by estimating the power spectral density of the noise present 2012
John Woodruff	Single and multichannel linear filters 2011
JEON-YU-Yong	Minima controlled recursive averaging (MCRA)2011
kluas	Blind source separation(BSS)2010
Apte	Phase spectrum and constant magnitude spectrum are combined 2010
Junfeng Li	Two-stage binaural speech enhancement based on the EC model with Wiener filter(TS-BASE/WF) 2009
HEINrich &Peter	Single channel speech enhancements by using generalized spectral subtraction 2009
TIM Van	Multi channel Wiener filter along with interaural transfer function extension(MWF-ITF) 2007
Sunitha	DCT-LMS 2007
Simon Doclo	Generalized Singular value decomposition (GSVD) 2002

CONCLUSION

Digital technology, in today’s world offers better hearing aid designs. In this paper many designing and speech enhancements techniques of digital hearing aids have been discussed. By studying all these hardware designs and algorithms It has been observed that there is a large scope to develop digital hearing aids by using Open hardware and algorithms using free and open source software which are playing vital role in the current trend technologies and giving custom made solutions. Hence my view by using those we may provide well equipped

digital hearing aids for Indian hearing impaired patients may be at reduced prices.

10T Sram Cell Designing Single Ended Decoupled Read Bit Line

R Bhanuchandar¹, B Harikrishna², Suman Mishra²

¹M.Tech Student, Department of Electronics and Communication Engineering, ²Professor, Department of Electronics and Communication Engineering, CMR Engineering College, Hyderabad

ABSTRACT

Read stability and read speed are the most likely problems encountered in the cells of the SRAM. The access transistors used to access the basic latch takes extra time to read the cell data during the read operation, and more over there exists a possibility of external noise corrupting the cell data. The problem of consumption of extra read time and possibility of noise corrupting the cell data can be circumvented by making use of 10T SRAM cell, modified with single ended decoupled read bit line, providing advantage of speed and noise margin. The conventional 6T SRAM cell is equipped with word line for both read and write processes, but the proposed 10T SRAM cell uses a different read enable line to read the stored bit. This allows the memory element to remain isolated from the external disturbance, additionally the extra time required to activate the access transistors is not required as the read operation in this cell does not require it. The design of read behaviour is analyzed using tanner tool 180nm technology and compared with the reported basic 6T structure.

Keywords: Read Stability, 10TSRAM Cell, Noise Margin, Access Transistor, Tanner Tool

INTRODUCTION

Control dissemination has turned into a top of the line ^[1], ^[2]. As we have hit the usage divider, the low power circuit design, and frame work level methods are searched out ^[3], ^[4]. Moreover, the static random-access memory (SRAM) is the most critical advanced large-scale framework on-chip (SoC) that is ever increasing ^[5]. Diminishing the power dissemination of SRAM won't just lower the general frame work control dispersal but will additionally increment the yield and enhance the SoC unwavering quality ^[6]. Decrease of the supply voltage is the most direct system to lessen the dynamic power dissipation. Be that as it may, 6T SRAM control supply can't be lessened forcefully because of its RSNM debasement. Numerous SRAM cells have been suggested that enhance the RSNM. In this work, the full V_{DD} pre-charge and charge reusing strategy for low power read task is presented. A 4T read port is intended to utilize the proposed strategy. Read BL (RBL) is charged and released through the read port as indicated by the condition of put away piece. Read port is fuelled by virtual power rails that run even and are shared by the

cells of a word. The dynamic control of read port power rails diminishes the RBL spillage considerably.

LITERATURE SURVEY

In this section, description about the different SRAMs is proposed. In the ^[7] the author proposed 9T SRAM cell which exhibited by a 72 Kb SRAM large scale with a Negative Bit-Line (NBL) Write-help and a versatile Read task timing following circuit actualized in 65 nm low-spillage CMOS innovation. Estimated full Read and Write usefulness is without mistake with V_{DD} down to 0.35 V (0.15 V lower than the edge voltage) with 229 KHz recurrence and 4.05 μ W control. In ^[8] the author proposed 9T cell used a plan with independent read and composes word lines; it is demonstrated that the 9T cell accomplishes changes in control dispersal, execution and dependability contrasted and past outlines (that require 10T and 8T) for low-control task. The 9T plot is amiable to little element sizes as experienced in the profound sub-micron/nano scopes of CMOS innovation. The author ^[9] investigated the cut off points of low-voltage task for conventional six-transistor (6T) SRAM and proposes an option bit cell that capacities

an excessive amount of lower voltages. Estimations affirm that a 256-kb 65-nm SRAM test chip utilizing the proposed bit cell works into sub-limit to beneath 400 mV. At this low voltage, the memory offers significant power and vitality reserve funds at the cost of speed, influencing it to appropriate to vitality compelled applications. The author in [10] have manufactured a 64-kb SRAM large scale utilizing 90-nm CMOS innovation and have acquired with it a base VDD of 440 mV and a 20-ns get to time with a 0.5-V supply. In [11] proposed method cell works down to 0.35 V with a read clamour edge of 74 mV and a compose commotion edge of 92 mV. Under this condition, the read and compose commotion edges of the customary six-transistor (6T) cell are 18 and 27 mV, individually. The cell territory is 1.57× the ordinary 6T SRAM cell zone in 45-nm configuration rules.

Existing System

The existing 10T SRAM using half-V_{DD} pre-charge and row-wise dynamically powered read port for low switching power and ultra low RBL leakage is shown in Figure 1.

Figure 1: Existing Circuit Diagram

As shown in the circuit diagram of Fig 1, the 6T SRAM circuit has 6T transistor, which is used for the write operation and 4T transistor, that is used for the read bit line for read operation. This circuit performs read and write operation simultaneously, BL and BLB are the inputs to the circuit for the write operation, whereas Q and QB are the output. In read operation QB is the input of the 4T transistor circuit where as R and RB are the inputs for the read operation and RBL is the output.

Write Operation

Case 1: When W=1, BL=1 and BLB=0.

The operation, when above inputs are given to the circuit, AL and AR transistor are ON. When the BL line goes high, it is conveyed to inverter circuit, making the PR transistor OFF and the NR transistor ON; the data is stored in the memory as QB=0. The BLB line is to go low, so the PL transistor is ON and NL transistor is OFF, which makes the V_{dd} to store as Q=1 in the memory, so the data stored is Q=1 and QB=0.

Case 2: When inputs W=1 and BL=0 and BLB=1.

The operation, when above inputs are given to the circuit AL and AR transistor are ON. When the BL line goes low, it is conveyed to inverter circuit, making the NR transistor is OFF and the PR transistor is ON; the data stored in the memory as QB=0. The BLB line goes to high, so that the PL transistor is OFF and NL transistor ON, which makes V_{dd} to store as Q=1 in the memory, so the stored data is Q=1 and QB=0.

Read Operation

In the read operation, the data that are stored in the memory can be read by the read bit line RBL. RBL is considered as the Q, and the inversion of RBL is considered as the QB.

Case 1: Read operation inputs when R=1 and RB=0 QB=0.

The operation when the input of the inverter circuit QB is low, the N1 transistor is OFF and the P1 transistor is ON. When V_{dd} is at Z node and then R=1, makes the N2 transistor to turn ON, and when RB=0, P2 transistor is ON. This acts as transmission gate then output of the RBL=1. So, the stored data RBL=Q=1 and then QB=0.

Case 2: Read operation inputs when R=1 and RB=0 QB=1.

The operation when the input of the inverter circuit QB is high, the P1 transistor is OFF and the N1 transistor is ON. When V_{dd} is grounded at Z node which goes low and then R goes high. The N2 transistor turns ON and RB goes high to make the P2 transistor ON. It acts as transmission gate then output of the RBL=0, So the stored data RBL=Q=0 and then QB=1.

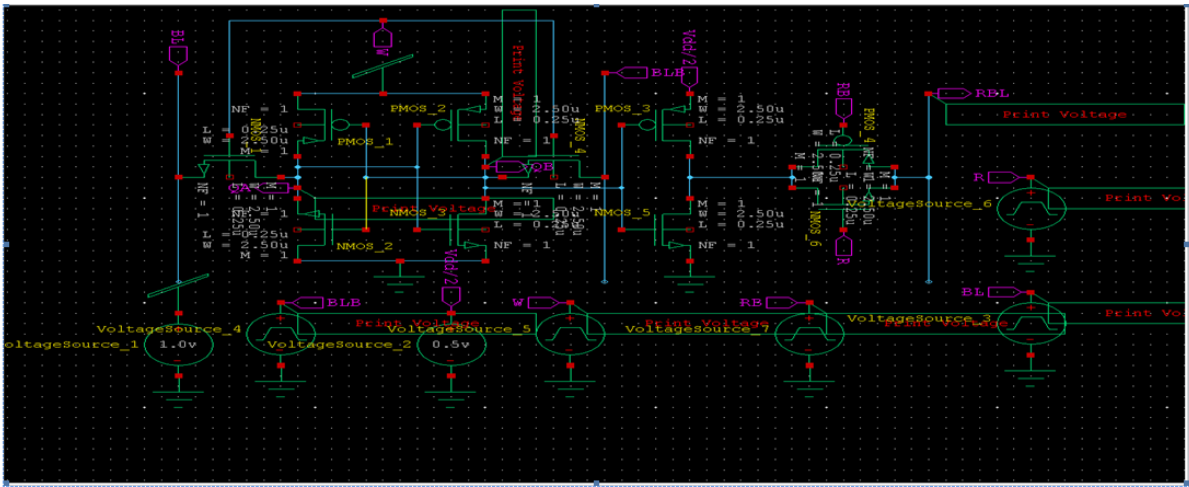

Figure2: Existing 10T SRAM Design Implementation usingTanner Tool

Case 3: When $W=0$, at any instant, the mode is going to be the hold mode. The circuit is realized using the tanner tool and the outputs are shown in the Figure 2. The corresponding results are shown in results section.

Proposed 10T SRAM with Single Ended Decoupled Read Bit Line

The proposed circuit has 10 number of transistors out of which 6 transistors connected to 6T SRAM for write operation. NMOS2 transistors and PMOS1 transistors forms an inverter circuit with NMOS3 and PMOS2 transistors. The inverters circuits are connected in decoupled manner. The design of proposed circuit is shown in Figure 3 and Figure 4 refers to the design in tanner software. The W line, BL line and the BLB line are the inputs to the circuit. For write operation Q and QB are the output. For the read operation QB is the input of the inverter circuit. R and RB lines are the inputs for the read operation and RBL is the output.

Figure 3: Proposed Circuit Design for 10T SRAM

Write Operation

Case 1: When $W=1, BL=1, BLB=0$.

The operation when inputs are high to the circuit, the NMOS-1 transistor and the NMOS-5 transistor are ON.

BL goes high and the high input is given to the inverter circuit, the PMOS-2 transistor is turned OFF and the NMOS-3 transistor is turned ON. The data is stored in the memory as $QB=0$. When $BLB=0$, the PMOS-1 transistor is ON, and V_{dd} is stored in the memory as $Q=1$ which makes the NMOS-2 transistor OFF. So, the data is stored in memory as $Q=1$ and $QB=0$.

Case 2: When inputs $W=1$ and $BL=0$ AND $BLB=1$.

The operation when the above inputs are given to the circuit, the NMOS-1 transistor and NMOS-5 transistor are ON. BL goes low and the low input is given to the inverter circuit, the NMOS-3 transistor is turned OFF and PMOS-2 transistor is turned ON. The data is stored in the memory as $QB=0$.When $BLB=1$, the PMOS-1 transistor is OFF, and the NMOS-2 transistor is ON, and V_{dd} is stored in the memory as $Q=1$.So, the data stored in memory as $Q=1$ and $QB=0$.

Read Operation

During the read operation, the data stored in the memory can be read by the read bit line RBL. RBL is considered as the Q inversion of RBL and is denoted as QB.

Case1:Read operation inputs when $R=1$ and $RB=0$ $QB=0$.

The operation when the input of inverter circuit $QB=0$, NMOS-4 transistor and the PMOS-3 transistor are OFF. When the V_{dd} is at Z node, then R goes high and the NMOS-6 transistor is ON. The RB goes low and the PMOS-5 transistor is ON. This acts as a transmission gate, with the output of the $RBL=1$.So, the data stored in memory as $RBL=Q=1$ and $QB=0$

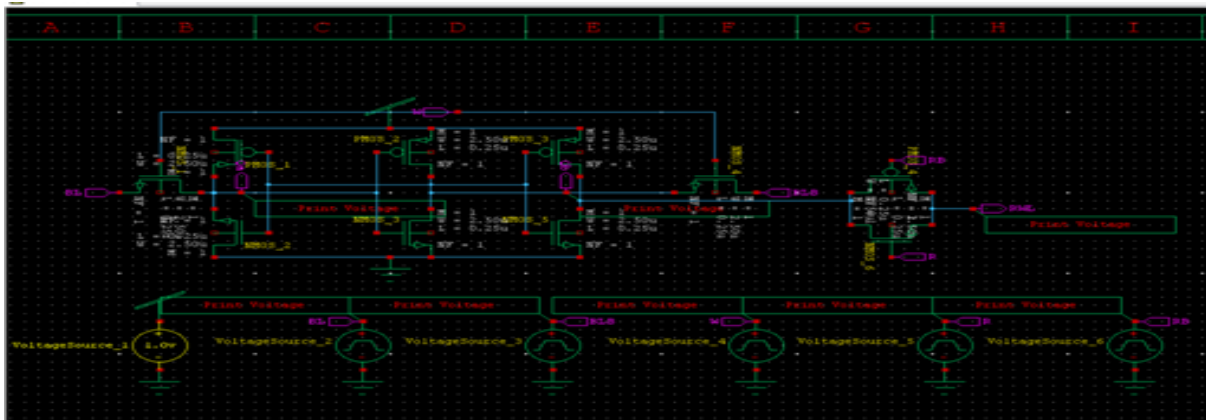

Figure 4: Proposed Circuit Design 10T SRAM Implemented in Tanner Tool

Case 2: Read operation inputs when R=1 and RB=0 QB=1.

The operation when the input to inverter circuit QB goes high, the PMOS-3 transistor is OFF and NMOS-4 transistor is ON. When V_{dd} is grounded and node Z=0, then R goes high and the NMOS-6 transistor is ON, this makes the RB go to low making the PMOS-5 transistor to ON. This acts as a transmission gate with the output as RBL=0. So, the data stored in memory as RBL=Q=0 and automatically QB=1.

Case 3: When the W=0 the circuit goes to the hold mode.

RESULTS AND DISCUSSION

The existing 10T SRAM cell simulation wave form is shown in Figure 5 for read and writes operation, with the read and writes inputs high. The corresponding results are tabulated in the Table 1. Table 2 shows the parameters comparison between the existing method with the proposed method.

Figure 5: Existing Design Results of 10T SRAM Outputs Read and Write Operation in Tanner Tool

Table 1: Result Analysis for Existing Method and Proposed Method

Parameters	Existing Method	Proposed Method
Max Power	2.287543e-008 at time 1e-006	3.354735e-008 at time 1e-006
Parsing	0.00 seconds	0.00 seconds
Setup	0.03 seconds	0.03 seconds
DC Operating point	0.06 seconds	0.06 seconds
Transient Analysis	0.11 seconds	0.11 seconds
Overhead	0.69 seconds	0.41 seconds
Total Read and Write Time	0.89 seconds	0.61 seconds

The proposed 10T SRAM cell simulation wave form is shown in Figure 6 for read and writes operation, with the read and writes inputs being high. Table 2 shows the comparison of 10T proposed system with 6T, 7T, 8T, 9T, 10T existing systems.

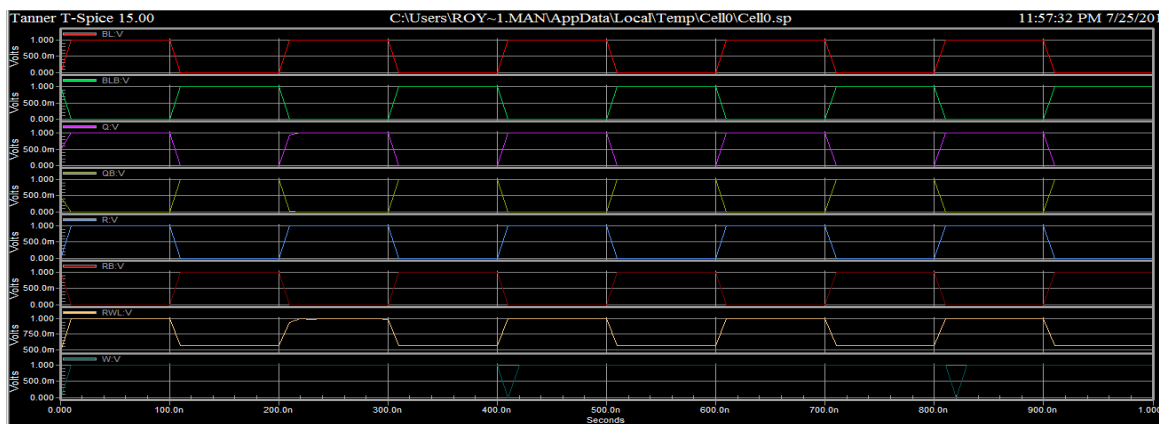

Figure 6: Proposed 10T SRAM Outputs Read and Write Operation Outputs

Table 2: Comparison with 10T Proposed System with 6T, 7T, 8T, 9T, 10T Existing System

Different parameters	6T	7T	8T	9T	10T Existing method	10T Proposed method
Write Stability	Low	Low	Low	Low	Low	High
Read Stability	Low	Low	Low	Low	Low	High
Cell Supply Reduction	Low	Low	Low	Low	Low	High
Power Dissipation	High	High	High	High	High	Low
Leakage Current	High	High	High	High	High	Low
Bit Line I_{On} and I_{Off} Ratio	High	High	High	High	High	Low
Variability	High	High	High	High	High	Low
ReadStaticNoise Margin	High	High	High	High	High	Low
Transient Analysis Time	High	High	High	High	High	Low
Speed of Operation	High	High	High	High	High	High

CONCLUSION

The proposed 10T SRAM circuit and the existing 10T SRAM circuit are simulated using the Tanner Tool software. The performances of both the circuits have been compared. For the proposed 10T SRAM system, the parameters of the system like the Read delay and Read Noise are improved. Hence it is evident that the proposed method produced better performance and high-speed operation. The power consumption of the proposed system is also compared with different types of 6T to 10T SRAMs, which shows advantage over

existing systems. This system can be used in modern satellite communication systems, graphic cards, mobile phones and other low-power applications.

IOT Enabled Waste Management System In Smart Cities

S. Keerthika¹, G Pravalika², Subramanyachari³

¹M.Tech Student, ²Assistant Professor, CMR Engineering College, ³Assistant Professor, CMR Engineering College, Hyderabad, Telangana

ABSTRACT

This paper proposes a waste management system in smart cities. As India is a developing nation, the important challenge is making the country as a smart city. The important concept of smart cities is the waste management which is very much trending and helpful these days. In the earlier existing systems, there is no indication whether the dustbin is over flow, It is more time consuming task and it is less effective. It also makes more traffic and noise. In this system the level of the dustbin will not be known and create the bad smell spreads and cause illness to human beings. In this proposed system, multiple dustbins from the different areas throughout the cities are connected using IOT technology. The dustbin uses low cost embedded devices and it will sense the level of dustbin, then it is sent to the municipality officer. Then the information is sent to the truck driver to collect the waste. The proposed system will help to avoid the overflow of dustbin. It will give the real time information about the level of the dustbin. It will send the message immediately when the dustbin is full. Cost of this system is minimum. Improves environment quality by reducing the smell and make the city clean. It will also reduce the wastage of time and energy for truck drivers.

Keywords: IOT, Smart cities, Waste management, Ultrasonic Sensor, WIFI, GPS.

INTRODUCTION

The Internet of Things (IoT) is the network of physical devices, vehicles, home appliances and other items embedded with electronics, software, sensors, actuators, and connectivity which enable these objects to connect and exchange data. This network allows the objects to be sense and controlled automatically across the existing infrastructure. This network creates the opportunities to integrate the things into computer based network system for improving the efficiency, accuracy, and economic benefits. Things that are connected to the Internet and those devices controlled from the Internet is called Internet of Things. In this system, the smart bin is connected with the internet to display the exact information about the dustbin level and to which area it belongs. In present there was a rapid growth in the population which leads to large quantity of waste disposal in the cities. The overflow of dustbin will create a unpleasant environment and it affect many people by spreading the deadly disease. The implementation of proper waste management system will avoid the spreading of such disease. The dustbins are properly managed and information is seen regularly and the municipality officer make immediate response

by intimating to truck driver. The truck driver will go immediately and collect the waste form the dustbin. Multiple dustbins are connected through the cities. The Dustbins are integrated with ultrasonic sensor, Raspberry pi. The ultrasonic sensor is used to detect the level of dust in the dustbin. After detecting the level of dustbin the information is send to the Raspberry pi at the Central System and Internet connection is enabled through the connection of Wi-Fi module. The Dustbin status whether the dustbin is full or empty and the location of the dustbin will displayed in TELNET APP ^[1]. A definition is required which best suits to the IoT-enabled waste collection in Smart Cities, which is ^[2]: “A Smart City is a city well performing in a forward-looking way in the following fundamental components (i.e., Smart Economy, Smart Mobility, Smart Environment, Smart People, Smart Living, and Smart Governance), built on the ‘smart’ combination of endowments 978-1-4799-8325-4/115/\$31.00 ©2015 IEEE and activities of self-decisive, independent and aware citizens”. This definition contains the fundamental component of Smart Environment which is relevant to environmental pollution. A municipality service which acts as a countermeasure to environmental pollution within the

Smart City is the 10Tenabled waste collection. Related research in the literature addresses the treatment of waste collection as an essential municipal service^[3]. The key issue in the waste management is that the garbage bin at public places gets overflowed well in advance before the commencement of the next cleaning process. This in turn leads to various hazards such as bad odor due to waste decomposition & ugliness to that place which may be the root cause for spread of various diseases^[4]. Our proposed system, 'IoT enabled dustbins' can ease these major issues and will have two major functionalities. First, improvising current waste collection system so that the hazards of waste accumulation and costs in collection process are minimized. Second, prevents spilling of the waste all over the roads maintaining cleanliness. Also, it rewards users with points if it is put in right dustbin so that more citizens can be engaged in proper recycling of waste by use of dustbins. costs related to waste collection are also minimized by routing system based on capacity of municipal trucks and the fullness of the dustbins, in order to get all the waste collected efficiently. In present scenario of digitalizing world everything in our surroundings have been equipped with modern technology and internet to ease our work and gain more efficiency. But the systems existing today for waste management are the same as they were before in most of the countries. Currently, for collection of waste in some countries, we have door to door collection systems that require a lot of efforts and money. A waste collector has to visit everybody's place, knocking the doors, and has to wait till each resident brings the waste to them^[5]. Authors propose a novel IoT-enabled dynamic routing model for waste collection in a Smart City. The proposed model is robust in case of emergency (i.e., a road under construction, unexpected traffic congestion). Related research in waste collection focuses on dynamic scheduling and routing models. However less research states the waste collection as a Smart City service. Concretely, models reported in the literature have not close relation with the concepts of IoT and Smart Cities. This is the focus of the current paper; to enable IoT for efficient waste collection in Smart Cities. Specifically, only in ^[6].it is addressed the waste collection as a problem which can be solved with IoT infrastructure; incorporated in Smart Cities. There are

two main classifications of collecting waste: collecting implementing bins and collecting door-to-door. In the first case on take s into consideration the bin is size and emptied over an area whereas in the second case waste is directly collected from houses and other areas by vehicles^[7]. The Smart Waste Management system that we have proposed and executed in this paper ensures proper storage and retrieval of the waste within a given a period. As waste gets dumped in the garbage pail, on reaching a maximum capacity it will lock down (so as to avoid spillage) and send an SMS so as to inform the authority mentioning that the trash in this particular can is decomposed or the can is full ^[8-11].

PROPOSED WASTE MANAGEMENT SYSTEM:

Figure 1 refers to the over view of proposed design of waste management system using IOT for smart cities. As the power supply given to the board through rectifier circuit which gives the regulated voltage of 5v to the raspberry pi3 model B. Raspberry pi has 40 GPIO pins. Devices interfaced to Raspberry pi are connected through these pins. Two ultrasonic sensors are connected to different pins of Raspberry pi. Ultrasonic sensor HC-SR04 contains 4 pins they are: vcc, trigger, echo, ground. The current consumed by the sensor is less than 15mA and hence can be directly powered by the on board 5V pins (If available). The Trigger and the Echo pins are both I/O pins and hence they can be connected to I/O pins of the Raspberry pi. when dust is dropped in bin slowly. It will detect the level of dustbin .5v d.c power supply is given to all components except Relay it requires 12 dc supply. wifi module ESP 8266 and GPS module is connected to Raspberry pi. GPS module will track the longitude, latitude values and location of the bin .This information is transferred to Raspberry pi through wi-fi. GPS and wifi module transmit the serial data but Raspberry pi will have TTL input So MAX 232 converts the signals from RS 232 Serial port to signals suitable for use in TTL compatible logic. TELNET app is created with IP address 192.168.4.1 in mobile phone. The status of the dustbin is displayed on LCD and Telnet app. The Municipality officer continuously moniter through Telnet app.

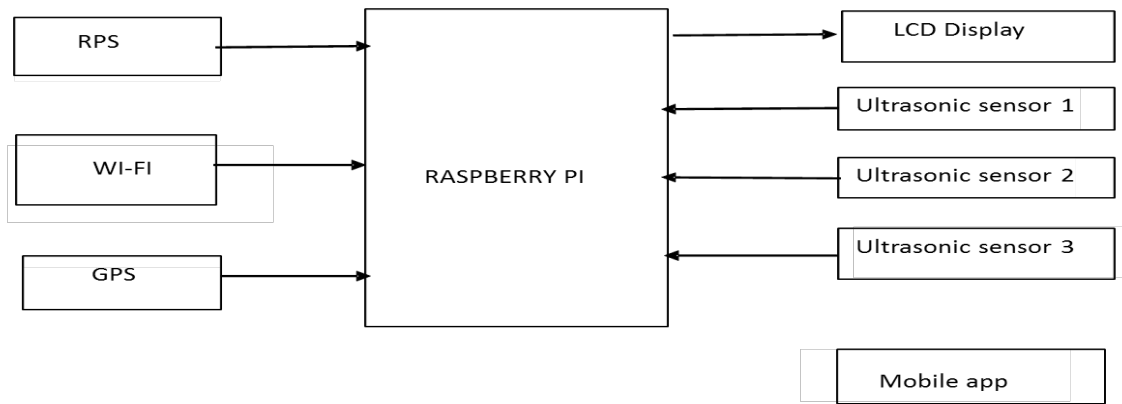

Figure 1: Overall implementation of waste management system

FLOW CHART

Figure 2 represents the flow model of IOT enabled waste management system. In starting process if the dustbin is full it will send the message to the garbage

collection department. If the dustbin is empty it will not send any message it will again go for starting process .if the dustbin is full department will send message to the truck driver. He will collect the dust from the location and the dustbin will be empty and the process stopped. if the dustbin is full the process continues.

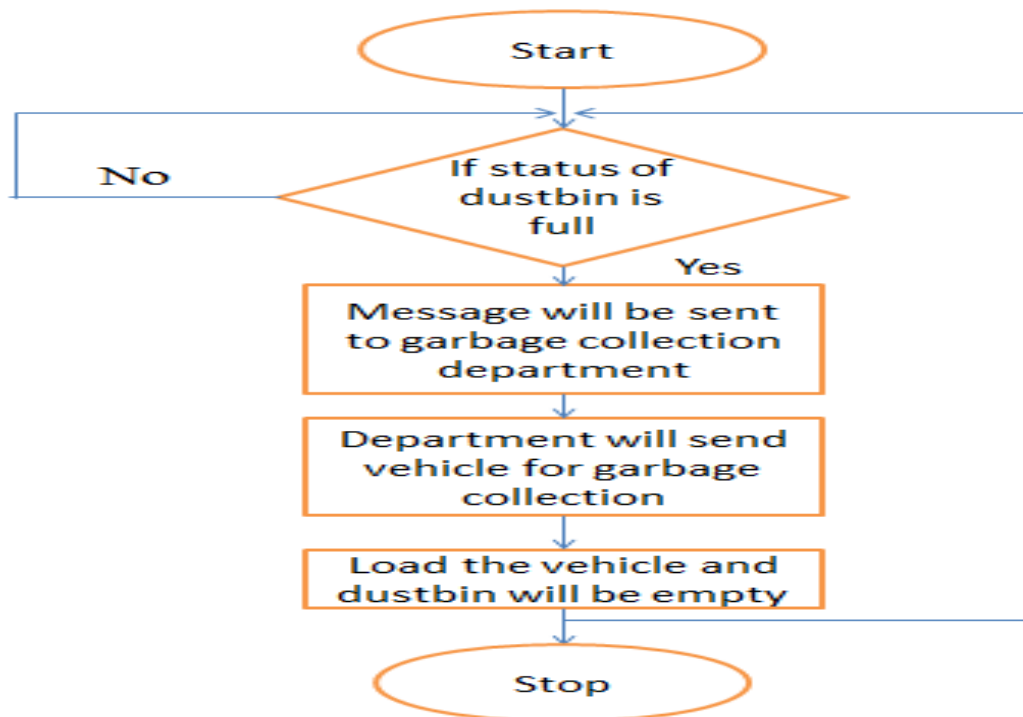

Figure 2: Flow chart of waste management system

RESULTS & DISCUSSION

Figure 3 represents the circuit diagram when power supply connected. It contains the modules as Raspberry pi, Regulated power supply, ultrasonic sensor, wifi, GPS module, max 232,RS232, Relay and LCD display. These devices are interfaced to the Raspberry pi. The data collected from the ultrasonic sensor and the location is identified from GPS module. For nearer communication WI-FI modem ESP 8266 used to facilitates wireless connections. When power supply connected all LED 's will blink . the output is displayed on 16*2 LCD display.

Figure 3: Circuit connection of waste management system

The Figure 4 Shows ultrasonic sensor is placed at the top of the dustbin.it will detect the level of dustbin whether it is filled or empty. These information is displayed on LCD and Telnet app.

Figure 4: when dustbin is placed and output status in mobile phone

The Figure 5 depicts two ultrasonic sensor values. These two will be placed above the dustbin. The ultrasonic sensor will continuously monitor the dustbin level. These values will be sent the Raspberry pi. 16*2 LCD display will connected to the pins of the Raspberry pi. These information are displayed on LCD display.

Figure 5: Dustbin values on LCD display

The Figure 6 shows the dustbin status whether it is filled or empty and longitude and latitude values of the bin. TELNET app is created with an IP address 192.168.4.1 and it is installed in mobile phone .wifi is enable in mobile phone and dustbin status continuously monitor through TELNET app.

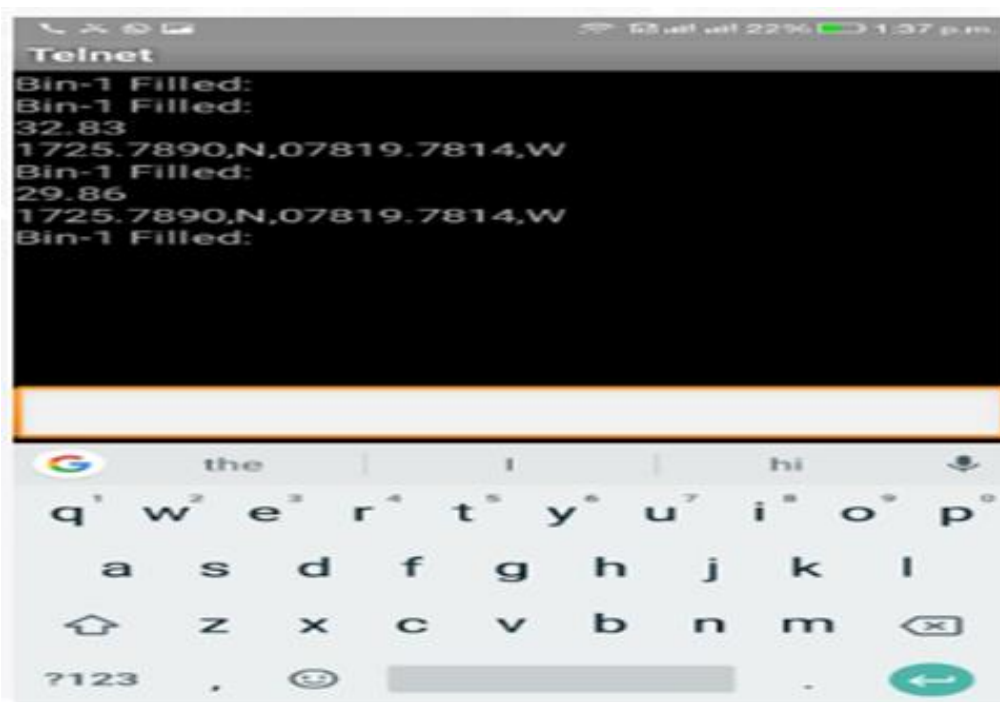

Figure 6: Dustbin status in TELNET app.

The Figure 7 shows the location. With GPS coordinates longitude and latitude values it identifies the exact location of the dustbin. The concerned officer will identifies the location and status of the dustbin and these information is sent to the garbage collection vehicle.

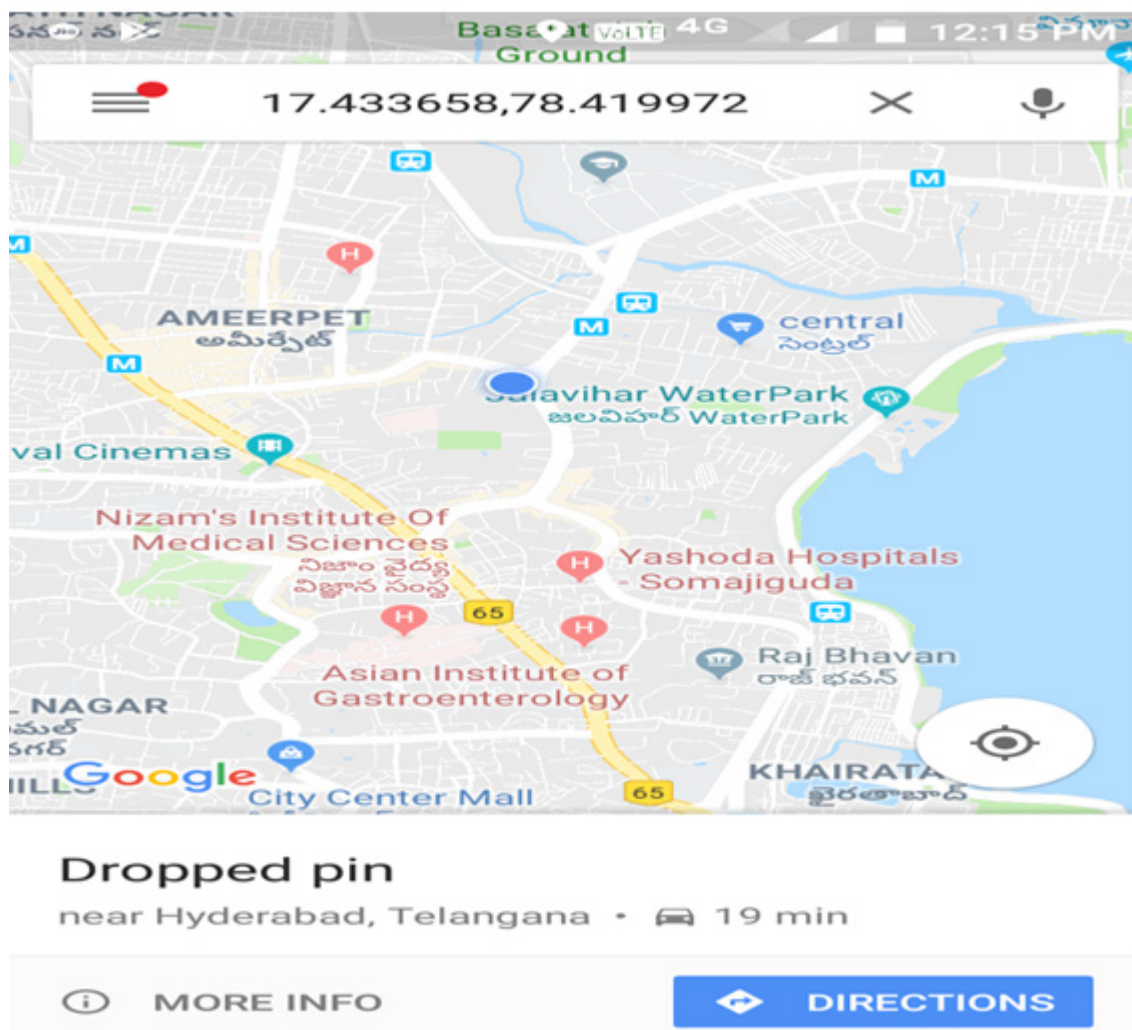

Figure 7: Location of the dustbin

CONCLUSION

This study ‘s emphasis gets on even more energy-efficient IoT as an enabler of different applications consisting of waste administration. Particularly, it intends to provide a big collection of versions handling the effective waste monitoring. Unique interest is paid on the waste collection. We offer initiatives for the smart transport within the context of IoT as well as Smart Cities for waste collection. We suggest an inductive taxonomy to execute relative evaluation of the evaluated designs. Ultimately, our future job is concentrated on the interpretation of an efficient IoT-enabled design for waste collection, which will certainly discuss the consolidation of high capability waste vehicles as mobile depots. On top of that, waste containers are positioned to enhance convenience of citizens.

Cervical Cancer (CC) Causes and Identification Techniques

K Vani¹, S Ram Kishore Reddy², S Poongodi³

¹Asst Prof, ²Assoc Prof, ³Professor, CMR Engineering College

ABSTRACT

In today era most of the people caused by the cancers globally. One of the cancer mostly hits women because of their unawareness is cervical cancer. In this Paper, we present an extensive study on the causes and different identification methods technically available PAP smear test on cervical cancer in today's world.

Keywords: Cervical Cancer, Identification Techniques, PAP smear test

INTRODUCTION

Cervical Cancer growth is caused by the uncontrolled development of cells in the cervix. The cervix is the limited base bit of a lady's uterus^[1]. It look like a cone, it associates with the uterus to the vagina. Cervical cancer diseases caused by the human papillomavirus (HPV). HPV is an unusually regular sexually transmitted virus.

Cervical cancer is most often diagnosed between the ages of 35 and 44. About 15% of cervical cancers are diagnosed in women over age 65. Few women under the age of 20 are diagnosed with cervical cancer. ^[1]The 5-year survival rate tells you what percent of women live at least 5 years after the cancer is found. Percent means how many out of 100. The 5-year survival rate for all women with cervical cancer is 67%. For white women, the 5-year survival rates are 69%, and for black women, the 5-year survival rate is 56%. Survival rates depend on many factors, including the stage of cervical cancer that is diagnosed.

When Cervical cancer recognized at a early stage, the 5-year survival rate for ladies with intrusive cervical tumor is 92%. Only 46% of women with cervical Cancer are identified at early stages^[2]. That the CC has spread to encompassing tissues or organs or potentially the territorial lymph hubs, the 5-year survival rate is 57%. If the growth has spread to a removed piece of the body, the 5-year survival rate is 17%. It is vital to recollect that insights on the survival rates for ladies with cervical tumor are a gauge. The estimate may not demonstrate the after effects of better finding or treatment accessible

for fewer than 5 years.

In 2018, an estimated 13,240 women in the United States diagnosed with invasive cervical cancer. Occurrence rates for the disease dropped by 50% between 1975 and 2014 due to an increase in screening, which can find cervical changes before they turn cancerous. It is estimated that 4,170 deaths from the disease will occur in 2018.

Figure 1 Cervix of the women

Causes of Cervical Cancer

The Risk factors which develops cervical cancer:

Human papillomavirus (HPV) infection: The most important risk factor for cervical cancer is infection with HPV ^[3]. HPV is one of the most risk factor for cause of CC. Sexual action with somebody who has HPV is the most widely recognized way somebody gets HPV. There are more than 100 distinct sorts of HPV, not which are all connected to tumor. The HPV composes that with cervical malignancy are HPV16 and HPV18.

Immune system deficiency: Women with lowered immune systems have a higher risk of developing cervical cancer [4]. A lowered immune system can be caused by immune suppression from corticosteroid medications, organ transplantation, treatments for other types of cancer, or from the human immunodeficiency virus (HIV), which is the virus that causes acquired immune deficiency syndrome (AIDS). When a woman has HIV, her immune system is less able to fight off early cancer.

Herpes: Women who have genital herpes have a higher risk of developing cervical cancer.

Smoking: Women who Are having smoke habit frequently, chances is their too get CC Compare to who do smoke..

Socioeconomic factors: Cervical malignancy is more typical among gatherings of ladies who are more averse to approach screening for CC. Those populaces will probably incorporate dark Women, Hispanic Women, and Native American Women.

Oral contraceptives: Some examination ponders recommend that oral contraceptives, which are conception prevention pills, might be related with an expansion in the danger of cervical cancer [5]. In any case, more research is expected to see how oral preventative utilize and the improvement of cervical disease are associated.

Test's for Cervical Cancer

The following tests may be used to identify cervical cancer:

Pelvic examination: In this examination, the specialist feels a lady's uterus, vagina, ovaries, cervix, bladder, and rectum to check for any strange changes. A Pap test is regularly done in the meantime.

Pap test: Amid a Pap test, the specialist tenderly scratches the outside of the cervix and vagina, [6] taking examples of the cells for testing. Enhanced Pap test strategies have made it simpler for specialists to discover carcinogenic cells. Conventional Pap tests can be difficult to peruse in light of the fact that cells can be dried out, secured with bodily fluid or blood, or cluster together on the slide.

HPV test: A HPV test is like a Pap test, in which the test is done on an example of cells from the patient's cervix. The specialist may test for HPV in the meantime

as a Pap test or after Pap test results demonstrate irregular changes to the cervix [7]. Certain strains of HPV, for example, HPV-16 and HPV-18, are seen all the more frequently in ladies with cervical malignancy and may help affirm an analysis. On the off chance that the specialist says the HPV test is "certain," this implies the test found the nearness of HPV [8]. Numerous ladies have HPV yet don't have cervical growth, so HPV testing alone isn't a precise test for cervical disease

Existing Identification Techniques for CC

In [9], this paper proposes a method for automatic cervical cancer detection using cervical cell segmentation and classification. A single cervical cell image is segmented into cytoplasm, nucleus and background using Radiating Gradient Vector Flow (RGVF) Snake. Herlev dataset consists of 7 cervical cell classes, i.e. superficial squamous, intermediate squamous, columnar, mild dysplasia, moderate dysplasia, severe dysplasia, and carcinoma in situ is considered. Different cellular and nuclei features are extracted for training the system. Dataset is tested on Support Vector Machine (SVM) and artificial neural networks (ANN) and Euclidean distance based system to classify seven different types of cells and to segregate abnormal from normal cells. In [10], this paper, the Author propose an automatic method to detect and classify the grade of cervical cancer using both geometric and texture features of Pap smear images and classifying accordingly using multi SVM. The geometric features are obtained through segmentation of nucleus and cytoplasm using independent level sets, detecting whether the cell is cancerous or normal, with reference to the ground truth. By extracting well defined GLCM texture features and using a combination of PCA and the best class of multi SVM, the images are classified with an accuracy of 95%. In [11], this paper, the author propose An efficient and practical algorithm to detect the cervical cancerous area is presented. Edge detection is applied on the image to find edges of tumor area. The hybrid segmentation is done on the sampled image i.e. combination of thresholding and watershed segmentation to extract the tumor infected area. The image is then processed using morphological image processing tools to detect the accurate dimensions of the tumor. The fine detection of tumor area is a challenging task in medical image science. Using this proposed method it is possible to detect infected area. The table 1 clearly explains that the identification of the tumor cells with accuracy and also it contains the algorithms which are proposed by various authors.

Table 1. Accuracy of the tumor cells identification

Author Name	Worked/proposed Algorithm/method and year	Accuracy
<i>S.Athinarayanan,M.V.Srinath</i>	ETCM+SVM and CFE+SVM 2016	86% & 90%
Rahmadwati,G.Maghdy,M.Ros	Gobar Filters,Segmentation(K-Means Clustering) 2011	89%
<i>Debashree Kashyap and Abhishek Somani</i>	Segmentation(PDE), Multi SVMs 2016	95%

In^[12], this paper describes a way of designing a hybrid decision support system in soft computing paradigm for detecting the different stages of cervical cancer. Hybridization includes the evolution of knowledge-based sub network modules with genetic algorithms (GA's) using rough set theory and the Interactive Dichotomizer3 (ID3) algorithm. Crude sub networks obtained via rough set theory and the ID3 algorithm is evolved using GA's. The evolution uses a restricted mutation operator which utilizes the knowledge of the modular structure, already generated, for faster convergence in. In this paper, the author explore various support vector based classifiers, namely support vector machine (SVM), twin support vector machine (TWSVM), and twin-hyper sphere support vector machine (THSVM), and test their performance on cervical cancer cell classification in 2-class and 4-class scenarios. The cervical cancer cell dataset named the LCH dataset used in this paper was collected and extracted from Lampang Cancer Hospital in Thailand. The experimental results show that TWSVM is preferable to SVM and THSVM in the cervical cancer cell classification.

CONCLUSION

This paper enlightens different algorithms for identification and level detection of Cervical Cancer.

Each one has its own advantage over the other. It is identifiable by the above study that there is large scope to develop algorithms based on Artificial intelligence. The current trend in medical image processing is around deep learning techniques which yields good results. Hence my perspective is that employing deep learning in identification and detection of Cervical Cancer may improve accuracy.

Use of Break-Even Analysis in Financial Appraisal of Projects

K Nagarajan¹, D Visagamoorthi¹

¹Professor, School of Management, Sri Krishna college of Engineering and Technology,
Coimbatore, Tamil Nadu, India

ABSTRACT

Break-even analysis plays an important role in financial appraisal of projects. Preparation of the financial profitability statement is a major milestone in financial appraisal. This is because of the reason that it involves many assumptions. The assumptions must be realistic. Out of the many assumptions made, the assumption on capacity utilisation for different years is a crucial one since many other parameters in the financial projection depend on this. Suppose a realistic financial projection has been made. The top management is in need of certain key performance indicators (KPI) to monitor. One such KPI is the Break-even point. If the top management has this indicator in hand for every year of operation, it will prove to be a very useful tool in having a check on whether the on-going operations are in order and whether the volume of output being produced/likely to be produced is above the required Break-even volume. This article explores the use of Break-even point as a Key Performance Indicator. Further, the article touches upon the finer aspects of classifying the costs into fixed and variable costs in arriving at the Break-even point.

Key words: Break-even point, Fixed Cost, Variable Cost, Cost of equity capital, Key Performance Indicator

INTRODUCTION

Break-even analysis plays a major role in financial appraisal of projects. Break-even output indicates the level of output at which an organization neither earns profit nor incurs any loss. In other words, at this level of output the cost of production is just recovered. Though the logic behind arriving at the Break-even output sounds very simple, there are many intricate issues in correctly assessing it. The crux of the problem in assessing the Break-even output lies in identifying all costs and correctly categorising the cost of production into two heads, viz., fixed costs and variable costs.

MATERIALS AND METHOD

For arriving at the Break-even point, the first thing to be done is to divide the total cost of production into fixed costs and variable costs. Though prima facie it appears simple, it is a rather difficult task since neither all fixed costs remain fixed over a period of time nor all variable costs vary in the same proportion as the level of output^[1]. For example, let us consider selling expenses. Though selling expenses will increase with the volume of output, it will not be in direct proportion to the volume of output. An organization will be spending proportionately more

at lower volumes of production. This means that selling expenses can't be considered as a variable cost, in the strict sense. The same is applicable for the expense under the head 'wages and salaries'. Thus, wherever there is a cost component that does not fall strictly under variable cost category, we need to split it into 'fixed component of the cost' and 'variable component of the cost'. Such a refinement will improve the accuracy of the analysis

Though many heads of expenses show a tendency to fluctuate between the boundary of fixed and variable costs, we need to arrive at some consensus. Banks and financial institutions treat the following as fixed costs for the calculation of Break-even point^[2]:

1. Wages and salaries
2. Repairs and maintenance
3. Factory supervision
4. Administrative expenses
5. Loyalty / know-how payments
6. Depreciation (on straight line basis)
7. Interest on Term-loan
8. Fixed portion of the selling expenses.

The costs incurred under the following heads are treated as variable in nature:

1. Raw material
2. Power & fuel
3. Consumable stores & spares

4. Interest on working capital loan
5. Variable selling expenses.

Let us revisit the formula for arriving at the Break-even point.

Figure.1 Break-even Point – Graphical Representation

Referring to Figure. 1, the Break-even point is identified at the point of intersection of the Total cost line and the Revenue line.

$$\begin{aligned} \text{Total Sales revenue} &= \text{Total Cost of production} \\ \text{i.e., } \text{BEP}_{\text{Output}} \times (\text{Selling price per unit}) &= \text{Fixed cost} + \text{Variable cost} \\ \text{BEP}_{\text{Output}} \times (\text{Selling price per unit}) &= \text{Fixed cost} + [\text{Variable cost per unit} \times \text{BEP}_{\text{Output}}] \\ \text{BEP}_{\text{Output}} &= \frac{\text{Fixed cost}}{(\text{Selling price per unit}) - (\text{Variable cost per unit})} \end{aligned}$$

Figure.1 Break-even Point – Graphical Representation

While applying the above formula for arriving at the Break-even output, care should be taken to include all relevant costs. It is customary to include all the fixed and variable costs enumerated in para-2 above. However, the Break-even output so arrived at, may not be the appropriate indicator [3]. For example, let us take a project that is newly implemented and that has a Term-loan component. The interest payable on the Term-loan is accounted for under the head ‘Fixed cost’ in BEP calculations. Suppose the BEP arrived at shows a Break-even output of, say 55%. It will give a notion that as long as the volume of output is above 55%, there is nothing much to worry about, since it guarantees that the organization will not run into a loss making situation. It may sound all right. But, there lies some

point that we have overlooked. Since the organization has borrowed Term-loan (may be for asset creation), it is under obligation to repay the Term-loan as per the agreed upon schedule of repayment. Hence, the profit earned should be sufficient enough to repay the Term-loan principal amount also, apart from meeting the interest commitments on Term-loan. Just as the Term-loan interest is a fixed cost, being an amount payable irrespective of the operating performance of the organization, the principal component of Term-loan repayment is also a fixed cost to the organization since the loan is to be repaid at any cost and it is not in any way linked to the volume of output achieved.

On the same logic, let us consider an organization

that does not have Term-loan component but is fully funded through equity. There is no interest payable on equity; there is also no repayment obligation on the equity capital. Does this mean that there is no fixed cost on account of equity in the capital structure? As equity has a cost, the cost of equity capital is a deemed fixed cost that the organization is required to pay [4]. The organization may either pay dividend to the equity share-holders or plough back the earnings either in full or part, which in turn will increase the share-holder value. Whatever may be the case, for a realistic assessment

of the Break-even point, cost of equity capital is to be considered as a fixed cost in the BEP calculations.

Obviously, if an organization has both Term-loan and equity capital in its capital structure, both Term-loan principal repayment obligation and cost of equity capital should be considered as fixed costs for BEP calculation [5].

In the light of the above discussion, we can modify the relationship for arriving at the BEP_{Output} as under:

$$BEP_{Output} = \frac{\text{Fixed cost of production) + (Repayment commitment of Term-loan) + (Cost of equity capital)}}{\text{(Selling price per unit) – (Variable cost per unit)}}$$

Figure 2 indicates the modified Break-even point chart that takes into account the repayment obligation of Term loan and the cost of equity capital

Figure 2: Modified Break-even Chart

Findings

In financial projection, capacity utilisation of the plant is predicted for future years, based on the demand and production constraints. Even if there are no production constraints, it is customary not to increase the capacity utilization beyond 80%, to be on the safer side and to take care of unexpected eventualities [6].

The projected profitability estimate of a new project is considered for illustration.

Estimated project cost: Rs.75.00 lakhs

Capital structure:

Equity shares: Rs.30.00 lakhs

Term loan : Rs.45.00 lakhs

Rs.75.00 lakhs

Additional inputs:

- 25% of the selling expenses can be treated as fixed expenses
- & 75% of the selling expenses can be treated as variable expenses, which vary according to the level of output.
- The project is meant for the manufacture of standard size of industrial valves.
- The installed capacity of the plant is 1,20,000 valves per annum and the selling price per valve is Rs. 187.50
- The capacity utilization of the plant is estimated at 60% in the first year of operation, 70% in the second year of operation and 80% from the third year onwards.
- Tax rate is assumed at 40%
- Interest on Term loan is charged on reducing balance of the loan amount.

The interest chargeable on the term loan and on the working capital loan, year wise, are suitably calculated and incorporated in the projected profitability statement. Table 1 indicates the probability statement.

Table 1: Probability Statement

Rs. in lakhs								
	I Year	II Year	III Year	IV Year	V Year	VI Year	VII Year	VIII Year
Capacity Utilization	60%	70%	80%	80%	80%	80%	80%	80%
1.Raw Material	50.00	60.67	69.33	69.33	69.33	69.33	69.33	69.33

i. Admn. expenses	3.75	4.38	5.00	5.00	5.00	5.00	5.00	5.00
ii. Selling expenses								
13.Operating Profit (EBIT) (11 – 12)	26.25	33.87	41.51	36.93	32.29	27.19	21.58	15.44
Less:								
14.Interest on Term-loan	7.65	6.84	5.02	3.32	2.04	1.02	0.34	0.04
15.Interest on Working Capital loan	4.20	4.90	5.60	5.60	5.60	5.60	5.60	5.60
16.Earnings before tax (EBT)	14.40	22.13	30.89	28.01	24.65	20.57	15.64	9.80
Less:								
17.Tax	5.76	8.85	12.36	11.20	9.86	8.23	6.26	3.92
18.Earnings after tax – Net Profit (EAT)	8.64	13.28	18.53	16.81	14.79	12.34	9.38	5.88
Add:								
19.Depreciation	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50
20.Cash accrual (18 + 19)	13.14	17.78	23.03	21.31	19.29	16.84	13.88	10.38
21.Term-loan repayment	Nil	9.50	12.00	8.00	7.00	5.00	3.00	0.50
	Overall Debt Service Coverage Ratio: 2.27:1.00							

An observation of the profitability statement will reveal that raw material, power, fuel and consumables fall strictly under the head of variable expenses. These expenses vary in direct proportion to the volume of output. The expense under the heads 'Wages & Salaries' and 'Factory supervision' increase at the rate of 10% every year; the expense under the head 'Repairs and Maintenance' increases at the rate of 5% every year. Thus, the expenses under the above heads can neither be considered as fixed nor as variable expenses. Though they have some variability, it is not strictly related to the volume of output. They are semi-variable in nature.

Thus, we run into the problem of not being able to segregate certain costs under two distinctive heads as 'fixed' and 'variable'. However, the structure of the equation for arriving at the Break-even volume does not get affected as long as we are able to classify the costs under the two heads, with reasonable degree of accuracy ^[7].

Let us calculate the Break-even output for the first year of operation. Though some of the costs are semi-variable in nature as explained above, we are required to segregate all the costs into fixed and variable costs, for which, let us follow the classification adopted by banks and financial institutions, as given in para-2. Table 2 indicates the calculation of BEP for the first year of operation.

Table 2 Calculation of BEP for the first year of operation: (Volume of out-put: 72,000 units - @60% of the installed capacity of 1,20,000 units)

Fixed Costs	(Rs. In lakhs)	Variable costs	(Rs. In lakhs)
Wages & Salaries :	30.00	Raw material:	50.00
Repairs & Maintenance:	2.00	Power:	2.00
Factory supervision:	4.00	Fuel:	3.00
Administrative expenses:	2.50	Consumables:	5.00
Depreciation:	4.50	Interest on working capital loan:	4.20
Interest on Term-loan:	7.65	Variable selling expenses (@75%)	2.81
Fixed selling expenses (@ 25%):	0.94	Total variable costs:	67.01
Total fixed costs:	51.59	Variable cost per unit : 67,01,000/72,000 Rs. 93.07	=

51,59,000

$$\begin{aligned} \text{Break-even output} &= \frac{51,59,000}{(187.50 - 93.07)} \\ &= 51,59,000 / 94.43 \\ &= 54,633 \text{ units} \end{aligned}$$

Note: In the first year of operation, the capacity utilisation is 60%; hence the expected output is only 72,000 units as against the installed capacity of 1,20,000 units. Since the BEP_{Output} is only 54,633 units, the

position is comfortable.

Though we have included the interest components in the cost, we have not given thought to the equity portion of the capital. Since equity has a cost, it should

be recovered by the business like any other cost. For the equity component of Rs.30.00 lakhs, assuming a cost of capital of, say 20%, the equity cost component comes to Rs.6.00 lakhs per annum. If we take this as a fixed cost, the modified BEP_{Output} will be as below:

$$\begin{aligned} \text{Break-even output} &= \frac{(51,59,000 + 6,00,000)}{(187.50 - 93.07)} \\ &= 57,59,000 / 94.43 = 60,989 \text{ units} \end{aligned}$$

We are still in a comfortable position since the capacity planned for the first year of operation is 72,000 units, which well above the BEP.

Since the fixed costs also change over the years and as there are certain costs that do not vary strictly in proportion to the volume of output, we need to calculate the Break-even output for every year of the operation. Table 3 indicates the calculation of BEP for the second year of operation.

Table 3 Calculation of BEP for the second year of operation: (Volume of out-put:84,000 units - @70% of the installed capacity of 1,20,000 units)

Fixed Costs	(Rs. In lakhs)	Variable costs	(Rs. In lakhs)
Wages & Salaries :	33.00	Raw material:	60.67
Repairs & Maintenance:	2.10	Power:	2.33
Factory supervision:	4.40	Fuel:	3.50
Administrative expenses:	2.92	Consumables:	5.83
Depreciation:	4.50	Interest on working capital loan:	4.90
Interest on Term-loan:	6.84	Variable selling expenses (@75%)	3.28
Fixed selling expenses (@ 25%):	1.10	Total variable costs:	80.51
Total fixed costs:	54.86	Variable cost per unit : 80,51,000/84,000	= Rs. 95.85

$$\begin{aligned} \text{Break-even output} &= \frac{54,86,000}{(187.50 - 95.85)} \\ &= 54,86,000 / 91.65 \\ &= 59,858 \text{ units} \end{aligned}$$

As we have seen above, this BEP_{Output} needs revision, by accounting for the cost of equity capital. There is one more thing to be considered in the second year of operation. In the second year of operation principal

repayment of the Term loan starts. The organisation is required to repay Rs.9,50,000 /- towards repayment of Term loan. The BEP_{Output} calculated without considering this aspect will fall short of the requirement. Though theoretically it will be correct, the organization has the obligation to repay long term debts within the stipulated period. The volume of production should be such that it generates adequate revenue to repay the Term loan instalments also apart from meeting other costs.

Considering the Term loan repayment component and the cost of equity capital, the revised BEP_{Output} will be as calculated below:

$$(51,59,000 + 6,00,000 + 9,50,000)$$

$$\text{Break-even output} =$$

$$\frac{(187.50 - 95.85)}{91.65}$$

$$= 70,36,000 / 91.65$$

$$= 76,770 \text{ units}$$

Since the expected output in the second year of operation is 84,000 units, it is above the Break-even output. Thus, the Break-even output calculated, taking into account the cost of equity capital and the repayment obligations of long term loans can act as a Key Performance Indicator.

In the illustration given, we have worked out the BEP_{Output} for the first two years of operation and we have found that our projections are safe and comfortable. As the year progresses, in general, the Term loan repayment obligations will increase, while the interest payable on Term loan will reduce (This is on the assumption of charging interest on the remaining unpaid principal amount). Further, while the volume of operation may reach a saturation level, the semi-variable costs may keep on increasing. For example, Wages & Salaries, Repairs & Maintenance etc., will keep on increasing in spite of constant level of output. Hence, it becomes essential to arrive the Break-even output for all the years (for which financial projections are made) and keep this data as a ready reference, so that it will come handy tool for monitoring the performance. Table 4 indicates the BEP_{Output} for the operation of years and Table 5 indicates the Break-even output computations from third to eighth year.

Table 4 BEP_{Output} calculated for the remaining years of operation are given below:

Year of operation	III	IV	V	VI	VII	VIII
Projected output	96,000	96,000	96,000	96,000	96,000	96,000
BEP_{Output}	59,880	62,902	66,470	70,769	76,748	82,236

Table 5 Break-even output computations from the third to the eighth year

Year:	III	IV	V	VI	VII	VIII
Fixed Costs:						
Wages & Salaries :	36.30	39.93	43.92	48.32	53.15	58.46
Factory supervision:	4.48	5.32	5.88	6.44	7.09	7.79
Administrative expenses:	3.33	3.33	3.33	3.33	3.33	3.33
Depreciation:	4.50	4.50	4.50	4.50	4.50	4.50
Interest on Term-loan:	5.02	3.32	2.04	1.02	0.34	0.04
Fixed selling expenses (@ 25%):	1.25	1.25	1.25	1.25	1.25	1.25
Total:	54.88	57.65	60.92	64.86	70.34	75.37
Variable Costs:						
Raw material:	69.33	69.33	69.33	69.33	69.33	69.33
Power:	2.67	2.67	2.67	2.67	2.67	2.67
Fuel:	4.00	4.00	4.00	4.00	4.00	4.00
Consumables:	6.67	6.67	6.67	6.67	6.67	6.67
Interest on working capital loan:	5.60	5.60	5.60	5.60	5.60	5.60
Variable selling expenses (@75%):	3.75	3.75	3.75	3.75	3.75	3.75
Total variable costs:	92.02	92.02	92.02	92.02	92.02	92.02
Variable cost per unit(Rs.):	95.85	95.85	95.85	95.85	95.85	95.85
Break-even output:	59880	62902	66470	70769	76748	82236

The BEP_{Output} for all the years, from the third to the eighth year are all below the projected output of 96,000 units. If due to any reason, the output gets reduced below the projected output of 96,000 units, the top management will be in a position to assess the risk involved, if the BEP_{Output} data are available for all the years. For example, when the output in a particular year, say, in the sixth year falls closer to 70,000 units, it will give an indication that the Break-even point is closer and the operations need closer monitoring.

CONCLUSION

Though many assumptions go into the preparation of projected profitability statements of projects, the appraisal will be on a sound footing if it arrives at the BEP_{Output} taking into account the cost of equity capital and loan repayment obligations. The BEP_{Output} can be calculated for the all the years for which financial projections are made. This will act as an indicator of performance measurement at the hands of the top management. Thus, taking all the costs and repayment obligations into account, including repayment of principal component of Term loans and cost of equity capital, and calculating the BEP_{Output} for a reasonable period in the future will help in better monitoring of operational performance of projects.

ABSTRACT

Introduction: Synovial sarcoma is a rare malignant tumour in the head and neck region. It has an aggressive nature and poor prognosis. The treatment of the synovial sarcoma is essentially surgical followed by postoperative chemoradiation.

Objective: To study the details of clinical profile and management of synovial sarcoma in the head and neck region at a tertiary care teaching hospital of eastern India.

Materials and Method: Between January 2009 and October 2015, six patients were diagnosed as synovial sarcoma in the head and neck area. Out of six patients, five were male and one was female. The age ranges from 21 to 48 years. All were diagnosed by histopathology and immunohistochemistry. There were surgically treated followed by chemoradiation.

Result: The common clinical presentations of head and neck synovial sarcoma are dysphagia, foreign body sensation in throat. The patients were in the range of 21-48 years old, among them five were male and one was female. The diagnosis was made by histopathologically and immunohistochemistry. All were treated with surgery followed by chemoradiation. One patient died due to distant metastasis.

Conclusion: Synovial sarcoma is an uncommon malignant lesion in the head and neck area. Imaging, histopathology and immunohistochemistry are essential for the diagnosis. Surgical excision and post operative chemoradiation are the ideal treatment. Early diagnosis helps the patients from the aerodigestive complications and death.

Keywords: Synovial sarcoma, neck, hypopharynx, Oropharynx, dysphagia.

INTRODUCTION

Synovial sarcoma is a rare malignant tumour of the head and neck area, originating from the pluripotent mesenchymal cells.¹ Although its name synovial sarcoma, it rarely arises from synovial membrane.² It is

commonly found near the large joints and may arise in close association with tendons, tendon sheaths, bursae and juxta-articular membrane and in 10% cases involve the joints. Synovial sarcoma usually affect knee, hip, ankle and shoulder joints whereas 3 to 10% of them seen in head and neck region. The behavior of the head and neck synovial sarcoma is almost similar to synovial sarcoma affecting the extremities where these lesions are commonly seen. Hypopharynx and parapharyngeal space are the most commonly affected in head and neck area although few cases are reported from larynx, nasopharynx, gingival sulcus, pyriform fossa, cheek, parotid gland, infratemporal fossa and

middle ear.³ The first synovial sarcoma was first reported by Jernstrom in 1954.⁴ The diagnosis is confirmed from the histopathological examination and supported by immunohistochemistry, cytogenetic analysis and electron microscopy. Treatment of the localized synovial sarcoma is complete surgical excision and supplemented with chemoradiation.⁵ The correct diagnosis, planning for surgery and supportive therapies for synovial sarcoma at oropharynx threatening airway, is always a challenge to the Otolaryngologist. Here we are reporting six cases of synovial sarcoma arising in head and neck area during 2009 to 2015.

MATERIALS AND METHOD

A retrospective study of six patients with synovial sarcoma at head and neck region was done during 2009 to 2015 at the Otorhinolaryngology department of our tertiary care teaching hospital.

The diagnoses of synovial sarcoma of all six cases were confirmed on the basis of histopathological examination and immunohistochemistry. The clinical profiles, demographic details, histopathological, immunohistochemistry, imaging of all six patients were analyzed.

RESULT

A total of six cases head and neck synovial sarcoma were reported during last 6 years of study period. Of these six patients, five were male and one was female. Age ranged from 21 to 48 years (mean age is 30.16). History of dysphagia, foreign body sensation in throat and shortness of breath were present among six cases. In three of the cases, the tumours were located in the oropharynx while in two cases in hypopharynx and one was in oral cavity. Detail clinical profiles of the patients are given in Table.1.

Table1: Demographic data and clinical profile of all patients

Case	Age in Years	Gender	Site of tumour	Clinical profile	Treatment	Follow up
1	29	Male	Hypopharynx	Muffled voice, Discomfort in throat	Partial Pharyngectomy and chemoradiation	Disease free since 1 year
2	48	Male	Posterior pharyngeal wall	Dysphagia	Partial Pharyngectomy and chemoradiation	Death due to distant metastasis
3	32	Male	Oropharynx	Discomfort in throat	Partial Pharyngectomy and chemoradiation	Disease free since 2 years
4	21	Female	Base of tongue	Dysphagia	Chemoradiation	Disease free since 3 years
5	25	Male	Oropharynx	Dysphagia, mild breathing difficulty	Partial Pharyngectomy and chemoradiation	Not attended after treatment
6	26	Male	Oropharynx	Foreign body sensation in throat	Chemoradiation	Disease free since 2years

Case 1

A 29 year old man attended the out patient department of Otorhinolaryngology with complaints of muffled voice and recurrent discomfort in the throat since 3months.He denied any history of smoking and alcohol consumption. Fiberoptic nasopharyngolaryngoscopy

revealed a smooth and pinkish coloured smooth mass arising from the left lateral hypopharyngeal wall and completely obstructing the supraglottic airway and hiding the glottic area of the larynx (Fig.1).

Fig.1: Nasopharyngolaryngoscopy picture of oropharynx showing mass arising from left lateral wall.

There was no cervical lymphadenopathy. Examinations of the nose, ear and oral cavity showed no abnormality. Routine hematological investigations were within normal limit. A lateral X-ray of the neck showed protrusion of the abnormal mass from the left lateral wall of oropharynx compromising the supraglottic airway. Computed tomography (CT scan) of the neck with contrast showed a hyper vascular mass arising from the left lateral wall of the oropharynx with size of 8cmx7cm obstructing the supraglottic area (Fig.2).

Fig. 2(A&B): CT (Sagittal cut) and MRI (Coronal Cut) scan showing mass in oropharynx obstructing the laryngeal airway.

X-ray of the chest was normal. Tracheostomy was done before surgery for safe airway and anticipating difficult intubation for general anesthesia. Endoscopic approach was done for excision of the tumour under general anesthesia. Partial Pharyngectomy with tumour

was done by endoscopic approach. Histopathology report revealed two types cells (Biphasic pattern): spindle cells and glandular cells which are characteristic of synovial sarcoma (Fig.3).

Fig.3: Histopathology picture showing Biphasic pattern of synovial sarcoma with spindle and glandular epithelial cells.

Immunohistochemistry showed strongly positive results for CD99, EMA, CBL2 and Vimentin (Fig.4).

Fig.4: Immunohistochemistry showing strong positivity with CD99 (Fig.4A), EMA (4B), BCL2 (4C) and Vimentin (4D).

As the tumour was involving the local tissue, the patient received five cycles of injectable chemotherapy of Doxorubicin (30mg/m²), Decarbazine (400mg/m²) and ifosfamide (2mg/m²). After that, the patient was given 66Gy radiotherapy to the head and neck region for six weeks duration. The patient was stable postoperatively. Patient follow-up was done by an oncologist with further treatment with chemotherapy and radiotherapy. After one year follow-up, the patient was disease-free without any swallowing defect or any dyspnea.

Case2

A 48 year old man came to out patient department of Otorhinolaryngology with complaints of progressive dysphagia. He had no other symptoms related to the ear, nose and throat. He had no history of weight loss or loss of appetite. He was not a known smoker and alcoholic. Indirect laryngoscopy showed pedunculated smooth mucosal mass attached to the posterior wall of hypopharynx above the pyriform sinus. There was no cervical lymphadenopathy. CT scan demonstrated an abnormal soft tissue mass on the posterior pharyngeal wall at the level of C4. Direct laryngoscopy was done under general anesthesia and mass removed as Excisional biopsy and sent for histopathological examination. The histopathology report revealed fibroblast like spindle cells and glandular cells. The immunohistochemistry showed strong positivity to the vimentin and EMA. The diagnosis was confirmed as synovial sarcoma followed by he underwent partial Pharyngectomy under general anesthesia with healthy margin. Later he sent for chemoradiation but he died after 2years due to distant metastasis.

Case-3

A 32 year old man attended the Outpatient department of Otorhinolaryngology with complaints of discomfort in throat with occasional bloody sputum. He had smoking habit with 10 cigarettes per day since five years. CT contrast of neck revealed hypervascular mass arising from right lateral wall of pharynx at the oropharynx. Biopsy from this lesion confirmed the biphasic synovial sarcoma. There was no neck node enlargement. Patient underwent partial Pharyngectomy endoscopically and sent for chemoradiation. Patient was disease free after chemoradiation and was on follow up.

Case-4

A 21 year old girl presented to the out patient department of Otorhinolaryngology with complaints of painless swelling at the left side of the oral cavity since four months. He was complaining mild dysphagia due to that mass. On examination there was a firm to soft tissue mass in the left side of base of the tongue (Fig.5).

Fig.5: Synovial sarcoma at the base of tongue.

She was not a chronic smokers and examination of ear, nose and throat were within normal limit. Computed tomography from skull base to the superior mediastinum showed a homogenous nonenhancing mass in the floor of the mouth. Biopsy was taken from the oral cavity mass and sent for histopathological examination which revealed biphasic of spindle cells in the matrix and epithelial cells making the gland like configuration. He was diagnosed as synovial sarcoma. After wide excision of the mass, She was advised for chemoradiation. After complete treatment, patient is under follow up with no evidence of recurrence till date.

Case-5

A 25 year male admitted to the Otorhinolaryngology department with history of dysphagia and mild breathing difficulty since one month. He had no fever and no habit of smoking and alcohol consumption. Examination of the oral cavity and oropharynx revealed a mass at the left lateral wall of oropharynx near the base of tongue. Ear and nasal examination were normal. Fiberoptic nasopharyngolaryngoscopy showed a rounded mass at the left lateral wall of the oropharynx near the base of tongue touching the epiglottis. Direct laryngoscopy was done with excision of mass and the mass was sent for histopathological examination. The histopathology report revealed biphasic pattern of synovial sarcoma with positive margin. Partial Pharyngectomy was done under general anesthesia with disease free margin. Postoperative chemoradiation was given to the patient. Patient is now in follow up period.

Case-6

A 26 year old man attended out patient department of Otorhinolaryngology with complaints of foreign body

sensation in throat since 3 months. He had no history of breathing difficulty or hemoptysis or hematemesis. There was no cervical lymphadenopathy. Indirect laryngoscopy showed a smooth bulging behind the right posterior tonsillar pillar. CT scan revealed a heterogenous mass at the right side of the oropharynx with size of 3x2 cm. Direct laryngoscopy was done for biopsy under general anesthesia. Mass was excised and send for biopsy where histopathology report and immunohistochemistry confirmed the diagnosis of synovial sarcoma. He was treated with radiotherapy with total dose of 50Gy followed by chemotherapy.

DISCUSSION

Sarcomas are the mesenchymal tumours which constitute 1% of all malignancy in the body whereas in head and neck region, constitutes 4-10%.⁶ Synovial sarcoma is a high grade tumour originating from the primitive undifferentiated pluripotent mesenchymal cells and unrelated to the synovial membrane.⁷ Synovial sarcoma is a malignant tumour originating from non-epithelial soft tissue. The name of this tumour is misnomer as it does not arise from the joint synovial. Synovial sarcoma is common among healthy young adults of age less than 40 years with slight male preponderance. Patients usually presents with painless mass progressive increase in size. According to site of origin in the head and neck area, patient present with dysphagia in oropharyngeal or hypopharyngeal involvement and complain change in voice or breathing difficulty in case of laryngeal involvement. This tumour is well circumscribed, rubbery and spherical mass. Histopathologically it shows two types: monophasic and biphasic patterns. The biphasic type consists of sarcomatous and epithelial components whereas monophasic type contains one component. The histopathological subtype does not correlate with prognosis of the synovial sarcoma. Out of the two type, biphasic one is most commonly seen. The epithelial cells are cuboidal or columnar types arranged in glandular configuration, compact nests or cleft like areas. They may show capillary projections. The stroma of this neoplastic tissue consists of sarcomatous fibroblasts like spindle cells. These cells show variable mitosis. Hyalinized collagen may be found in stroma which makes spindle cells into fascicles. There may be focal necrosis and hemorrhage may or may not be found in the neoplasm. Metastasis of the synovial sarcoma from the head and neck area is mainly occurs to the lungs followed by lymph nodes and bone. This metastasis may occur in late period

of the disease.⁸ Although synovial sarcoma is a slow growing neoplasm, long term survival of the patient is not satisfactory.⁹ The five year survival in head and neck synovial sarcoma is approximately 40% to 60%.¹⁰ The confirmation of diagnosis of synovial sarcoma is based on the histopathology. Immunohistochemistry, electron microscopy study and cytogenetic analysis are the supportive to the exact diagnosis of synovial sarcoma. The histopathology shows spindle cells which are elongated cells with scanty cytoplasm and monophasic pattern consists of solely spindle cells or biphasic pattern contains both spindle cells and epithelial elements. The immunohistochemistry showed markers for cytokeratin and epithelial membrane antigen and genetic analysis yields t(X; 18; P11; q11) translocation in more than 90% cases of synovial sarcoma.¹¹ Treatment of sarcoma in the head and neck region is mainly surgical. The ideal surgical treatment is wide excision of the tumour in order to achieve negative surgical margins for improved local control of the lesion and longer survival.¹² Along with surgical treatment, radiation and chemotherapy have been studied as treatment options to improve the outcomes, sometimes it's role is controversial.¹³ Some studies suggest chemoradiation has beneficial effect in synovial sarcoma.¹⁴ The type of surgical technique is decided on depth and site of the tumour, adjacent structure involvement, need for reconstruction where it need wider and more radical resection of the sarcomatous tumour. Wide resection with negative margins remains the foundation of the treatment, which is not easily achieved in the oropharynx. Surgical excision of this tumour is the mainstay of the treatment. Surgery of the synovial sarcoma at the oropharynx or hypopharynx creates challenge as other tumour in this difficult location. Open approach for large tumour at oropharynx or hypopharynx involves lip-splitting mandibulotomy and free flap reconstruction which may lead to speech and swallowing problems cosmetic problem and lower quality of life.¹⁵ Endoscopic approach for removal of oropharyngeal tumour is often successful technique. Trans Oral Robotic Surgery (TORS) is a recent application to this difficult area for resection of the tumour. Surgical excision with postoperative radiotherapy decreases the recurrence rate. Radiation with or without chemotherapy appears to be ideal treatment for increased survival of the patient. It is very important for the otolaryngologists to be familiar with the aggressive nature of this neoplasm which carries high morbidity and mortality. Multiple factors are responsible for prognosis of the synovial sarcoma.

Most significant prognostic factors are size of the tumour and extension of the tumour into surrounding structures at the time of treatment.¹⁶ The survival of the patients inversely proportional to these two factors. Although synovial sarcoma occurs among young adults, head neck synovial sarcoma does not give better prognosis in this early age. The rate of long term survival declines due to distant metastasis where lungs are the most common site followed by bone marrow. Synovial sarcoma is an aggressive neoplasm with a five year disease free survival is 72% and overall five year survival is 74-76%.¹⁷ Pediatric patients with synovial sarcoma have a significantly lower mortality rate in comparisons to the adult patients(16% vs 34%).¹⁸ Patient should be under constant follow up to check local recurrence or any distant metastasis. The prognosis of the synovial sarcoma is poor but in the head and neck region it is less particularly patients with tumour size less than 5cm, containing fewer than 10 mitoses/10 high power microscopic fields and lack of a poorly differentiated component.¹⁹ The larger size of the tumour and presence of poorly differentiated components have significance in adverse prognostic factors.

CONCLUSION

Synovial sarcoma is an extremely rare malignant tumour of the head and neck region. Often patient is asymptomatic and biopsy of the tumour confirms the diagnosis. As there are no specific clinical and radiological features, and tumour mass is smooth appearance and well circumscribed, delay the diagnosis of the malignant nature of this lesion. It always constitutes a challenge for both diagnosis and treatment, need multidisciplinary approach. The synovial sarcoma at the oropharynx obstructing the supraglottic airway creates threatens patient's life. Safety of the airway is the first concern before treating the tumour proper. The treatment of this tumour is wide surgical excision along with neoadjuvant chemoradiation. Early diagnosis and treatment of the synovial sarcoma improves the prognosis and survival of the patients. Long term follow up is must to rule out any local recurrence and distant metastasis.

Association of Neuroretinal Parameters with Diabetic Neuropathy and Nephropathy

Ankita Choudhury¹, Lolly Pattnaik², Madan Mohan Mahapatra³

¹Post graduate Student, ²Professor, ³Professor, Department of Ophthalmology IMS and SUM Hospital, Siksha 'O' Anusandhan university, Bhubaneswar, Odisha

ABSTRACT

Aim and objective:- To evaluate OCT based associations of retinal neuropathy with nephropathy and peripheral neuropathy in a cohort of 100 diabetic patients utilizing eGFR, nerve conduction velocity (NCV) and ganglion cell layer (GCL) and retinal nerve fibre layer (RNFL) thickness as potential neuroretinal biomarkers of diabetic microvascular damage.

Materials and method:- TOPCON : 3D OCT- 1 Maestro version 8.3 X; Glaucoma analysis in the macula, 3D: macula V mode was used for obtaining mean layer thickness of 7mm x 7mm area surrounding the fovea after automated segmentation of SD-OCT images. eGFR and NCV were recorded.

Statistical analysis:- SPSS 20 statistical software package was utilized for analysis. Bivariate correlation analysis was done for determining relationship between nerve conduction velocities of sensory and motor nerves, eGFR and mean RNFL and GCL thickness. Regression analysis and Chi-square test was done to evaluate the extent of these associations.

Results:- There was strong interrelationship between all variables except triglycerides which had a minimal effect on age and duration of diabetes. Regression analysis showed significant association between eGFR and RNFL or GCL thickness (F=14.40; F=10.18) but not between nerve conduction velocity and the same (F=1.76;F=2.62) but Chi-square revealed significant relationship between grades of nephropathy ($\chi^2=25.87$; $p<0.001$ for RNFL, $\chi^2=12.943$; $p<0.005$ for GCL) neuropathy ($\chi^2=12.94$; $p=0.44$ for RNFL, $\chi^2=25.65$; $p=0.002$ for GCL) with RNFL and GCL thickness.

Conclusion:- The study provides evidence of the concept that such a classification is possible but larger population based studies are needed for framing a dependable and flawless corroboration.

Keywords: OCT, diabetes, neuropathy, nephropathy, retinal neuropathy.

INTRODUCTION

Diabetes is a chronic disease characterised by hyperglycaemia and affects the blood vessels and the nerves predominantly. There is significant association between the ensuing neuropathy, retinopathy and nephropathy¹.

Over the years association between the microvascular complications have intrigued investigators^{1,2,3,4,5,6,7}. Studies have shown close association of diabetic retinopathy with neurodegeneration of retina^{8,9,10,11,12,13}. With the introduction of optical coherence tomography (OCT) accurate measurement of the retinal layers in vivo is possible with a high degree of accuracy. Thinning of the inner retinal layers that is diabetic neurodegeneration is associated with duration of diabetes and is independent of visible retinal vasculopathy and glycaemic control¹⁵.

The prevalence of diabetic retinopathy (DR) in patients with diabetic peripheral neuropathy (DPN)

Corresponding author

was 2.75 times than in case without diabetic peripheral neuropathy⁷. Salwa et al, Katulanda et al and Ji et al have found almost equal ratio of association between retinopathy and neuropathy cases^{16,17,18}. Further Ramachandran et al correlated the equal prevalence of retinopathy and neuropathy¹⁹.

OCT allows quantitative measurement of the retinal thickness and morphological changes.

Nerve conduction study is done to record the electrical response of a muscle to stimulation of a particular nerve at two or more points along its course. Glomerular filtration rate (GFR) allows us to determine the renal function. Normal GFR is 90 mL/min/1.73 m² or higher. Estimated GFR below 60 mL/min/1.73 m² is abnormal, if that persists for 3 months or more indicates chronic kidney disease. GFR below 15 mL/min/1.73 m² is suggestive of kidney failure.

In our study we have attempted to utilize the differential thinning of various retinal layers specifically ganglion cell layer (GCL) and retinal nerve fibre layer (RNFL), as potential neuroretinal biomarkers of microvascular damage in the kidney and peripheral nerves.

The concept of early diabetic retinopathy including a neurodegenerative component was pre-existing, but this is the first time OCT based association of diabetic retinopathy, neurodegeneration, nephropathy and peripheral neuropathy will be highlighted in a broader perspective.

MATERIAL AND METHOD

The aim of the study was to elaborate a few diabetes related microvascular complications in the retina, kidney and peripheral nerves. In this study we have attempted to link the results of compromised microcirculation which leads to diabetic neuropathy with nephropathy in the kidney and neuropathy in the peripheral nerves. OCT derived ganglion cell layer and retinal nerve fibre layer parameters of right eye of diabetic and non-diabetic patients (control) were

assessed and correlated with diabetic nephropathy and neuropathy. This was done to find a useful tool for early detection of these complications and help in formulation of a simple correlating classification that can be used by ophthalmologists, neurologists, and nephrologists independently.

Method

This study was conducted in a multispecialty hospital and medical college from December 2016 to August 2018. Diabetic patients were enrolled from Endocrine Department as per the inclusion and exclusion criteria. Demographic data was collected using a predesigned questionnaire. Venous blood sample was taken for elaboration of blood tests such as fasting blood sugar, post-prandial blood sugar, HbA1c, blood urea and serum Creatinine. Diabetic retinopathy status was assessed and graded using indirect ophthalmoscopy and digital non-mydratric fundus photograph. Macular scan was done using TOPCON: 3D OCT- 1 Maestro version 8.3 X; Glaucoma analysis in the macula, 3D: macula V mode of a 7x7 mm area and scan resolution of 512x128.

This function analysed the thickness of RNFL (RNFL and ILM), GCL+ (GCL and IPL). Diabetic nephropathy was diagnosed and graded using MDRD formula for calculating eGFR $186 \times (\text{Creatinine}/88.4)^{-1.154} \times (\text{Age})^{-0.203} \times (0.742 \text{ if female}) \times (1.210 \text{ if black})^{20}$

Diabetic neuropathy was diagnosed and grading done using nerve conduction study by Nicolet EDX with Viking Software and Nicolet AT2+6 amplifier. Summation of motor and sensory nerve conduction velocities of all the nerves was done separately before labelling the patient having sensory, motor or sensory motor deficit.

RESULTS

100 diabetic patients and 50 controls participated in the study. There were almost equal numbers of male and female patients in the study group. The demographic details including the HbA1c and RNFL and GCL mean values are tabulated in table 1.

TABLE 1: DEMOGRAPHIC DETAILS INCLUDING THE HbA1c, RNFL AND GCL MEAN VALUE OF DIABETIC AND NON-DIABETIC GROUP

	Diabetic (n=100)	Non-diabetic (n=50)
Age	41.95±14.20	47.70±10.00
Gender (male:female)	51:49	29:21
Duration of diabetes	10-29±5.48	
HbA1c	7.70±1.76	4.92±0.45
Triglycerides	108±37.50	69±11.26
eGFR	101.21±29.66	123.32±18.75
RE RNFL	27.14±3.61	34.73±2.58
RE GCL	58.71±27.67	67.56±3.58
LE RNFL	27.67±3.88	34.54±2.92
LE GCL	58.96±4.74	66.38±3.20

There existed significant difference with respect to eGFR, RNFL and GCL thickness between diabetic patients and non-diabetic patients ($p < 0.05$)(table 2)

TABLE 2: showing one way ANOVA to assess the mean difference of eGFR, RNFL and GCL layers between diabetic and non-diabetic.

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	1915.213	1	1915.213	175.173	.000
Within Groups	1618.120	148	10.933		
Total	3533.333	149			

Cross tabulation data showed significant association between the various grades of neuropathy and the retinal layers (GCL and RNFL) thickness $p < 0.05$ for RNFL and $p = 0.002$ for GCL (Table 3)

TABLE 4: DIFFERENT GRADES OF NEUROPATHY AND RNFL AND GCL THICKNESS

TYPE OF NEUROPATHY	RIGHT EYE RNFL			RIGHT EYE GCL				Total no. of patients
	20-25 um	26-30 um	31-35 um	50-55 um	56-60 um	61-65 um	66-70 Um	
NO NEUROPATHY	0	11	6	0	2	12	3	17
SENSORY NEUROPATHY	15	18	12	15	11	13	6	45
SENSORY MOTOR NEUROPATHY	16	15	6	14	15	6	2	37
MOTOR NEUROPATHY	1	0	0	0	1	0	0	1
Total no. of patients	32	44	24	29	27	31	11	100

Chi –square value for neuropathy grades and right eye RNFL thickness-12.94;df -6;(p=0.044)
 Chi Square value for neuropathy grades and right eye GCL thickness-25.5;df-9;(p=0.002)

Similarly, the Chi-Square Test showed a significant Chi-square value for association between eGFR indicative of Kidney function and the retinal nerve layers (RNFL AND GCL) thickness $p < 0.01$ for both RNFL and GCL thickness (table 4)

TABLE 5: DIFFERENT GRADES OF NEPHROPATHY AND RNFL AND GCL THICKNESS

NEPHROPATHY	RIGHT EYE RNFL			RIGHT EYE GCL				Total no. of patients
	20-25 um	26-30 um	31-35 um	50-55 um	56-60 um	61-65 um	66-70 um	
eGFR 90+	13	40	20	13	24	26	10	73

eGFR 30-59	12	2	2	10	3	2	1	16
Total no of patients	32	44	24	29	29	31	11	100

Chi square value for nephropathy grades and right eye RNFL thickness-25.876;df-4;(p<0.0001).

Chi square value for nephropathy grades and right eye GCL thickness -17.56;df-6;(p=0.007)

DISCUSSION

With changing lifestyle, diabetes and its complications are globally assuming epidemic proportions^{2,21,22,,23,24,25}. Diabetic retinopathy, retinal neuropathy, peripheral neuropathy are well established complications of the diabetic process^{21,26,27,28}.

The correlation between these processes has been established pathophysiologically⁶⁹. Anatomical correlation between retinal neuropathy with nephropathy and peripheral neuropathy is possible following the introduction of newer generation SD-OCT machine with higher axial resolution and image quality.

In our study we have attempted to correlate the renal function (in terms of eGFR using MDRD equation) and the neuropathy status (using nerve conduction velocity) with the changes in thickness of RNFL and GCL (the third order neurons and its axons of the visual pathway).

In corroboration with previous studies the mean RNFL and GCL layers were much less in our diabetic patients compared to non-diabetic as shown in table 115,29,30. This differential thinning of the neuroretinal layer has been utilised by us as a neuroretinal biomarker of microvascular damage of the kidneys and the peripheral nerves. The concept of neurodegenerative damage was pre-existing but this is the first time that OCT

based association of diabetic retinal neurodegeneration, nephropathy and peripheral neuropathy will be highlighted

Estimated GFR showed a high correlation with age. HbA1c level was negatively correlated ($r = -0.384$) which denoted that with increasing HbA1c levels eGFR decreased increasing the risk of nephropathy. RNFL and GCL thickness and DPN also shows negative correlation ($r = -0.351$) which signified that with increasing HbA1c levels there was decrease in nerve conduction velocity thereby increasing risk for peripheral neuropathy at the level of $p < 0.01$ whereas it was minimally correlated with duration of diabetes $p = 0.01$ (Table-5 supplementary file).

RNFL and GCL thickness showed a high negative correlation ($r = -0.204$ for RE RNFL thickness ; $r = -0.399$) with duration of diabetes which signified that with increasing duration of diabetes there occurred decrease in thickness of RNFL and GCL ($p < 0.01$). RNFL and GCL values also showed high correlation with HbA1c ,eGFR values and peripheral neuropathy at the level $p < 0.01$ (Table-5 supplementary file).

Diabetic peripheral neuropathy showed extremely significant correlation value $p < 0.01$ with age, eGFR, RNFL and GCL thickness and significant correlation of $p < 0.05$ with duration of diabetes and HbA1c levels. DPN was negatively correlated with eGFR (nephropathy) and

RNFL and GCL thickness which implied that if there was peripheral neuropathy there was associated presence of nephropathy and retinal neuropathy (decrease in RNFL and GCL thickness) (Table-5 supplementary file).

Linear regression of conduction velocity of the nerve and the retinal nerve layers failed to elicit any correlation but it ought to be recollected that in diabetes the preferentially affected nerves are the sensory nerves and the motor nerves are affected rarely and that too in the later phases of uncontrolled diabetes. (Tables 3,6 and 7- supplementary file). So with further subdivision of the neuropathy into several groups there was a significant influence of the nerve conduction velocity status of the neurodegeneration process (Table 3: Chi Sq. value for RNFL=12.943 and $p=0.04$ and Chi Sq. value for GCL=25.655, $p=0.002$)

Previously Shahidi et al utilizing a neuropathy disability score had found inferior quadrant retinal nerve fibre thinning to be associated with peripheral neuropathy. Nerve conduction study used by us can elicit much earlier forms of peripheral neuropathy³⁰.

Triglyceride had a minimal effect on age and duration of diabetes and was not correlated with the other variables. The result of linear regression analysis showed there existed significant effect of eGFR on RNFL and GCL at $p<0.01$ (Table 8 and 9- supplementary file) A strong correlation of HbA1c value with diabetic nephropathy and retinal neuropathy reiterated the importance of appropriate blood sugar control for prevention of diabetic microvascular damage³² Unlike the study done by Kareem et al³² we did not find appreciable evidence of correlation between triglyceride levels, nephropathy, retinal neuropathy and peripheral neuropathy in our group of diabetic patients. But there was some association between the triglyceride levels and the age and duration of diabetes.

Gokhale et al have found significant correlation of the sensory neuropathy with retinopathy score (0.29 at $p=0.01$) and minimal correlation of 0.02 of motor neuropathy with the retinopathy score. But the retinopathy scores referred to by them are the clinically evident diabetic retinopathy levels classified into 5 groups.

In our study the association of peripheral neuropathy with changes in GCL was more prominent (Chi-sq. value =25.65, $p=0.002$), than the changes in RNFL (Chi-sq.

value 12.943, $p=0.04$) (table 3).

The association of nephropathy in terms of eGFR with inner retinal nerve fibre layer thickness was much stronger compared to neuropathy (Chi Sq. value for GCL=17.561, $p=0.007$ and Chi Sq. value for RNFL=25.876, $p=0.000$) (table 4).

Limitation

The small sample of patients cannot be extrapolated to the entire population. Thereby warranting larger population based studies.

Although our machine is a SD-OCT, the absolute GCL and RNFL values have not been taken as the TOPCON machine measures the GCL along with the IPL thickness and RNFL measure is the actual RNFL along with ILM.

CONCLUSION

In conclusion, this study shows a significant association of diabetic nephropathy and neuropathy grades with diabetic retinal neurodegeneration evidenced by the thinning of the GCL and RNFL, arranged in identical groups of increasing thickness. Mean age of diabetic patients was 41.95 ± 14.20 and male: female ratio was almost the same i.e. 51:49.

Sensory neuropathies followed by mixed neuropathy were the most common types of neuropathy and were significantly associated with thinning of the RGCL and RNFL.

Nephropathy grades were more strongly associated with inner retinal layer thickness (i.e. GCL and RNFL thickness) (table 4)

All these suggest retinal neuropathy process preceding clinically evident diabetic retinopathy and is significantly associated with diabetic microvascular changes in the kidney and the peripheral nerves.

An Unusual and Interesting Cause of Headache-A Case Report

Santosh Kumar Swain¹, Smrutipragnya Samal², Mahesh Chandra Sahu³, Priyanka Debta⁴

¹Professor, Department of Otorhinolaryngology, ²Research Scholar, ³Assistant Professor, Medical Research Laboratory, IMS and SUM hospital, Siksha "O" Anusandhan University, K8, Kalinganagar, Bhubaneswar, Odisha, India, ⁴Associate Professor, Department of Oral Pathology & Microbiology, I.D.S., Siksha "O" Anusandhan, Deemed to be university, BBSR, Odisha, India

ABSTRACT

Headache is a common complaint in day to day clinical practice. Although rarely life threatening, it is a major cause behind the suffering and lack of productivity at work place. Improper diagnosis leads to delayed treatment which gives financial burden to the patient. Clinical evaluation of a headache patient is almost dependent on adequate history taking. By careful diagnosis and appropriate treatment give a great help to the patient. Cutaneous larva migrans, a zoonotic helminthiasis, causes morbidity due to severe, intractable pruritus. However, here we are presenting an unusual cause of frontal headache due to cutaneous larva migrans in frontal area, which is an extremely rare and an interesting incidence in medical literature.

Keywords: Headache, Helminthiasis, cutaneous larva migrant.

INTRODUCTION

The most frequent painful condition that affects human being is the headache. Headache is not a disease, but a symptom reflecting presence of myriad disease spectrum. The most critical task of the treating physician is establishing the proper diagnosis from the patient suffering from headache. In fact, most treatment failure arises due to misdiagnosis. When headache is persistent, it becomes a source of misery to the sufferers as well as to those who venture to treat it. Computed tomography (CT scan) and diagnostic nasal endoscopy resolve most of the puzzles in *rhinosinusogenic* headaches and provide solution. Hookworm larvae, specifically *Ancylostoma braziliense*, excreted from infected cats, dogs and cattle which can enter the exposed skin of human being and commonly affect the hands, buttocks and feet. If larvae migrate give rise to characteristic serpiginous lesion ¹, ². Staying beneath the skin, the larva migrant causing

headache is an extremely rare clinical manifestation. Here we are presenting an interesting case where frontal headache is due to cutaneous larva migrans.

CASE REPORT

A 32 year old male came to Out patient department of Otorhinolaryngology with complaints of headache since 3 months. The patient was referred from neurology clinic to rule out any nose and sinus causes. The previous CT scan of brain was normal. The pain was confined to right frontal area. He had no history of nausea and vomiting. He had no complaints of photophobia and phonophobia. He had no travel history to any other country. General and systemic examinations of the patients were within normal limits. There was no tenderness over any sinuses on palpation. There were mild erythematous changes on the skin over right frontal area. We advised CT scan of paranasal sinus which was also normal. Routine blood tests were within normal limits except increase eosinophilic count. His complain was only right side frontal headache along with irritation and mild crippling sensation at right frontal area. As patient also complained something crippling below the skin of right frontal area along with headache, so he was planned for exposure of the target area and had undergone an incision (Fig.1). This revealed a helminthes just below the skin of right

frontal area (Fig.2). On microbiological evaluation, it confirmed a cutaneous larva migrans. The patient was treated with a single dose of ivermectin 12mg and albendazole 400mg once daily for 3 consecutive days along with analgesics and antihistamines. Follow up after two weeks showed complete disappearance of frontal headache and erythematous changes over the frontal area.

Fig.1: Intraoperative picture showing incision on right frontal area.

Fig.2: Helminthes recovered from right frontal area which stayed below the skin.

DISCUSSION

Headache is probably one of the commonest symptom, which every person in their life has experienced and sometime or other. Headache is not a disease, but a symptom reflecting presence of myriad of pathological spectrum. Sometimes there are serious and life threatening causes of headache and it is imperative that the clinical evaluation must be sufficiently to diagnosis these causes so that adequate investigations and therapy can be limited. Headache may be primary or secondary. Primary headache is often recurrent, benign and has no underlying serious cause and not

associated with neurological deficit. Majority of the headache are primary whereas secondary headaches usually have underlying etiology such as meningitis, intracranial hemorrhages, glaucoma, tumours, sinusitis and arteritis. A complete neurologic, Otolaryngological and ophthalmological examinations are needed for proper diagnosis and treatment. Frontal headache due to presence of cutaneous larva migrans is an extremely rare clinical observation in medical literature. Cutaneous larva migrans is skin infection caused by a parasite and diagnosed on the basis of clinical presentation of the patient. It often presents with serpiginous lesions seen over the dorsum and soles of the foot. These infections usually occur due to sunbathing, tropical climate, walking on sea beach with barefoot, over crowded area and poor hygiene³. Other body parts affected are thigh, back and buttock which rest on the contaminated area like sands. Rare sites of the body affected by this parasitic infection are penis, oral mucosa and anterior abdominal wall⁴. Cutaneous larva migrans is caused by the accidental percutaneous penetration and migration of nematode larva along the epidermis. These are usually of animal hookworms and most commonly *Ancylostoma braziliense*, *Ancylostoma canium* and *Gnathostoma* species⁵. The ova of the nematodes are excreted via the primary host fecal materials and they hatch to become larva in warm environment, humid area in gardens, fields and sea beaches being the preferred sites. The larva penetrate the human skin when come in contact with infected soil, so mostly affect farmers, gardeners and those taking sunbath in sea beaches. Once it matures, the filariform larva penetrate the intact skin by using their protease and migrate to different places usually between *stratum granulosum* and *stratum corneum*⁶. These larvae are thought to lack the collagenase enzyme needed to enter the human basement membrane of the dermis and so the lesions are confined to the epidermis. These larvae are not developed further in human being as humans are not their natural hosts. So human act as incidental, dead-end hosts and the disease is self limiting in many cases. This disease is usually seen in developing country like Brazil, India and West Indies. It occurs in the persons those have visited the tropics or spread in the form of an epidemic. The patients often give a history of foreign visit and barefoot walk over sandy soil or beaches. Cutaneous larva migrans enter or penetrate the intact or exposed skin and migrate via epidermis. The symptoms are highly variable and ranges from simple itching over the skin to severe morbidity of

the patient affecting daily life of the patient. Cutaneous larva migrans causes morbidity of the patient due to severe and intractable pruritis and pain by cutaneous larva migration of cat or dog hookworm which enters intact skin by direct touch with contaminated sand or soil. Due to rash and intense pruritic rash and pain leads to impaired concentration, mood disturbance and sleep disturbance. Transmission of cutaneous larva migrans occurs during lying on sea beaches or walking on the sands at sea beaches. Laboratory findings have no role for the diagnosis. Some patient may show increased eosinophil count. In our case, due to severe headache and skin irritation, mild erythematous changes and patient repeatedly told something below the skin of forehead, so an incision made on right frontal area, which revealed a hook worm and finally diagnosed as cutaneous larva migrans. The classical skin lesion in cutaneous larva migrans is itchy, erythematous serpiginous track. Most common sites are over the dorsa of feet, buttocks and dorsa of hands even also involve genitalia, oral cavity mucosa and the breast region have been reported. Intense itching is also a common association in this lesion and sometimes secondary infected with bacteria due to repeated scratching. Sometimes vesicubullous lesions are also seen over the skin lesions⁷. Ivermectin is usually the treatment of choice in cutaneous larva migrans. A single oral dose of 200µg/kg body weight kills the larva effectively. If the first dose fails to cure, a second dose gives a definite help. A single dose of ivermectin is better and more effective than single dose of albendazole. In ivermectin is not available, repeated treatment with albendazole are better alternative⁸.

CONCLUSION

The most frequent painful condition that affects humans is headache. Headache due to subcutaneous larva migrans is an extremely rare in medical literature. Cutaneous larva migrans is a non-communicable disease

and has little public health relevance. It causes significant morbidity to the patient. Even it is an extremely rare, after remove of hook worm larva below the skin of forehead, the headache was disappeared. Although it is an interesting and extremely rare clinical incidence in medical literature, should be kept in mind during evaluation of headache.

Recurrent Aphthous Ulcer among Family Members Affected with HIV/AIDS infection-A Case Report

Santosh Kumar Swain¹, Swayamprabha Sahoo², Mahesh Chandra Sahu³, Priyanka Debta⁴

¹Professor, ²Research Scholar, ³Assistant Professor Medical Research Laboratory, Medical Research Laboratory, IMS and SUM Hospital, Siksha "O" Anusandhan Deemed to be University, K8, Kalinganagar, Bhubaneswar, Odisha, India, ⁴Associate Professor, Department of Oral Pathology & Microbiology, I.D.S., Siksha "O" Anusandhan, Deemed to be University, BBSR, Odisha, India

ABSTRACT

Recurrent aphthous ulcer is a clinical condition characterized by painful ulcer with different size affecting the mucosa of oral cavity. Its etiology and pathogenesis is not clearly known and the diagnosis is based on the clinical picture. These lesions may be classified into minor, major and herpetiformis. The aphthous ulcers in the oral cavity affect speech and feeding, leading to poor quality of life. The aphthous ulcers in immunocompromised patients like AIDS cause severe type of ulceration. Here we are presenting a report of two patients (daughter and mother) in a family suffering from AIDS with major recurrent aphthous ulcers in the oral cavity.

Keywords: Aphthous ulcer, HIV infections, Oral ulcer.

INTRODUCTION

The term 'aphthous' in medicine is derived from a Greek word 'aphtha' which means ulceration. Recurrent aphthous ulcer is seen worldwide and characterized by multiple, recurrent, small ovoid or round ulcers with circumscribed margins, erythematous haloes and grey or yellow floors¹. It is seen commonly in childhood or adolescent age group. Recurrent aphthous ulcer or Canker sores is commonly seen in the oral cavity, characterized by recurrent episodes of a single or multiple and painful ulcers covered by fibrin and surrounded by erythematous rim locating in the non-keratinizing mucosa of the oral cavity. Recurrent aphthous ulcers seen in 5-25% of the general population and it is more than 50% among students at the time of examination². Although recurrent aphthous ulcers are self-limited, this lesion causes pain and discomfort and interfere in eating, speaking and

swallowing which leads to poor quality of life. Early and effective treatment of recurrent aphthous ulcer minimizes the discomfort in speaking and painful swallowing. Here, we are presenting a case of two patients from same family where both are immunocompromised by HIV infections presenting with recurrent aphthous ulcers.

Case Report

A 12 year old girl attended the out patient department of Otorhinolaryngology along with her mother with complaints of recurrent ulcers in the oral cavity. Both daughter and mother were known cases of HIV positive under the treatment with antiretro-viral drugs. The child was affected with HIV by vertical transmission from her mother. Intraoral examinations showed ulcers on the labial mucosa, tongue, buccal mucosa and floor of the mouth. Ulcer in the oral cavity looks necrotic background, raised borders and an erythematous halo (Fig.1). Both mother and daughter complained severe pain in the oral cavity, difficulty during feeding and brushing teeth. According to the father, these lesions in the oral cavity occurring frequently. Both had bilateral enlargement of submandibular lymph nodes. Personal history revealed that the mother was chronic alcoholic, smoker, hypertensive and HIV positive since 5years under

the treatment with antiretroviral and anti-hypertensive drugs. They have low socioeconomic background and both patients were treated with povidone iodine mouth gargle, triamcinolone local ointment and anesthetic local application for seven days. They were advised not to swallow medicine. After one week treatment, they still had some residual lesions but no complaints of pain or discomfort in the oral cavity during feed and ulcers showed signs of remission. After two weeks of treatment, aphthous ulcers were completely disappeared.

DISCUSSION

Aphthous ulcers are often recurrent and multiple lesions seen in the oral cavity mucosa particularly in buccal mucosa, labial mucosa, floor of the mouth and tongue. The etiopathogenesis of recurrent aphthous ulcer remains unclear. Several etiological factors are thought to relate for causing this lesion such as trauma, immunological dysfunction, psychological stress, systemic diseases, nutritional deficiency, infections and so on³. The other possible etiologies are drug use, lack of folic acid, vitamin B12, iron and other dietary factors, stress, hormonal changes, metabolic diseases and infections⁴. AIDS patients may presents with different clinical conditions like mouth ulcers. Mouth ulcers caused by herpes simplex and cytomegalovirus are most prevalent during the disease period of AIDS⁵. Thus the diagnosis must include history taking and clinical presentations⁶. In this case, the diagnosis of the recurrent major aphthous ulcer was established. The clinical presentations like multiple ulcers greater than 1cm, lesions seen in non-keratinized mucosa, presence of scar and history of recurrence established the diagnosis in our case. This clinical entity can be classified into three types such as minor, major and herpetiformis⁷. As per “Classification and Diagnostic

Criteria for Oral Lesions in HIV Infection” (proposed by Ec-Clearing- house on Oral Problems Related to HIV Infection and WHO Centre on Oral Manifestations Collaborating on the Immunodeficiency Virus in 1993), the recurrent aphthous ulcer is part of the group 3 (lesions observed in HIV infection). This classification states that the incidence of major and herpetiformis types of aphthous ulcers are increased in patients with HIV infection and particularly for children with HIV infection, this classification is modified and recurrent aphthous ulcer is in the group 1 (lesions commonly associated with pediatric HIV infection)⁸. In our case, patients presented with severe oral ulcerations with size of approx. 1cm with recurrence pattern and scars due to previous ulcers. Aphthous ulcers were seen in the buccal mucosa, labial mucosa, floor of the mouth and tongue. A genetic predisposition is associated with approximately 40% of patients with recurrent aphthous ulcer and these patients have a family history of aphthous ulcers in the oral cavity. These patients present with early and severe presentation of ulcerations. Recurrent aphthous ulcers may be associated with HLA-B51 which control heat shock proteins or cytokines⁹. It is likely that immunologically mediated mechanism are involved in the etiopathogenesis of recurrent aphthous ulcer. It may be due to excessive production of IL-1 or IL-6¹⁰. This clinical condition is considered as recurrent aphthous ulcers as these are painful, deeper, repair slowly and may be healed with scar. These lesions of the oral cavity are usually more than 1cm in diameter¹¹. The exact etiology of the aphthous ulcer is till not clear and many predisposing factors like trauma, stress, immunological, viral infections etc., are taken into consideration. Management of recurrent aphthous ulcers remains unsatisfactory. Most of the treatment done in aphthous ulcers are only for reducing severity of the ulceration but not meant to stop recurrence. As there multiple causes for aphthous ulcer, the objective of the treatment is always to give symptomatic treatment of pain by different topical application of anesthetic or antiseptic agents. To enhance healing process, different anti-inflammatory and anti-allergic agents are often tried. Treatment of recurrent aphthous ulcer in the oral cavity is always challenging to clinician regardless to its type. Although there are numerous treatment options for aphthous ulcer, there is no effective treatment option till now. Medications used in recurrent aphthous ulcer are mainly meant to relieve pain, discomfort and decrease the healing period. The topical anesthetic agent is used for patient with less

frequent minor recurrent aphthous ulcer or herpetiformis types. In major type of aphthous ulcer or in more frequent minor and herpetiformis types, there are numerous topical treatment options are available like topical anesthetics, sucralphate, corticosteroids (Clobetasol propionate 0.05%, dexamethasone 0.5mg/5ml, fluocinonide 0.05%)¹². Systemic treatment options of recurrent aphthous ulcer are corticosteroids like prednisolone, intralesional triamcinolone and immunomodulators like thalidomide (200mg/day)¹². Amlexanox (C₁₆H₁₄N₂O₄) is a topical antiallergic, anti-inflammatory drug and has been used as a 5% topical paste for the treatment of patients with recurrent aphthous ulcer¹³. Treatment of recurrent aphthous ulcers done occasionally with systemic corticosteroids. The prolonged use of systemic corticosteroids are not advised due to its side effect particularly in immunocompromised patients¹⁴. The systemic steroids, Colchicines, Azathioprin, Thalidomide, Levamisole, Cyclophosphamide, Pentoxiphylline, Dapsone may be reserved in case of refractory condition as these drugs have many side effects in comparison to topical medications¹⁵. Allicin is a component derived from the garlic extracts can be used for the treatment of recurrent aphthous ulcer due to their multiple bioactivities such as anti-inflammatory, anti-microbial, anti-oxidant and immunomodulatory properties². Application of low powered lasers is thought to stimulate the reepithelization of the ulcer and helpful for healing of the recurrent aphthous ulcer¹⁶. In our case the recurrent aphthous ulcer of daughter and mother are relieved by topical application of steroid, anesthetic agents and antiseptic mouth gargle.

CONCLUSION

Aphthous ulcers are common lesions in the oral mucosa characterized by multiple, recurrent, small, round or ovoid ulcers with circumscribed margins, erythematous haloes and yellow grey floors. Recurrent aphthous ulcers in HIV patients give rise to severe pain and significant morbidity. Recurrent painful aphthous ulcers affect oral functions and reduce quality of life. Early attention should be given for diagnosis and treatment for relieving pain by maintaining proper nutrition and preventing recurrence.

ABSTRACT

Introduction: The nomenclature of potentially malignant disorders (PMDs) of the oral mucosa, with the risk of conversion to oral squamous cell carcinoma (OSCC) have been very diverse. Despite the ability to identify PMD, clinicians have been unable to predict the behavior of lesions or quantify the risk of malignant transformation. This study aims to qualitatively and quantitatively over a five year period using clinical spectrum of presentation and frequency distribution, prevalence, malignant transformation rates of PMD's.

Materials and Method: This study follows a longitudinal prospective study design which was conducted in the Department of Oral Medicine, Oral Diagnosis and Radiology, at S.C.B. Dental College and Hospital, Cuttack over 5 years, from January 2013 to December 2017. The study intended to primarily address and document the clinical diversity, 5year frequency distribution, prevalence, malignant transformation rates of OPMD's.

Results: The frequency of OPMD's was 55% with 36.88 % males. The most and least frequently encountered OPMD included Pouch keratosis (30.96% of OPMD's) and Discoid Lupus Erythematosus (0.002% of OPMD's). The mean age of malignant transformation was 41 years with a male predilection (68 %) and was largely habit associated (72%). Over the 5 year period the highest rate of malignant transformation was observed for actinic cheilitis (20.66%) and least for oral lichen planus (0.35%).

Discussion and Conclusion: During the 5 year study period, 55.01% were OPMD's and 6.34% were head and neck cancers. The significantly higher rate of transformation noted in our population can be attributed to late presentation for treatment, rampant production and continued use of smokeless forms of tobacco. To the best of our knowledge, this study is one of the few to recruit a large population presenting with varied lesions.

Keywords:- Potential malignant disorders, Malignant lesions, Head and neck cancer.

INTRODUCTION

Potentially malignant disorders (PMDs) of the oral mucosa, with the risk of conversion to oral squamous cell carcinoma (OSCC), are described in the literature

as ‘pre-cancer’¹⁻³, ‘precursor lesions’⁴, ‘pre-malignant’, ‘intraepithelial neoplasia’⁵, and ‘potentially malignant’⁶. The clinical concept of malignant transformation in oral mucosa has been proposed for more than 100 years. Sir James Paget first described malignant transformation of an oral lesion into tongue carcinoma in 1870⁷. Schwimmer also reported the same finding in 1877⁸. Several years later, the term “potentially malignant disorders”⁶ was defined by World Health Organization (WHO) as the risk of malignancy being present in a lesion or condition either during the time of initial diagnosis or at a future date. WHO earlier has also classified PMDs into two subgroups⁹ as follows: a) precancerous lesion, a benign lesion with morphologically altered tissue, which has a greater than normal risk of transforming into malignancy; b) precancerous condition, a disease or patients’ habit that does not necessarily alter the clinical appearance of local tissues but is associated with a greater than normal risk of precancerous lesion or cancer development in that tissue.

Despite the ability to identify PMD, clinicians have been unable to predict the behaviour of lesions or quantify the risk of malignant transformation. Overall estimates of outcome are mostly anecdotal and retrospective. Moreover the natural history of PMDs is unfortunately, not only inconsistent but also unpredictable.

This study aims to address the above shortcoming qualitatively and quantitatively over a five year period using clinical spectrum of presentation and frequency distribution, prevalence, malignant transformation rates respectively, following a longitudinal prospective study design.

MATERIAL AND METHOD

The present longitudinal study was conducted in the Department of Oral Medicine, Oral Diagnosis and Radiology, at S.C.B. Dental College and Hospital, Cuttack. The period of study was 5 years, from January

2013 to December 2017. This study aims:

- To observe the clinical spectrum of presentation of OPMD’s
- To document the 5year frequency distribution of various OPMD’s and malignant lesions of head and neck region
- To estimate the prevalence of these lesions in the presenting population
- To observe the gender predilections of the above OPMD’s and malignant lesions
- To estimate the malignant transformation rates of various OPMD’s into OSCC
- To put forth a comparative evaluation of malignant transformation rates amongst the studied OPMD’s
- To calculate the net 5 year cancer burden

Patients presenting with any OPMD as per the new classification proposed by Sarode et.al¹⁰ were included in the study. Also included were patients who presented with malignant pathologies of head and neck region. The present follow up study was based on clinical, cytological, histopathological, radiographic, hematological or other needful investigations, all part of the routine treatment and follow up protocol. The follow-up time for this study is defined as the duration between the initial diagnosis and the occurrence of confirmed oral cancer. A schematic representation of the diagnostic approach is shown in Fig-1. Institutional Review board was of the opinion that an ethical approval was not deemed necessary as protocols adopted were part of routine patient care and follow up. The patients were treated under the domain of implied consent. However, due information was provided to each patient about the nature of the disease, treatment protocols and it effects.

RESULTS

The study included all patients who were clinically and/or histopathologically diagnosed as any one of the OPMD's (Fig-2). Patients lost to follow up were excluded from the study. The net patient inflow over 5

years (January 2013 to December 2017) was 2,51,702 . The frequency distribution has been depicted in table-1. The frequency of patients with OPMD's was 55% with 17.06 % females and 36.88 % males. The lesions with a male predominance included Leukoplakia (74.24%), Oral Submucous Fibrosis (83.55%), Pouch keratosis (71.26%) and Actinic chelitis (82.75%) while Oral lichen planus (77.63%) had a female preponderance (fig-4). Cases of Discoid Lupus Erythematosus occurred exclusively in females. In our study, patients with Epidermolysis Bullosa were equitably distributed amongst males and females.

Table-1: Annual and 5-year frequency distribution with 5 year prevalence.

Year	Leukoplakia	Oral submucous fibrosis	Pouch keratosis	Oral lichen planus	Actinic chelitis	Smokers palate	Discoid Lupus Erythematosus	Epidermolysis Bullosa
2013	5307	5565	7400	4866	4	1098	0	1
2014	6060	5937	9533	5171	5	2380	0	0
2015	6342	4139	8578	5241	6	2036	2	0
2016	6450	5964	8633	5370	6	2206	1	1
2017	7253	6168	8731	5392	8	2617	0	2
5 YR BURDEN	31412	27763	42875	26040	29	10337	3	4
5 YR PREVALENCE	12.47%	11.03%	17.03%	10.34%	0.011%	4.10%	0.001%	0.002%

The most and least frequently encountered OPMD included Pouch keratosis (30.96% of OPMD's) and Discoid Lupus Erythematosus (0.002% of OPMD's) respectively while Oral Submucous Fibrosis (20.05% of OPMD's) and Oral Lichen Planus (18.80% of OPMD's) presented nearly equally in patients reporting at our tertiary care centre. The male:female ratio of various OPMDs reported were 2.88 for Leukoplakia, 5.08 for Oral Submucous Fibrosis, 3.16 for Pouch keratosis, 0.28 for Oral Lichen Planus, 4.8 for Actinic chelitis, 23.96 for Smokers Palate, and 1 for Epidermolysis Bullosa. The mean age of presentation of OPMDs was 33.6 years. Amongst males, the mean age was 29.6 years while for females it was 37.5 years. The age group most commonly affected by any of the OPMD's was 20-40 years. Patients with lichen planus presented early (mean age 28 years) while cases with leukoplakia presented

late (mean age 36 years). Smokers palate was more of an incidental finding (79%) than a primary presentation (21%).

Fig-4: Gender distribution of various OPMD's.

With respect to site predilection, lower left buccal vestibule (53%) and left buccal mucosa(28%) were the chief sites for Leukoplakia, lower left buccal vestibule

was the primary site for Pouch keratosis (77%), bilateral buccal mucosa (42%) and gingivae (32%) for Lichen planus and lower lip for Actinic cheilitis (100%). Remaining patients had involvement of multiple intraoral sites. Oral submucous fibrosis had more of a panoral involvement. About 47% of the OPMDs showed candidal colonization.

The various predictors for malignant transformation in our study included age, gender, site, appearance and presence of deleterious habits. The net 5 year malignant transformation rates of various OPMDs to oral squamous cell carcinoma have been depicted in fig-5.

Fig-5: 5 year malignant transformation rates of various OPMDs.

The lesion with highest rate of malignant transformation was Actinic cheilitis (20.66%) while Oral lichen planus (0.35%) had least conversion in our population. 2 cases of idiopathic OSMF and 3 cases of cryptogenic leukoplakia were encountered over the period of study. The mean age of malignant transformation was 41 years with a male predilection (68 %) and was largely habit associated (72%). The type of tobacco consumed and other relevant attributes have been summarized in table-2. Smokeless tobacco forms were consumed by 66.25% while smoking by 35.08%. Overall, 22.99 % were addicted to both. Cessation of tobacco habits were reported in 8.24%. Lesions presenting with erosions, ulcerations, surface elevations, nodularity or other features contributing to clinical non homogeneity in appearance of the lesions were more susceptible to malignant transformation (66%).

Cases presenting primarily as malignancy were 6.34 %. Out of these, 8(0.05%) were of salivary origin, 2(0.012%) melanoma, 1(0.006%) metastatic carcinoma, 2(0.012%) lymphoma, 3(0.018 %) malignant ameloblastoma. The remaining cases 15949 (99.9%) presented as a primary intraoral malignancy (fig-3).

DISCUSSION

During the 5 year study period (January 2013 to December 2017), 55.01% were OPMD's and 6.34% were head and neck cancers (HNCA). According to various studies, the estimated prevalence HNCA with respect to total body malignancies varies from 9.8% to 42.7%.¹¹⁻¹³

The diverse spectrum of clinical presentations of various oral potentially malignant disorders were encountered. The overall prevalence over 5 years was 55% with a mean yearly prevalence of 11%. This was higher than the rates observed in other studies.¹⁴⁻¹⁶

The most frequently encountered OPMD was leukoplakia (12.47%). Majority cases of the cases were habit associated with only 3 being idiopathic. The 5 year malignant transformation rate was 11.70%. Transformation occurred in the habit associated group and in 1 case in the cryptogenic group. The noted malignant transformation rate (5.374%) was higher compared to study by Tung-Yuan Wang et al.¹⁷ According to study by Gupta PC et al, the overall malignant transformation rates were very low (0.3%–2.19%)¹⁸. Warnakulasuriya and Ariyawardana¹⁹ carried out a systematic review of 24 studies and found an overall malignant transformation rate of 0.13% to 34% making our observation conformant to this range.

The next most common disorder encountered was oral sub mucous fibrosis (11.03%). All but 2 cases were habit associated. The 2 idiopathic cases gave no history of tobacco habits, both presented in females in late second decade, with 1 giving a similar familial history. None of the idiopathic cases showed malignant transformation. The five year transformation rate was documented as 12.50%, in agreement with the often cited metric of a

7-13% malignant transformation rate of OSF stems from a Taiwanese study.²⁰ As demonstrated in a long-term follow-up study in India, scrutinizing 99 patients with OSF for 17 years, a malignant transformation rate of 7.6% was documented.²¹ In contradistinction, more recent, larger studies have suggested a lower rate; in a recent review by Ray et al the transformation rate varied from 1.9% to 7.6%.²²

The significantly higher rate of transformation noted in our population can be attributed to late presentation for treatment, rampant production and continued use of smokeless forms of tobacco, ease of availability at cheaper costs and lower tax rates and ill belief that smokeless tobacco is good for health increasing appetite and vigor.

Oral lichen planus, presented in our population with a prevalence rate of 10.34%, chiefly manifesting amongst women (77.63%). The overall 5 year malignant transformation rate documented was only 0.35% entirely sparing the reticular variant. As reported by Sana Maher Hasan Aghbari et al²³, 1.1% of OLP patients developed OSCC, while the rate of malignant transformation among OLL cases was 2.5%. Studies by Ingafou M et al²⁴, Carbone M et al²⁵, Pakfetrat Abbas et al²⁶, Kaplan Ilana et al²⁷, Bermejo-Fenoll A et al²⁸, Torrente-Castells Eulàlia et al²⁹ and Shen Zheng Yu et al³⁰ have reported malignant transformation rates for OLP that ranged between 0.07% and 5.8%. Studies by Alves Mônica Ghislaine Oliveira et al³¹ and Rode Matjaz et al³² showed no malignant transformation.

Other less frequently encountered lesions were actinic cheilitis (0.011%) and smokers palate (4.10%). The malignant transformation rate of actinic cheilitis and smokers palate were respectively 20.66% and 0.86%, over the 5 year study period. Actinic cheilitis can progress

to OSCC in approximately 15% of cases as documented by Main JH et al³³, Robinson JK³⁴, Kaugars GE et al³⁵ and Markoupoulos A et al.³⁶ In our study, malignant transformation is higher. This can be attributed to occupational exposures and also to application of unauthenticated products over the lesion. Although most of the studies in literature elaborates on reverse smoking being causative to oral cancer development and an OPMD, our study did find cases of heavy smokers in whom dysplastic changes occurred (0.86%). This serves to elucidate the fact that any surface and/or symptomatic finding in the palate of a chronic smoker should be evaluated with caution. During the course of this study, dysplastic changes were also documented in lesions originally diagnosed as tobacco pouch keratosis (3.90%).

CONCLUSION:

To the best of our knowledge, this study is one of the few to recruit a large population presenting with varied lesions. It serves to present an overview of few epidemiologic associations between disease, gender, site, age and deleterious habits. However, owing to a large sample recruitment, various parameters still remain unaddressed which can be a potential ground for future research. Association between the diseases studied and various systemic co-morbidities can be introspected. Chances of underestimation of transformation rates does exist which can be ruled out with a longer follow up period. Also integration of chairside screening and histologic prognostic factors into routine diagnostic and treatment procedures might serve to change the natural course of the disease.

ABSTRACT

Objective: Photodynamic therapy (PDT) is a contemporary and non-invasive therapeutic approach, used in the treatment of non-oncological diseases as well as cancers. The present study was conducted to evaluate the efficacy of 5-aminolevulinic acid-mediated PDT (5-ALA-PDT) as an alternative therapeutic modality for oral lichen planus (OLP) as well as its role in OLP calcitrant to conventional pharmacologic treatments.

Methods: This study was based on the premise of non-randomized, non-comparative prospective split mouth design. The study sample of 36 patients was selected from the patients attending the Outpatient Department of Oral Medicine and Radiology, SCBDCH based on predefined inclusion and exclusion determinants. Objective (REU score) and subjective symptom assessment (VAS score) was done at baseline and at 2 weeks, 4 weeks and 3 months follow up post 5-ALA mediated PDT.

Results: Statistically significant intra group difference was observed in REU and VAS score ($p=0.000$) was observed. Statistically significant results were obtained for VAS at 4 weeks ($p=0.000$) and 3 months ($p=0.000$) and at 3 months ($p=0.008$) for REU.

Conclusion: This study shows promising results favoring the use of PDT for oral lichen planus, both as a curative and palliative measure. Effectiveness of multimodal approach combining PDT with conventional treatment is a potential ground for future research.

Keywords: Photodynamic Therapy, Lichen Planus, Amino Levulinic Acid

INTRODUCTION

Photodynamic therapy (PDT) is a contemporary and non-invasive therapeutic approach, used in the treatment of non-oncological diseases as well as cancers of various types and locations. Photodynamic therapy (PDT), also known as photoradiation therapy, phototherapy, or photochemotherapy, involves the use of a photoactive dye (photosensitizer) that is activated by exposure to light of a specific wavelength in the presence of oxygen.¹ This causes "direct" reactive oxygen species-induced cytotoxic effects, major changes by disrupting

blood and lymphatic vessels, upregulation of heat shock proteins and a myriad of other effects.² Photodynamic therapy (PDT) has received increased attention since the regulatory approvals have been granted to several photosensitizing drugs and light applicators worldwide.³ A photosensitive agent or photosensitizer can be classified by their chemical structures and origins into three broad families: porphyrin-based (e.g. photofrin, 5-aminolevulinic acid (ALA, BPD-MA), chlorophyll based (chlorins, purpurins, bacteriochlorins) and dye (phtalocyanine, naphthalocyanine).⁴ One of the commonly used photosensitisers, Aminolevulinic acid

(ALA) is a prodrug that is metabolized intracellularly to form the photosensitizing molecule protoporphyrin IX (PpIX) which when activated by light produces cytotoxic reactive oxygen species and free radicals which are phototoxic.⁵ One of the remarkable outcomes seen with long drug incubation period photosensitizers, is an associated downtime as a result of erythema, edema, crusting, healing, and pigmentary changes, which can take up to a week or more to resolve in many individuals. Pain associated with ALA-PDT has also been documented and reported in the literature as the “PDT effect”.⁶

The present study was conducted to evaluate the efficacy of 5-aminolevulinic acid-mediated PDT (5-ALA-PDT) as an alternative therapeutic modality for oral lichen planus as well as its role in OLP calcitrant to conventional pharmacologic treatments.

MATERIAL AND METHOD

The following study protocol encompassed a non-randomized, non-comparative prospective split mouth study design. Ethical approval was deemed a priority and duly obtained prior to the commencement of the study from the Institutional Ethics Committee, S.C.B Medical College, Cuttack [Regd. No. ECR/B4/Inst/OR/2013, Issued under rule 122DD of Drugs and Cosmetics Rules 1945, status assigned- recommended]. The study sample was selected from amongst the patients attending the

Outpatient Department of Oral Medicine and Radiology, SCBDCH. Sample selection was done based upon a pre defined set of inclusion and exclusion criteria. Inclusion determinants included a clinical diagnosis of any one of the typical variants of oral lichen planus (OLP) of buccal mucosa present bilaterally, which was histopathologically confirmed; also patients previously diagnosed and under conventional treatment for oral lichen planus who were nonresponsive or calcitrant and/or dissatisfied or reluctant to continue the conventional treatments were included. However, prior to their inclusion they were clinically and histopathologically reassessed. Participants were 20 to 70 years of age. Patients were weighed out against the following exclusion determinants: histopathologic non-confirmation or signs of dysplasia, lichenoid reactions with clinical improvement after removal of suspected etiology, any past or current systemic compromise or debility and pharmacologic treatments that could predispose to and/or alter the course of OLP and treatments instituted in the study hence, OLP with dermatologic manifestations, allergy to phototherapy and photosensitizers, pregnancy, lactation, patients with deleterious oral habits (smoking and smokeless tobacco, alcohol) and parafunction. An informed consent was obtained from all subjects after detailed explanation of study protocol, advantages and disadvantages with a clause allowing voluntary discontinuation of participation on behalf of the subject at any point during the study.

A sample of 36 patients was recruited into this study based upon the outlined inclusion and exclusion criteria and an in depth appraisal of history. Pre treatment assessment was done for clinical characteristics of the lesions, symptom evaluation, and histopathological confirmation. Care was taken during enrollment of patients that lesions were present on bilateral buccal mucosa with similar clinical manifestations. Pre treatment assessment of the intraoral lesions on buccal mucosa was done in accord with the REU scale.⁷ The severity of the lesion in each site was scored according to the following: presence of reticular/hyperkeratotic/white papular (R) lesions (0-none, 1-presence), presence of erosive/erythematous (E) lesions and/or ulcerative

(U) lesions (0-none, 1-lesions smaller than 1 cm², lesions from 1 to 3 cm², 3-lesions larger than 3 cm²). The total weighted score was a summation of reticulation score, erythematous score (weighted 1.5), and ulcerative score (weighted 2.0). To measure dimensions using REU scale, transparent flexible grid with marking squares of 1x1 mm² of minimum dimension was used (fig-1.1, 1.2, 1.3). The clinical examination was performed by two examiners (Oral Medicine specialist and Oral Pathologist) separately to rule out any bias concerning the scoring. Also a recording of symptom (burning and pain) was done using VAS score. These values were treated as baseline. Following this, a punch biopsy was taken from the most representative site of buccal mucosa. Only

unilateral biopsy was done with the side of biopsy being treated as control and the contralateral lesional buccal mucosa was treated as test site (PDT intervention), to avoid any untoward effects of wound healing on appearance hence subsequent scoring of lesions. The biopsy specimen was harvested as aseptically as possible under local anesthesia (2% lignocaine with 1:200000 adrenalin) using a 4mm diameter and depth disposable punch instrument (fig-2.1, 2.2, 2.3). The specimen was transported in screw capped vials with 10% buffered formalin and sent for histopathological confirmation (fig-2.4). A period of 2 to 4 weeks was allowed to lapse with supervision for adequate healing of biopsy site.

Before application of the photosensitizer, an atopic patch testing was done. None of the subjects tested positive. The lesions on test and control site were cleaned with cotton wool soaked in a soap free cleansing lotion. 5-ALA 10% (Research Product International, purity grade $\geq 98\%$, molecular weight-167.6; fig-3.1) was applied to the test site and distilled water to control site using a cotton swab (fig-3.2). The patient was instructed to refrain from consumption of food and water during the test period. After an incubation period of 2 hours, the test site was given a radiant exposure of 120 J/cm² with a wavelength range of 625-675nm of red light, at irradiances of 100-130 mW/cm² using a light emitting diode source (Epic10 Biolase, operating voltage-100 V to 240 V, wavelength-940 \pm 10nm, maximum power output-10W, continuous power mode, fig- 4.1, 4.2) for a period of 120 seconds. The control site was spared of

the above procedure. However, the aiming beam of the laser equipment was flashed at control site. The distilled water application with the aiming beam was chosen as placebo to ALA-PDT. The subjects were followed up after 2 weeks, 1 month and 3 months from baseline with post treatment REU and VAS recorded at each visit for the test and control site separately. During the study period, 2 patients were lost to follow up at 2 weeks and 1 patient reported an increase in burning and pain for which conventional treatment regimen was instituted.

OBSERVATIONS AND RESULTS

The study enrolled a final sample of 36 patients. 33 patients completed the study and 2 patients were lost to follow up after the first follow up visit (2 weeks). Hence to test the hypothesis intention to treat analysis was performed by taking Last Observation Carried Forward (LOFT). For all statistical evaluation, the subjects' one side was maintained as a unit of measurement. The compliance of parameters to normal distribution was evaluated using Shapiro-Wilk test. The balancing of groups by age and gender was tested by Mann Whitney U test. Quantitative data were recorded as median value + SD (Standard Deviation) for the investigated parameters. Friedman test was used to compare intra group parameters. The statistical significance was set at $p < 0.05$. The Bon-Ferroni corrected Wilcoxon signed rank test was used to evaluate the intra group comparison. The Bon-Ferroni corrected Mann Whitney U test was used to compare inter group parameters ($p < 0.008$).

Table-1: Intra and inter group comparisons of clinical parameters (mean + SD). Intra group comparison by Friedman test ($p < 0.05$) and inter group multiple comparison by Bonferroni corrected Wilcoxon signed rank test ($p < 0.0008$). Significant values are in bold.

	VAS	2.00±1.10	5.00±0.72	73.500	0.000*

In table-1, the intra and inter group comparison of REU and VAS has been depicted by taking mean+SD of baseline visit and follow up visits at 2 weeks, 4 weeks and 3 months. Statistically significant intra group difference was observed in REU and VAS score ($p=0.000$).

In table-2 and table-3, Wilcoxon Signed Rank test was done with post-hoc analysis of REU and VAS score among various visits in test group. Statistically significant result was found between baseline and 3 months for REU and baseline and 4 weeks and 3 months for VAS. Table-4 elaborates inter group comparison of REU and VAS scores at various visits between study groups. Statistically significant results were obtained for VAS at 4 weeks and 3 months and at 3 months for REU.

DISCUSSION

Oral lichen planus (OLP) is one of the most prevalent chronic diseases of the oral cavity and due to the complexity in establishing the etiopathogenesis, therapy chiefly takes on a symptomatic approach. Photodynamic therapy due to its considerable tissue specificity, excellent safety profile, and competence to cover anatomically complex and diverse areas is a potential contender for treatment of oral conditions, allowing to preserve important healthy tissues, rendering both curative and palliative benefits.^{7,8} Oral lichen planus is a therapeutic challenge for complete symptom redressal. Photodynamic therapy (PDT) has been reported as a very potential treatment method as it does not cause scarring because of the eradication of microfoci after PDT, which cannot be seen upon macroscopical examination. This method also decreases the risk of recurrence.⁹

Our study was based on the premise of a split mouth design to objectively (REU) and subjectively (VAS) study the effect of 5% ALA- light emitting diode source PDT on oral lichen planus against distilled water application with the aiming beam as placebo. The study included a sample of 36 patients with 13 (36.11%) males and 23 (63.89%) females, giving a female predilection of 1.76. The mean age of the participants was 39.27 years with 37.15 years as mean age amongst males and 40.47 years amongst females.

Various laser and non laser light sources have been used for PDT. Lasers at 635 nm were used as light source in researches by Kubler et al¹⁰, Fan et al¹¹, Sieron et al¹², Tsai et al¹³ Chen et al¹⁴, and Lin et al¹⁵; 585 nm was used in studies by Franco¹⁶, Shafirstien et al¹⁷. But our study

relied upon LED source at 625-675 nm in corroboration with studies by Mc Gillis and Fein¹⁸, Rivard and Ozog¹⁹, Erickson et al²⁰, and Jerjes et al²¹. Factors like reasonable cost, convenience and safety of use have promoted its use.

In our study, the mean REU score did not change over the first 2 weeks. However, a significant reduction was seen at 4 weeks and 3 months follow up on the test site ($p=0.000^*$). The control site had no fluctuation whatsoever in the REU score. With respect to evaluation of symptoms, subjective VAS score decreased significantly on the test site through 2 weeks, 4 weeks, 3 months follow up from baseline ($p=0.000^*$). The VAS score on the placebo site evidently increased from baseline through the follow up visits as documented in table-1. In a study by Kvaal et al²², clinical behavior and response to topical methyl 5-aminolevulinate (MAL) photodynamic therapy (PDT) of oral lichen planus; as a result of 1 treatment session, there was a significant improvement of oral lichen planus after 6 months ($P = 0.02$). Savarimuthu Wilfred Prassana et al²³, performed PDT on 15 OLP lesions wherein the mean size score showed a reduction of 0.8 ± 0.8 pre and post PDT.

This study included 2 patients who were unresponsive or calcitrant to maximum tolerable doses of topical and systemic steroids used alone and also in combination with adjuvant therapy. However, upon application of 5% ALA-PDT, symptomatic relief was obtained by the patients (baseline VAS was and ; VAS at 3 months was and respectively). This reflected objectively in their REU scores (baseline REU was - and; REU at 3 months was and respectively).

Literature concerning the treatment of oral lichen planus using 5% ALA mediated PDT is scarce. However, a number of reports exist highlighting its potential role in treating dermatologic lichen planus lesions. Kirby et al²⁴ in 1999 reported a case of hypertrophic lichen planus on penis wherein for the first time PDT using 5-ALA was done for 2 weeks. In a study by Kotya Naik et al²⁵, about 66.6% patients responded to PDT as shown by a decrease in mean size score from 2.22 ± 0.79 to 1.41 ± 0.74 after therapy. PDT the most promising therapeutic regimens which can be integrated into mainstream treatment owing to minimal normal tissue toxicity and greatly reduced long-term morbidity.²⁶ According to ZhiXia Fan et al¹¹, complete response rate of 71% was achieved by using 10% ALA cream with 635 nm diode laser at

100J/cm² after 1 to 4 courses of treatment; patients who achieved complete response showed no recurrence.

This study shows promising results favouring the use of PDT for oral lichen planus, both as a curative and palliative measure. This method of non invasive treatment excludes dependence on patient compliance to seek outcome as treatment is instituted by the clinician. Results in favour were also obtained for calcitrant cases stressing on the scope of this therapeutic modality to cure cases unresponsive to routine treatment strategies. However, this study has a few drawbacks like small sample size, short follow up period, exclusion of atypical variants of the disease per se, lack of generalisability of results owing to difference of population parameters and manufacture specifications of dye and light source and lack of suitable blinding which can be a source of potential bias to the study. More clinical studies and verifications with multi centre randomised controlled trials, with larger sample size, and longer follow up periods are required to evaluate the effectiveness of PDT in OLP.

CONCLUSION

This study does have a few drawbacks which need to be addressed in future studies. Various other photosensitisers like methylene blue can also be studied and a comparison with ALA can be established. Also effectiveness of multimodal approach combining PDT with conventional treatment is a potential ground for future research.

ABSTRACT

The present article retrospectively elaborates the indication and the final visual acuity at 1 year in a cohort of 28 patients administered with 1 or more doses of 0.7 mg intravitrealozurdex over a period of 1 year. Data of 28 eyes of 28 patients was retrieved from the medical record division. Majority of the patients were in the age group of 50 -60 years. The most common indication was vascular occlusion (n=15) followed by post cataract extraction (n=7), diabetic macular edema (n=6). 5 patients had raised IOP one –two months following injection. 19 pts had prior intravitreal anti-VEGF injection. 2 patients repeated ozurdex injection at 6 months. There was a difference of 173 +/-90.5 (p<0.0001) in the 1 year CRT value.

Keywords : Dexamethasone implant; diabetic macular edema; vascular occlusion; central retinal thickness; visual acuity

INTRODUCTION

Anti-VEGF's and triamcinolone acetonide were the mainstay in the treatment of macular edema due to vascular occlusion, non-infectious posterior uveitis and diabetes till the introduction of sustained release steroid implants.¹

This was done primarily to mitigate the risks, complications and frequent dosing of the previous modalities of treatment.² Sustained release flucinolone acetonide and dexamethasone were consequently introduced for use as Retisert, Iluvien and Ozurdex.^{3,4,5,6,7,8}

Ozurdex is an Allergan manufactured and FDA approved biodegradable dexamethasone intravitreal implant marketed in USA and in India. It is available in two strengths, 0.35 mg and 0.7 mg.

Cross study comparison for the various therapeutic options was difficult due to variation in the baseline visual acuity at enrolment, duration of macular edema along with the primary outcome measures.^{1,9,10} Till date there have been no large RCT's comparing all the therapeutic options in the patient with comparable baseline inclusion

criteria's and outcome measures.

The present article retrospectively elaborates the indication and the final visual acuity at 1 year in a cohort of 28 patients administered with 1 or more doses of 0.7 mg intravitrealozurdex over a period of 1 year.

MATERIAL AND METHOD

This was a retrospective study in a tertiary care eye hospital of eastern India. The medical records were searched for all patients who had one or more injection of intravitrealozurdex over a period of 3 years and had a minimum period of follow up of at least one year.

The outcome was assessed in terms of visual acuity, central retinal thickness (CRT), mean foveal thickness (MFT), total macular volume (TMV) and frequency of complications.

SPSS 20 software package were used for evaluating the results.

Procedure

In all cases 0.7 mg ozurdex had been used. All the injections were performed by a single surgeon

under strict asepsis .For every patient topical 0.5% paracaine drop was instilled followed by periocular area cleaning with povidine iodine solution and sterile draping followed by subconjunctival 2% xylocaine injection . A 22 G applicator needle was used for injecting ozurdex as described in the product manual . Indirect ophthalmoscopy was performed after injection to confirm its position in the vitreous cavity.

Findings

Data of the 28 eyes of 28 patients was retrieved from the medical record division. Majority of the patients were in the age group of 50 -60 years . The most common

indication for ozurdex injection was vascular occlusion (n=15) followed by post cataract extraction (n=7), diabetic macular edema (n=6). 13 patients were diabetic and 10 patients were hypertensive .From amongst the 15 vascular occlusion cases who had received ozurdex 5 were only hypertensive. 5 patients had raised IOP one –two months following injection .the raised intraocular pressure ranged between 25 to 30 mm Hg. 19 pts had prior intravitreal anti VEGF injection (accentrix) 2 patients repeat ozurdex injection at 6 months. The preinjection and the post injection values have been depicted in table 1.

TABLE- 1 Baseline characteristics of the study eyes

Abbreviations: CRT:central retinal thickness, MFT – mean fovealthickness, TMV – Total macular volume

Discussion

Sustained release biodegradable dexamethasone intravitreal implant was initially approved by FDA for treatment of macular edema due to vascular occlusions (CRVO & BRVO) and non infectious posterior uveitis and was marketed under the trade name ozurdex.¹¹

In the later part of 2014 it was approved for use in the general diabetic macular edema patient population.

It is hydrophilic and five times more potent than triamcinolone acetonide allowing for higher vitreous concentration but has a very short half life in the vitreous cavity.

It is manufactured in 2 strengths 0.35 mg and 0.7 mg and has a biphasic drug release pattern with high doses upto 60 days followed by rapid decline between day 60-90 days and a steady lower level till 6 months.

This delivery system ensures a higher concentration of the drug directly in the posterior segment without encountering the associated systemic side effect.

In comparison to flucinoloneacetonide (Retisert), Ozurdex is less expensive, implantation procedure less invasive and post injection patients have a significantly lower rate of cataract and raised intraocular pressure.

The purpose of our study was to have an idea of the present indications of sustained release dexamethasone implant in a tertiary eye care center of India and the efficacy outcome in terms of BCVA from baseline pre-injection levels and central retinal thickness parameters using stratus 3000, Zeis OCT machine.

In DME and vascular occlusion patients there is a breakdown of blood retinal barrier with upregulation of proinflammatory mediators. Ozurdex targets the inflammatory pathway by decreasing the expression of VEGF and other inflammatory mediators thereby reducing vascular permeability and oxidative stress induced damage and promoting stabilization of inner and outer blood retinal barrier.^{12,13,14,15}

The non-injection ocular complications associated with phase III trial of Ozurdex are cataract (66% in phakic patient), intraocular pressure elevation >25mmHg (29.7%),conjunctival hemorrhage (23.5%),vitreous

hemorrhage (10%),Macular fibrosis (8.3%),Conjunctival hyperaemia (7.2%),eye pain (6.1%), vitreous detachment (5.8%) and dry eye (5.8%) .Macular edema, a frequent cause of decreased visual acuity has been tackled till date with antiVEGF and steroids.

AntiVEGF target the VEGF's directly in the vitreous whereas corticosteroids target the very expression of these VEGF's.^{12,16}

These modalities of intravitreal therapy have been used as monotherapy or in combination with each other and lasers.

Flucinoloneacetonide,another soluble biodegradable steroid derivative though having a longer duration of activity and thereby less frequent implantation requirements had a much higher incidence of cataract and raised intraocular pressure complications necessitating further surgical procedures (FAME study).^{3,17}

Use of sustained release dexamethasone implant substantially reduced incidences of these side effects.³

Though it has been FDA approved for use in RVO, DME and non-infectious uveitis there have been off level use in cases of post uveitic and cataract surgeries CME.^{18,19}

Sorkin et al has elicited the effect of these implants in macular edema of different etiologies. They had a follow up period of 22±6.9 weeks but we had a longer followup period (1 year).²⁰

The reduction in central retinal thickness from baseline of our patients was marginally less than the result of Sorkin et al. This is corroborative to the effect ofOzurdex in various clinical trials.

It normally shows peak value around 60-90 days with tapering effect towards 6 months and a further decrease to almost a plateau at 1 year.Our preference for use of the implant was psudophakia, vitrectomised eyes, recalcitrant cases unresponsive to routine anti VEGF's,patients with cardiovascular risks,central retinal thickness more than 400 milli micron. Complications associated with flucinolone such as cataract progression and need for glaucoma therapy were substantially reduced with the use of sustained release dexamethasone implant.¹¹Post cataract Cystoid macular edema is an off label use of dexamethasone implant.

CONCLUSION

Ozurdex is a potent biodegradable sustained release intravitreal implant with minimal side-effects. It can be used effectively in vitrectomised and non-vitrectomised eyes with maximal efficacy at 2 months. It has been used frequently in recalcitrant cases after repeated anti-VEGF therapy.

ABSTRACT

Trigeminal neuralgia (TN) is one of the ancient neuropathic disorders which torments a significant proportion of the population. Although Carbamazepine is the first line drug of choice in the treatment of this debility, cases falling into the domain of intractable neuralgia fail to respond to maximum tolerable doses of the drug. In such cases, Oxcarbazepine (OXC) may be given more preference owing to the minor risk for drug interactions and its better tolerability in comparison with CBZ. This study was designed to study the therapeutic effectiveness of OXC in intractable TN using Efficacy index of Clinical Global Impressions (CGI) score, also accounting for the adverse effects using Liverpool Adverse Events Profile.

Keywords: Intractable TN, Clinical Global Impressions (CGI) score, Efficacy index, Liverpool Adverse Events Profile.

INTRODUCTION

Although early descriptions of Trigeminal Neuralgia (TN) can be inferred from the writings of Galen¹, Aretaeus of Cappadocia^{2,3}, the first accurate descriptions of TN were not officially documented until the 1700s. In 1756, Nicholas Andre⁴ conceptualized TN in terms of convulsive behavior, believing that it belonged to the same continuum of diseases as tetanus or spasms. He coined the term *tic douloureux* to indicate both the pain his patients described and the facial spasms that he documented. In 1773, John Fothergill described TN as 'a painful affection of the face', in which excruciating episodes come on abruptly, and irregularly, with each episode lasting for short intervals⁵. He also remarked how daily activities like eating, talking or tactile contact might elicit these episodes. He disapproved the notion of TN belonging to convulsive disorders and instead

suggested that it might be the manifestation of some type of cancer.

International Association for Study of Headaches (IASH) describes TN as 'painful, unilateral affliction of the face, characterized by brief electric shock-like (lancinating) pain, limited to the distribution of one or more divisions of the trigeminal nerve. Pain is commonly evoked by trivial stimuli, including washing, shaving, talking, brushing of teeth, but may also occur spontaneously. The pain is abrupt in onset and termination, and may remit for varying periods'⁶.

According to the American Academy of Neurology (AAN), the European Federation of Neurological Societies (EFNS)^{7,8} and also other recent guidelines, carbamazepine (CBZ) and oxcarbazepine (OXC) are the first-line medical treatments for pain alleviation in TN. They exert their action through frequency dependent

blockade of voltage-gated sodium channel. OXC may be given more preference owing to the minor risk for drug interactions and its better tolerability in comparison with CBZ.

The AAN-EFNS guidelines recommended that patients unresponsive or that cannot reach the therapeutic dosage of the drug because of adverse events should be made aware of the availability of surgery. Surgical procedures include Gasserian ganglion percutaneous techniques⁹, microvascular decompression in the posterior fossa¹⁰, and gamma knife radiosurgery¹¹. Microvascular decompression may be considered over other surgical techniques to provide the longest duration of pain freedom. According to the available evidence no oral treatment is better than CBZ or OXC, but in case of refractory trigeminal neuralgia, among the non-surgical option, lamotrigine and botulinum toxin injections should be considered¹².

AIM OF THE STUDY

- To study the therapeutic effectiveness of Oxcarbazepine (OXC) in intractable TN.
- To document the adverse effect profile of OXC.

MATERIAL AND METHOD

Sample: The present study on intractable TN was conducted amongst 57 patients randomly selected from the Department of Oral Medicine and Radiology, SCBDCH, Cuttack, Odisha.

Inclusion Criteria:

Patients with unilateral, bilateral episodic electric shock-like pain, paroxysmal, confined to any branch of the trigeminal nerve without other causes of orofacial pain or organic pathology (as screened with MRI), unresponsive to first line drugs.

Patients on Carbamazepine (CBZ) Monotherapy, who are unresponsive to its maximum tolerable dose (MTD).

Patients unresponsive to MTD of any non-carbamazepine (N-CBZ) group of drugs, who were shifted to N-CBZ group because they did not respond to MTD of CBZ and/or showed intolerable adverse effects to CBZ.

Patients who showed relapse after an effective

period of CBZ therapy, currently on MTD of CBZ or N-CBZ drugs.

Exclusion Criteria:

Patients with organic pathology precipitating TN like multiple sclerosis, TN-post nerve trauma, idiopathic sensory trigeminal neuropathy, etc.

Patients with debilitating diseases, liver or hepatic pathology.

Patients with history of other neurological disorders, undergoing treatment for the same.

Pregnant or lactating women or women on oral contraceptives.

Study Design

A total of 57 patients were recruited into this interventional study, based on the above inclusion and exclusion criteria, from the outpatient department of Department of Oral Medicine and Radiology, SCBDCH, Cuttack. Diagnosis of TN was confirmed by a detailed history and clinical examination by a neurologist and a dental practitioner, separately, to rule out inter-examiner variability and bias. Intraoral and Extraoral radiographs were taken to rule out odontogenic factors for orofacial pain. Patients who did not have pain paroxysms at the time of history taking and examination were kept under observation without any intervention until the real attack was observed. Pretreatment documentation of number of pain attacks was done by asking the patient to maintain a pain diary, wherein the number of daily pain episodes was recorded for a week. On the subsequent weekly follow-up, the mean attacks per day was calculated by the examiner, which was taken as the baseline value. Out of these 57 patients, 42 patients were on MTD of CBZ, and the remaining 13 were on MTD of N-CBZ drugs. The drug regimen was converted to OXC monotherapy.

Protocol adopted for conversion of existing monotherapy (CBZ or N-CBZ) to OXC monotherapy

For patients on MTD of CBZ (1200 mg/d): Out of 57 patients, 42 patients were on CBZ monotherapy at MTD of 1200 mg/d (400 mg TDS). Any attempted increase in CBZ dose beyond 1200mg/d either led to intolerable side effects or had no effect on reducing pain frequency (side effect profile outweighed therapeutic efficacy and/or response to dose escalation

was minimal). Hence 1200mg/d was taken as the last titratable value of CBZ in this group of patients. The strategy adopted for monotherapy conversion to OXC was in accordance with SPECTRA CONCENSUS PANEL RECOMMENDATIONS¹³ and UK OXCARBAZEPINE ADVISORY BOARD¹⁴. In first week (week 1; ie. At the end of observation week, week 0), the CBZ dose was tapered by approximately 20% of MTD (1200 mg/d). In the subsequent week (week 2), further dose reduction was done by 20% of original dose. Based on the type of oral tablet formulation available and patient compliance, daily dose regimen (no. of. divided doses) was determined. No inadvertent increase in pain frequency was observed during the taper over 2 weeks. In the beginning of third week (week 3), overnight shift was done to OXC 900 mg/d (300mg TID), following 1:1.5 switch. Dose escalation of OXC was done at 300mg/d weekly, with the dose being titrated upwards through 1200 mg/d, 1500mg/d, 1800mg/d, 2100mg/d to 2400 mg/d.

Patients on MTD of N-CBZ group: Drug switch was done following the guidelines outlined in SPECTRA CONCENSUS PANEL RECOMMENDATIONS¹³ and UK OXCARBAZEPINE ADVISORY BOARD¹⁴, taking needful consultation from a neurologist.

The patients were followed up on a weekly basis; their pain diaries were evaluated to calculate the mean number of pain attacks per day for the preceding week, with changes in mean attacks per day documented, if any. Scoring of therapeutic efficacy of OXC was recorded by using the Efficacy Index of Clinical Global

Impressions (CGI) Scoring¹⁵. Also, the adverse effects, if any, due to OXC were recorded using the Liverpool Adverse Event Profile^{16,17} on a weekly basis. Routine hematological examinations were done to keep track of any biochemical or blood panel derangements. The OXC dose with maximal therapeutic effect and minimal adverse effect was chosen for each patient by proper dose adjustment and monitoring.

In due course of the study, a sample attrition of 5 patients occurred; 3 were lost to follow-up, 1 dropped out due to adverse effects of OXC, and 1 was excluded as the drug side effects outweighed the therapeutic efficacy. This patient was, however, given proper medical treatment.

FINDINGS

The final sample included in the study exhibited a strength of 52 patients. Out of these, 13 (25%) reported a duration of diagnosed trigeminal neuralgia of less than 6 months, 26 (50%) for a period of 6 months to less than 3.5 years, 6 (11.5%) reported a duration within 3.5 to less than 7.5 years, 5(9.5%) within 7.5 to less than 10.5 years and 2 (4%) reported this duration to be greater than 10.5 years.

The side effect spectrum as documented with the Liverpool Adverse Events Profile reflected that 67% of patients reported central nervous system symptoms, 45% experienced gastrointestinal ailments while 36% reported back with an array of other symptoms. These presentations have been graphically summarized in table1.

Table 1: Spectrum of side effects as recorded with Liverpool Adverse Events Profile (in percentages).

Table 2: Scoring of therapeutic efficacy of OXC as recorded by Efficacy Index of CGI Scoring (number of patients).

THERAPEUTIC EFFECT	SIDE EFFECTS			
	none	do not significantly interfere with patient functioning	significantly interferes with patient functioning	outweighs therapeutic effect
MARKED	5	15	4	0
MODERATE	8	13	1	0
MINIMAL	3	1	1	0
UNCHANGED	1	0	1	1
			<i>drop out</i>	<i>excluded from study</i>

The most commonly encountered central nervous system effect was sleepiness as reported by 11(22%) of patients. 10 (20%) of patients complained of vomiting which was documented as the predominant gastrointestinal symptom post drug switch. Only 1 (2%) patient reported allergy to the new drug. Blood electrolyte profile revealed that 13 (28%) of patients had hyponatremia.

The therapeutic effect of OXC was weighed against its observed and/or experienced adverse effects and scoring done using CGI, the results of which have been shown in table 2.

Majority of the recruits reported an efficacy index of 2, followed by a score of 6. None of the patients reported a score of 4, 8, 12 and 14. Patient with a documented score 15 dropped out of the study. Patient with efficacy index of 16 was excluded from the study with suitable referral and follow up with a neurologist as continued therapy with the drug per se was not deemed advisable.

CONCLUSION

The present study was conducted with a focus on trying to evaluate the therapeutic benefit against adverse effects of OXC in patients with intractable TN. The results of the study showed a promising outcome. 44.44% of patients experienced marked

therapeutic effect, of whom 83.33% reported none to minimal interference with patient functioning. There is compelling evidence suggesting that oxcarbazepine can provide significant analgesia in varied neuropathic pain presentations, including trigeminal neuralgia. The analgesic effects of oxcarbazepine, and its generally improved safety and tolerability profile compared with other standard Antiepileptic drugs, suggests that oxcarbazepine will be an important add on to the neuropathic pain armamentarium. However, the validity and generalisability of such a study as above can be strengthened and tested by multicentric trials.

ABSTRACT

Introduction- GLUT-1 is an endogenous marker of hypoxia which has been identified in diverse human tumors and there is evidence that GLUT-1 is associated with tumor aggressiveness in head and neck squamous cell carcinoma.

Aim - Evaluation and comparison of GLUT-1 expression in verrucous carcinoma & various grades of squamous cell carcinoma.

Objective- Our study aims to find the correlation of GLUT-1 expression with the clinical and histopathological features of various lesions included in the study which are Verrucous carcinoma and various grades of squamous cell carcinoma. It also aims at evaluating the aggressiveness of each individual lesion.

Materials & method- Study group - Histopathologically diagnosed 10 verrucous carcinoma(VC) cases, 30 oral squamous cell carcinoma (OSCC) cases, 10 each of well differentiated, moderately differentiated and poorly differentiated were selected. Only primary carcinoma cases were considered. For control group- 10 biopsy specimen of normal oral mucosa that are taken during minor oral surgical procedures with patient consent. Immunohistochemistry method was employed to evaluate the GLUT-1 expression in the various tissue sections.

Results- GLUT-1 expression is increased VC and OSCC in comparison to normal mucosa. Its expression in various OSCC cases is correlated with the aggressiveness, local metastasis.

Conclusion- Immunoexpression of GLUT-1 of tumor cells (VC & OSCC) can act as an adjunct in predicting the aggressiveness of each lesion and better prognosis can be achieved by modified treatment planning as per the need of the individual lesion.

Keywords: *Glut-1, Squamous cell Carcinoma, Verrucous Carcinoma.*

INTRODUCTION

Glut-1 is a hypoxic tumor marker which is used to determine the metabolic activity of tumor cells. Our study comprises of immunohistochemical comparison of Glut-1 expression in normal mucosa, Verrucous

carcinoma & all the three histological grades of oral Squamous cell carcinoma.¹⁻³ There are some prognostic tumor biomarkers associated with the clinical outcome of Oral Squamous Cell Carcinoma (OSCC) and there are diverse types of cell and tissue molecular biomarkers that can provide information complementary to that which can be obtained from clinical examination and histopathological studies.²⁻⁵

It has been suggested that, like CA IX and HIF-1 alpha, GLUT-1 might represent an endogenous marker of hypoxia which has been identified in diverse human tumors and there is some evidence that GLUT-1 might relate to aggressiveness in Head and Neck Squamous Cell Carcinoma (HNSCC).⁶⁻⁸ In animal cells, sugars are the major source of metabolic energy.⁸⁻¹⁰ However, as the plasma membrane is impermeable to polar molecules, membrane-associated carrier proteins are necessary for the introduction of sugars in cells. GLUT transporters use existing gradients in sugar concentration, between external and internal sides of plasma membrane, to facilitate its translocation.¹¹⁻¹⁴ SCC is a histologically distinct form of cancer. It arises from the uncontrolled multiplication of cells of epithelium, or cells showing particular cytological or tissue architectural characteristics of squamous cell differentiation, such as the presence of keratin, tonofilament bundles or desmosomes, structures involved in cell-to-cell adhesion.¹⁵ Verrucous carcinoma

is a low grade histopathological variant of Squamous cell carcinoma with intact basement membrane and pushing border rete ridges and intraepithelial keratinisation.¹⁶ It is considered a potentially malignant disorder as often it has been seen that it eventually leads to Squamous cell carcinoma. Some of the studies are carried out in evaluating the expression of GLUT-1 in epithelial dysplasia and carcinoma but not many have been carried out in Verrucous carcinoma.¹⁷⁻¹⁹ Our study is evaluating the expression of Glut-1 in verrucous carcinoma and the various grades of squamous cell carcinoma.

MATERIALS & METHOD

Materials included Glut 1 antibody and IHC kit from Path N Situ. Positively charged slides and the other materials required for IHC were obtained. The study group comprised of 10 well differentiated OSCC, 10 moderately differentiated OSCC, 5 poorly differentiated OSCC, 10 VC and 5 normal epithelium tissues. Formalin fixed paraffin embedded tissue blocks were taken of the earlier diagnosed cases from the institution. Patients with immunocompromised diseases or who are already undergoing treatment were excluded. IHC was performed with the given tissue sections using Glut- 1 antibody (Fig.1,2,3,4,5). The slides were studied and scored on the basis of stained cells with glut-1.

Immunoexpression of Glut-1 :

Fig-1-Normal mucosa

Fig-2- Verrucous Carcinoma

Fig-3- WDSCC

Fig4-MDSCC

Fig-5-PDSCC

FINDINGS

When clinical parameters like age, sex, site, habit and TNM staging of OSCC cases were compared, there was significant association of Glut-1 expression with age group of patients (p=0.01, table 2) whereas in VC Glut-1 expression was significantly associated with habits of patients (p=0.02, table 1). On comparing the expression of Glut-1 in normal, VC and different grades of OSCC it was seen that mean value of Glut-1 expression increased in VC and different grades of OSCC in comparison to

normal tissue.

Results clearly indicated that Glut-1 expression showed mixed results in relation to the various clinical parameters like age, sex, site, habit etc whereas histopathologically its expression was directly proportional to the aggressiveness of the lesion. Its expression increased from normal epithelium to Verrucous carcinoma and in various grades of squamous cell carcinoma progressively along with the grade of OSCC. P was found to be highly significant histopathologically. (table 3;P=0,p<.05)

DISCUSSION

GLUT-1 expression has been studied extensively in HNSCC; however the prognostic value of this parameter has not been analyzed systematically in OSCC.^{16,18} Not many studies have been done on Verrucous carcinoma before. Enhancement of glucose utilization, especially of glycolytic (anaerobic) metabolism is widespread characteristic of malignant cells. Malignant cells show an increase glucose uptake and utilization when compared to their benign/normal counterpart invitro and invivo.⁹⁻¹¹ Glycolytic metabolism helps to maintain the increased energy requirement of rapidly proliferating cells and represent an important adaptive change believed to be necessary to overcome the adverse micro environmental conditions existing in tumors.¹³⁻¹⁵ For this reason, these metabolic changes have been traditionally used to provide diagnostic and prognostic information.¹⁵⁻¹⁶ In tumors, increased glucose uptake is chiefly achieved through the up regulation of several large families of facilitative glucose transporters and these are regulated by various oncogenes and growth factors.¹⁷ In particular, facilitative glucose transporter (GLUT-1) is one of the proteins up regulated in hypoxic

conditions. GLUT-1 staining occurs in outer epithelial layers which may be a function of the differentiation and invasion process. However, GLUT-1 staining also exists in central tumor nests, distal to blood vessels, may signify the existence of hypoxia-induced GLUT-1. The role of GLUT-1 in OSCC is controversial. Several studies have reported an association between GLUT-1 expression and neoplastic progression in various tumors such as malignancies of head and neck, esophageal, lung etc.¹⁸ However, little is known about the expression in various histological grades of OSCC. Hence, the present study was undertaken to evaluate GLUT-1 expression in normal mucosa and in various histological grades of OSCC and also in Verrucous carcinoma as it denotes low grade histopathological variant of squamous cell carcinoma.¹⁹ Thus, the present study aims at analyzing GLUT-1 expression in normal mucosa and different grades of OSCC and Verrucous carcinoma to assess the reliability of GLUT-1 as a promising prognostic marker. The present study revealed statistically significant difference between expression of GLUT-1 in normal mucosa and OSCC cases, showed negative or weak expression of GLUT-1 in normal epithelium and GLUT-1 immunostaining was detected in cell layers

above parabasal layer and its expression increased with increase in grading of OSCC.¹⁶⁻¹⁹

In the present study normal mucosa showed focal to homogenous GLUT-1 expression seen in basal compartment and few places of suprabasal cell layer which was similar to the results of Reisser et al and their results showed weak expression of Glut-1 in normal mucosa in comparison to OSCC. This finding is in concordance with the studies performed by Ayala et al²⁰, Burnstein et al²¹. We found less expression of GLUT-1 in the keratinized pearl area which was also seen by Angadi V C et al suggesting the pro stromal pattern of Glut-1 expression which is, low in central differentiated areas of WDSCC as it is inversely related to the glycogen content.¹² GLUT-1 expression was more in stage III cases of PDSCC which supported the findings of Harshani et al²² who showed positive correlation between GLUT-1 expression and TNM staging whereas Yamada et al²³ Demeda et al²⁴ found no significant association of GLUT-1 expression with tumor size or clinical stage of the tumor in OSCC patients. On comparing overall OSCC cases with clinical staging of the tumor we did not find any significant correlation of TNM staging with GLUT-1 expression in contrast to the study done by Azad N et al, who compared the GLUT-1 expression between the tobacco & non tobacco users in OSCC cases and found that there was more expression of GLUT-1 in tobacco user groups.¹⁷ Various other carcinomas like gastric carcinoma²⁶, bladder carcinoma, colorectal carcinoma²⁷, rectal carcinoma²⁸, eosophageal carcinoma²⁹, laryngeal carcinoma, pancreatic carcinoma have also been associated with poor overall survival with GLUT-1 expression. In order to understand the tumor biology, the energy metabolism of tumor cells has been investigated. Many authors (Ayala F R et al²⁰, Kunkel M et al⁴, Ohba S et al¹¹, Schutter H D et al³¹, Eckert A W et al⁹, Grimm M et al³², Harshani J M et al²², Li C X et al³³) reached a conclusion that GLUT-1 can act as a predictive marker in head & neck squamous cell carcinoma specially the oral squamous cell carcinoma but only one study done by Baer³⁴ et al, reported that in OSCC expression of GLUT-1 is ineffective as a prognostic indicator. Kunkel M et al⁴ & Ayala F R et al²⁰ suggested that Glut-1 over expression is associated with shorter survival which was also supported by other studies carried out by Schutter H D et al³¹ & Eckert A W et al¹⁵ (survival $p=0.001$) who found out that Glut-1 can be used as an independent marker in routine assessment

of OSCC.

CONCLUSION

The present study concludes that a significant increased expression of GLUT-1 may serve as a promising immunomarker which may help the clinicians to analyze the behaviour of VC & OSCC. GLUT-1 can be used as an aid in assessing the aggressiveness of Verrucous Carcinoma and it also helps us in predicting which lesions are more likely to develop into malignancy. In OSCC cases GLUT-1 acts as an adjunct in deciding the individual prognosis of each case.

ABSTRACT

Introduction: Methylene blue, widely used as a histologic dye, has potential photochemical and photobiological properties favoring its use as a photosensitizer in photodynamic therapy (PDT) of varied diseases. This study was designed to assess the efficacy of MB mediated PDT in treatment of Oral Lichen Planus.

Materials and Method: A sample selection of 37 patients was done based upon a predefined set of inclusion and exclusion determinants from the Outpatient Department of Oral Medicine and Radiology, SCBDCH, Cuttack This study encompassed a non-randomized, non-comparative prospective split mouth study protocol. Pre-treatment assessment of clinical presentation and symptoms was done using REU and VAS score respectively. The subjects were treated with a single session of MB-PDT and followed up after 2 weeks, 1 month and 3 months from baseline. The post treatment REU and VAS recorded at each visit for the test and control site separately.

Findings: For the final sample of 35 recruits, Repeated measure ANOVA was used for analysis of REU and VAS score among various visits in test group. With respect to REU scores, statistically significant results were obtained for baseline with 3 months follow up , for 2 weeks with 3 months follow up and for 4 weeks with 3 months follow up. The VAS score was statistically significant amongst all comparisons.

Conclusion: MB is photochemically and photobiologically a dynamic molecule which can be effectively harnessed to target various premalignant and malignant pathologies to prevent its progression.

Keywords: Methylene blue, Photodynamic therapy, REU score

INTRODUCTION

Photodynamic therapy (PDT) is a promising modality for the management of various tumors and

non malignant diseases, based on the combination of a photosensitizer that is selectively localized in the target tissue and illumination of the lesion with visible light, resulting in photodamage and subsequent cell death.^{1,2} Early preparations of photosensitizers for PDT , based on a complex mixture of porphyrins called haematoporphyrin derivatives were first generation photosensitizers.³ Ongoing research in photochemotherapy has uncovered new photosensitizers that belong to the different classes of compounds

Corresponding author:

including porphyrins, chlorins, phthalocyanines, texafrins and phenothiaziniums.⁴ Methylene blue is a widely known histological dye. Chemico-structurally MB is a phenothiazinium compound. Its favorable photochemistry and photophysics confers upon this molecule a great potential for application in PDT. This molecule has a well characterized and effective photochemistry that triggers both photosensitization mechanisms type I and type II⁵. Its photodisruptive effect damages biomolecules and efficiently induces death in several target cells, tissues and organisms. Therefore, upon photoactivation, it can be used to treat an array of cancerous and non-cancerous diseases.

MATERIAL AND METHOD

(a) Research design and study sample: The subsequent research design relied upon a non-randomized, non-comparative prospective split mouth study protocol. The study recruited participants from amongst the patients attending the Outpatient Department of Oral Medicine and Radiology, SCBDCH, Cuttack. Sample selection was done based upon the following outlined inclusion and exclusion criteria.

(b) Inclusion criteria:

1. clinical diagnosis of any one of the typical variants of oral lichen planus (OLP) of buccal mucosa present bilaterally, with histopathological confirmation
2. patients previously diagnosed and under conventional treatment for oral lichen planus who where nonresponsive or calcitrant
3. dissatisfied or reluctant to continue the conventional treatments

(Patients included as per criteria 2 and 3 were clinically and histopathologically reassessed prior to their inclusion in the study.)

(c) Exclusion criteria:

1. histopathologic non-confirmation of oral lichen planus
2. dysplastic features histopathologically
3. lichenoid reactions with clinical improvement after removal of suspected etiology
4. systemic compromise or debility and

pharmacologic treatments that could predispose to and/or alter the course of OLP and effect of treatments instituted in the study hence

5. OLP with dermatologic manifestations
6. Documented allergy to phototherapy and photosensitizers
7. pregnancy, lactation
8. patients with deleterious oral habits (smoking and smokeless tobacco, alcohol) and parafunction.

An informed consent was obtained from all subjects after detailed explanation of study protocol, advantages and disadvantages with a clause allowing voluntary discontinuation of participation on behalf of the subject at any point during the study.

d. Methodology

A sample of 37 patients was recruited into this study based upon the outlined norms. Pre treatment evaluation included 3 stages: assessment of clinical characteristics of the lesions, symptom evaluation , and histopathological confirmation. During recruitment of patients, it was ensured that lesions were present on bilateral buccal mucosa with similar clinical manifestations. Pre treatment assessment (Stage-1) of the intraoral lesions on buccal mucosa was done in corroboration with the REU scale⁶. Lesion severity in each site was scored according to the following: presence of reticular/hyperkeratotic/white papular (R) lesions (0-none, 1-presence), presence of erosive/erythematous (E) lesions and/or ulcerative (U) lesions (0-none, 1-lesions smaller than 1 cm², lesions from 1 to 3 cm², 3-lesions larger than 3 cm²). The total weighted score was a summation of reticulation score, erythematous score (weighted 1.5), and ulcerative score (weighted 2.0). To measure dimensions using REU scale, transparent flexible grid with marking squares of 1x1 mm² of minimum dimension was used. The clinical examination was performed by two examiners (Oral Medicine specialist and Oral Pathologist) separately to rule out any bias concerning the scoring. Also a recording of symptom (burning and pain) was done using VAS score (pretreatment stage-2). These were baseline pretreatment data. Following this, a punch biopsy was taken from the most representative site of buccal mucosa (pre-treatment stage-3). Only unilateral biopsy was done with the side of biopsy being treated as control and the

contralateral lesional buccal mucosa was treated as test site (PDT intervention), to avoid any untoward effects of wound healing on appearance hence subsequent scoring of lesions. The biopsy specimen was harvested as aseptically as possible under local anesthesia (2% lignocaine with 1:200000 adrenalin) using a 4mm diameter and depth disposable punch instrument. The specimen was transported in screw capped vials with 10% buffered formalin and sent for histopathological confirmation. A period of 2 to 4 weeks was allowed to lapse with supervision for adequate healing of biopsy site.

Before application of the photosensitizer, an atopic patch testing was done. None of the subjects tested positive. The lesions on test and control site were cleaned with cotton wool soaked in a soap free cleansing lotion. The subject was instructed to swish with freshly prepared 5% MB solution (Sigma , Life Sciences, purity grade $\geq 97\%$, molecular weight-319.85) for 5 minutes

(fig-1,2). The patient refrained from consumption of food and water during the test period. Twenty minutes after application of the dye, the test site was given a radiant exposure of 120 J/cm² with a wavelength range of 625-675nm of red light, at irradiances of 100-130 mW/cm² using a light emitting diode source (Epic10 Biolase, operating voltage-100 V to 240 V, wavelength-940+/-10nm, maximum power output-10W, continuous power mode, fig-3,4) for a period of 120 seconds. The control site was spared of the above procedure. However, the aiming beam of the laser equipment was flashed at control site. The distilled water application with the aiming beam was chosen as placebo to MB-PDT. The subjects were assigned a follow up visits after 2 weeks, 1 month and 3 months from baseline with post treatment REU and VAS recorded at each visit for the test and control site separately. During the study period, 2 patients were lost to follow up at 2 weeks and were excluded from the study giving a net sample strength of 35 patients.

FINDINGS

The intra and intergroup (test and control sites) comparisons of both objective and subjective parameters (REU and VAS) at baseline and subsequent follow up visits have been documented in table 1. Out of 35 patients recruited in the final sample, 14 were males and 21 were females giving a percentage distribution of 60% and 40% in favor of female predilection. Statistically significant change in both REU and VAS score was observed at the test site in contrast to the side of non intervention.

Inter group comparison of REU and VAS score at various visits between study groups.

In table-2 and table-3, repeated measure ANOVA was used for analysis of REU and VAS score among various visits in test group. With respect to REU scores, statistically significant results were obtained for baseline with 3 months follow up, for 2 weeks with 3 months follow up and for 4 weeks with 3 months follow up. The VAS score was statistically significant amongst all comparisons.

Table-4 elucidates inter group comparison of REU and VAS scores at various visits between study groups. Statistically significant results were obtained for VAS at all follow up visits and at 3 months for REU.

CONCLUSION

Nearly a century ago, the antibacterial characteristics of MB which is a phenothiazine dye were described and attributed to its photodynamic properties. MB itself has been used in medical practice for more than 100 years and is recognized as having very low tissue toxicity. Clinical uses of MB include the treatment of ifosfamide encephalopathy, methemoglobinemia, urolithiasis, and cyanide poisoning.^{7,8} Photodynamic therapy (PDT) has been considered as an alternative/complimentary therapeutic modality for the management of premalignant lesions. The results from this study highlight the potential role of methylene

blue mediated PDT in alleviating subjective symptoms whilst also causing regression in clinical lesion. MB is photochemically and photobiologically a dynamic molecule. Its photoaction occurs in direct contact with membranes, polyelectrolytes and in the presence of reducing agents. Photosensitization reactions induced by MB excitation are known to cause damage to several biomolecules.^{9,10} these mechanisms can be effectively harnessed to target various premalignant and malignant pathologies to prevent its progression.

Short Term PV Power Forecasting Using Empirical Mode Decomposition based Orthogonal Extreme Learning Machine Technique

Niranjan Nayak¹, Alok Kumar Pani²

¹Associate Professor, ²Assistant Professor, Department of Electrical and Electronics Engineering, ITER, Siksha 'O' Anusandhan (Deemed to be University)

ABSTRACT

In present power scenario solar power generation plays a significant role, but due to its instability and irregularity nature the grid management problem becomes a prominent and challenging task. To avoid these types of problems here we have investigated an EMD based orthogonal extreme learning machine technique, which can continuously replace the old data with new data. EMD is used to decompose the data before application of various type of ELM, which eliminates the instability of the system. This paper presents the development of a reliable algorithm for short term forecasting of PV generated power of an existing solar power plant situated in Bhubaneswar, odisha, India (the detailed specification is given in table-1) . Here the PV power is forecasted EMD based orthogonal ELM algorithm and the results are compared with ELM, EMD-ELM and OS-ELM .The results depict that the proposed machine learning technique performs better than other mentioned algorithms.

Keywords: PV power, Orthogonal Extreme Learning Machine (O-ELM), Empirical Mode Decomposition,(EMD), OS-ELM, and PV power forecasting;

INTRODUCTION

The huge consumption of fossil fuel, fast growing of environment pollution the researchers are more encouraged for the clean energy i.e, renewable and sustainable energy like solar and wind energy etc¹. As per the survey of the international energy agency the present Photovoltaic power production growth has overcome that of last 40 years. China has played a major role in global market followed by Japan and USA in 2013.The PV power generation and its penetration to the conventional grid reduces the power shortage in a great extent. Further the roof top PV power generation has been encouraged by the Governments which partially balance the power demand. It is expected by 2050 the

solar energy may contribute about 16% of the global generation capacity. Research on photovoltaic power offers solutions to many challenges like irregularity of solar irradiance, nonlinear characteristics of PV cell and the power system itself^{2,3}. The extensive studies have conducted to improve the overall performance of the PV system. Besides many advantages the PV system faced many challenge for its instability and Random intermittent power output⁴.During on grid operation the fluctuating PV power generation produces grid stability problem challenges the network protection, which makes difficulty to prepare generation planning. Thus an accurate calculation of PV power output is essential to frame healthier generation plan and proper energy management which includes temporary compensation, coordinated power control and cost reduction ⁵.

Further better forecasting of PV power improves the system security and stability along with optimized system operation⁶.Forecasting generally conducted in two methods such as physical method and statistical methods. The physical method of prediction deals with the parameters which affect the PV power output directly

Corresponding Author:

Niranjan Nayak,

Associate Professor, Department of Electrical &Electronics and Engineering, ITER, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, India. Email ID: mihirmohanty@soa.ac.in

such as solar emission, atmospheric temperature etc. The forecasted parameters then used in the model to get PV output power. Otherwise considering the historical data a statistical model is built with help of orthogonal ELM to expect the PV power in short term horizon. It has been already tested by many researchers that the physical method is better than the statistical methods ⁷. In reference⁸ the authors investigated the performance of extreme learning machine with forgetting mechanism (FOS-ELM), which gives partially unsatisfactory results. Many regression models like random forest and support vector regression models are applied which shows the inter relation between input and output variables and the results were validated. The performances of such models is affected by their major drawback that it can degrade the operation in the middle ^{9,10,11}. In reference^{12,13} Radial Basis Function network (RBF) is applied to predict the solar power on daily basis, using the geographical like temperature, humidity and solar irradiance. In reference ^{15,16}the back propagation network (BPN) and artificial neural network (ANN) are applied for short term forecasting and high accuracy was achieved but the computation time was long and these methods are not suitable for complex problems. In all the above research articles reviewed overlooked the time confirmation of the data, and assumed to be that the data should not be useless. But in reality since the training data are time responsive, they need to be updated. A few research concentrated on this fact so far. In the article^{17,18} the researchers have proposed online one day prediction model in which the input parameters are classified based on the climatic condition. Many authors have investigated a two stage prediction of photovoltaic power in which first a statistical normalization of PV power data is achieved and then the forecast of normalized PV power to predict the photovoltaic power¹⁹. However the recent researches

has been focused on the Extreme learning algorithm due to following characteristics,

1. The commutation complexity of ELM is much lower as compare to other machine learning techniques.
2. It has high learning speed as compare to other feed forward learning algorithms.
3. The ELM is a high performing machine learning technique with certain modifications, so far.
4. It needs a small number of hidden layers and they need not be tuned [20].

The major contribution of this work is

1. Orthogonal Extreme learning machine (O-ELM) is applied for short term calculation of a real time existing solar plant power output.
2. The accuracy of different prediction models like, ELM, OS-ELM and O-ELM prediction model are compared.
3. The simulation model shows that this type ELM application is a new method which gives better performance than other forecasting models.

Data collection:

The collection of data from a physical existing Photovoltaic power plant is very vital factor before applying any forecasting technique. The time series past data like irradiance, temperature and power are collected from an existing PV power plant located on the roof top of SOA(deemed to be) university, Bhubaneswar, Odisha, India. (The specification is mentioned in table-1). The entire data set is classified in to two parts such as 80 percent data is used for training and rest 20 % data is used for testing.

Table 1: Specification of Solar Power Plant

SL No	Sspecification	system	Temperature
1.	Type of cell	Polycrystalline	20°25
2.	Type of cell	Polycrystalline	85°80
3.	Type of cel	Polycrystalline	106.25m ²
4.	Longitude		85°80
5.	Area Cover		106.25m ²

Data decomposition Processing:

As presented in the figure – and -- the time series data is decomposed into small components known as intrinsic membership function (IMF). From the decomposition outcome, it is seen that the trend of the high frequency IMFs decomposed by the EMD method is relatively stable, which is favorable to forecast. The fluctuation of low frequency signal is higher than high frequency signals. The objective of using EMD is to improve the prediction precision and stability. After decomposition IMFs contains local properties of the parent signal, in diverse time scales, makes the IMFs as narrow-band signal and justify the following two conditions such as the data set contains equal number of zero cross and acute value, or greater than equals to one. The other condition is the average of local maxima and minima at any point is zero.

The model admits that any part of the new sequence of signals can be explained in the following expression.

$$s(t) = \sum_{i=1}^n \lambda_i(t) + rn(t) \tag{1}$$

The EMD process is completely iterative. It decomposes the signals into IMFs with various magnitude and frequency. The IMF generation satisfies the conditions such as the data set contains equal number of zero cross and acute value, or greater than equals to one. The other condition is the average of local maxima and minima at any point is zero.

The 1st component of IMF is given by,

$$IMF_1(t) = s(t) - a_1(t) \tag{2}$$

IMF₁ is the first IMF of the signal $x(t)$, if not an IMF then is to be considered as original signal and decomposed repeatedly. $kIMF_1$ is considered to be an IMF and denoted as

$$\sigma_1 = kIMF_1 \tag{3}$$

The first IMF is removed from $x(t)$. By using $s(t) - \sigma_1(t) = \rho_1(t)$, r_1 is considered to be the residue of the original signal and other IMFs are obtained $\sigma_1, \sigma_2, \dots, \sigma_n$.

$$\text{Then } \rho_1(t) - \sigma_2(t) = a(t) \tag{4}$$

$$\rho_n(t) - \sigma_n(t) = a(t) \tag{5}$$

Equation (4) and (5) gives the modified form of eqn(1)

The terminating condition for this shifting process was recommended by Huag et.al, a normalized squared difference between the two consecutive shifting operations is essential.

$$S_1 D_k = \sum_{t=0}^T \frac{|IMF_{n(k-1)}(t) - IMF_{nk}(t)|^2}{IMF_{n(k-1)}^2(t)} \tag{6}$$

The shifting process is stopped by any predetermined criteria, by summing all the IMFs and the final residue the signal

$x_n(t)$ can be reconstructed as

$$x_n(t) = \sum_{i=1}^m c_{ni}(t) + r_{nm}(t) \tag{7}$$

Extreme learning Machine technique (ELM):

The extreme learning machine is a single hidden layer ANN with arbitrary hidden neurons. The fundamental nature of ELM includes special from the common accepting of learning, No tuning is required for the hidden layer of SLFN. One of the classic execution of ELMs is to pertain arbitrary iterative nodes in the hidden layer, which may be free of the training data. Different from conventional learning algorithms for neural networks ELM not only tends to achieve the minimum training error but also the least norm of output weights.

Figure-1: Structure of Conventional ELM

Table-2: The nomenclatures of the prediction model.

Symbols	Nomenclature
L	Number of hidden layer neurons
$N =$	number of different learning samples (x,y) .
$\gamma =$	Output weight vector.
$F =$	Activation function.
$M =$	Hidden layer output matrix
$Y =$	Training data output vector.
$C =$	Regularisation parameter.

The output function of ELM is written as

$$f_L(s_n) = \sum_{i=1}^L \beta_i G(a_i, b_i, s_n) = y_n \tag{8}$$

Where $s \in R^{d \times N}$, $a_i \in R^{1 \times d}$, $b_i \in R$, a_i, b_i are randomly selected matrices and vectors respectively.

γ is the output weight vector which establish the link between output and hidden neuron and φ is the activate function which interlinks between i_{th} random hidden neuron with all input neurons which is a sigmoid function is given by

$$\varphi(a, b, x) = \frac{1}{1 + e^{-ax+b}} \tag{9}$$

Equation (1) can be written in matrix form as

$$M \cdot \gamma = Y \tag{10}$$

Where

$$M = \begin{bmatrix} \varphi(a_1, b_1, s_1) & \dots & \dots & \dots & \varphi(a_L, b_L, s_1) \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ \varphi(a_1, b_1, s_N) & \dots & \dots & \dots & \varphi(a_L, b_L, s_N) \end{bmatrix} \tag{11}$$

And

$$\gamma = [\gamma_1 \ \gamma_2 \ \dots \ \gamma_L]^T \quad Y = [y_1 \ y_2 \ \dots \ y_N]^T \tag{13}$$

Then the least square solution of equation (1) is given by

$$\gamma = M^+ Y = M^T (MM^T) Y \tag{14}$$

Where M is the hidden layer matrix with which i_{th} element m_i is the hidden layer output of input vector s_i . Y is the training data output vector. γ is the only parameter to find out in the training process. Here the number of hidden layers must be less than the training samples. To get better the stability and generalise performance of the prediction model a regularisation parameter is to be introduced in the equation (6) as given below.

$$\gamma = M^T \left(MM^T + \frac{1}{C} E \right) Y \tag{15}$$

Online Sequential Extreme Learning Machine Forecasting Model

Different forecasting algorithms have been developed to make the computation faster. For this purpose the classical extreme learning machine algorithm (ELM) is most powerful and efficient forecasting model in which the training speed is some thousand times better than other established forecasting models like, ANN, RBFN etc, in various prediction horizon. However for prediction of non stationary pattern of PV power still requires more accurate prediction. Thus in this work, on line sequential forecasting is tested on a real time solar power plant for prediction of PV power. Unlike ELM machine learning technique, in OS-ELM the data are trained either one by one or block by block. The block size may be fixed or variable.

block size may be fixed or variable.

OS-ELM algorithm:

Step 1: Set initialization of training data. Assume $n = \{(s_i, \varphi_i)\}_{i=1}^n$ as initial data.

- (i) Input weight w_i and bias b_j where $j = 1, 2, \dots, l$. are set arbitraley.
- (ii) The hidden layer output matrix M_0 is calculated.

$$M_0 = \begin{bmatrix} \varphi(w_1 s_1 + b_1) & \dots & \varphi(w_l s_1 + b_l) \\ \vdots & \ddots & \vdots \\ \varphi(w_1 s_n + b_1) & \dots & \varphi(w_l s_n + b_l) \end{bmatrix} \tag{16}$$

(iii) Estimate the initial output weight vector:

$$\gamma_0 = P_0 M_0^T G$$

Where

$$P_0 = (M_0^T M_0)^{-1}$$

$$G = [\varphi_1 \dots \varphi_n]^T$$

(iv) Set $k = 0$.

Step 2: Online study.

- (i) Here $(k + 1)^{th}$ block of new data is $\{(s_i, \varphi_i)\}_{i=\sum_{j=0}^{k+1} n_j}^{i=\sum_{j=0}^{k+1} n_j + 1}$ is ready,

(ii) Compute the fractional hidden layer output matrix M_{k+1} based on the latest data.

$$M_{k+1} = \begin{bmatrix} \varphi(w_1 s_{i=\sum_{j=0}^k n_j + 1} + b_1) & \dots & \varphi(w_l s_{i=\sum_{j=0}^k n_j + 1} + b_l) \\ \vdots & \ddots & \vdots \\ \varphi(w_1 s_{i=\sum_{j=0}^{k+1} n_j} + b_1) & \dots & \varphi(w_l s_{i=\sum_{j=0}^{k+1} n_j} + b_l) \end{bmatrix} \quad G_0 = [\varphi_{i=\sum_{j=0}^k n_j + 1} \dots \varphi_{i=\sum_{j=0}^{k+1} n_j}]^T \tag{17}$$

(iii) Estimate the new P_{k+1} and β_{k+1} based on (i) and (ii).

$$P_{k+1} = P_k - P_k M_{k+1}^T (I + M_{k+1} P_k M_{k+1}^T)^{-1} M_{k+1} \tag{18}$$

$$\gamma^{(k+1)} = \gamma^{(k)} + P_{k+1} M_{k+1}^T (F_{k+1} - M_{k+1} \gamma^{(k)}) \tag{19}$$

(iv) Set $k = k + 1$, and then go back to Step 2.

Data Pre-Processing:

We then normalize the different parameters to adjust to the ELM for batter generalization:

$$\bar{s}_i = \frac{s_i - s_{\min}}{s_{\max} - s_{\min}} \tag{20}$$

Where s_i is the input or output data, while s_{\max} and s_{\min} are the maximum and minimum of the value.

The whole data set is divided into two parts, one set is known as training set containing 80% data for training and other set contains 20% data for testing. The input data was collected from a real time PV power plant (given in table -1)

Orthogonal ELM:

The ELM theory achieves the smallest training error and the norm of the output weight matrix.

$$\sigma(w) = \min_w \|MW - Y\|^2 + \lambda \|W\|^2 \tag{21}$$

Where $\lambda > 0$ is a regularization parameter.

Setting $\frac{d\sigma}{dw} = 0$ (22)

The analytical solution of the above differential equation is given by

$$W^* = (M^T M + \lambda I)^{-1} M^T Y$$

The objective of orthogonal ELM is to formulate the model with some orthogonal constraints.

$$\frac{\min}{W^T W - I} \|MW - Y\|^2 \tag{23}$$

Where $M \in R^{n \times k}$ $W \in R^{k \times c}$ and $Y \in R^{k \times c}$ the data will be preserved in a sub space in metric structure. The OELM model can be formulated with optimization method as described below. Here in the above expressions since $k > c$ it is difficult to get direct solution due to orthogonal constraints.

The optimization of above equation can be done according to following theorem.

A. Theorem:1

The optimal solution of the unbalance orthogonal procrustes problem in equation (23) is similar to that of the following problem.

$$\frac{\min}{\tilde{W}^T, \tilde{W} - 1, Y} \|M\tilde{W} - [Y, Y_1]\|^2 \tag{24}$$

The equation is correspondent of the following

$$\text{Where } \tilde{W} = [W, W_1] \in R^{k \times k}, W_1 \in R^{k \times (k-c)} \text{ and } Y_1 \in R^{n \times (k-c)} \tag{25}$$

From the objective of the equation (24), the optimized solution of the output matrix

$Y_1 = MW_1$, substituting the relation in equation (24) we obtained

$$\frac{\min}{\tilde{W}^T, \tilde{W} - 1, Y_1} \|M\tilde{W} - [Y, MW_1]\|^2 \tag{26}$$

This is equivalent to the following equation

$$\frac{\min}{W^T, W - 1} \|MW - Y\|^2 \tag{27}$$

This concludes the proof.

As per the outcome of theorem-1, the objective of equation (24) can be solved directly instead of UOP.

Nevertheless the minimization equation (24) with respect to \tilde{W} and Y_1 is not possible. Thus one variable is updated by fixing other one.

When fixing Y_1 , $M \in R^{n \times k}$ and $(Y, Y_1) \in R^{n \times k}$

The objective of equation (**) will be simplified by balanced orthogonal procrustes as given below.

$$\frac{\min}{\tilde{W}^T, \tilde{W} - 1} \|M\tilde{W} - [Y, Y_1]\|^2 \tag{28}$$

The above equation can be solved by singular value decomposition method.

$$\text{Let assume SVD of } M^T [Y, Y_1] \text{ is } H^T [Y, Y_1] = \rho \eta \lambda^T \tag{29}$$

Where $\rho \in R^{k \times k}$, $\eta \in R^{k \times k}$ and $\lambda \in R^{k \times k}$

The solution of (^) is given by

$$\tilde{W} = \rho \lambda^T \tag{30}$$

Once \tilde{W} is found, the first c columns of matrix \tilde{W} is assumed to be the output weight matrix W .

With \tilde{W} is fixed, the problem in equation (24) can be simplified as following

$$\frac{\min}{Y_i} \|M[W, W_1] - [YY_1]\|^2 \tag{31}$$

Obviously the solution of the above equation is

$$Y_1 = MW_1 \tag{32}$$

Where W_1 is the last k-c column of \tilde{W}_1 .

The variant orthogonal ELM algorithm is described as following.

Algorithm:

Step-1: Set input training data $x \in R^{d \times n}$ and $Y \in R^{n \times c}$

Step-2: Set output weighted matrix $W \in R^{k \times c}$

Step-3: Select input weight matrix α randomly and hidden layer bias b ;

Step-4: Compute the hidden layer matrix M .

Step-5: concentrate M

Step-6: Set the initialization of Y_1 i.e $Y_1 = 0^{n \times (k-c)}$

Step-7: while not converge do.

Step-8: update \tilde{W} as per the equation (30)

$$W = \tilde{W}(:, 1 : c) \text{ and } W = \tilde{W}(:, 1 : c + 1, k)$$

Step-9: update Y_1 based on (32)

Accuracy Estimation:

The performance of Orthogonal extreme learning machine O-ELM can be evaluated by different error indexes. The errors like mean absolute percentage error (MAPE),mean absolute error (MAE) and root mean square error (RMSE) are calculated as shown below.

$$\varepsilon_{mape} = \frac{1}{N} \left| \frac{d_{actual} - d_{forecasted}}{D_{actual}} \right| \times 100 \tag{33}$$

$$\varepsilon_{mae} = \frac{1}{N} \sum |d_{actual} - d_{forecasted}| \tag{34}$$

$$\varepsilon_{rmse} = \sqrt{\frac{1}{N} \sum_{k=1}^N (d_{actual} - d_{forecasted})^2} \tag{35}$$

Where ‘d’ represent data set.

Result Analysis:

From the various solar powers forecasting results depicted that the EMD based orthogonal ELM produces best forecasting errors, in comparison to the EMD-ELM and OS-ELM prediction model. The decrease in the implementation time by selecting less number of training samples ,where it can be observed that by minimizing the data matrix size from 1400×1400 to 1400×300 thereby performing an inversion of 300×300 matrix, The graphical display of the prediction performance of the EMD-OELM, it is observed that the different error factors are minimum in case of proposed forecasting model.

CONCLUSION

In this paper a novel EMD based orthogonal ELM is proposed to forecast solar power output variations over a time horizon varying from 5 min to 30 minutes ahead. The nonlinearity of the solar power is minimized with the help of decomposition methods namely Empirical Mode decomposition techniques. The proposed method is also compared with OS-ELM and the basic ELM showing clearly the superior prediction performance of the OELM in comparison to ELM and OSELM. The training time can be substantially reduced by using random number of support vectors from the subset of training data with a small reduction in MAPE and other

performance metrics. The detailed validation of the forecasting results for very short term, short term and medium term prediction is done using the data of a local 11.2 KW PV system in the state of Odisha, India.

ABSTRACT

Background: Here 5 plant extracts; *Argemone Mexicana*, *Alangium solivifolium*, *Butea monosperma*, *Combretum albidum* and *Strychnus nuxvomica* were evaluated for antibacterial activities against isolated MDR bacteria.

Materials and method: All the bacteria were isolated from clinical sample and identified with the culture morphology and biochemical test. The antibiotic sensitive pattern was carried out by disc diffusion method and the antimicrobial property of 5 plants were screened by agar diffusion method by agar well diffusion method.

Result: All the 5 plants of different family showing different antimicrobial activity. Antimicrobial activity of 5 plants against MDR bacteria is showing different results.

Conclusion: All the 5 plants showed good antimicrobial activity which can be used as drug after isolation of pure phytocompounds and their toxicity test.

Keywords: MDR, Antibiotic, Bacteria, Medicinal plant, Agar well diffusion

INTRODUCTION

Medicinal plants are the effective source for both traditional and modern medicines, which are genuinely useful for primary health care since many years. According to World Health Organisation (WHO) traditional medicines are safe remedies for both microbial and non-microbial origins.¹ Many antibiotics have become almost obsolete due to drug resistance² and consequently new drugs must be sought for. Herbal treatment is one possible way to treat disease caused by multidrug resistant bacteria.³

Argemone mexicana L. (Papaveraceae) commonly known as prickly poppy, is used as a medicinal plant in several countries. The plant possesses analgesic, narcotic, antispasmodic and sedative properties. The fresh yellow, milky, seed extract contains protein dissolving substances which are effective in the treatment of warts, cold sores, cutaneous infectious, skin diseases, itches,

dropsy jaundice and the smoke of the seeds are used to relieve toothache.^{4,5}

Alangium salvifolium (L.f) Wang belongs to family Alangiaceae. Locally it called as Ankolam⁶. Alangiaceae is a monogeneric family of trees and shrubs found in tropical and subtropical region. There are nearly twenty one species of *Alangium* grouped into four sections *Alangium*, *Conostigma*, *Marlea* and *Rhytidendra*⁷. Antibacterial compound was isolated from the flower of *Alangium salvifolium*⁸. Recent phytochemical studies of this plant resulted in the isolation of several flavanoids, phenolic compound, irridoid glycosides and oxyglucoside.

In ethno-botanical literature of India, several hundreds of plants are known to have the potential to treat many diseases and one of those popular ones is *Butea monosperma* Lam. (*B. monosperma*, family Fabaceae⁹ (Figure 1). *B. monosperma* is traditionally

used for the treatment of inflammatory diseases¹⁰; it is hepatoprotective¹¹, antidiabetic¹², antihelminthic¹³, it possess antitumor, antiulcer activities and wound healing^{14,15}, leaves possess antimicrobial property¹⁶⁻¹⁷, and roots have antispermatic activity¹⁸.

Leaves of the medicinal plant *Combretum albidum* G. Don are used in treating patients with jaundice and its bark is used for treating various skin diseases¹⁹. A decoction of the fruit is used for treating dysentery and diarrhoea²⁰. Thus, *C. albidum* has an established record of ethnobotanical image and Its bark extract also has liver-protective effects²¹.

Strychnos nux vomica belongs to the family Loganiaceae. It is an energetic poison affecting the central nervous system. It's a medicine for paralysis and nervous debility generally²². Traditionally it is used for treating acute diarrhoea, mixed with lemon juice and made into pills and taken orally during dysentery, arthritis, rheumatism and piles²³.

Here 5 plant extracts; Argemone Mexicana, Alangium solivifolium, Butea monosperma, Combretum albidum and Strychnus nuxvomica were evaluated for antibacterial activities against isolated MDR bacteria.

MATERIALS AND METHOD

Bacteria were isolated from collected clinical samples (urine, stool, pus, blood, swabs and body fluids) of inpatient and outpatient departments (IPD and OPD) patients of IMS and Sum Hospital, Bhubaneswar. Isolated bacterial strains were cultured on suitable specialized media, and biochemical identifications of isolated strains along with corresponding reference strains obtained from Microbial Type Culture Collections (MTCC). All bacteria isolated from clinical samples were identified with standard Clinical Laboratory Standard Institute (CLSI) guidelines (CLSI, 2011). Antibiotic susceptibility of clinically isolated bacteria were carried out by the Kirby-Bauer's/ disc-diffusion method.

Collection of plant material

Plants were collected from Kalahandi forest during December 2009 (Table 1). During the collection of plants, 15 hamlets (villages) of Junagarh block of Kalahandi district (Odisha) were surveyed. Junagarh is situated at 19°.10' and 20°.30' north latitude and 82°.30' and 83°.50' east longitude. The survey was done with

a questioner and personal interview, using the snowball technique in survey and sampling (Haines, 1924; Panda and Padhy, 2008)

Antibacterial assays of plant extracts Agar-well diffusion method

An aliquot of 100 µL of plant extract was taken in MHA bacterial culture to know its antibacterial activities. An aliquot of 100 µL 30 µg/mL chloramphenicol with an average diameter of zone of inhibition of 21 mm and 10 % DMSO solution was the reference control; 10 % DMSO solution had no antibacterial activity.

RESULTS

Isolation and identification of bacteria from clinical samples

Twenty four bacterial taxa (18 GN and 6 GP bacteria) were isolated from blood, CS, ED, DC, sputum, stool, swabs and urine. Colony morphology of isolated bacteria and corresponding MTCC strains of GN bacteria simultaneously were noted. All colony morphology of isolated GP bacteria and corresponding MTCC strains simultaneously were noted and biochemical identification of GP cocci, catalase, oxidase and coagulase tests were also performed (Table 3b). Results of tests and morphology of colonies helped the assignment of clinical isolates to suitable taxa, along with used standard strains obtained from Microbial Type Culture Collection (MTCC), Chandigarh.

Antimicrobial activities of medicinal plants

Ethnomedicinal information on 5 plants was documented along with details of modalities about crude extracts as medicine for many ailments (Table 1). Most of these plants were lesser-known/ non-common and are in the use by aborigines for infectious diseases. Apart from these, crude extracts of these 5 plants were also used by the tribal peoples for treating other diseases, such as, allergies, asthma, bronchitis, dyspepsia, leprosy, jaundice, cholera, malaria, rheumatism, nausea, fever, colitis, skin, stomachache, respiratory tract infection, infertility, skin diseases and wound infection, diarrhea and dysentery, etc.

Antibacterial activity of aqueous and ethanol extracts of 5 plants were recorded against 24 MDR bacteria by the agar-well diffusion method (Table 2). All five plants were resulted a significant antibacterial activities against

isolated 24 MDR pathogenic bacteria. *A. mexicana* registered a noticeable antibacterial activity against *A. baumannii*, *C. violaceum*, *K. oxytoca*, *S. marcescens*, *S. paratyphi* A, *S. aureus*, *S. epidermidis* and *S. pyogenes*. Likewise extract of *A. salvifolium*, registered good antibacterial activity against *A. baumannii*, *E. coli*, *K. oxytoca*, *K. pneumonia*, *P. aeruginosa*, *S. marcescens*,

E. faecalis, *S. aureus*, *S. epidermidis*, *S. mutans* and *S. pyogenes*. Similarly *B. monosperma*, *C. albidum* and *S. nuxvomica* had registered significant antibacterial activities against *P. aeruginosa*, *S. dysenteriae*, *E. faecalis*, *S. paratyphi* A, *E. faecalis*, *S. aureus*, *S. mutans* and *S. pyogenes*. (Table 2)

Table 1 Ethnolic medicinal information of 5 plants used

Sl. No.	Name of plant	Name of family	Local name	Parts used	Ethnomedicinal uses
1	<i>Argemone mexicana</i> L.	Papaveraceae	Bada gokhura, Agara (NE)	Stem, leaf, seed	Used for scabies, eye troubles, menorrhoea, spermatorrhoea, jaundice and wound infections. A tea spoon of latex is given every day during jaundice.
2	<i>Alangium salvifolium</i> (L.f.)	Cornaceae	Ankuli (NE)	Root, leaf, seed, bark	Leaves, roots, seeds and the bark of the plant is used in the preparation of decoction and making pills. Leave are used in the treatment of rabies
3	<i>Strychnos nuxvomica</i> L.	Loganiaceae	Kochila (NE)	Leaf	Mixed with lemon juice and made into pills and taken orally during acute diarrhoea, dysentery, arthritis, rheumatism and piles.
4	<i>Butea monosperma</i> Lam.	Fabaceae	Palasa (NE)	Leaf, flower	For blood pressure, flowers are soaked in warm water overnight, filtered and filtrate is taken in empty stomach for a month. One table spoon of decoction is given for 3 days after 5th day of menstruation for conception.
5	<i>Combretum albidum</i> G. Don	Combretaceae	Piluki(NE)	Leaf	It acts as potent antitubercular and used to cure liver and is useful in diarrhoea. It is also used in fever, inflammations, amenorrhoea.

DISCUSSIONS

The antibiotics used so far against any bacterial pathogen including *P. aeruginosa* are from microbial sources. Gradually, the target bacterium develops resistance to those antibiotics readily and survives. Moreover, crude drugs from eukaryotic systems (as plants) have an array of compounds against which resistance can never be developed in any pathogen.

In fact, eukaryotic compounds in crude extracts when employed against a pathogen, a synergistic effect is achieved with the eventual control of the pathogen; that is how certain plants are reported to be highly successful and popular in managing infections in 'traditional health care systems', worldwide. By the by, the development of scientifically un-approved drugs has proliferated so much that the plant-based crudemedicine trade in local and international markets is popular, worldwide ²⁴. Studies

on crude phyto-extracts in monitoring of antimicrobial activities of plants are of practical importance. Herein, the efficiency of *A. mexicana* in the control of several types of infections in the age-old 'low-cost health-care module' of marginalized and poverty-stricken aborigine-folklore of India in crude plant extract²⁴⁻²⁶; *A. mexicana* belongs to the plant-family, Papaveraceae to which another the most successful medicinal plant, *Papaver somniferum*, (yielding morphine and many more) belongs, in controlling in vitro MDR strains of *P. aeruginosa*. Reminded that it is the causative organism in bacteremic form of pneumonia of aged and immune-compromised patients in bringing 80% mortality²⁷. This study of antibiogram of clinical isolates of *P. aeruginosa* should be helpful to establish appropriate treatment regimen in a situation of changing epidemiology of the organism. More particularly, corneal infections are rapidly progressive and require immediate appropriate chemotherapy for control of the infection²⁸.

In this study we tried to explore the antibacterial property of the ethanolic seed extracts of the *Strychnos nux vomica* seeds. Results showed antibacterial activity and poor antifungal activity by the ethanolic seed extract. Our study contradicted the earlier reports of Gnanavel et al (2012) in which herbal extracts inhibited only the gram positive bacteria²⁹. Whereas in our study we got better inhibition of the seed extract over gram negative bacteria, which marks an important finding as we have proved it again that this plant has got lot of antibacterial activity. R. Mahalingam et al (2011) has proved the exhibition of antibacterial activity of ethyl-acetate and n-butanol root extracts of *Strychnos nux vomica* in which the zone of inhibition ranged from 13 -16mm against tested pathogens³⁰. Antibacterial activity effect of ethanolic extract of bark of the *strychnos nux vomica* was reported earlier, in which *Escherichia coli* was the organism which showed inhibition which was similar in our study also³¹. *Staphylococcus aureus*, *Acinetobacter* sp, *Klebsiella* sp, *P.aeruginosa*, *S.typhi*, *V.cholerae* microbial organisms have shown inhibition to ethanolic and water extracts of *Strychnos nux vomica* leaves and bark whereas *C.fereundii*, *C.violeceum*, *E.coli*, *Proteus* species didn't showed any inhibition as reported in an earlier study³². In our results we didn't see any antimicrobial activity of the ethanolic extract against *Bacillus subtilis*, *Salmonella typhi* and *Proteus*. Antifungal activity against fungal samples like, *Aspergillus niger*, *Aspergillus flavus*, and *Candida albicans* was not promising as we didn't see any

inhibition activity. Previous reports on the same fungi using methanolic and aqueous extracts of *Strychnos nux vomica* leaves showed no antifungal activity, however n-butanol extract have showed promising results. Ethanolic bark extract had registered a good control on National Type Culture Collection bacterial strains (drug sensitive strains of *S. aureus*, *Bacillus cereus*, *P. aeruginosa* and *E. coli*), with the highest sizes of zones of inhibition against the used bacteria, at around 100 mg/mL with the aqueous extract of the plant³³.

ABSTRACT

Dermatophyte species are normal keratinophilic organisms in charge of superficial contaminations called dermatophytosis or ringworm and made out of three anamorphic genera, Trichophyton, Microsporum and Epidermophyton. Using a few reciprocal atomic techniques, dermatophytes have been appeared to comprise a homogeneous gathering of species with low hereditary decent variety standing out from high phenotypic heterogeneity. Our aim of the study was to identify dermatophytes with biomaterial such as primers for early detection. Till now much of the studies has been done through polymerase chain reaction and few advance techniques been used .In contrast, in all but a few cases distinction between dermatophyte strains has failed, which has hindered the development of molecular-based epidemiological investigations. Here we focused on specific primers to detect dermatophytes at the earliest.

Key words: Dermatophytes, Primers, PCR, Nucleotides, DNA sequence

INTRODUCTION

Dermatophytes are growths that can attack keratinized tissues, causing diseases of the skin, hair and nails¹. Relatively every human contracts something like one such disease in their lifetime. Because of this high occurrence, more than 500 million US dollars are spent every year on antimycotic treatment against dermatophytes². The predominant species experienced in dermatology are grouped in three genera: Trichophyton, Microsporum and Epidermophyton. Trichophyton in a cutting edge sense contains the anthropophilic species, alongside species tainting tamed creatures³.

Routine methodology for dermatophyte species distinguishing proof depend on examination of the province (pigmentation of the surface and invert sides, geography, surface, and rate of development) and

tiny morphology (size and state of macroconidia and microconidia, spirals, nodular organs, and pectinate branches). Encourage recognizable proof qualities incorporate nourishing necessities (vitamins and amino acids) and temperature resistance, and in addition urease generation, antacid creation of bromocresol purple medium, in vitro hair aperture, and so forth⁴. The particular distinguishing proof of dermatophytes isn't constantly conceivable utilizing these conventional, phonetic approaches⁵⁻⁷. Molecular apparatuses, for example, RFLP, arbitrary intensification of polymorphic DNA and other DNA fingerprinting techniques, have likewise been utilized for the ID of chose dermatophytes⁸⁻¹¹.

In the mid 1980s, nucleic corrosive based strategies were utilized to attempt to determine inquiries regarding the transformative connections between dermatophytes. Other atomic techniques that are not reasonable for central investigations, have been as of late created to encourage the depiction of species and strains. Demonstrative and epidemiological applications are conceived.

In spite of the fact that there has been ongoing advancement in the improvement of a continuous PCR for some dermatophytes¹², there is no report of the

utilization of transformation filtering approaches. PCR-based SSCP investigation has a dazzling limit with regards to the atomic distinguishing proof of different pathogens¹³, gave appropriate DNA markers being used. The first genotypic study on dermatophytes used the base composition of chromosomal DNA of 34 species belonging to the three genera. It showed unexpected results: all species were found to have G>C molar fractions within a narrow range of 48.7–50.3%¹⁴.

The exact role of drug resistance in treatment failure is not clearly understood. This study was designed to identification of dermatophytes with biomaterials such as primers for early detection.

MATERIALS AND METHOD

This was an absolutely lab based investigation incorporating continuous examples got in the mycology research facility from 200 patients clinically associated with dermatophytosis from the dermatology outpatient division of IMS and SUM Hospital from June 2015-2016. Rehash tests from patients were avoided. Moral leeway from the organization was not required, as the examination consolidated the examples sent for routine parasitic examinations and the concise clinical history (statistic information, clinical introduction, and site of association) fused in the examination was given on the examination order frame sent with the example. No extra clinical history was gathered from the patients, and no follow-up was performed.

Tests got were subjected to coordinate minute examination utilizing 10% KOH for skin scrapings or hair and 20% KOH for nail tests. For essential confinement, the examples were vaccinated in Sabouraud's dextrose agar (SDA) slants and were hatched at 25 °C for 30 days before crediting them as negative for fungi.

Recognizable proof of the disconnects was finished by standard mycological research facility strategies including morphology on SDA and potato dextrose agar (PDA). Slide culture or microculture was done to consider the morphology of microconidia and macroconidia, the nature of the sporulation, the development of chlamydospores, or the exceptional structures, for example, spirals, pectinate, the racquet hyphae on corn dinner agar (CMA) and PDA. Other extraordinary tests were performed where vital including hair aperture test and development on rice grain medium. Biochemical tests with urea hydrolysis, 1% peptone agar, and SDA with 5% NaCl were utilized for species distinguishing proof.

After Isolation of DNA from the respected samples purification and amplification of DNA is required

Purification of amplified DNA

Groups of the suitable size were extracted from the agarose gel. DNA extraction from the extracted gel parts was performed and PCR Clean-up unit as indicated by the maker's directions.

RESULTS AND DISCUSSION

For choice of the best restorative system, recognizable proof of dermatophytes at the sort or species level is important. Since traditional research facility systems for the recognizable proof of dermatophytes is either moderate or then again need enough specificity, for some disconnects, the social qualities were conflicting, and additionally testing was required to affirm their personality¹⁵. Use of nucleic corrosive intensification innovation, has made fast and exact distinguishing proof of dermatophytes conceivable, are required¹⁵.

PCR RFLP gives a quick and down to earth instrument for distinguishing proof of dermatophyte confines that is free of morphological and biochemical qualities and along these lines improves research facility conclusion of dermatophytosis¹⁶. Atomic systems are more helpful for dermatophyte recognizable proof as they are quick and more delicate. Besides, these techniques depend on hereditary cosmetics, or, in other words than phenotypic portrayal, and they can recognize atypical dermatophytes that couldn't be distinguished by culture-based procedures¹⁷. These genotypic methodologies can recognize the dermatophytes to the species and in addition the strain levels¹⁸⁻¹⁹.

Diagnosis of Genetic Analysis of Type 2 Diabetes Mellitus and Diabetic Complications at a Tertiary Care Teaching Hospital

Samapika Bhuyan¹, Kanishka Uthansingh¹, Ishwar Chandra Behera²,
Srikant Kumar Dhar³, Mahesh Chandra Sahu⁴

¹Research Scholar, Medical Research Laboratory, ²Professor, Department of Community Medicine, ³Professor, Department of Medicine, ⁴Assistant Professor, Medical Research Laboratory, IMS and SUM Hospital, Siksha O Anusandhan Deemed to be University, K8, Kalinga Nagar, Bhubaneswar, Odisha, India

ABSTRACT

Background: Type 2 diabetes mellitus (T2DM) is a common multifactorial genetic syndrome, which is determined by several different genes and environmental factors. It now affects 150 million people worldwide but its incidence is increasing rapidly because of secondary factors, such as obesity, hypertension, and lack of physical activity. The genetic study should be carried out to determine the genetic factors involved in type 2 diabetes mellitus.

Aim: To find out the genetic diversity of T2DM with respect to TCF7L2, MTHFR, KCNJ11, FOXO1, CNDP1 gene in comorbidity patients.

Materials and Method: A total of 50 diabetic patient's blood samples were collected and their different clinical tests were evaluated. Five genes (TCF7L2, MTHFR, KCNJ11, FOXO1, CNDP1) associated with T2FM were downloaded from NCBI and their respective primer were designed with primer 3 tool online software. The synthesized primers were used for PCR and amplified products were sequenced with sangers methods and verified in BLAST. After identification of gene, the sequence were submitted through blanket and accession numbers were documented. The genetic diversities were determined with different phylogenetic trees.

Results: Among 50 T2DM patients 12 were selected for genetic analysis with respect to their other comorbidity diseases. Out of 12 patients TCF7L2 primer was amplified with 10 patients samples, MTHFR primer was amplified in 9 patients, CNDP1 primer was amplified in 5 patients, KCNJ11 primer was amplified in 5 patient. There was no amplification with FOXO1 primer. From five primers, the sample amplified with TCF7L2 primer was most. So in our case TCF7L2 gene was present in maximum patients.

Conclusions: The study described here will help to establish whether providing type 2 diabetes genetic risk information in a primary care setting can help improve patients' clinical outcomes, risk perceptions, and/or their engagement in healthy behavior change. In addition, study design features such as the use of existing clinic personnel for risk counseling could inform the future development and implementation of care models for the use of individual genetic risk information in primary care.

INTRODUCTION

Type 2 diabetes (T2D) is a complex multifactorial disorder which occurs due to chronic hyperglycemia, impaired insulin secretion from pancreatic b-cells. Increased glucagon secretion from pancreatic a-cells

and insulin resistance in target tissues is another effect of type 2 diabetes. For which aging populations, increasing prevalence of obesity and physical inactivity happens. The number of patients with T2D has dramatically increased worldwide ¹.

A number of genome-wide association studies in diverse human populations have identified more than 60 common variants and loci associated with risk for T2D ². Basically, many genes perform key regulatory functions in the development of T2DM, which is a polygenic disorder with multiple genes located on different chromosomes contributing to its susceptibility. The analysis of genetic factors associated with T2DM is further complicated by the fact that a variety of environmental factors interact with these genes to produce the disorder. In contrast to T1D and T2D, monogenic diabetes represents a form of non-autoimmune, early onset diabetes that is primarily genetic. Maturity onset diabetes of the young(MODY), first reported in 1974 ³. MODY is estimated to represent 1–2% of diabetes ⁴. More than 40 genetic variations that modify the risk of T2DM development have been identified. Causative genetic variations of several monogenic forms of diabetes, including maturity-onset diabetes of the young, neonatal diabetes and maternally inherited diabetes and deafness were successfully identified using this approach ^{5,6,7}. MODY forms of diabetes occur before the age of 25 years. The first gene causally implicated was coded for the enzyme glucokinase (GCK)⁴. A few years later, two other monogenic forms of diabetes, MODY1 and MODY3, were attributed to mutations in transcription factor genes; the hepatocyte nuclear factor 4 and 1 alpha (HNF4A, HNF1A), respectively ^{8,9}. Numerous reports have been published on the genetics of T2DM with most

recent ones showcasing the effect of SNP’s in various genes corresponding to risk prediction of T2DM such as, gene variants of Transcription factor-7-like 2 (TCF7L2), Methylene Tetrahydrofolate Reductase (MTHFR), Potassium channel (KCNJ11), carnosine peptidase 1 gene(CNDP1), Forkhead transcription factor (Foxo1).

In this study designed specific primers to detect other co-morbidities associated with T2DM. Also correlated with clinical and genetic.

MATERIALS AND METHOD

This is a prospective study and carried out in a tertiary care teaching hospital at IMS and SUM Hospital, Bhubaneswar. In this study all suspected cases of diabetes were undertaken and from the all patient the diagnosed diabetes population were participated for the further genetical study to find out other co-morbidity disease, also compared with the clinical symptoms and conventional diagnosis methods.

For which we collected a total sample of 50 patients in IMS & SUM HOSPITAL, BBSR from march for our study. The samples were collected from different medicine wards of the hospital.

Sample collection procedure

The patient’s 2ml of blood sample was collected in EDTA vials to prevent clotting of blood by nurses of different wards. DNA were isolated and used for PCR amplifications. The previously designed marker (Table 1)analysis were conducted using the genomic DNA collected from patient’s blood samples. From a total of 50 samples, only 12 samples were used for gene analysis.

Table 1: Synthesized forward and reverse primers

RESULTS

Sample analysis

In the Dissertation period of 3 months, a total number of 50 blood samples were collected from patients admitted to different medicine wards of IMS & SUM Hospital, Bhubaneswar. The patients detected with T2DM and other co-morbidity diseases were admitted. While collecting sample age groups, sex, clinical tests and diseases of the patients were noted cautiously (Fig 1).

Figure 1. Different clinical tests for DM with respect to age groups

A total number of T2DM patients were screened for FBS, PPBS, Hb1AC. It was revealed that in the age group of 40-49 both FBS and PPBS are high. But in the age group of 70-79 the Hb1AC test is more. Among 50 patients, 33 were male and rest were female. Number of patients with respect to age of male and female were compared with T test and seen that there is no significance among them. Hence T2DM distributed equally in genders

In our study we observed that most of the patients with type 2 diabetes were suffered from HNT. There was patients also had kidney, liver and heart related problems. Some with asthma, migraine, gastric ulcer, neuro dislipidemia, cellulitis, dnp, hypothyroidism related problems. Some of the male had BEP issues(fig 2).

Figure 2. Other co-morbidity associated with type 2 diabetes

For genetic study of 12 patients, 10 different forward and reverse primers were synthesized. The synthesized primers with their nucleotide sequence and length in

base pair were mentioned. The amount of distilled water added (in µl) to use that primers in PCR was noted (Table 1).

PCR amplification result

A good quantity of DNA was revealed. All DNA were diluted to 1 ng/µl for 25µl PCR reactions. No result was revealed in negative control. So it was confirmed that there was no contamination during PCR. Out of 12 samples TCF7L2 primer was amplified with 10 patient's samples (fig 3), MTHFR primer was amplified in 9 patients (fig 4), CNDP1 primer was amplified in 5 patients, KCNJ11 primer was amplified in 5 patients. There was no amplification with FOXO1 primer which mean that there was no morbidities related to this FOXO1 gene in patients we had screened. (fig 4) (Table 2).

Figure 3. Selected samples were amplified with TCF7L2 primer for identification of disease related to T2D and sequencing

Figure 4. Selected samples were amplified with MTHFR primer for identification of disease related to T2D and sequencing

Table 2: Disease diagnosed by clinical and genetical

SL.NO	PRIMER	Disease	CLINICAL	GENETICAL
1	TCF7L2	T2DM	12	10
2	MTHFR	NEUROPATHY	2	9
3	KCNJ11	DIABETES	12	5
4	FOXO1	OBESITY	3	0
5	CNDP1	DIABETIC NEPHROPATHY	2	5

From the selected 12 patients for clinical study there was 10 patients whose DNA get amplified with TCF7L2 primer, with MTHFR primer was in 9 patients, with KCNJ11 primer was in 5 patients, there was no amplification with FOXO1 primer and with CNDP1 primer was in 5 patients (Table 2).

DISCUSSION

In our study we had taken five genes TCF7L2, MTHFR, KCNJ11, FOXO1 and CNDP1 for gene analysis in T2DM. To identify these genes, a total number of 10 forward and reverse primers were synthesized with the help of NCBI and batch primer 3 tool websites. We observed in maximum patients DNA sample the gene TCF7L2 (SNP marker) with synthesized primers by PCR reactions. Apart from this gene other genes MTHFR, KCNJ11, CNDP1 were also revealed in certain DNA samples with synthesized primers by PCR method. But the genes FOXO1 were not revealed with our synthesized primers.

The Department of Molecular Medicine, University of Texas Health Science Center, USA has done some research to identify TCF7L2-associated combinatorial epigenetic patterns in a diverse set of cell types and they found that for the first time at a genome-wide scale revealed the enhanced transcriptional activity of cell-type-specific TCF7L2 intragenic enhancers in regulating gene expression¹⁰. Tehran University of Medical Sciences, Tehran, Iran investigate the association between MTHFR genotype with diabetic neuropathy to determine whether C677T polymorphism can serve as a useful genetic marker of neuropathy among Iranian patients with type 2 diabetes and found that MTHFR 677 variant confer risk for diabetic neuropathy among Iranian patients with type 2 diabetes¹¹. In another study MTHFR variants were significantly associated with macro albuminuria¹².

Department of Diabetes and Endocrinology, UK aimed to study the effects of a wide range of KCNJ11 mutations and of diabetes duration, in a large sample of patients who attempted to transfer to sulfonylureas from insulin and concluded that Transfer from insulin is successful for most KCNJ11 patients and is best predicted by the *in vitro* response of the specific mutation and the duration of diabetes¹³.

KCNJ11-related neonatal diabetes can almost always be treated with oral SU therapy in place of insulin¹⁴.

Department of Endocrinology, the First Affiliated Hospital of Chongqing Medical University, Chongqing, China aimed to investigate the impact of FOXO1-IRS2 interaction or the 2 genes-environment interactions on T2DM susceptibility in Chinese Han population and concluded that an association of FOXO1 and *IRS2* gene polymorphisms with T2DM in Chinese Han population, supporting FOXO1-obesity interaction as a key factor for the risk of T2DM¹⁵.

CONCLUSION

The disease diagnosis through molecular method is more authentic as compared to conventional method. Here we have diagnosed 50 patients by conventional method and with the help of synthesized primers. We have detected other co morbidity diseases with respect to diabetes. The genetic study will help to establish whether providing type 2 diabetes genetic risk information in a primary care setting can help improve patients clinical outcomes, risk perceptions, and/or their engagement in healthy behavior change. In addition, study design features such as the use of existing clinic personnel for risk counseling could inform the future development and implementation of care models for the use of individual genetic risk information in primary care.

ABSTRACT

Background: Urinary Tract Infection (UTI) prevails to be the most common infection among all nosocomial infections. Due to indiscriminate, misuse and over use of antibiotics in ICU, it reveals multidrug resistant (MDR) strains. Proper antibiograms study should be carried out before empirical therapy.

Aim: In this study, we aimed to investigate the common isolates of UTI and their drug susceptibility test and identified the gene responsible for resistance to tigecycline antibiotic.

Materials and method: This study was executed with routine microscopic, identification of organisms and drug sensitivity of isolates from 270 urine samples for a period of six months at Institute of Medical Science and SUM Hospital, Bhubaneswar, Odisha. Bacteria were identified with universal primer (16S rRNA). Bacteria having tigecycline resistant genes were identified using specific primers.

Results: From 270 urine samples, 128 showed significant growth. *P. aeruginosa* was common isolate, followed by *S. aureus*, *E. coli*. In case of fungus, *C. albicans* was common. Bacteria were identified using 16S rRNA primer (8F, 1541R). Drug susceptibility pattern revealed highly resistant to imipenem and azithromycin in case of Gram negative bacteria. However, colistin was sensitive to all. In case of Gram positive cocci, ciprofloxacin and penicillin remained high resistance but chloramphenicol was the most sensitive. For fungal isolates amphotericin and fluconazole remained highly resistant while itraconazole showed high sensitive. By using specific primers (SoxS, acrA and tolC), tigecycline resistant genes were identified in *E. coli* and *Shigella* species.

Conclusion: Empirical use of antibiotic should not be practiced while prescribing drugs. Proper identification and drug susceptibility pattern of organisms should be conducted before prescribing a drug. PCR method should be implemented for early detection of antibiotic resistance patterns.

Keywords: Nosocomial infection, MDR, 16S rRNA, Tigecycline, Empirical therapy, ICU.

INTRODUCTION

Among all nosocomial infections, Urinary tract infection (UTI) prevails to be the most common all

around the globe¹. UTIs are caused by microbial invasion into urinary tract that extends from renal cortex of kidney to the urethral meatus. Many evidences revealed that UTI is solo responsible for high consumption of antibiotic in both community and hospitalized patients¹.

Corresponding Author*

E-Mail: mchsahu@gmail.com

In hospitals prolonged use of catheter increases the chances of UTI. But recurrence of UTI can lead to irreversible damage of the kidneys, resulting in renal hypertension and renal failure². Another type of UTI is

kidney infection, also known as pyelonephritis. But this can be diagnosed by quantitative urine cultures and bit more prolonged course of antibiotic therapy³.

In case of elderly individuals, colonization of bacteria in genitourinary system is common at any time. These bacteria may be associated with symptoms and thus require treatment with an antibiotic. The presence of bacteria in the urinary tract of older adults, without symptoms or associated consequences is also a well-recognized phenomenon, which may not require antibiotics⁴. But use of antibiotics in this context facilitates the emergence of multidrug resistant bacteria. The admittance of old aged patients to hospitals have low immune-competence as compared to adults, which reveals more UTI⁵.

Emergence of multidrug resistant bacteria (MDR) in present world, pose epic difficulties in clinical management by increasing the overall vulnerability of human health particularly in developing countries like India^{6,7}.

Many factors paves the path for emergence of MDR bacteria: first, for quick relieve from infection, use of latest generation form of antibiotic⁸; second, giving less importance to drug history of patient during prescription; third, irregularity in the use of antibiotics by the patient during treatment period; fourth, lower level of dose, far below the 'mutant preventive concentration'⁹; fifth, intake of medicines by patients without a proper prescription¹⁰.

Occurrence of nosocomial infections from intensive care units (ICUs) has also been reported due to the 'severity of infection by one or other pathogen in patients with pestiferous wounds.' Despite of better cleanliness around the hospital environments, device associated infections has also been reported from many hospitals due to human error¹¹.

An important cause of nosocomial infection can be sited as lack of general awareness among the public as well as health care workers. However, awareness can be sprouted among public under an effective medical surveillance system¹². For prevention aseptic general practices must be used and proper antibiotic should be prescribed by proper culture and identification of microorganisms. So microscopic analysis and proper identification should be carried out for better treatment and rule out the prescription of antibiotics.

In this study, the causative organisms for UTI as well as their antibiotic sensitivity pattern was carried out among all patients admitted to neuroscience intensive care unit (NSICU) of a tertiary care teaching hospital in eastern Odisha.

MATERIALS AND METHOD

This prospective study was carried out for a period of 6 months (Jan to June 2018) and this study was approved from the Ethics Committee of our esteemed Institute. A total of 270 urine samples were obtained from Neuroscience Intensive care unit (NSICU), IMS and SUM Hospital, Bhubaneswar, Odisha. All the samples were processed with in 3 hr of collection, for routine microscopic urine were centrifuged at 19,000 RPM for 5 minutes. The pallet was collected and inoculated on Cystine-Lactose-Electrolyte Deficient (CLED), Blood Agar (BA) and MacConkey Agar (MAC) plates and incubated at 37°C for 24 hours. All the bacteria were identified with culture morphology and biochemical tests of conventional methods and antibiotic sensitivity patterns were carried out by disc diffusion methods.

RESULTS

Of the 270 urine samples, 128 (47.4%) showed significant growth. More than 3 colony cultures were taken as contamination. Out of 128 growths, 39.25% had single colony, 7.03% had two colonies and 0.74% had three colonies. (Table 1)

Table 1: Occurrence of colony from single culture.

Sl. No	No. of colony	Frequency	Percentage
1	Single colony	106	39.25
2	Two colonies	19	7.03
3	Three colonies	2	0.74
4	More than three colonies	1	0.37
5	No growth	142	52.29
	Total	270	

Samples were collected from different age groups of both male and female patients, admitted to NSICU. Male patients were more in number than female patients. Age group study revealed that admittance of patients of age group 40-60 had highest (38.1%) percentage among others. (Table 2)

Table 2: Distribution of patients according to age groups.

Sl.no	Age group	No. of males	No. of females	Percentage
1	0-20	7	1	2.9
2	20-40	31	22	19.6
3	40-60	74	29	38.1
4	60-80	61	30	33.7
5	80-100	11	4	5.5
	Total	184	86	

Patients having many diseases were admitted, whereas Diabetic patients were more than others. This study also revealed that female patients with Urinary Tract Infection (UTI) were more in number than male patients. (Table 3)

Tab 3: Distribution of patients according to diseases.

Sl. No	Name of diseases	Number of males	Number of females
1	Diabetes	20	14
2	RTA	17	0
3	SAH	10	3
4	Head injury	18	0
5	ARDS	5	4
6	HTN	13	4
7	CVA	35	12
8	UTI	1	12
9	Others	65	37
	Total	184	86

Routine and microscopic of urine samples concluded that presence of fungus, crystals, pus cell, hyphae and bacteria in case of diabetic patients was more than others. In case of urinary tract infection patients the occurrence of bacteria was high. (Table 4)

Table 4: Routine and microscopic (in %) of urine samples with diseases

Sl.NO	Diseases	Pus cell	RBC	WBC	Fungus	Hyphae	Crystals	Bacteria
1	Diabetes	80	10	30	86	90	100	50
2	RTA	40	20	45	0	0	12.2	0
3	SAH	56	10	20	0	0	19.6	0
4	Head injury	20	0	12	0	0	10	0
5	ARDS	30	0	11.5	12	14	5.5	0
6	HTN	45	0	23	56.5	58.5	21.4	0
7	CVA	55	20	56	45.2	46.1	10.9	22.5
8	UTI	60	10	41	30	36	21.4	56.4
9	Others	88	40	55.3	34.8	40	30.1	10.1

The distribution of gram negative and gram positive isolates is listed in table 5. Of all bacteria, *Pseudomonas sp.* (21.9%) was frequent, followed by *Staphylococcus aureus* (14.6%), *E. coli* (10.9%), *Enterococcus* (9.7%), *Coagulase negative Staphylococcus* (9.7%), *Streptococcus* (8.5%), *Shigella sp.* (7.3%), *Proteus vulgaris* (4.8%), *Acinetobacter sp.* (4.8%), *Gram positive Bacillus* (3.6%), *Serratia sp.* (2.4%) and *Enterobacteraerogenes* (1.2%).

Susceptibility Data

For all gram negative and gram positive bacteria, 16 different antibiotics of different class were used. For gram negative bacteria, 10 class of antibiotics and for gram positive bacteria, 8 classes of antibiotics were chosen.

Gram negative bacteria data

Out of 10 class of antibiotics, gram negative bacteria were highest resistant to macrolids, carbapenems,

aminoglycosides, oxazolidinones. But were least resistant to polymixins class. Class β -lactams showed variable result. *Pseudomonas sp.* showed highest percentage of resistant to all antibiotics except colistin (38.4%) and tigecycline (45%). *Escherichia coli* showed variable percentage of resistant to all classes. Class polymyxins showed highest percentage of susceptible for all gram negative bacteria.

Gram positive bacteria data

Staphylococcus aureus showed highest percentage of resistant to all antibiotics except chloramphenicol (0%). *Streptococcus sp.* and *Gram positive bacillus* showed variable results. But *coagulase negative staphylococcus* showed highest percentage of resistant to all antibiotics as compared to other species. Again class β -lactams, cephalosporins, macrolides and aminoglycosides were least susceptible for all gram positive bacteria. Class 3rd generation cephalosporins and chloramphenicol showed highest percentage of susceptible for all gram positive bacteria. (Table 5)

Table 5: Total number and percentage of isolated organisms.

Sl. No	Name of organisms	Frequency	Percentage
1	<i>Pseudomonas sp.</i>	18	21.9
2	<i>Staphylococcus aureus</i>	12	14.6
3	<i>Escherichia coli</i>	9	10.9
4	<i>Enterococcus</i>	8	9.7
5	CONS	8	9.7
6	<i>Streptococcus</i>	7	8.5
7	<i>Shigella sp.</i>	6	7.3
8	<i>Proteus vulgaris</i>	4	4.8
9	<i>Acinetobacter sp.</i>	4	4.8
10	GPB	3	3.6
11	<i>Serratia marcescens</i>	2	2.4
12	<i>Enterobacteraerogenes</i>	1	1.2
	Total	82	

Note: RTA (Renal tubular acidosis), SAH (Subarachnoid hemorrhage), ARDS (Acute respiratory distress syndrome), HTN (Hypertension), CVA (Cerebrovascular accident), UTI (Urinary tract infection).

DISCUSSION

From the study, it was confirmed that bacteria have evolved to be resistant to different classes of antibiotic¹³.

Increase of antibiotic resistant bacteria had become a global issue because of its capability in causing severe and lethal infection.¹²

Our study revealed that prevalence of gram negative bacteria was higher and *Enterobacteriaceae* family was highest among them. This data was also recorded in many studies of UTIs¹⁴⁻¹⁶.

In this study, *Pseudomonas* sp. was the most frequently isolated microorganism (21.9%). But in other studies *E.coli* was the common isolate^{17,18}. *Staphylococcus aureus* was the second most common isolates in our study (14.6%). But in many studies, other bacteria were common¹⁹. *E.coli* was third isolate (10.9%).

Percentage resistance of all gram negative bacteria to imipenem was higher, which is in accordance with other literatures¹². But in a study all MDR were susceptible for imipenem²⁰. Azithromycin and clarithromycin were also least susceptible for all gram negative bacteria. In our study, resistant percentage of all gram negative bacteria to 3rd generation cephalosporin and amikacin was higher, while in other study, it showed susceptible¹⁷. All studies showed that colistin was susceptible for many gram negative bacteria, which confirms that it can be used as antibiotic for UTIs.

Our article showed that *Pseudomonas* sp. had highest percentage of resistant to all antibiotics than other bacteria, which is in accordance with another study, where *E.coli* and *Klebsiella pneumoniae* being highest isolates were least resistant to many antibiotics than *Pseudomonas* sp. and *Proteus vulgaris*²⁰. An interesting data came out of a study that in ED (Emergency Department) *E.coli* remained the most common pathogen in both MDR and non-MDR UTIs. Among non-MDR UTIs, except ampicillin, other antibiotics used were susceptible. For MDR UTIs, carbapenems (100%) and amikacin (90%) were susceptible²¹. But our study revealed that all organisms were high resistant to both carbapenems and amikacin, which is a matter of discussion that now a days many organisms are evolving to be MDR by being resistant to commonly used antibiotics.

In case of gram positive bacteria, *Staphylococcus aureus* showed resistant to all antibiotics except chloramphenicol. Vancomycin showed variable results. GPB was 100% resistant to vancomycin but *Staphylococcus aureus* showed 50% resistant. Vancomycin was a perfect antibiotic for all gram positive bacteria²². But our study revealed that chloramphenicol is the perfect antibiotic for gram positive bacteria.

In summary, our study suggested that in NSICU maximum number of diabetic patients suffer from UTIs. The UTIs might affect the islet function or blood glucose control in patients with T₂DM. Patients getting admitted

to ICU should go through routine urine checkup. So that infection can be controlled in a least lethal condition. From our study, *Pseudomonas* sp. was highest isolated gram negative bacteria, followed by *Staphylococcus aureus*. Antibiotic susceptibility showed resistant of *Pseudomonas* sp. to commonly used imipenem antibiotic but was susceptible for colistin. *Staphylococcus aureus* showed highest resistant to ciprofloxacin and ofloxacin but was susceptible for chloramphenicol. So when a consultant specialist prescribes antibiotics for UTIs, he/she should go for antibiotic susceptibility test results and select a best antibiotic so that chances of recurrent should be minimal.

CONCLUSION

This study showed that all the isolated organisms were resistant to more than 5 to 6 antibiotics, which is an alarming issue for doctors. Instead of *E.coli*, *Pseudomonas* sp. was highest isolates and resistant of it to many antibiotics confirmed its evolution to MDR. MDR bacteria became a major problem for the doctors because of its life threatening infection. A strict antibiotic prescription should be made to stop this infection. This study can be concluded that in case of gram negative bacteria colistin and in case of gram positive bacteria chloramphenicol can be used as antibiotic.

Surveillance of Organisms Associated with CSOM and Otomycosis at a Tertiary Care Teaching Hospital

Swapnarani Sahoo¹, Santosh Kumar Swain,² Smrutipragnya Samal³, Mahesh Chandra Sahu⁴

¹Professor, Department of Otorhinolaryngology, ²Research Scholar, Department of Otorhinolaryngology, ³Assistant Professor, Medical Research Laboratory, IMS and SUM hospital, Siksha "O" Anusandhan University, K8, Kalinganagar, Bhubaneswar, Odisha, India

ABSTRACTS

Background: To isolate causative organisms and drug sensitivity pattern for CSOM associated Otomycosis patients. Bacteria and fungus were identified with conventional macroscopic and microscopic staining procedures.

Materials method: A total 128 samples were collected from ear infection patients and processed those in different agar media for identification of organism and for antibiotic susceptibility test of those organisms was performed against the commonly used antibiotic and antifungal drug

Result: out of 128 samples, a total of 79 organisms were identified as bacteria and 38 organisms were identified as fungus. It was revealed that *C. tropicalis* (41.66%) was predominant in Otomycosis and *aspergillus* sp. (5.55%) was the least causative organism.

Conclusion: The *aspergillus* and *candida* species are the most common fungal isolates and *s.aureus* and *pseudomonas* species are most common bacterial isolates in ear infection. In ear discharging patient both CSOM and Otomycosis can be revealed. So, before treatment the causative organism and their drug sensitivity pattern should be carried out. The empirical therapy should be avoided and for early detection of drug sensitivity pattern PCR method should be implemented.

Keyword: *Candida*, CSOM, antifungal drug, antibiotic susceptible, Otomycosis

INTRODUCTION

In daily clinical practice, the discharging ear are often due to Chronic suppurative otitis media (CSOM) and otomycosis. CSOM is an inflammation of the middle ear cleft, with or without intact tympanic membrane. CSOM is defined as infection of the middle ear that lasts for >3 months and is accompanied by tympanic membrane perforation¹. Otitis media is known to be one of most common childhood infections and a leading reason for antibiotic prescriptions in the developed world². It is one of the most common diseases of all

age groups, especially of childhood. The incidence of CSOM is higher in developing countries, especially among the low socioeconomic strata of the society (with an urban rural ratio of 1:2) because of poor nutrition, improper hygiene, and lack of health education³. The disease is highly prevalent in tropical regions including South Asia⁴.

Fortunately, with progress in medical diagnosis and antibiotic therapy, it is unusual for otitis media to manifest its lethal potential. Nonetheless, a clear understanding of the pathology of otitis media is important for the clinician to be able to distinguish between infection that can be controlled by antibiotics and those that require surgical intervention⁵. However, a systematic review found no clear evidence that antibiotics are effective in preventing the progression of AOM to CSOM even among children who are at high risk for the disease⁶. Fungal infections

superimposed over chronic suppurative otitis media is suspected when the discharging ear does not respond to local antibiotic ear drops⁷.

Incidence of chronic suppurative otitis media has been reported varying from 2.55% to 9.25%. In PGI Chandigarh incidence was 11% in ENT OPD⁸. In the recent year, prevalence of fungal infections including the middle ear and inner ear is on the increase dramatically because of increased use of broad spectrum antibiotics, cytotoxic chemotherapy, increased incidence of diabetes, corticosteroids, immuno-suppressants, tuberculosis and AIDS. In addition to these factors, poor socio-economic status, swimming habits, water supply, scratching the ear canal with infected nail with fungus may also lead to superadded fungus infection^{7,8}. Use of local steroids provoke the incidence of fungal infections. Local steroids therapy lower down resistance, makes a room for fungus growth through external auditory canal⁹.

The present study was carried out to know the incidence of fungal infection in CSOM patients and to evaluate whether the fungus is primary or secondary infection. Also undertaken the drug sensitivity patterns for both isolated bacteria and fungi.

MATERIALS AND METHOD

This prospective study was carried out in IMS and SUM hospital Bhubaneswar from march to June 2018. This study was approved from the institutional ethical committee of the respected institute. The study was carried out on 128 patients attending the outpatient department of otorhinolaryngology.

Processing of sample

The collected samples were processed within 4-6 hours of collection. The samples were first cultured in

blood agar (BA) plate and MacConkey (MAC) plate sabouraud’s dextrose agar (SDA) plate. The inoculated plates were incubated at 37 for 24 hours to 48 hours. Then the samples were kept in incubation with 2ml of NB (Nutrient broth). Then after 24 hours the result of cultured plate was studied and noted. The isolated bacteria were identified by both colony morphology and biochemical characteristics.

Antifungal Screening of isolated fungus

Fungal isolates were tested for antifungal susceptibility testing by using Standard Kirby Bauer’s disc diffusion method. Standard inoculums were made by taking 1-2 colonies and were dip into liquid SDB and put in to shaker for 3 hours. After 3 hours the liquid fungal culture was spread plated on SDA plates or Potato Dextrose Agar (PDA) plates using sterile spreader. Antifungal impregnated disks (Table 4) were placed onto the medium using an automated disk dispenser. SDA/PDA plates were then incubated at room temperature for 48 hours. After 48 hours the clear inhibition zones were measured and interpreted by clinical and laboratory standards to check the resistance pattern of each microbial isolates.

RESULT

Ear infection is mainly caused by bacteria and fungus (CSOM and otomycosis). In this study total number of 128 ear infection patients was enrolled to know the causative organism for it. It was seen that among 128 ear infection patients 74 was from urban and rest 54 from rural area. With diagnosis it was revealed 44 patients were chronic suppurative otitis media (CSOM) and rest 55 were otomycosis. It was also documented as 29 patients were infected with both CSOM and otomycosis (Fig 1).

Fig 1: Incident of ear infections with regional distribution

All age group patients were participated in this study and it was found that ear infection is common at all age groups. The duration of discharge was documented with respected to age group. ANOVA test was applied to know role of duration of discharge with respect to age group but it was revealed that statistically it was insignificant with $p=0.25$. So, CSOM and otomycolosis can cause at any age groups (Fig 2).

Fig 2: Duration of discharge of patients with respect to age groups

Different types of discharges were found in this study and all type of discharge were documented and it was found that 48 patients were mucopurulent discharge. The nature of discharge in male and female were compared with T-test and it was revealed that there was no significant with respect to discharge as $p=0.91$ with T-test (Fig 3).

Fig 3: Nature of discharge in ear infection patients

Bacteriological and Fungal Work

All ear swab samples were culture in different agar media to observe the colony, morphology of the organism. It was observed that in 11 samples there was no growth (8.59%) whereas the single colonies were identified with 105 samples. A total no of 117colonies are identified with 128number of ear discharge samples. Among 117 microbial colonies, maximum 82.03% single colonies were found whereas 8 double colonies and 4 three or more colonies were revealed (Fig 4).

Fig 4: Number of colonies in cultured plates

Grams staining results

Grams staining showed 4 groups of results such as; Gram negative bacteria (GNB), Gram positive cocci (GPC), Gram positive bacilli (GPB) and Budding yeast colony (BYC). Occurrence of BYC was highest among all, followed by GPC, GNB and GPB (Fig5).

Fig 5: Frequency of organisms

Fig 6: Gram stains result, 6a- GPC, 6b- GNB, 6c- GPB, 6d- BYC.

Lactophenol Cotton Blue Staining of fungi

Fig 7: Cotton blue stain of aspergillus

All isolated bacteria were identified with both culture morphology and biochemical test. There was 11 bacterial species were identified in this study. The total number of isolated bacteria were 79 whereas *S. aureus*(22.78%) was predominant followed by *pseudomonas aeruginosa*(21.51%).A total number of 11 different bacteria species were identified from 128 samples. Total number of *Staphylococcus aureus* was

18 (22.78%), *Coagulase negative staphylococcus* was 9 (11.39%), *Pseudomonas* species was 17 (21.51%), *Proteus* species was 4 (5.06%), *Acenetobacter* was 4 (5.06%), *Salmonella* species was 4 (5.06%), *Streptococcus* was 5 (6.32%), *Enterococcus* was 5 (6.32%), *Gram positive bacillus* was 9 (11.39%), *Shigella* sp. was 3 (3.79%) and *Klebsiella* was 1(1.26%) (Fig8).

Fig 8: 8a- Pseudomonas on NA, 8b-Klebsiella on NA, 8c-Proteus on NA, 8d-Acinetobacter on NA, 8e- Shigella on BA, 8f- Salmonella on BA.

Fig 9: 9a- *Cons.* On NA, 9b- *GPB* on NA, 9c- *Streptococcus* on BA, 9d- *S. aureus* on NA, 9e- *Enterococcus* on NA, 9f- *S. aureus* on BA.

In all otomycosis patients the causative fungi were identified with the culture morphology, microscopic and with specific Candida differential agar medium. It was revealed that *C. tropicalis* (41.66%) was predominant in otomycosis and *aspergillus* sp. (5.55%) was the least causative organism in otomycosis. A total number of 5 fungal strains were identified in this study. There was 25% of *C. albicans*, 41.66% of *C. tropicalis*, 19.44% of *C. glabrata*, 8.33% of *C. krusei* and a total of 5.55% of *aspergillus* sp. were characterized in this study (Fig11).

Fig 10: Total Fungus isolate

Fig 11:Resistance percentage of GPC

Fig 12: ABST for Gram positive bacteria.

Antibiotic susceptibility for Gram negative bacteria

A total number of 16 antibiotics of 11 classes of antibiotics were screened against gram negative bacteria and it was revealed that clarithromycin was most resistant and ciprofloxacin was more sensitive antibiotic against gram negative bacteria isolated from

ENT discharges. Aminoglycoside group of antibiotics also played an important role to control gram negative bacteria isolated from ear infection. Pseudomonas is highly resistance to amoxiclav and clarithromycin i: e 90% each. *proteous sp.* and *Acinetobacter* were both 100% resistance to azithromycin and colistin. Salmonella sp. was resistance to many antibiotics like amoxiclav, moxifloxacin,cefoxitin and imipenamcilastin (Fig13).

Fig 14:Resistance percentage of GNB

Note: AMC- Amoxyclav, TI- Ticarcillin, CIP- Ciprofloxacin, MO- Moxifloxacin, NX- Norfloxacin, LE- Levofloxacin, CX- Cefoxitin, CTX- Cefotaxime, IC- Imipenem/Cilastin, IPM- Imipenem, GEN- Gentamycin, AK- Amikacin, E- Erythromycin, AZM- Azithromycin, CLR- Clarithromycin, TE- Tetracycline, TGC- Tigecycline, COT- Cotrimaxole, CL- Colistin, LZ- Linezolid.

Antifungal screening test

Five species of fungi were screened with 7 antifungal agents and it was revealed that an average fluconazole

was most resistance against all fungus (87.77%) followed by nystatin(84.31%). It was the most sensitive antifungal agents for all fungal species isolated from ear discharged (68.99%).In this study *C.albicans* were highly resistance to fluconazole i: e 88.89% whereas *C. tropicalis* were highly resistance to nystatin i:e 86.67% and *c. krusei* were 100% resistance to many antifungal agents like nystatin, clotrimazole and fluconazole, *C. glabrata* were highly resistance to clotrimazole and ketoconazole and 100% resistance to fluconazole similarly aspergillus were 100% resistance to three anti-fungal agent i:e amphotericin-B, nystatin and ketoconazole(Fig 15).

Fig 15: Resistance percentage of fungus

Fig 16: Antifungal screening of *C. albican* and *A. fumigatus*

DISCUSSION

CSOM are common conditions encountered in a general otolaryngology clinic setting and its prevalence has been quoted to range from 9% to 27.2%^{10,11} among patients who present with signs and symptoms of otitis externa and up to 30%^{12,13} in patients with discharging ears. CSOM is the term used to describe a variety of signs, symptoms, and physical findings that result from the long-term damage to the middle ear by infection and inflammation. CSOM is the inflammation of the ear that causes recurrent ear discharge through a perforation of the ear drum¹⁴. It is worldwide in distribution with a higher prevalence in the hot, humid, and dusty areas of the tropics and subtropics^{15,16}. Although rarely life threatening, the disease is a challenging and frustrating entity for both the patients and otolaryngologists as it frequently requires long-term treatment and follow up. Despite this, there could be recurrences. In the present study the highest incidence of fungal CSOM was noted in second and third decades of life (more than 60%), and this observation was concurrent to the studies conducted by various other authors^{16,17}. High exposure of the youngsters to the fungal spores might be responsible for high incidence of fungal infections in this specific age group¹⁸. Among the fungal etiology in CSOM, the most commonly isolated organisms are *Aspergillus* species and

Candida species¹⁹. In the present study, *Candida* species comprised of more than 89% of the total fungal isolates, whereas approximately 10% of the total microorganisms were species of *Aspergillus*. According to Yadav RK et al *Aspergillus* species comprised of more than 45% of the total fungal isolates, whereas approximately 40% of the total microorganisms were species of *Candida* (Reffff). *A. Flavus* and *A. Niger* were the most common *Aspergillus* species. Among the *Candida* species, the most common isolates were *C. tropicalis* and *c. albicans*. Earlier study from India,¹⁶ reported higher isolation rate of *Aspergillus* species as compared to *Candida* species.

Therefore, the frequency of azole-resistant to *Aspergillus* likely underdiagnosed, with a possible risk of unsuitable treatment. In our study, the resistance strains of *Aspergillus* were shown the positive in PCR with the primer designed from gene CYP51A responsible for voriconazole and ERG11 gene responsible for amphotericin b.

CONCLUSION

In ear discharging patient both CSOM and otomycosis can be revealed. So, before treatment the causative organism and their drug sensitivity pattern should be carried out. In case of CSOM associate with otomycosis both antibiotic and antifungal should be

prescribed for better and early treatment. The empirical therapy should be avoided and for early detection of drug sensitivity pattern PCR method should be implemented.

ABSTRACT

Visualization of patients with Gastric malignant growth (GC) is for the most part poor due to the absence of basic, helpful, and noninvasive instruments for GC discovery at the beginning period. The revelation of microRNAs (miRNAs) and their diverse articulation profiles among various types of illnesses has opened another road for tumor finding. The point of the examination was particular preliminaries as a biomarker for early detection of GI tract malignancy.

Method: A total of 232 patients with gastric cancer who underwent gastrectomy and 62 healthy volunteers were prospectively included between Midst of 2017 and June 2018. Peripheral blood samples were collected before gastrectomy, and circulating tumor cells (CTCs) were examined using a centrifugal microfluidic system with a new fluid-assisted separation technique.

Results: In the wake of making a beneficiary working trademark bend to recognize the discriminative CTC esteem required separate patients with gastric malignant growth from solid volunteers, affectability and specificity were about enhanced at a CTC limit of 2 for each 7.5 mL of blood. Of the 232 people with a CTC level ≥ 2 per 7.5 mL of blood, (98%) had gastric malignant growth, and of the 48 people with a CTC level < 2 per 7.5 mL of blood, 65% were solid controls. Likewise, the affectability and specificity for the separation of patients with gastric disease from solid controls were 86.3 % and 92.8%, separately. Be that as it may, the nearness of CTCs was not related with any clinicopathologic highlights, for example, organizing, histologic type, or mucin phenotype.

INTRODUCTION

Gastric cancer is the third leading cause of cancer death in the world ^{1,2,3}. Over 8.2 million people die of cancer each year due to the inaccessibility of appropriate detection procedures and treatments ⁴.

Colorectal cancer (CRC) is the third most common cancer in the world. It accounts for nearly 50,000 deaths

each year and is the second leading cause of cancer-related death ^{5,6}. Though qualified consideration and screening programs assume critical jobs in the survival of patients with Colorectal cancer (CRC), careful resection in the beginning period is the best treatment and drags out the survival of patients. Tragically, beginning time CRCs are hard to identify on account of less indications

The proteome of circulating blood has been applied to detect biomarkers for CRC such as carcinoembryonic antigen (CEA) and carbohydrate antigen 19-9 (CA19-9), but its sensitivity and specificity, especially for early stage colorectal cancer, seems to be insufficient⁷.

The components basic chemoresistance in gastric tumor are not by any stretch of the imagination known,

yet the accompanying instruments have been accounted for: diminished intracellular medication collection as well as expanded medication efflux, expanded nucleotide extraction repair action, avoidance of apoptosis, initiation of a few flagging pathways and the presence of putative disease undeveloped cells. Another hypothesis for chemosensitivity is the malignancy undeveloped cell theory: a little level of growth cells, the remaining disease cells or the putative tumor undifferentiated organisms, are impervious to chemotherapy-interceded cell murdering, and turn into the hotspot for tumor backslide. On the off chance that the administrative instruments for keeping up this cell populace are found, specialists disturbing the components might be utilized to create novel techniques to treat gastric growth.

GC is a heterogeneous ailment in which every malignancy persistent displays a particular hereditary and sub-atomic profile. Sadly, in spite of the fact that a various investigations has been led on atomic biomarkers, the majority of the distinguished biomarkers bombed in the approval thinks about. Nearly patients with cutting edge GC still can't be treated with a focused on treatment and as of now no indicative markers can be seen for optional anticipation. For having the capacity to utilize GC related biomarkers in clinical consideration of patients, extensive survey to decide the heading for distinguishing the exact biomarker pinpoint that can be investigated for the customized treatment.

Therefore, new methods and novel diagnostic biomarkers are urgently required for mass surveys of early events of CRC.

The bad prognosis is the result of the aggressive biological character of the tumor, a lack of reliable diagnostic techniques for early-stage detection and absence of effective individualized treatment⁸.

The components basic chemoresistance in gastric tumor are not by any stretch of the imagination known, yet the accompanying instruments have been accounted for: diminished intracellular medication collection as well as expanded medication efflux, expanded nucleotide

extraction repair action, avoidance of apoptosis, initiation of a few flagging pathways and the presence of putative disease undeveloped cells. Another hypothesis for chemosensitivity is the malignancy undeveloped cell theory: a little level of growth cells, the remaining disease cells or the putative tumor undifferentiated organisms, are impervious to chemotherapy-interceded cell murdering, and turn into the hotspot for tumor backslide. On the off chance that the administrative instruments for keeping up this cell populace are found, specialists disturbing the components might be utilized to create novel techniques to treat gastric growth.

Of the numerous elements related with long haul survival of gastric malignancy patients, strategies of gastrectomy and fundamental treatment have been examined extensively. Albeit less examined, biologic varieties in gastric tumors among races may to some degree drive a portion of the watched survival inconsistencies. Later sub-atomic portrayals of gastric adenocarcinomas exhibit a huge sub-atomic heterogeneity in this growth.⁹

MATERIAL AND METHOD

Patients and Specimens The study was approved by the Institutional Review Board and IMS & SUM Hospital, Bhubaneswar, Odisha. Written consent for using the samples for research purposes was obtained from all patients. Gastric carcinoma tissues were obtained from department of Gastroenterology from the concerned procedure area A to total of 236 patients from the the same department. The eligibility criteria of the current study were as follows: (1) a pathologic examination confirming the presence of gastric cancer and experienced radical surgery, (2) complete basic clinical data, (3) the absence of any prior treatment for cancer, and (4) no serious complications or other malignant disease. There were 78 males and rest females. Relevant clinical pathologic features (Table 1) were all obtained from the patients' files. Tumor stage was classified according to the 7th Union International Cancer Control (UICC) TNM staging system¹⁰.

Table 1: Mucin expression in gastric cancer according to the level of circulating tumor cells

DISCUSSION

CONCLUSIONS AND FUTURE

PERSPECTIVES

Plasmacytoma variation translocation 1 is a nearly very much described oncogenic lncRNA, which is up-controlled in malignant growths, particularly in numerous stomach related framework tumors, which incorporates oesophageal disease, GC, HCC, CRC and PC. We checked on GACAT2 communication with DNA, RNA, and in addition related proteins in event of stomach related framework malignant growths. It is enticing to guess that GACAT2 may hinder authoritative strides in various stomach related framework malignant growth suppressive and oncogenic pathways. GACAT2

could advance tumor cell multiplication, movement and attack. GACAT2 up-direction is generally connected with poor visualization. GACAT2 will be a possibly helpful biomarker for conclusion and restorative focuses of stomach related framework tumors. Be that as it may, there is still absence of the autonomous associate investigation for approval. Along these lines, multicentre studies will be required, which can improve the clinical utility of GACAT2 as a compelling biomarker¹⁰.

Efficacy of Meaning Centered Group Psychotherapy to People Living with HIV on their Quality of Life at Selected Art Centre of Odisha

Sasmita Das¹, Anusuya Khatua², Mahesh Chandra Sahu³

¹Associate Dean ,SUM Nursing college, ²Msc Nursing Student, ³Assistant Professor, Medical Research Laboratory, IMS and SUM Hospital, Siksha O Anusandhan (Deemed to be University) K8, Kalinga Nagar, Bhubaneswar-751003, Odisha, India

ABSTRACT

Backgrounds: Since the human immunodeficiency virus was first discovered in 1983, several treatment options have been developed. With an increased prevalence of people living with HIV on life-long Highly Active antiretroviral therapy should be required. This research intends to fill the gaps in the conceptual approach of quality of life of people living with HIV through meaning centered group psychotherapy.

Materials and Method: Non Probability Purposive Sampling technique was used and samples were patients taking ART medication in ART center Bhubaneswar. The selection criteria were; People living with HIV those are present at the time of data collection and Clients who are willing to participate in the study. We excluded People living with HIV those were not present at the time of data collection and clients who are not willing to participate in the study.

Results: It is revealed that relationship of quality of life within selected demographic variables and paired t-test was used for comparison between pre test and post test quality of life, correlation between pre test and post test both quality of life in experimental group.

Conclusions: The findings conclude that the meaning centered group psycho therapy developed by the researcher was found to be helpful in improvement of quality of life of people living with HIV.

Keywords: HIV, psycho therapy, Chi-square test and Anova.

INTRODUCTION

Since the human immunodeficiency virus was first discovered in 1983, several treatment options have been developed. With an increased prevalence of people living with HIV on life-long Highly Active Antiretroviral Therapy, it is becoming increasingly important to determine which factors contribute to a better quality of life. While people are living longer, they may be living with increased health-challenges related to HIV disease,

the side effects of treatment or emerging concurrent morbidities related to HIV or aging. Hence, despite living longer, individuals may not always be 'living well'. Quality of life has become an essential outcome to consider in the overall health and well-being of people living with HIV. Several factors have been identified as contributing to better quality of life among people living with HIV, including social support , spiritual well-being , education level, not being an injecting drug user and having good adherence to Highly Active Antiretroviral Therapy¹. Hope-oriented group therapy improves quality of life in men suffering from HIV².

Meanwhile, other factors such as HIV-related stigma , non-disclosure of one's HIV status have been reported to negatively affect quality of life. Due to the strong

Mail: mchsahu@gmail.com

relationship between quality of life and many important indicators for treatment success, quality of life has been widely applied in evaluating the impact of HIV-related interventions among different populations³.

Greater use of maladaptive coping strategies was associated with lower levels of energy and social functioning. Interventions aimed at developing adaptive coping strategies and improving pain management may improve functional aspects of quality of life in persons living with HIV/AIDS⁴. As it has widely been recognized that psychological support is vital for improves of quality of life. Meaning centered group psychotherapy intervention programs are strongly encouraged to improve quality of life. This research intends to fill the gaps in the conceptual approach of quality of life of people living with HIV through meaning centered group psychotherapy.

Aim

MATERIALS AND METHOD

Study design

Pre experimental one group pre test post test design adopted to achieve the objectives. The design can be represented as pretest-treatment-post test.

Samples and data collection

A total of 45 people participated in the study; however, 40 were finally chosen and others were excluded due to inadequate responses. To verify the statistical power of our sample size, the formula $N = (Z^2 \times P \times P) / e^2$ was used. By using the above formula, the sample size was $N = 30$ where Z value was 1.96. In this research, out of every 50 people, 1 people is affected with HIV. So, 'p' value is 1/50 or 0.020 and 'e' is called tolerable error, which was 0.05. However, for uniformity & availability, we had taken the sample size of 40. Therefore, our sample size seemed appropriate.

The content validity of the tool was established by giving it to five experts and the reliability of this tool was calculated by using Cronbach's alpha formula and found that "r"=0.74, which was statistically reliable for the study.

The procedure and purpose of data collection was explained to the samples in detail. If they agreed to participate in the study, they were asked to provide written

informed consent. Data were collected anonymously to protect the participants' rights and privacy. It was agreed that the data would not be used for other purposes. They were also informed that they could quit at any time during data collection. Pre-test was conducted to assess their quality of life. The time duration was approximately 25 minutes and the questionnaire was collected back by the investigator. Meaning centered group psychotherapy is an eight-week (90 minutes weekly sessions) group intervention, which used a mix of didactics, discussions and experiential exercises that are centred around particular themes related to meaning and HIV. Evaluation will be done by conducting post test on the 9th week, after meaning centered group psychotherapy by using the same questionnaire for to assess the quality of life.

Description of tools

The WHOQOL-Brief (Field Trial Version) produces a profile with four domain scores and two individually scored items about an individual's overall perception of quality of life and health. The four domain scores are scaled in a positive direction with higher scores indicating a higher quality of life. The four domains are physical domain, psychological domain, social domain and environmental domain. The question scores of the respondents on all the 26 questions of the BREF ranged from 1 to 5. This indicated that the whole spectrum of the 5-point scales was utilized in the reflection of quality of life of the subjects.

RESULTS

The distribution of subjects according to demographic variables

The distribution of subjects according to demographic variables represents that (65%) are female, (35%) are male, most (30%) of people are of age group above 45yrs, (27.5%) of sample are 35-44yrs, (20%) of sample are 25-34 yrs, (12.5%) of sample are 18-24 yrs and (10%) of sample are 11-17yrs age group, (27.5%) of sample are unmarried, (65%) of sample are married and (7.5%) of sample are divorced or widow, no one of sample are illiterate, 25% of sample are elementary, 65% of sample are middle or high and 7.5% are university level of education, 10% of sample had prison history, 17.5% of sample had intravenous drug use, 65% of sample had unprotected sex and 7.5% of sample had blood transfusion risk factors, 17.5% of sample through

intravenous drug, 65% of sample through unprotected sex, 10% of sample through vertical and 7.5% of sample had unknown mode of transmission, 87.5% of sample had treated with HAART (Highly active antiretroviral therapy) and 12.5% of sample had untreated with HAART, 42.5% of sample had more than Rs/-10000, 42.5% of sample had less than Rs/-10000 and 6.25% of sample had no income per month. 85% of sample are employed and 15% of sample are unemployed or retired.

Pre-test quality of life

In general health domain, 62.5% of sample were having poor general health, 37.5% of sample were having average general health and no one of total sample were having good general health. In pre test quality of life domain-1 i.e. physical health 77.5% of sample were having poor physical health, 22.5% of sample were having average physical health and no one among the sample were having good physical health. In pre test quality of life domain-2 i.e. psychological health 85% of sample were having poor psychological health, 15% of sample were having average psychological health and no one among the sample were having good psychological health. In pre test quality of life domain-3 i.e. social health 77.5% of sample were having poor social health, 22.5% of sample were having average social health and no one among the sample were having good social health. In pre test quality of life domain-4 i.e. environmental health 85% of sample were having poor environmental health, 15% of sample were having average environmental health and no one among the sample were having good environmental health. In pre test quality of life 87.5% of sample were having poor quality of life, 12.5% of sample were having average quality of life and no one among the sample were having good quality of life. **Post-test quality of life.**

In general health domain, 62.5% of sample were having good general health, 37.5% of sample were having average general health and no one of total sample were having poor general health. In post test quality of life domain-1 i.e. physical health 52.5% of sample were having good physical health, 47.5% of sample were having average physical health and no one among the sample were having poor physical health. In post test quality of life domain-2 i.e. psychological health 60%

of sample were having good psychological health, 40% of sample were having average psychological health and no one among the sample were having poor psychological health. In post test quality of life domain-3 i.e. social health 60% of sample were having good social health, 40% of sample were having average social health and no one among the sample were having poor social health. In post test quality of life domain-4 i.e. environmental health 77.5% of sample were having average environmental health, 22.5% of sample were having good environmental health and no one among the sample were having poor environmental health. In post test quality of life 22.5% of sample were having good quality of life, 77.5% of sample were having average quality of life and no one among the sample were having good quality of life. Hence in pre test most of the samples were in poor quality of life and no one were having poor quality of life.

Comparison of pre test quality of life with post test quality of life.

The mean score of pre test general health is 37.5 where the mean score of post test general health is 78. So there is increase of general health in post test than the pre test. The mean score of pre test physical health is 38.5 where the mean score of post test physical health is 76.14. There is increase of physical health in post test than the pre test. The mean score of pre test psychological health is 36.58 where the mean score of post test psychological health is 79.33. There is increase of psychological health in post test than the pre test. The mean score of pre test social health is 37.33 where the mean score of post test social health is 79.83. There is increase of social health in post test than the pre test. The mean score of pre test environmental health is 35.87 where the mean score of post test environmental health is 75.18. There is increase of environmental health in post test than the pre test. The mean score of pre test quality of life is 35.67 where the mean score of post test quality of life is 74.36. There is increase of quality of life in post test than the pre test.

Effect of meaning centered group psychotherapy on quality of life through paired t-test

Table 1-Paired t test calculation for effectiveness of meaning centered group psychotherapy

ITEM	MEAN	DF	SD	PAIRED t TEST	INFERENCE
Quality of life (pre test)	35.67	39	25.0071	t=4.4681 p=0.05	extremely significant
Quality of life (post test)	74.36538				

The above Table-1, represented that there is extremely significant relation in quality of life, which means the meaning centered group psychotherapy is effective for improving quality of life of people living with HIV.

Association of post test quality of life with selected demographic variables

The chi square association of post test quality of life with selected demographic variables was obtained. No demographic variables were statistically significant with quality of life.

Association of quality of life within selected demographic variables by Anova test

The “p” value of gender and marriage is 0.33 and 0.18 which is more than 0.05. here it is proved that there is no association of quality of life within gender and marriage status. The “p” value of gender and risk factor is 0.65 and 0.55 which is more than 0.05. here it is proved that there is no association of quality of life within gender and risk factor. The “p” value of gender and HAART is 0.29 and 0.12 which is more than 0.05. here it is proved that there is no association of quality of life within gender and HAART. The “p” value of marriage and risk factor is 0.24 and 0.20 which is more than 0.05. here it is proved that there is no association of quality of life within marriage and risk factor. The “p” value of marriage and HAART is 0.36 and 0.19 which is more than 0.05. here it is proved that there is no association of quality of life within marriage and HAART. The “p” value of risk factor and HAART is 0.25 and 0.12 which is more than 0.05. Based on the above findings it is proved that there is no association of quality of life within risk factor and HAART.

DISCUSSION

The goal of this study was to investigate the efficacy

of group meaning centered psycho therapy of people living with HIV quality of life. In general, the obtained results show that group meaning centered psycho therapy led to improvement of patients’ quality of life, which is consistent with the results of other studies on people living with HIV’s quality of life. Analysis of pre test and post test for quality of life reveals that there is marked improvement in quality of life in post test than pre test.

In a study on the effect of peer education on the QOL of breast cancer patients after surgery, showed an increase in patients’ QOL after the intervention⁵.

In 2012, a study conducted on the effects of lung cancer complications on the patients and their caregivers showed that the patients, their caregivers, and their professional caregivers were all under the influence of cancer-related complications, faced QOL reduction, and needed supportive interventions⁶. In a literature review study on the promotion of quality and quantity of cancer patients’ showed that group psychotherapy influenced not only the patients’ quality of life but also their quantity of life and led to more survival of these patients, reduction of their pain, reduction of their mood disorders, and improvement of their quality of life. All the above-mentioned studies obtained results consistent with those of the present study, although they were not methodologically similar⁷.

Test results revealed that group meaning centered psychotherapy led to improvement of patients’ quality of life. In the reviewed studies, group meaning centered hope therapy had been administered, but a meta-analysis on the social-psychological care among the caregivers of cancer patients and they found that caregivers’ stress can result in sleep disorders and changes in their physical health and immunity system function⁸. Group meaning centered hope therapy in either patients’ group or families’ group led to improvement of patients’ QOL,

which is consistent with the results of other studies on cancer patients' QOL⁹⁻¹².

CONCLUSION

There was significant improvement of quality of life of people living with HIV. Meaning centered group psycho therapy is found to be useful for improving quality of life of people living with HIV. The findings conclude that the meaning centered group psycho therapy developed by the researcher was found to be helpful in improvement of quality of life of people living with HIV.

Survey on Gene Selection Methodologies based on Filter, Wrapper, Embedded and Hybrid Approaches

Suchishree Panda¹, Kaberi Das², Debahuti Mishra³

¹Research Scholar, ²Associate Professor, Department of Computer Science and Engineering, ³Professor, Department of Computer Science and Engineering, Orissa Engineering College, Odisha, India

ABSTRACT

Gene selection has become a most elementary tool for processing high dimensional data. It is an important pre-processing step which is essential for microarray analysis and classification. DNA microarray technique is applied for analyzing large number of genes at a time, by which the expression levels of the genes are determined. Selection of genes applying high dimensional gene expression data is primary and most important work for accurate disease prediction and classification. Gene expression data are in the form of matrix and usually it contains irrelevant, redundant and noisy data, so the study and analysis of data faces problematic situation. Most important and primary purpose of gene selection methods is to get rid of from the problem of curse of dimensionality, enhance the performance and efficiency of classification algorithms by eliminating irrelevant genes and reduction of noise. This paper describes the various gene selection methods declaring with their relevant pros and cons. It also denotes a review on few gene selection methods, mainly those that have been proposed in last few years.

Keywords: DNA microarray, Gene selection, High dimensionality, Gene expression

BACKGROUND

The new microarray technology has made the life of scientists easier by enabling them to determine the utterance of height of numerous genes. Now-a-days, the microarray technology plays a vital role in terms of assisting the physicians in the diagnosis of diseases by incorporating appropriate treatment strategies for the patients. The microarray technology is proving to be a major breakthrough in cancer diagnosis because of the platform it provides to compare the gene expressions of cancer and healthy cells. Classification of sample as “diseased” or “not-diseased” has become a huge challenge in biomedical studies over the years. This helps in designing precise models to diagnose cancer. The classification through microarray gene expression

data is extremely hard, as thousands of gene expressions are carried by each sample. The high dimensionality of the data with a limited number of samples often cause poor performance in categorization, hence this particular concept is popularly known as the curse of dimensionality in statistical pattern identification.

Microarray Data for Gene Expression

The inherent parts in living creature are known as Genes. The genes are part of an acid that named deoxyribonucleic which contains the knowledge about ribonucleic acid and elements of protein. Genes are the basic block which builds any living creature. The generation of protein is a two-step sequence: The step one is called as ‘transcription’, explains the way a gene within a DNA is shown by alienating its vital information to messenger acid of ribonucleic. The step two, called as “translation”, relate that protein is synthesis following decrypting details from the mRNA by Ribosomes. This cycle which helps a gene to be described as proteins is called ‘gene expression’. Genes are generated from microarray technology. Gene expression profile is an organized matrix of gene expression data. Rows of the

Professor, Department of Computer Science and Engineering, Siksha ‘O’ Anusandhan Deemed to be University, Bhubaneswar, Odisha, India
E-mail: debahutimishra@soa.ac.in

matrix denote genes and the column of the matrix denotes samples.

Importance of Gene Selection

Major drawbacks of Gene Microarray Data are the “Curse of Dimensionality”. It comprises of a few specimen, although these will have large amount of genes. It has been found that a large number of genes are not important and an overhead which are not helpful for determination of cancer, only a little count of genes may be important. To build a faster method for precise determination of cancer the important pre-processing step is to select the genes. Gene selection methods in this prospect are apparently comprehensive solutions to develop a faster solution for categorizing cancers. The issues often appear when the data is not clear and comprises limited features is called over generalization problem.

Traditional approach for gene selection

Filter Approach

Figure 1. Filter approach to gene selection.

According to the Filter approach each genes are individually evaluated to get the best result. Genes having best analytical value are preferred or taken into consideration in filter approach. Filter is an approach where genes are only selected depending upon performance measuring, it does not related to the data modeling algorithm. Aim of Filter method is to rank the genes individually according to the weight vector and select the best gene. Classifiers have no role in the filter approach, so it a classifier independent approach. Genes having best analytical value are preferred or taken into consideration in filter approach.

Pros: - Data set that contains high dimensional value can be easily evaluated by applying filter approach. Complexity of filter approach is very much low.

Cons:-There is no role of classifier performance and inter dependency of genes in filter gene selection approach, so it is not a surprising matter that the classifier performance is low in filter selection approach. Also in filter selection approach redundant genes may be found because there is no interdependency between genes.

L.Beretta *et al.* (2011) found the modified version of ReliefF i.e SReliefF and Turned sReliefF algorithm to overcome the time analysis deficiency in the year of 2011. This approach also helps in selecting suitable

genes in existence of right- censored genes in the data set. In this work they also compare both the proposed algorithm (SReliefF and Turned sReliefF) by applying on the cancer microarray dataset. They found that both the method had discerning capability even when the given data set have small sample size. When assumed data set were small then Turned sReliefF is better than SReliefF¹

Zijiang Yang *et al.* (2011) presented a new innovative Partial least Square (PLS) approach, which is based on three indicators (VIP, VEG, IEG). They trial the innovatively proposed method by implementing it on MIT acute myeloid leukemia/acute lymphoblastic leukemia, which is a two category dataset and smallroundbluecelltumors (SRBCT), which comes under multicategory datasets. In this work they found that the proposed method can deal with both the two category and multicategory dataset with high efficiency. And also the proposed algorithm can handle the data with high dimension and small sample size².

Debahuti Mishra *et al.* (2011) analyze the outcome of two approaches based on Signal-to noise ratio (SNR), for choosing markers genes from the Leukemia dataset. In the first attempt they apply the K-means clustering and SNR ranking and further in the second approach they use only the SNR ranking for choosing the genes. They use KNN, SVM, PNN and FNN as classifier.

After comparing according to the first attempt they got the result like, 100%, 96%, and 96% with SVM, KNN & PNN respectively for five number of genes, 2.17 with FNN for 10 number of genes and again on second approach 96%, 96% and 62% with SVM, KNN and PNN for 5 number of genes, 2.52 with FNN for 10 number of genes³.

To improve the stability of choosing genes Guoyin Wang *et al.* (2013) proposed an EMDBSWA-efficient mean deviation based sample weighting algorithm. In this work they execute a sequence of analysis with four regularly studied public data set (Colon, leukemia, prostate, Lung). They analyze the proposed method with the margin based sample weighting method and state of the art ensemble framework using ReliefF as the base algorithm. Result revealed that the proposed method achieve more balanced gene sets than others⁴.

A method was proposed by Devi Arockia Vanitha *et al.* (2015) for choosing informative genes by using Mutual Information (MI) a type of filter approach. The performance of the newly invented method is measured by applying it on 2 cancer microarray data set, Colon cancer and Lymphoma. They use SVM as the classifier and measure the result of the classifier by using (LOOCV)-Leave –one-out cross validation. From

the experiment they observe that the proposed algorithm shorten the size of the data set on the basis of choosing informative genes⁵.

Wenyan Zhong *et al.* proposed (2017) a distance based gene selection method called Bhattacharyya distance applicable for two group classification issue. Colon cancer and Leukemia data set were used to measure the accuracy and efficiency of the discussed method. In this work they use SVM as a classifier with the chosen genes. And also they compare the newly invented method B/SVM, with other frequently used method such as SVM-RFE and SWKC/SVM. Result revealed that B/SVM performed better than other two method⁶.

In this work Ryan J. Urbanowicz *et al.* (2018) had replaced Relief- based algorithms (RBA) with other gene selection algorithms. In this work first they broadly studied type of gene selection and replace RBA in that place. Next step they announce original Relief method with its working principle. Lastly the ReliefF algorithm in described with its procedure. They arrange a compared summary of RBA algorithms along with its policies, functionality, contributions, time complexity, adaptation to key data features, and its software accessibility⁷.

Wrapper Approach

Figure 2. Wrapper approach to gene selection

In Wrapper approach a predicted model is used for gene selection by scoring the genes. Classifier performance is taken as a measure concern for evaluating the genes in Wrapper approach. Wrapper approach are given as two categories deterministic approach and stochastic approach. SFS (Sequential Forward Selection) and SBE (Sequential backward elimination) are the method comes under deterministic approach category and RHC (Randomized hill climbing), ACO (Ant colony optimization), GA (Genetic algorithm) and such optimization based algorithm are comes under stochastic approach.

Pros:-Classifier performance is very high.It gives more accurate gene subset from filter method.

Cons:-Search space complexity is very high for the data set with high dimension. It leads to high time complexity. Wrapper approach not much useful for dimensionally high data set because of nature wise this approach is computationally high. This method is quite slower than filter as it uses classifiers.

A new method called LEAF- Leave one-out Forward selection was proposed by Kentaro Fukuta *et al.* (2010) because of its usefulness for searching genes which provide related information for cancer classification. The

proposed approach is based on forward selection method which was incorporated with the LOOCV concept. This method provides DPS which indicates the discrimination power score of the related genes. They had applied the new method on three leukemia based data set i.e. ALL/AML, ALL/MLL and MLL/AML for measuring the working efficiency of the approach. Result proved that this method is as useful as a powerful to search or define marker genes⁸.

Aiguo Wang (2014) proposed an IWSS-Incremental wrapper based gene subset selection, to get more accurate classification result compare to filter method. In this work they tried to scale down the complexity of time related to wrapper based gene selection method using KNN as the classifier. Experiment on six microarray dataset was done to measure the efficiency of the proposed algorithm. The data set used are SRBCT, Leukemia1, Leukemia2, DLBCL, Prostate, and Ovarian⁹.

A. Sylvia Selva Rani *et al.* (2015) invented a new algorithm for gene selection. The newly proposed algorithm is Binary Bat Algorithm (BBA). It is an unsupervised wrapped based algorithm for selecting the subset of optimal gene set. The accuracy of the proposed algorithm was compared with other existing gene selection method like, GA-Genetic Algorithm, PSO-RR-Particle Swarm Optimization with Relative Reduct, Quick Reduct and ACO-Ant Colony Optimization [30]. DT-Decision tree, MP-multilayer perceptron, SVM are used as classifier in this work. Revealed that this proposed algorithm provides more accuracy when equated with other optimization process¹⁰.

Thanh Trinh *et al.* (2016) proposed a method based on Random forest method for gene selection i.e FRF (frequency-based Random forest). In this work they used Breiman's random forest code to design a random forest model according to the given high dimensional data set. They set the rule that according to the threshold value the gene are selected. In this work they take 19 data set into account to test and measure the efficiency of the proposed method. They compare their method with other methods like, Guide Regularized Random Forest (GRRF), weighted subspace random forest (WSRF). They proved in their analysis that random forest model for gene selection is efficient¹¹.

A SPEA-Strength Pareto Evolutionary Algorithm was proposed by Swagatam Basu *et al.* (2017). This

algorithm was applicable for choosing informative genes which can provide best gene subset for analyzing disease. They collect the data set of colon cancer and applied with some classifiers to measure the accuracy of the proposed method. In future SPEA can be extended to SPEA2¹².

Bhavna Srivastava *et al.* (2014) presented a comparative study between filter method and wrapper method. They use RF-ReliefF which is the extension of Relief algorithm as the filter and RGSSA-Randomized gene subset selection algorithm as wrapper method for comparison. Cancerous data sets taken in this work are Ovarian, Lymphomas and Leukemia. Some most useful classifiers are also have major role in this work to define the particular disease that are SVM, NB, DA, NN, ABMI, GB, RB, BAG. This work give more confidence to the researchers to use SVM as a classifier¹³.

Optimization algorithms used for Gene Selection

Yajie Liu *et al.* (2013) explain the study of TLPSO- two-layer particle swarm optimization and its establishment for better accuracy in term of classify the uncertain samples of tanning data set. They had taken 3 microarray gene expression data sets which contains Leukemia, DLBCL and Tumor data set having multiclass problem to test the efficiency of the proposed method. In this work they also compare the secured result of TLPSO with PSO. Result revealed that TLPSO algorithm performed better accuracy than PSO in the sense of global searching capability and classification of genes with large number of samples¹⁴.

Ahmed Ibrahim Hafez *et al.* (2015) proposed a new method named CSO- chicken swarm optimization, for gene selection. The proposed method was applied on 18 datasets such as BC-Breast-Cancer, Breast-EW, Congress-EW, Exactly, Exactly2, Heart-EW, Ionosphere-EW, Krvskp-EW, Lymphography, M-of-n, Penglung-EW, Sonar-EW, Spect-EW, Tic-tac-toe, Vote, Waveform-EW, Wine-EW and Zoo, to select the best gene subset from the data set. The data sets used in this work are drawn from UCI Repository. They compare the outcome of the proposed method with most popularly used GA and PSO algorithm to study the performance, which proves that CSO can achieve good result than other two methods¹⁵.

Again Ahmed Ibrahim Hafez (2016) suggested another algorithm named SCA- sine cosine algorithm

for improvement in gene selection. They also compare the result of SCA with GA and PSO to measure the efficiency and to know which one is better for gene selection. And they proved that SCA is performed better than GA and PSO by implementing it on 18 microarray cancer based data sets that are BC-Breast-Cancer, Breast-EW, Congress-EW, Exactly, Exactly2, Heart-EW, Ionosphere-EW, Krvskp-EW, Lymphography, M-of-n, Penglung-EW, Sonar-EW, Spect-EW, Tic-tac-toe, Vote, Waveform-EW, Wine-EW and Zoo¹⁶.

Hossam M. Zawbaa *et al.* (2016) proposed a new method named MFO- Moth-flame optimization, for gene selection. The proposed method was applied on 18 datasets such as BC-Breast-Cancer, Breast-EW, Congress-EW, Exactly, Exactly2, Heart-EW, Ionosphere-EW, Krvskp-EW, Lymphography, M-of-n, Penglung-EW, Sonar-EW, Spect-EW, Tic-tac-toe, Vote, Waveform-EW, Wine-EW and Zoo, to select the best gene subset from the data set. They compare the outcome of the proposed method with most popularly used GA and PSO algorithm to study the performance, which proves that MFO can achieve good result than other two methods, but it consume more time¹⁷.

Madhu Sudana Rao Nalluri (2017) introduced a method to reduce the risk of analyzing gene subset. The invented method was AFSSO- Artificial Fish Swarm Optimization algorithm. This method was applied on 9 different data sets (SRBCT, Hepatitis, Wine, Parkinsons, Glass, Bupa, Movement, Svmguide3, and Churn) to measure the rate of performance. Data sets used here are having both binary classes and multiple classes. This algorithm gives better performance for the data sets having fewer genes. In this work they use SVM as classifier¹⁸.

R.Ranjani Rani and Dr.D.Ramyachitra (2017) got 100% result by applying KHO- Krill Herd Optimization for gene selection. In this work they use RF- Random Forest technique as classifier with KHO algorithm. Here in this work ten (Ovarian, Leukemia, Colon, Lymphoma, DLBL, CNS, SRBCT, Lung, Prostate, Breast Cancer) different microarray data set were used to calculate the effectiveness of the suggested method. They compared the proposed technique with other famous surviving approaches such as PSO/SVM, PSO/RF, FSO/SVM and FSO/RF¹⁹.

Embedded Approach

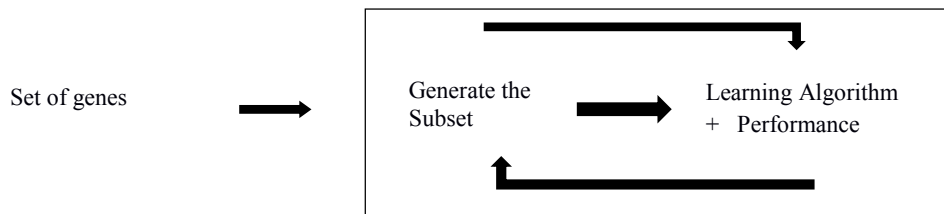

Figure 3. Embedded approach to gene selection

Embedded methods are of special case for wrapper methods, and during the construction of a classifier gene selection is conducted. When a gene selection technique is inserted with a learning algorithm is called an embedded method. Embedded methods are faster than wrappers and make the gene selection more efficient for the learning algorithm with which that they collaborate. Embedded methods are used by taking the benefits of the model dataset for problem diagnosis and for choosing appropriate gene which is most important one. Methods like decision tree and neural network are comes into this category. Computational complexity of

embedded method is very high.

After a lot of researches Ho Sun Shon, Kenu Ho Ryu (2010) invent a gene selection method which is based on a combined filter method embedded with a lasso regression model. It means that in first phase by using filter method some of the significant genes are selected, and further stage LASSO model was applied. In this work the experimental data are two class Leukemia data set (ALL & AML). The researchers found that LASSO model gives best performance from other existing model²⁰.

Edmundo Bonilla-Huerta *et al.* (2016) proposed a two stage approach for gene selection and classification. Multiple Fusion Filters are combinely applied in the first stage for preliminary gene selection. Then in the second stage by using an embedded GA, TS and SVM most relevant subset of genes are chosen. This proposed method is tested on four microarray data sets (Leukemia, Colon, Lung, CNS, and DLBCL). Embedded approach obtain small gene subset with high accuracy²¹.

Muthukrishnan R and Rohini R (2016) explores regression methods for gene selection, OLS regression, ridge regression and the LASSO regression. Experimental result shows that LASSO gives better performance than other²².

MI-B-ASGL (Mutual information-based Adaptive Sparse Group Lasso) method was proposed by Juntao Li, Wenpeng Dong, and Deyuan Meng (2017) for choosing genes. Efficiency and accuracy have been measured on three type of cancer datasets i.e. colon, lung and prostate. Result revealed this proposed method can increase the accuracy of both classification and gene selection²³.

Hybrid Approach

None of the gene selection method are capable of to solve the whole problem alone. So to overcome this problem some ensemble approaches are found. This type of assembling approaches are called hybrid method and the results of this method are integrated.

Pros:-Performance as well as accuracy is higher than filter method. Computational complexity is far better than wrapper method. Flexible and robustness is high on high dimensional data.

Cons:-This is a classifier specific method. This approach depends on the combination of different feature selection method.

Yukyee Leung and Yeungsam Hung (2010) introduced a hybrid method based on MFMW (multiple-filter multiple-wrapper). They proposed this method to overcome the drawbacks of SFSW-single-filter-single-wrapper. In this work they compare this two method i.e MFMW and SFSW by doing the experiment on 6 microarray cancer data set (Leukemia, Colon, Breast tumors, lymphoma, prostate and lung cancer). Results shows that MFMW is better than SFSW²⁴.

Piyushkumar A. Mundra and Jagath C. Rajapakse

(2010) proposed a hybrid gene selection method based on both MRMR and SVM. Here in this work first MRMR is used for electing the maximum relevant and minimum relevant genes from the total data set and then they tries to remove the least significant genes by using SVM-RFE. The proposed method gives best result as compared to MRMR or SVM-RFE. They used 4 data set (Colon, Leukemia, Prostate and hepato) to do the experiment²⁵.

Mohd Saberi Mohamad (2010) invented a three stage gene selection method. In this work they use GR or IG as a filter method for preliminary selection of gene subset. In the next step they use MOGASVM as hybrid method to select the closest gene subset among the preliminary gene set. The third step is to measure the frequency of each gene in the near optimal gene subset. The proposed three-stage gene selection method was tested on three tumor based data sets (MLL data set, SRBCT data set and Colon data set) that contain both two class and multiclass of tumor samples. This method avoid over fitting problem with high accuracy²⁶.

Feihu Yang *et al.* (2011) proposed an algorithm for gene selection named RF-MI, which is applicable for multiple class. At first they had applied ReliefF algorithm on the total data set and further they used MI for more clarification. They compared the proposed algorithm with ReliefF and GR solely and got the result that the proposed algorithm is better than the two sole method. Experiments obtained on UCI data set. Compared result revealed that the proposed algorithm have lower time complexity as well as lower space complexity²⁷.

S. Nikumbh *et al.* (2012) proposed two Hybrid methods one is BBO – RF-(Biogeography – based Optimization) – Random Forests and another one is BBO – SVM for gene selection. Outcome of the proposed algorithm was tested on 3 cancer based microarray gene data set that are colon, Breast, Leukemia. Result proved that the proposed method is easy to implement, and also both of the method are robust and flexible²⁸.

In a study Bo Liao *et al.* (2014) invented a method for choosing best gene subset named LSLS- locality sensitive Laplacian score. This is a supervised method for gene selection. The presented method was combined LSLS and a wrapper based method i.e sequential forward selection or sequential backward selection for further refinement of genes. They had worked on six cancerous

data set that are: - Prostate, AML-ALL Leukemia, DLBCL, Lung Cancer, MLL Leukemia and SRBCT. The researcher compared their proposed method with other predefined methods such as KW+SVM, Relieff+SVM, SPFS+SVM and got to know that their method was shown best result for Lung, SRBCT, and Prostate data sets²⁹.

Saima Rathore *et al.* (2014) proposed a feed forward gene selection procedure. In their study they used two gene selection algorithms one after another that mean that the outcome the first method (Chi-square) was fed as input to the second (mRMR), which is named as feed forward. They measure the accuracy of the proposed method by applying it on three standard colon cancerous data set³⁰.

J.Cao (2015) invented a gene selection method based on SVDD-Support vector data description. As SVDD can only consider the problem with target class only to overcome this problem a new method was proposed in this work called as MSVDD. It can applied to multiclass microarray data set. And also a RFE introduced to remove non related genes. So all total the new method is MSVDD-RFE. To validate the efficiency of the proposed method they applied it on five microarray datasets that are Leukemia, colon, Leukemia3, Novartis and lung cancer. This method revealed the result with high accuracy and low time complexity³¹.

Hanaa Salem *et al.* (2015) proposed a combined method of IG-Information gain and DGA-Deep Genetic Algorithm for gene selection. In this work they first applied IG-(INFORMATION GAIN) for selecting genes and then uses GA-(genetic algorithm) for gene reduction. Finally they used GP for cancer classification. To evaluate the accuracy of the proposed method they applied it on seven different data sets and also outcome is compared with six recently invented methods. Data sets taken into consideration are Lung-cancer- Ontario, Lung cancer-Michigan, Leukemia, Colon, Central nervous system, DLBCL, Prostate. The outcome shows that the new method was capable for classification accuracy maximization and number of chosen genes against other approaches are minimized³².

F. Vafae *et al.* (2016) proposed a two phase hybrid gene selection method. In the first phase Fisher Criterion belongs to filter approach, is used as to reduce the initial genes, further in second phase a Hybridization of CLA-

(Cellular Learning automata) and ACO-(Ant colony Optimization) belong to wrapper approach is used to find the set of features which improve the classification accuracy. In this work they evaluate the proposed method on 4 microarray data sets (lung cancer, colon cancer, prostate cancer, leukemia)³³.

Atiyeh Mortazav *et al.* (2016) invented a novel gene selection method which is the combination of two filter based gene selection method, named as MI-mutual information and FR-Fisher ratio. A Shapley index used in this work to measure the power of each gene. And lastly they had applied a forward selection scheme to weight individual gene according to the scoring function. The outcome of the novel method was compared with other popularly used gene selection algorithms such as FR-Fisher ratio, mRMR-minimum redundancy maximum relevance, and cooperative game based gene selection. The average classification accuracy on eleven microarray data sets (Brain Tumor2, Leukemia1, Leukemia2, Lung Cancer, SRCBT, 11Tumors, 14 Tumors, 9 Tumors, Brain Tumor1, Prostate Tumor, and DLBCL) proved that the proposed approach improves both average accuracy and average stability compared to other approaches³⁴.

Elnaz Pashaei proposed (2016) RFR-BBHA in this study. In this approach, BBHA combined with RFR-Random Forest Ranking was applied to perform gene election. Experiment based on four cancer microarray data set (Colon, CNS-Central Nervous System, ALL-AML, MLL) shows that the proposed approach revealed higher classification accuracy by obtaining less number of genes. Bagging with 10-fold cross validation is used as classifier to classify the related disease³⁵.

A combined method for gene reduction which contains both gene extraction and gene selection was investigated by Thuy Hang Dang *et al.* (2016). It is a systematic gene reduction framework. To operate the invented framework they used PCA- Principle component analysis as gene extraction and DT- Decision tree as gene selection. In this work multi-layer perceptron was used as gene classification at last. To measure the accuracy researchers had taken three data sets (Leukemia, Prostate, and DLBCL). They proved that gene extraction is also an important step with gene selection to get best gene subset³⁶.

L. Gao *et al.* (2017) presented a method for gene selection based on hybrid approach i.e. Information

gain-support vector machine (IG-SVM) by applying on 5 cancerous microarray data sets (lung, colon, prostate, leukemia, DLBCL). They apply and compared different filter methods (IG, Gain ratio, ReliefF, Correlation) to filtering out irrelevant and redundant genes, and result revealed that IG was best as compared to other, then for further removing of redundant genes, they used SVM by eliminate the noisy data from the datasets more effectively. In the final step informative genes are selected by IG-SVM, given as the input to the LIB-SVM classifier³⁷.

S. Singh *et al.* (2017) proposed a novel algorithm, which is based on execution flow of various data reduction filter like low variance filter (LVF), low entropy filter (LVF), etc. This reduction filters are combined to get the optimum number of gene set. This proposed method is a three stages gene selection process. First stage is based on removing noise from the total data set. Second stage they tries to remove the missing values by using KNN (K Nearest neighbor). In last step the suggested algorithm works by combining the various data reduction filters and performs six dissimilar types of execution flows. The performance of the proposed algorithm is verified by applying on three dissimilar types of gene expression data set i.e lung, breast and prostate³⁸.

L. Mengdi *et al.* proposed a ReliefF PSO algorithm in the year of 2018, which consist of two part. In the first part they calculate the weight vector of all individual genes by using the Relief method and remove the genes which are irrelevant for the classification. In the second part to access the best subset of gene, they use PSO algorithm to identify the redundant genes and also remove it. Performance of the proposed algorithm was figured out by applying this on four cancer data set i.e. Colon cancer, SRBCT, Leukemia, Lung cancer. They compare their proposed algorithm with other algorithms like ReliefF, mRMRReliefF, CFS, FCBF and result revealed that ReliefF PSO best from others³⁹.

Y. Sun *et al.* (2018) presented a CEMFE-(Cross-entropy based multi-filter ensemble) method, for the classification of gene data set. In this work they first use multiple filtering method (SNR, TS and PC) to choose the relevant gene subset. Secondly they use the Cross Entropy method to examine the gene which are independent and relevant. In conclusion to select the best gene subset they use the forward feature selection method which is a wrapper based approach. They

evaluated the algorithm by applying this on five types of cancer data set (colon, prostate, leukemia, lymphoma and lung). They used SVM, KNN and NB as classifier to classify the gene. Result revealed that the proposed algorithm gives high accuracy as well as it select less genes from others⁴⁰.

Kavitha K R *et al.* (2017) proposed a hybrid gene selection method using both FCBF (Fast Correlation-Based Filter) and SVM-RFE. In the first step they apply the FCBF to remove the prominent genes from the total dataset and further they had applied SVM-RFE to figure out the genes which are not relevant for the classification. They aimed to classify the Leukemia data set in their work. They had compared the proposed method with SVM-RFE and proved that the proposed method took less time than SVM-RFE⁴¹.

D.Pavithra and Mr.B.Lakshmanan (2017) presented a hybrid method based on both filter (Mutual information) and wrapper (Genetic Algorithm) method. Colon cancer dataset is taken as input gene set for classification. This method performs well. Decision tree (C4.5) used for classification of the chosen genes⁴².

CONCLUSION

This paper delivers review of gene selection procedures using gene expression data. It describes the DNA microarray, the difficulties involved in the method of gene selection including high dimensional data, irrelevant, redundant and noisy data. It provides the details of gene selection methods using Filter, Wrapper, Embedded and hybrid. Gene selection in which genes are taken as features is a significant job. As the subgroup of useful and promising genes acquired after applying different gene selection methods. These are used by different classifiers to reach best classification accuracy, disease prediction etc. This paper argues the classification of gene selection methods with its advantages and disadvantages. Many researchers put vast and creative efforts in filter, wrapper and embedded methods. Hybrid method which combines the advantages of both filter and wrapper proves to give favorable results. Thus the encroachment of hybrid methods for gene selection can be considered auspicious. In recent years most of the gene selection work were done using hybrid method as it achieve best result compared to others.

An Approach to Predict Hypertension based on Handwritten Manuscript

Seema Kedar¹, D. S. Bormane²

¹Dept. of Computer Engineering, JSPM's Rajarshi Shahu College of Engineering, S.P.P.U, Pune, India,

²Professor, Dept. of Electronics and Telecommunication, AISSMS College of Engineering, Pune, India

ABSTRACT

Background/Objectives: Hypertension is leading cause of deaths all over the world as it leads to heart, kidney and brain damage. Most of the Indian population is not health conscious. Around 58% urban and 75% rural Indians are not aware of their hypertensive status. As per survey in 2013, there is increase of 138% in deaths due to hypertension in India in comparison with number of deaths in 1990. This paper presents an approach for predicting hypertension using handwritten manuscript which is based on science of handwriting analysis. Handwriting analysis is the ancient science which is used to predict personality, emotional state and health conditions of the writer. As per the science of handwriting analysis, the handwriting strokes of the person remains same throughout the life. Handwriting is recognized as being unique to each individual. It is not related to gender and age. Handwriting analysis is used to understand PRE-ILLNESS warnings which appear in the handwriting much before the disease symptoms can be detected by any modern equipment or tests. In this paper, an approach for predicting hypertensive people based on handwritten manuscript is presented. The proposed system extracts eighteen writing features such as Euler number, number of right and left slant lines, number of horizontal and vertical lines, total length of horizontal and vertical lines, total length of left and right slant lines, overall image size, top margin, right margin, bottom margin, left margin, spacing between the words and lines, font size, and letter slant from a handwritten manuscript. Three different feature sets namely geometric, graphological and integrated feature set have been formed using extracted writing features.

Methods/Statistical analysis: This study uses a dataset of 150 handwritten manuscripts of hypertensive people and 150 of control group people. The performance of the system has been evaluated with different size datasets and for each feature set.

Findings: The proposed approach provides maximum 93.30% sensitivity, 92.2% specificity, 92.75% accuracy, 92.25% positive predictive value, 93.30% negative predictive value, positive likelihood ratio 12.52, negative likelihood ratio 0.07 using support vector machine classifier with integrated feature set.

Improvements/Applications: Extremely useful in healthcare centers and individual health analysis.

Keywords: *Handwritten manuscript, writing features, handwriting analysis, geometric features, graphological features, integrated feature set.*

INTRODUCTION

Globally 7.5 million deaths occur due to Hypertension [1]. Hypertension is one of the leading causes for premature deaths and disability worldwide. It is global health challenge as it leads to chronic kidney disease and cardiovascular disease [2]. Hypertension is the most important risk factor for the heart disease.

It is the need of time to take necessary steps for early prediction of hypertension, and develop techniques which are cost effective and easily available.

Prediction, control and treatment of hypertension are very important for the prevention of consequent heart and kidney diseases. Most of the governments across the globe are creating awareness about hypertension among

the people. Efforts are taken to reduce mortality counts due to hypertension. Early detection and appropriate treatment is the key to fight against this disease.

Various approaches have been used by researchers to predict possibility of heart disease using soft computing approaches based on parameters like cholesterol, sex, resting blood pressure, fasting blood sugar, age, chest pain type, resting ECG, exercise induced angina, maximum heart rate, old peak, slope, and number of vessels colored [3, 4, 5, 6]. There is no single computerized approach available to predict hypertension.

As per the research done in the University of Plymouth, England, the health conditions are revealed through writing features [7]. Based on the science of handwriting analysis, the handwriting of person shows pre-illness warnings [8]. People suffering from same disease have similar writing features also referred as graphological features like margin, slant, size, spacing between the words and lines, baseline etc.

This paper presents an approach to predict hypertension using support vector machine (SVM)

classifier based on handwritten manuscript. The proposed system extracts ten geometric features such as Euler number, number of right and left slant lines, number of horizontal and vertical lines, total length of horizontal and vertical lines, total length of left and right slant lines, and overall image size from a written manuscript. It also extracts eight graphological features such as top margin, right margin, bottom margin, left margin, spacing between the words and lines, font size, and letter slant from the manuscript. These features are used to predict whether the writer is healthy (control group) or hypertensive person using SVM classifier.

The remainder of the paper is organized as follows: first the brief overview of proposed system is given. The experimental results are discussed in next section. The last section concludes the paper.

Proposed Approach

The proposed system works in four stages namely scanning, preprocessing, feature extraction and classification as shown in Figure 1.

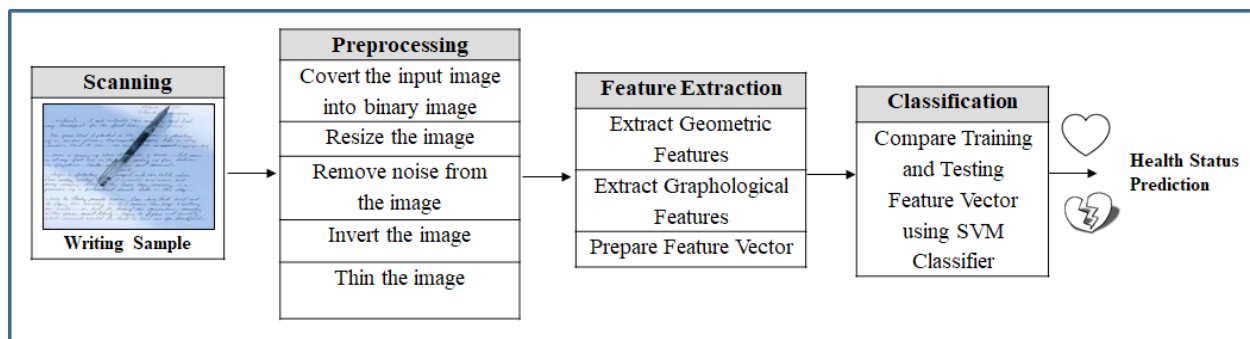

Figure 1. Block diagram of proposed system

1) Scanning:

This stage converts the input handwritten manuscript collected on A4 size white paper into JPEG image using the scanner. This scanned image is given as input to the preprocessing stage.

2) Preprocessing:

The scanned image is preprocessed so as to reconstruct it, remove noise from it and to improve the accuracy of algorithms applied on it. This stage converts the scanned image into gray scale. The grayscale image is converted into binary image. Further the binary image is resized and noise is removed from it. This image is

then inverted and finally thinned.

3) Feature extraction:

This stage extracts geometric and graphological features required for effective classification using SVM [9, 10, 11]. Three different feature sets namely geometric, graphological, and integrated feature set are formed using extracted features. Different feature sets with related features are given in Table 1.

4) Classification:

The proposed approach uses SVM classifier for classification of input data. Initially the system

prepares training feature vector using all images from training dataset. While preparing the training feature vector, the proposed algorithm reads the input image from training data set and preprocesses it. Then as per requirement it either extracts geometric or graphological or both geometric and graphological features from the preprocessed image and forms the feature set using respective features. If the input image belongs to control group category it adds the label 'CG' to newly created feature set else it adds the label 'Hypertension' to it.

This feature set is added into training feature vector. This process is repeated for all the images in training dataset. During testing, the system reads the test image from testing dataset. It preprocesses the test image and prepares the testing feature vector for it by extracting geometric or graphological or both geometric and graphological features as per requirement. The SVM classifier compares both training and testing feature vectors and predicts whether the writer is control group or hypertensive person.

Table 1. Feature Sets

Sr. No.	Feature Set	No. of Features	Features
1.	Geometric feature set	10	Euler number, number of right and left slant lines, number of horizontal and vertical lines, total length of horizontal and vertical lines, total length of left and right slant lines, and overall image size.
2.	Graphological feature set	8	Top margin, right margin, bottom margin, left margin, spacing between the lines, spacing between the words, letter slant, and letter size.
3.	Integrated feature set	18	Euler number, number of right and left slant lines, number of horizontal and vertical lines, total length of horizontal and vertical lines, total length of left and right slant lines, and overall image size, top margin, right margin, bottom margin, left margin, spacing between the lines, spacing between the words, letter slant, and letter size.

EXPERIMENTAL RESULTS AND DISCUSSION

The proposed approach has been implemented using a system with Intel i5 processor, 8.00 GB RAM, 64-bit operating system, and Matlab R2014a. A database of 300 handwritten manuscripts has been prepared by collecting handwritten manuscripts from hypertensive and control group people. The authenticity of the data has been verified while collecting the data from various clinics under the guidance of doctors. The dataset contains 150 manuscripts of hypertensive people and 150 of control group people.

Performance analysis of SVM with different feature sets

The performance of SVM classifier is evaluated for geometric, graphological and integrated feature sets using dataset *Set1* given in Table 2. The *Set1* contains 300 handwritten manuscripts. The *Set1* is partitioned into training dataset with 200 manuscripts, 100 of hypertension and 100 of control group class, and testing dataset with 100 handwritten manuscripts, 50 of hypertension and 50 of control group (CG) class.

Table 2. Dataset *Set1* Details

Health Status	No. of Training Samples	No. of Testing Samples	Total Samples
CG	100	50	150
HBP	100	50	150

The confusion matrix shown in Table 3 is prepared based on results obtained for geometric, graphological and integrated feature sets using SVM classifier.

Table 3. Confusion Matrix for geometric, graphological and integrated feature sets

		Predicted Class for					
		Geometric Feature Set		Graphological Feature Set		Integrated Feature Set	
		Hypertension	CG	Hypertension	CG	Hypertension	CG
Actual Class Values	Hypertension (50)	31 (TP)	19 (FN)	44 (TP)	6 (FN)	46 (TP)	4 (FN)
	CG (50)	11 (FP)	39 (TN)	6 (FP)	44 (TN)	3 (FP)	47 (TN)
Total (100)		42	58	50	50	49	51

To evaluate performance of SVM classifier accuracy, specificity, sensitivity, positive predictive value (PPV), negative predictive value (NPV), positive likelihood ratio (LR+) and negative likelihood ratio (LR-) have been computed separately for geometric, graphological and integrated feature sets. Specificity and sensitivity shows the diagnostic accuracy of a test. The terms PPV and NPV represent the probability of disease. Test with specificity, sensitivity, PPV, and NPV greater than 90% has got high credibility. LR+ and LR- are more useful clinically to measure diagnostic accuracy. To rule in or rule out diagnoses, LR+ greater than 10 and LR- less than 0.1 provides strong evidence.

performance of the proposed system when used with different feature sets. For geometric feature set, sensitivity was found to be 62%, specificity 78%, PPV 62% and NPV 67%, LR+ 2.82 and LR- 0.49. This shows that the results obtained using only geometric features are sometimes useful clinically. For graphological feature set, sensitivity was found to be 88%, specificity 88%, PPV 88% and NPV 88%, LR+ 7.33 and LR- 0.14. This indicates that the test performed using graphological features are often useful. In case of integrated feature set, sensitivity was found to be 92%, specificity 94%, PPV 94% and NPV 92%, LR+ 15.33 and LR- 0.085. This indicates that the test performed using integrated feature set is highly credible and very useful test clinically.

Following Figure 2 and Figure 3 represents the

Figure 2. Performance analysis of SVM classifier for different feature sets

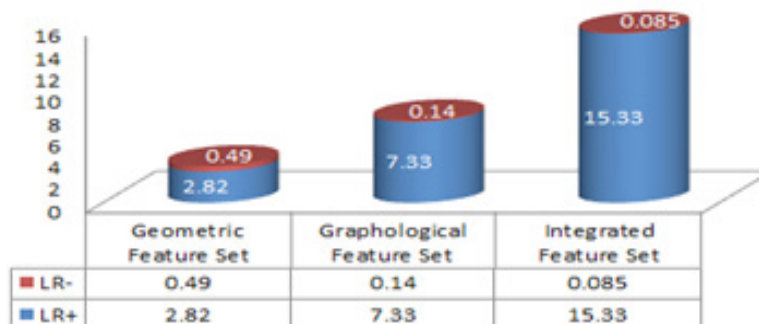

Figure 3. Featuresetwise Likelihood Ratios

Performance analysis using different data sets

As SVM classifier gives good performance with integrated features set, the performance of proposed system is further evaluated with integrated feature set using three more datasets. The second set *Set2* contains 3/4 of total images i.e 225 images for training and 1/4 of total images i.e 75 images for testing. The third set *Set3* contains 4/5 of total images i.e 240 images for training and 1/5 of total images i.e 60 images for testing. The fourth set *Set4* contains 5/6 of total images

i.e 250 images for training and 1/6 of total images i.e 50 images for testing. The performance of the proposed system with integrated feature set using different data sets is shown in Figure 4 and Figure 5. It gives average 93.30% sensitivity, 92.2% specificity, 92.75% accuracy, PPV 92.25%, NPV 93.30%, LR+ 12.52, LR- 0.07. Thus, sensitivity, specificity, PPV and NPV values are above 90%, LR+ is above 10 and LR- is below 1. This shows that the proposed approach outperforms with any database size.

Figure 4. Performance analysis of SVM with integrated feature set using different datasets

Figure 5. Likelihood Ratios for different datasets.

CONCLUSION

The proposed approach uses SVM classifier to predict hypertension based on handwritten manuscript. The SVM classifier outperforms with integrated features set. With 93.30% sensitivity, 92.2% specificity, 92.75% accuracy, 92.25% PPV, 93.30% NPV, LR+ 12.52, LR-0.07, this approach appears to be an excellent for predicting the healthy and hypertensive people. With geometric features, the proposed approach does

not give satisfactory results, but when it is used with graphological features or the combination of geometric and graphological features, it gives satisfactory results. This proves that graphological features reveal health status. The graphological features have been selected for this research by assuming the science of graphology which says that the people suffering from same disease have similar kinds of writing features and this has been proved through this research. From this, we can conclude

that the health status is reflected through handwriting of the person if the writer writes in relax and comfortable environment. Thus, the proposed approach is a novel technique for prediction of hypertension. To the best of our knowledge, this is first attempt for predicting hypertension using SVM classifier based on handwritten manuscript.

Analysing the Causes of Cyclonic Severity in Bay of Bengal and Its Effects in Biotic Species Using XGBoost Algorithm

S Karthick¹, D Malathi², Ramraj¹, Yashwant K¹

¹Dept of SWE, SRM IST, Chennai, India, ²Dept of CSE, SRM IST, Chennai, India

ABSTRACT

The severity of the cyclone depends on the amount of the pressure drop in the centre and the rate at which it increases outwards. The importance for the prediction of cyclone intensity ⁷ is growing day by day. In this paper we are addressing about the four type of severity of cyclone - Depression(D), Deep Depression(DD), Cyclonic Storm(CS), Super Cyclonic Storm (SCS). The objective of the work is predicting the cyclone severity using the wind speed, latitude, longitude of the pressure. When the severity is predicted well in advance then it will be very useful for the disaster management for proper planning. In this paper we are applying Xgboost model of linear regression for prediction. Xgboost is a gradient boosting algorithm which is based on decision tree. The model is trained with the dataset of 10 years (1990 – 2000) containing latitude, longitude and pressure drop of the cyclones occurred in Bay of Bengal (BOB) along with the date and time. Added to this, Cyclone or hurricane causes many hindrance to the Biotic Species including Land and Sea animals, plants, etc.,

Keywords: *Decision Trees, Gradient Boosting, Xgboost, Feature Score*

INTRODUCTION

Indian sub-continent is one of the most vulnerable regions of cyclone in the world. It has a coast line of totally 7516 km (5400 km along the mainland; 132 km in Lakshadweep; and 1900 km in Andaman and Nicobar Islands), which covers nearly 10% of the world's Tropical Cyclones ^{8,9}. The data Analysis for the period 1980-2000 shows that on an average, annually 370 million people are exposed to cyclone in India. In the pre-monsoon season, the chance for cyclone is about 25% around the Arabian Sea and 30% around the Bay of Bengal. The aftermath of cyclones results in large number of deaths and heavy loss of private and public properties. Thus, prediction of cyclone severity is highly crucial.

Until now, various machine learning techniques such as decision tree ⁴, SVM ⁵, random forest ⁶, etc. are used to predict the severity of cyclone. In this work, we

are going to apply the XGBOOST algorithm to predict its severity in Bay of Bengal. The paper is organised as follows: Section 2 will have an overview about other various machine learning methods used for cyclone prediction Section 3 will discuss about the XGBOOST methodology Section 4 will show the result of the experiment with XGBOOST

METHOD

About the Algorithm

Before starting with Xgboost we should know what a decision tree is and how it works. A decision tree is basically a uses a tree like model for decisions and their possible consequences, including chance event outcomes, resource costs, etc. It is one way to display an algorithm that only contains conditional control statements.

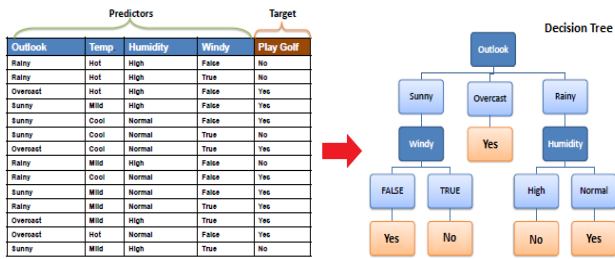

Fig. 1 Dataset and Architecture of prediction using Decision Tree

The dataset in Fig.1 contains various events in which player will play or not play golf on a given day. When we train the classifier it classifies the events just like the graph shown in the image. For example, on a particular day suppose outlook is overcast temperature is high humidity is high and wind speed is low. When the decision tree gets this type of input it goes through each possible case in the tree and finally generates output in this case it will give yes. This is how decision trees work.

Random forest is an algorithm in which we rely on prediction from multiple trees. We first train multiple classifiers with dataset and then test the prediction made by them. It generally has a greedy approach so as to get the optimum solution. Accuracy is generally higher in random forests than compared to decision trees since random forests make prediction based on results from multiple trees and the most optimum solution is selected.

Xgboost works somewhat similar to decision trees; the difference is that it adds score to each node of the tree and evaluates based on the score generated.

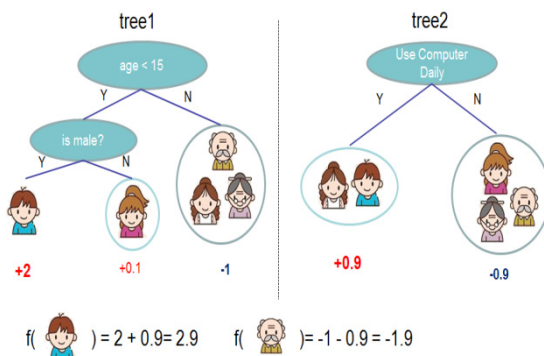

Fig. 2 Addition of score to decision tree nodes-Xgboost

As shown Fig.2, at each node we add a certain score. At the time of evaluation these scores are added and based on the scores decision are made. Before we proceed further we need to check how much accurate prediction our model gives. For this we define an objective function. An objective function is a function which measures accuracy of a model on a given dataset.

An objective function has basically two parts: First is the loss function which tells how predictive our model is and second is the regularization function which helps to avoid over fitting.

This is the general equation for objective function:

$$obj(\theta) = L(\theta) + \Omega(\theta) \tag{1}$$

Here $L(\theta)$ is the loss function and $\Omega(\theta)$ is the regularization function. Now a question arises as how are the scores assigned to each node. After renormalizing the tree we can write the objective value of t-th tree as:

$$obj(t) = \sum_{j=1}^T T[(\sum_{i \in I_j} g_i)w_j + 2(\sum_{i \in I_j} h_i + \lambda)w_j^2] + \gamma T \tag{2}$$

Basically, for a given tree structure, we push the statistics g_i and h_i to the leaves they belong to, sum the statistics together, and use the formula to calculate how good the tree is. This score is like the impurity measure in a decision tree, except that it also takes the model complexity into account. ¹

A. SVR for predicting Tropical cyclone

[Dataset: <http://www.bom.gov.au>; <http://www.esrl.noaa.gov/psd/data/gridded/>]

There is huge amount of data present in these datasets. There is a large amount of data present in the above datasets. They have been recorded over different times. They don't follow same scale. So, first thing to be done is to standardise them. The data is then divided into two parts: 28 years and 12 years. The 28 years is used for training our predictor while the 12 year is used for testing the predictor. SVR operates in high dimensions. Each observation is mapped into m-dimensional feature space. A model is then created using the SVR model equation. All the calculations are done using Weka. In SVR there arose a situation for development of different types of predictors in total 48 different predictors. To solve this issue we applied initial variable selection was employed using linear regression, which reduced 48 predictors to 6. Further the six predictors were tested on the dataset and their general properties were checked out. Optimal ones were picked. This again reduced the number of predictors from 6 to 3. Linear, polynomial and radial basis functions were evaluated for SVR. After substantial experiment with 406 kernels, the radial function with $\gamma = 0.73$ and $C = 1$ were having optimal generalization properties.

SVR has been applied successfully in predicting the development of tropical cyclones. Compared to multi linear regression model, SVR has improvised the accuracy by ~40%. 5

A. Decision Trees for modelling rainfall prediction

[Dataset:ftp ncdc.noaa.gov/pub/data/g sod/2014/.]

The dataset is first divided into two parts: one for training and the other part for testing the predictor. During the training process the predictor is provided with the training dataset. The predictor learns from the dataset and finds relation between values between different features that were provided. The model is then tested for its accuracy by comparing the predicted value by the predictor with the actual value present in the test dataset. Feature selection is a very important task before you train the task. It is good to have many features but the features should be relevant. Irrelevant features do not make much sense and can harm by reducing the accuracy. Though the performance vector depicts accuracy as 100%, when we compare the actual and target data, we find that the success rate for the year 2014 is 80.67. 4

B. Automated weather event analysis with C4.5 classifier 10

[Dataset:http://www.wunderground.com/history/airport/ KCQT/2015/1/1/CustomHistory.html]

C 4.5 is a classifier used to build decision tree classification system. It builds decision tree based on information entropy from the training data set. Information entropy is basically how much information is present in an event. C 4.5 makes decision when it gets the highest information gain based on the formula, $I(\text{gain}) = H(\text{event}) - H(\text{Event} | \text{Feature})$ From the experiments that were conducted it is clear that C4.5 can classify weather events using the weather information. It is able to predict the weather with minimal amount of error and lower number of features as compared to other classification methods.3

C. Radar emitter classification using XGBOOST

[Dataset: For the purpose of this research, large radar signals data set with 268,545 samples is collected in the database. The dataset includes 50 different types of radar emitters.]

Here we first use data in radar database, then select the features from the database and then process each attribute with special process set. Then we randomly select 80% of the samples in the data set as training set, 20% as test set, and assure that each class is contained in the training set and test set with the same proportion. These two sets are used to train supervised classification model. With supervised learning, parameters of classification model can be adjusted to the best state. The new intercepted signals then can be recognised after attributes pre-processing. XGBOOST is a gradient tree boosting algorithm which has shown results for many state of the art results on machine learning algorithm. The main idea of this gradient tree boosting is that the result is not predicted just by a single tree classifier but by multiple tree classifiers. The loss function and penalty term is also considered while training the classifier 2. This type of problem can also be solved using evolutionary algorithms 12

Algorithm:

1. Input Dataset.
2. After proper pre-processing the dataset is passed for training.
 - a. The classifier looks for important features first and then accordingly introduce best possible splits needed. It generally follows a greedy approach for finding the most optimal split since this approach is fast.1
 - b. After splitting percentile value is assigned at each split by using the approximate algorithm during the training of the dataset. 1
3. Based on these percentile values these scores are assigned at each split .[1]
4. Based on the scores ranks are allotted to these splits.
5. At the time of predicting an event the scores are added to predict which event is going to happen.
6. While dealing with real time data there are many issues inside the dataset like empty space, unreasonable zeroes added in place of missing values.
 - a. For a normal decision tree this events can be misleading.

b. But Xgboost creates a separate path for these kind of events and predicts based on the scores related to previous events.1

7. Accuracy score is calculated.

How Random Forests work:

Before starting with Random forests we should have a rough idea of ensembles. An ensemble is a set of classifiers that learn a target function, and their predictions are combined to classify new examples. In random forests algorithm we rely on predictions from multiple decision trees. An ensemble consists of multiple decision trees i.e. it has multiple classifiers. In the dataset we train each classifier with the present dataset. The ensembles use a divide and conquer approach to classify. With this we can classify the dataset and values present more precisely thereby giving better accuracy as compared to other algorithms.

The XGBOOST tuned classifier has shown significantly improved results than compared to general machine learning algorithm like SVM. Weighted XGBOOST method achieves 98.3% accuracy on our test set, while the classic support vector machine (SVM) and RVM methods get 89.1 and 79.6% accuracy, the gradient boost gets 91.9% accuracy, and DBN achieves 95.4% accuracy.

RESULTS AND DISCUSSION

In the experiment we have taken following parameters into consideration while training latitude, longitude, CI no, pressure, wind and pressure drop. The xgboost algorithm is implemented in python and runs on ubuntu 14 LTS machine having 4GB RAM. The following graphs show the feature importance in the algorithm. xgb.importance() function tells importance of each feature by calculating the feature score or f score.

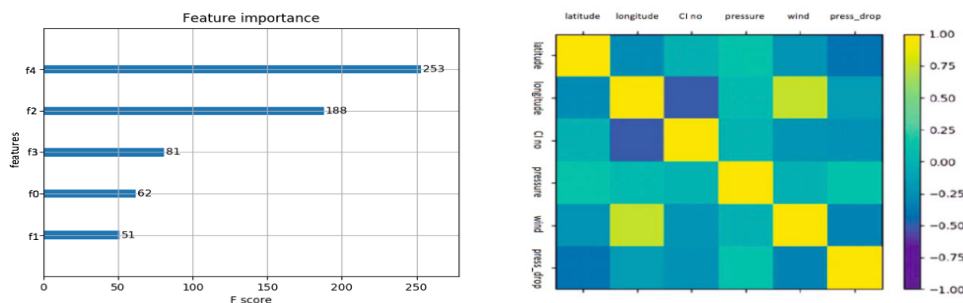

Fig. 3 Feature importance based on Fscore

From Fig. 3 shown, it is clear that feature f4 i.e. pressure is having the highest importance. After training the Xgboost classifier with the dataset we get following results as shown in the images below:

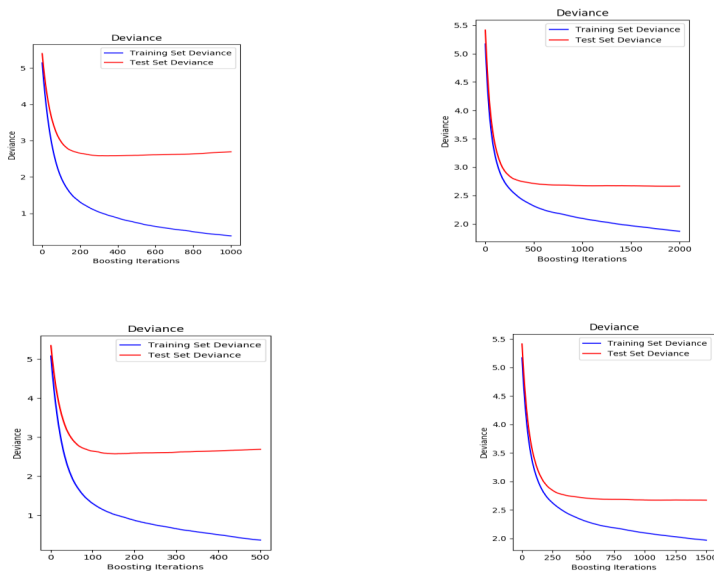

Fig.4. Deviations after booting iteration

The images in Fig.4 show deviations after different boosting iterations. From figure it is clear that we get least number of deviations after 1500 iterations. Any further increase and the deviation increases and lower than this deviation is clearly high. So we get most optimum deviation after 1500 iterations. Beyond this the variance increases further due to overfitting.

Many Plants got devastated due the severity of cyclone or hurricane ¹¹ over the coast of Bay of Bengal. Species also affected by migrating it's place from one to another due to the severity in the sea during cyclone.

CONCLUSION

In this paper we have implemented Xgboost to predict the cyclonic severity at Bay of Bengal. On comparing with other classifiers from different models, we have found that it has generated accurate results. On training the classifier beyond certain extent we can see that variance increases as discussed in the result section. The issues can be optimized by regularizing the dataset thereby preparing a real fit data.

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **editor.ijphrd@gmail.com**
